WORDPERFECT CORPORATION UNVEILS WORKGROUP COMPUTING SOLUTIONS FOR UNIX SYSTEMS

WordPerfect Office 4.0 for UNIX SUN SPARCstations Demonstrated at UniForum

SAN FRANCISCO — March 17, 1993 — WordPerfect Corporation today began demonstrations of its integrated electronic mail, personal calendaring and group scheduling package for UNIX systems — WordPerfect Office 4.0 for UNIX.

WordPerfect Corporation announced WordPerfect Office 4.0 in October of 1992. Versions of WordPerfect Office 4.0 for Windows, DOS and Macintosh are in beta and are scheduled for release during the second quarter of 1993. WordPerfect Office 4.0 for UNIX SUN OS is scheduled to release approximately two months following the release of the other platforms, with versions for IBM AIX, HP/UX, DG/UX and SCO UNIX planned to ship by the end of 1993.

WordPerfect Office 4.0 integrates electronic mail, personal calendaring and group scheduling into a single application. Integrating the three applications means that the features previously associated only with e-mail

products are now available for group scheduling and personal calendaring. Version 4.0 also includes rules-based message management, task management functionality and workflow technology.

"E-mail, calendaring and scheduling are mission-critical communication tools for today's workforce, and by combining the three products into one we have truly revolutionized workgroup computing," said David Clare, product marketing director for WordPerfect Office. "WordPerfect Office 4.0 provides the workgroup functionality our customers are demanding and our competition is only talking about."

"In addition to providing a very robust messaging system, WordPerfect Office 4.0 offers our customers the option to run a UNIX, DOS or Macintosh server with any of the WordPerfect Office 4.0 clients," said Lowell Camp, product marketing manager for WordPerfect Office for UNIX. "This type of flexibility allows our customers to build a messaging system that best fits their enterprise's needs."

The WordPerfect Office 4.0 UNIX Connection Server is a 32-bit, multitasking, high-throughput electronic messaging server that increases the performance of message transport by more than 15 percent. The UNIX server, combined with the new feature set and functionality of WordPerfect Office, makes WordPerfect Office 4.0 a true enterprise-wide messaging solution, said Camp.
