

SCHED  
**NAME**

SCHED

sched - Job scheduler.

**SYNOPSIS**

**load=sched.exe**

**DESCRIPTION**

Insert into the section **[windows]** in the file **win.ini**:

**load=sched.exe**

**Sched** runs idle waiting for jobs. If a job is passed to **sched**, **sched** changes to the directory specified in the job, and runs the program (with optional parameters) specified in the job as a child process. If the last specified parameter is the **&** symbol, the program will run minimized.

**Sched** tries to find the program in the current directory, in the Windows directory, in the Windows system directory and finally in the directories specified in the environment variable **PATH**.

The environment variable **TEMP** must have been set to your directory to be used for temporary files.
