Identity passwords

You can configure your identity to prompt you for a password when you log on or switch from another identity. This will protect your identity so others cannot log on as you unless they know your password. They will also be prompted for a password if they attempt to remove or change settings for your identity.

Adding a password to your identity does not protect your data from other people using the computer. If you prefer greater security, you should set up and configure a Windows User Profile for each user.

Setting up multiple identities

If you have more than one person who uses the same computer, you can set up an identity for each person. This allows different users to log on without having to restart the computer. This way, your Internet connection won't be lost, and all open programs will remain open. There is no limit to the number of identities you can have. Each user can have a separate identity or one person can have several identities. For example, a family could set up one identity for each parent and each child, or the children could all share one identity.
