

Sparkle:

The module sparkle.sea is a self extracting archive, and contains the latest version of sparkle. Sparkle plays mpeg files on the Macintosh. Double click on the module, and place the contents in a folder on your disk.

Sparkle is provided courtesy of Maynard James Handley, who now works for Apple Computer. He has given SIGGRAPH 95 permission to place Sparkle on this CD-ROM.

Maynard has placed some restrictions on Sparkle in the past; in general, all he asks is that you ask his permission to put it on a CD-ROM. There are a variety of README files in the archive; please read them for information and any restrictions on the use of Sparkle.

Sparkle uses Threads, and if you are using MacOS 7.1 or earlier, you will need to install the Threads init. Threads is already in MacOS 7.5.
