#### **Trimline**

Take the tackable 1/2" molded fiberglass core of 10 lb. density, wrap it in fabric, polyolefin or perforated vinyl wallcovering of your choice, wrinkle-free and with tailored corners, and you've got one of the most popular panel systems for interior decors: Trimline. It offers a trimmer profile, a noise reduction coefficient (NRC) range of .55 to .80, and the versatility that goes with a choice of square, bevel, and radius edging and custom rounded corners.

#### **PS-80**

Some interiors don't call for standard-shaped panels. When panels have to be altered to fit, the PS-80 is the one for the job. Its 1" or 2" sound absorbing fiberglass core is surrounded by resin-hardened perimeter edges, is lightweight and can easily be cut to meet installation requirements. Special shapes and thicknesses are available in PS-80, and radius, bevel and miter edges are offered in addition to the standard square edges.
