RECONSTRUCTED STONE CURBING

HANOVER® ROCKCURB®

Reconstructed stone curbing has been designed to provide the performance of granite at a fraction of the cost. The stone is carefully graded and placed under a million pounds of pressure, similar to the forces which form natural stone. Extremely dense concrete with high compressive strengths give the units low water absorption rates and salt resistant qualities.

The units are consistent in size and many times more durable than poured in place curbing. They are easy to lift for repairs or for utility maintenance. If changes need to be made to the street or sidewalk, HANOVER RockCurb® can be reconfigured and reinstalled.

RockCurb® Radius Sections can be used when the installation incorporates curves. Gentle arches or circles can be accommodated by using a combination of radii and straight sections.

The 18" Curbing is available in both an angled Battered Edge and a rounded Bullnose Edge profile. A complete selection of radii are available so that almost any municipal requirement can be met.

The 12" Curbing is available in the Battered Edge profile only and a limited number of outside radii.

The stocked color is Limestone Gray. Special aggregate blends and textured surface complete the appearance of stone. Custom colors and aggregates can be accommodated when quantities permit.

For more information, please request our brochure: *RECONSTRUCTED STONE CURBING AND WALLING.*
