

```

// TYPESET.WCM — Replace ASCII quotation, apostrophe, and dash marks
// with typesetter-style marks,
//           using characters from WP charsets 1 and 4, and arrange
for correct hyphenation at dashes.
//
//          "foo"      becomes  "foo"
//          'foo'     becomes  'foo'
//          dad's     becomes  dads
//          foo--bar   becomes  foo—bar
//
// For simplicity and speed—so that we needn't step through the doc
character by character but can
// instead use Search—we do the job on quote marks in two passes: one for
ASCII doublequotes and
// one for ASCII singlequotes/apostrophes.
//
// WARNING: this screws up on nested quotation marks of the same kind (e.g.
doublequotes
// within doublequotes). This could be fixed, but the speed penalty makes it
probably not worthwhile.
//
// Author: Richard Reiner <rreiner@nexus.yorku.ca>
//
// Revision history
//    12 Jun 1992          RjR  Initial version
//    16 Jun 1992          RjR  Logic to distinguish between
singlequotes and apostrophes;
//                           loop unrolling for speed.
//    25 Jun 1992          RjR  Added conversion of dashes; changed
name to TYPESET.WCM.
//    16 Oct 1992          RjR  Added extra passes to insert [HyphSRt]
codes after Emdashes and Endashes.
