

This dialog allows you to select the folders in which Tidy It Up ! should create the dummy files. There is a list of special folders that can be quickly added by checking/unchecking the checkbox. All but the system folder checkbox are only used under system 7.

You can add and delete any folder in the list by using the Add and Delete Buttons. Tidy It Up ! II stores the path from the system folder: this feature is useful for folders like "Control Panels (disabled)" used by some INIT managers. Tidy It Up ! disregards the volume name and the system folder name.
