CLIPBOX v 1.0

Copyright 1992 Gordon L. Smith

 Clipbox is a utility designed to aid in working with the Windows Clipboard.   Currently, only the CLipboard Text mode is supported.   Clipbox can be used to hold up to 8 differents Clipboard copies in a stack, can append the CLipboard to designated file, edit the Clipboard and print the Clipboard.

Command Buttons

Startup Options

About Clipbox

Command Buttons

GET

Clicking the GET button, takes what is currently on the CLipboard and adds it to the CLipbox stack.

?

The ? button brings up this Help file.

LOG

The Log button, takes what is currently on the Clipboard and APPENDS it to the designated Log File.   By default this file is CLIPBOX.LOG in the Windows Directory.   On the Startup Screen, you can specify another Log file, if desired.   When you click the LOG button, a popup prompt askes for the title.   If you include a title, then this title, along with todays date, is also written to the Log File.   If you do not specify a title, then only the CLipboard text is appended.

P

The P button prints text currently on the CLipboard.   (This only works for text).

E

The E button grabs what is currently on the CLipboard, opens a textbox to enable you to edit what is currently on the CLipboard.   When you click DONE, what is currently in this edit box will be put back on the CLipboard.   While you are editing, you can take other entires off the Clipbox stack and paste them into the Clipboard edit text box.   This is also a convenient means to view what is on the Clipboard at any time.   This only works when Clipboard is in text mode.

S

The S button saves the current Clipbox Stack to Clipbox.Dat in the Windows Directory. If you have several pieces of info you have taken off the CLipboard and want to ensure they are not lost, click the S button and they will be saved.   This data file is automatically loaded each time you start Clipbox.

X

The X button, quits CLipbox.   The current stack is automatically saved to Clipbox.Dat in the Windows Directory.

Dropdown Listbox

This is a listing of up to eight items currently held in the CLipbox stack.   After 8 items are on the stack, the oldest is automatically rolled off as new ones are loaded.   To put one of the entires back on the Clipboard, just click the title in the Listbox.

Startup

 The Startup forms allows you to pick the mode of operation.   In the LOG MODE, the only function you can perform is to append information to the designated Log File.   The STACK MODE provides the full Clipbox functions.   You can use this form to designate the desired Log File, when operating in the LOG Mode (in the STACK Mode the Log File is Clipbox.Log in the Windows Directory).   If you choose to use a new Log File, it does NOT have to be located in the Windows Directory.

 CLipbox can be automatically   started in the Log Mode by specifying the desired Log File on the command line when the program is started. The format is CLIPBOX <Complete file name, including path>.   To append information to this Log File, just double click the icon.
