ManageWise 2.0 reports on server performance over the last year. ManageWise collects information you need for long-term projects and analyzes trends of your server's performance parameters, including CPU usage, memory usage, users logged and print queue length, over the last month or last year and then lets you view results graphically.

Analyzes declining network performance. ManageWise provides distributed analysis tools that let you monitor network traffic trends and make better decisions about your network more cost effectively.

With ManageWise, you can understand traffic routes and their relative costs to optimize network traffic. For example, you may need to move a server closer to users who use it more frequently.
