

## **Playbound Tiles & Playbound Poured-in-Place**

### **Playbound Tiles**

State-of-the-art production techniques produce long-term benefits on the playground. Dual density construction – a medium density bottom joined to a high density top – enables this product to provide an unparalleled combination of key benefits. Factory molded into a variety of colors and thicknesses in easy-to-handle pieces, they are ready to glue in place upon delivery.

### **Playbound Poured-in-Place**

A seamless system that is easily customized to meet the safety, design and aesthetic requirements of your playground. Because the rubber and urethane elements are mixed and applied on-site, having school colors, logos, game and/or geometric shapes permanently incorporated into the surface are practical options. Certified installers are available to customize the surface to meet your color, design and thickness requirements.
