

## Open

Open (Command-O) works in standard Macintosh fashion, with one additional choice. Below the scroll box listing available files and folders is a [Show pop-up menu](#), for the file type you want to open. DiskPaper Reader can open some files not created with DiskPaper.

- Select the file type you want to open. Your choice is indicated with a check mark.
- Choose All Available to see all openable files, including but not limited to the other choices on the menu.
