WarpPNG

1.1 WarpPNG.datatype 44.1

WarpPNG.datatype 44.1 - the
fastest
24-bit PNG picture datatype!
(for WarpUp PPC systems only)

1.2 Description

As you've probably guessed, WarpPNG.datatype is a yet another PNG datatype. The difference is that this is for owners of PPC cards, and it has been targetted specifically at WarpUp (not PowerUp). Even better, it is compact, clean, free and well behaved - a true plug'n'play PPC datatype.

I decided to write this datatype because no other decent WarpOS native PNG datatype exists for the PPC, and it is was relatively easy to implement being based on the same engine that WarpJPEG.datatype uses.

1.3 System Requirements

This datatype needs the following in order to work:

- PPC accelerator card + 68040/060
- WarpUp Release 4 (powerpc.library V15) or higher
- picture.datatype v43 or higher
(i.e. either of the ones supplied with AmigaOS 3.5, P96 or CGraphX)
- Kickstart 3.0 or higher

Note that a graphics card is not necessary - the P96 or OS 3.5 picture.datatype will automatically dither images down to your display requirements.

1.4 Installation

To install this datatype, simply run the provided installer script ←
by
double-clicking the icon.

Alternatively, the datatype can be installed manually (be sure to understand the

requirements
first though) by typing the following shell

commands:

```
Copy "Devs/Datatypes/PNG#?" DEVS:Datatypes
Copy Classes/Datatypes/WarpPNG.datatype SYS:Classes/Datatypes
AddDataTypes REFRESH
```

You'll probably want to make a backup of your existing PNG descriptor (the file in DEVS:Datatypes) first. You will also need to ensure there are no other PNG datatypes in DEVS:Datatypes. Finally, a reboot may be needed for the changes to take effect.

1.5 Speed

The fastest PNG datatype?

WarpPNG is currently the fastest PNG datatype available. The table below shows the time (in seconds) it took to decode 14 different images on my A1200 603e/240MHz 060/50MHz, with BVision, with other datatypes configured as close as possible to WarpPNG's internal settings:

	PowerPC	M68K		
	WarpPNG	akPNG	44.60	PNGdt
	44.1	PPC	/ 68K	G.Nikl
1024x768 24-bit, 833721 bytes	1.36	2.42	5.01	3.75
1024x768 24-bit int, 1037008 bytes	2.05	3.17	10.02	6.22
779x767 24-bit, 946564 bytes	1.19	2.26	4.83	3.33
473x639 24-bit, 377518 bytes	0.57	1.35	2.02	1.49
473x639 24-bit int, 459869 bytes	0.82	1.66	4.08	2.52
368x463 24-bit, 279896 bytes	0.38	1.14	1.61	1.02
251x400 24-bit, 136856 bytes	0.25	0.97	0.97	0.59
718x425 grey, 157890 bytes	0.27	1.06	1.27	0.71
718x425 grey int, 182522 bytes	0.38	1.21	3.33	1.39
1024x768 256 col, 324599 bytes	0.43	1.27	1.62	0.93
779x767 256 col, 404245 bytes	0.42	1.31	1.96	0.95
473x639 256 col, 163397 bytes	0.24	0.98	0.98	0.49
368x463 256 col, 115942 bytes	0.16	0.88	0.64	0.33
251x400 256 col, 57056 bytes	0.11	0.83	0.46	0.20

(int = interlaced image)

These figures are provided for comparison purposes only, but they speak for themselves... WarpPNG is 3-4 times as fast as the PPC version of akPNG in most cases (just under 2 times faster in the worst case), and around 3 times faster than 68k datatypes on a 060 (the speed difference will be even greater on 040 systems with a fast PPC). All this and no loss in image quality!

Still too slow!

Despite these facts, I'm still disappointed with the relatively slow performance advantage offered by my 603e over my 060 (approximately only 3 times faster). The main problem is that PPC datatypes still have to use the 68k for reading the data from disk and for creating / writing to the bitmap time lost for file i/o is negligible as WarpPNG uses double buffered asynchronous i/o (supports DMA controllers).

The largest bottleneck is that the DTM_WRITEPIXELARRAY method of the picture.datatype has to be used to write the image data from WarpPNG into the image bitmap. As this process is done via picture.datatype, it can only currently be performed by the 68k. To give you some idea of how much of a problem this is for WarpPNG, typically, half of the overall decode time is used by the PPC to decode the whole image, and the other half is used by DTM_WRITEPIXELARRAY on the 68k. And that's on a graphics card - the time used by DTM_WRITEPIXELARRAY will probably be even greater on

systems using native Amiga graphics. It doesn't take a genius to see that this is slowing the datatype down, and is the main reason why WarpPNG will still be faster on a 060 than a 040.

How to make the datatype faster

Is there anything that can be done about this? Well, yes, there are a few patches that you can install which should make things faster:

- NewWPA8 (util/boot/NewWPA8.lha on Aminet) should provide a notable speed increase on native Amiga graphics - probably won't make any difference if you use a graphics card.
- If you use a graphics card and CyberGraphX, you may want to make sure you are using the supplied v43 picture.datatype, as this will be faster than the P96 and OS3.5 picture.datatype on your system.

Of course, any other general speed-up patches should help too.

1.6 Distribution Conditions

WarpPNG.datatype is public domain with the copyright remaining ↔
with the

author

and may be freely distributed legally providing:

- (1) None of the distributed files are changed in any way
- (2) It is not sold for profit and it is not included on any disks that are sold solely for profit (includes magazine coverdisks)
- (3) The distribution contents remain complete (see list below)

If this software is to be sold for profit, permission must be obtained from me, the

author

.

Aminet, Amiga Format and Amigactive have been granted permission to distribute WarpPNG.datatype on their CDs.

The following files must be present in their original and unchanged form in any copies of this software:

```
Classes/Datatypes/WarpPNG.datatype
Devs/Datatypes/PNG
Devs/Datatypes/PNG.info
WarpPNG.guide
WarpPNGG.guide.info
Install_WarpPNG
Install_WarpPNG.info
```

1.7 Disclaimer

This software is provided "as is", without warranty of any kind, either expressed or implied, statutory or otherwise. By using the archive and its contents, you accept the entire risk as to its quality and performance.

Neither Oliver Roberts nor any other party involved in the creation, production or delivery of the archive and its contents shall be liable for any direct, indirect, special, consequential or incidental damages, including without limitation damages for loss of profits, loss of use or loss of anticipated costs, expenses or damages, and any data or information which may be lost or rendered inaccurate, even if Oliver Roberts is advised of the possibility of such damages.

Do not attempt to tamper with the supplied files. Doing so will cause problems and you may find things start going wrong!

1.8 Acknowledgements

PNG support provided by the libpng link library by the PNG Development Group, and the zlib link library by Jean-loup Gailly and Mark Adler (both compiled for WarpOS, of course).

It was made possible by VBCC, which was used to build and compile the datatype. Thanks to Volker Barthelmann and the other authors involved.

Thanks also to Sam Jordan for WarpOS and helping me out with various queries regarding it.

Finally, thanks to the OS 3.5 development team - now everyone has access to a 24-bit picture.datatype, I don't need to bother messing about adding dithering routines :)

1.9 About the author

If you have any problems with this software, or if you have any suggestions/queries, please contact me and I will do my best to sort any bugs out as soon as possible:

www: <http://www.nanunanu.org/~oliver/>
icq: 34640231

1.10 Future

Some things that may appear in the future:

- If I can squeeze any more speed out of the datatype, I'll do so :)
 - I'm currently experimenting with using asynchronous double-buffering techniques in the datatype in an attempt to make the datatype faster,
-

but so far this has turned out to be slower!

If you have any other suggestions, please
let me know

.

Future releases of WarpPNG.datatype will be available from either Aminet
(util/dtype/WarpPNGdt.lha) or its webpage:

<http://www.nanunanu.org/~oliver/warppng.html>
