PP-PRODUCT PRESENTATION-CURVATURA™ Ceilings

The CURVATURA Ceiling System is a one-of-a-kind system that produces dramatic, 3-dimensional designs and offers the freedom to combine shape, texture and lighting for a look all your own.

UA-USES, APPLICATIONS-

A CURVATURA ceiling is more than just a distinctive ceiling product - it is a complete system. The suspension system is a collection of 16 curved vault main tee segments and 16 curved valley main tee segments, both available in four arc series - 30°, 45°, 60° and 90°. Assembly involves simply putting vaults and valleys together to create a wavy ceiling.

AI-ASSEMBLY, INSTALLATION-

A CURVATURA ceiling is easy to install. The main tees are simply spliced together from a selection of arc segments in a predetermined order. Each segment is numbered at the factory and corresponds to a string of numbers specified by the architect during the ceiling design stage. Detailed installation instructions are provided to the contractor, assuring that the installation conforms to the architect's design. The panels are held in place with hold-down tabs that are built into the web of the CURVATURA grid - a tremendous time-saving feature.

MF-MATERIALS, FINISHES-

CURVATURA's flexible 2" x 2" (51 x 51 mm) panels are available in smooth aluminum and perforated aluminum wire mesh of brass or stainless steel, and translucent fiber reinforced plastic (FRP). An optional lay-in poly-bagged fiberglass batt provides localized acoustical control.
