

SPEED USERS MANUAL

(This is intended a supplement to the FAST users manual)

SPEED is essentially FAST with a copy of the CCP written by Digital Research. For this reason, distribution of SPEED should be limited to those who are licensed users of CP/M. Except for this restriction, SPEED is considered public domain software.

One notable difference between FAST and SPEED is the length of time that they remain in your system. FAST is present only for the execution of one transient. SPEED, on the other hand, stays in your system until you cold boot or type control-A. SPEED prompts with '>A>' (get it? greater than A> heh heh) as a constant reminder that it is in control. You should always be aware that SPEED is control because, like FAST, it disables the disk change detection built into BDOS. It is possible to clobber a disk by switching disks and not booting. Control-C does nothing except reset BDOS under SPEED. When you must change disks, type control-B to reset SPEED.
