Disclaimer

Permission is granted to make and distribute verbatim copies of this manual provided the copyright notice and this permission notice are preserved on all copies.

COPYRIGHT

Copyright (C) 1991-93 Stefan Becker

No program, document, data file or source code from this software package, neither in whole nor in part, may be included or used in other software packages unless it is authorized by a written permission from the author.

NO WARRANTY

There is no warranty for this software package. Although the author has tried to prevent errors, he can't guarantee that the software package described in this document is 100% reliable. You are therefore using this material at your own risk. The author cannot be made responsible for any damage which is caused by using this software package.

DISTRIBUTION

This software package is freely distributable. It may be put on any media which is used for the distribution of free software, like Public Domain disk collections, CDROMs, FTP servers or bulletin board systems.

In order to ensure the integrity of this software package, distributors should use the original archive file WBStart1_3.lha. The author cannot be made responsible if this software package has become unusable due to modifications of the archive contents or of the archive file itself.

There is no limit on the costs of the distribution, e.g. for the media, like floppy disks, streamer tapes or compact disks, or the process of duplicating. Such limits have been proven to be harmful to the idea of freely distributable software, e.g. instead of reducing the price of the floppy disk below the limit, the software was simply removed from the master disk.

Although the author does not impose any limit on the distribution of this software package, he would like to express his personal opinions on this matter:

- * This software package should be made available to everyone free of charge whenever it is possible.
- * If you have acquired this software package under normal conditions from a Public Domain dealer on a floppy disk at a price higher than 5DM or US \$5, then you have definitely paid too much. Please don't support this improper profit making any longer and switch to a cheaper source as soon as possible.

USAGE RESTRICTIONS

No program, document, data file or source code from this software package, neither in whole nor in part, may be used on any machine which is used

- * for the research, development, construction, testing or production of weapons or other military applications. This also includes any machine which is used in the education for any of the above mentioned purposes.
- * by people who accept, support or use violence against other people, e.g. citizens from foreign countries.

SPECIAL NOTE

Support Fred Fish and his AmigaLibDisk collection! If you have some money to spare then please set up a subscription of his disks or donate it to him directly. If he has to close down, we will loose our main source for freely distributable Amiga software.

What is the purpose of this program?

WBStart is a package to emulate the Workbench startup procedure. Emulating this method is easy, because you only have to load a program, create a process for it and then send a WB startup message to it. The only problem is this startup message, because it contains memory and directory locks owned by your process and it is only returned after the WB process ends. So you can't leave your program until ALL WB processes you created have ended, or the replied messages will go into nowhere land.

WBStart solves this problem by using a handler process, which handles the

creation of the processes and then waits for the reply messages. You just send a message to the handler port, which contains all needed information, like name and parameters. The handler duplicates this information, so you can free your copy and leave your program.

Installation & Usage

Just copy the file WBStart-Handler into your L: directory. Be sure to set the execute flag on this file with

```
Protect L:WBStart-Handler +e
```

You can break WBStart-Handler by sending a CTRL-C to its process. If all WB processes have returned, it will exit.

WBStarter is an example program how to use the handler. It has the following syntax:

```
WBStarter <command> [<command> ...]
```

WBStarter tries to start every command as WB process without parameters. If the handler is not running, WBStarter tries to start it.

How to use WBStart-Handler from your programs

The handler opens a public message port named "WBStart-Handler Port". You must send a message of the following type to this port:

```
struct WBStartMsg {
    struct Message  wbsm_Msg;
    char           *wbsm_Name;
    BPTR          wbsm_DirLock;
    ULONG         wbsm_Stack;
    LONG          wbsm_Prio;
    ULONG         wbsm_NumArgs;
    struct WBArg  *wbsm_ArgList;
};
```

wbsm_Msg

Standard message structure. You MUST initialize the mn_ReplyPort field to your own message port.

wbsm_Name

Pointer to a string, which contains the name of the program. The handler recognizes project icons and extracts the default tool.

wbsm_DirLock

Lock on a directory. wbsm_Name will be used relative to this directory.

wbsm_Stack

Stack size for the new process. Minimum is 4096 Bytes. If a tool icon exists, then the stack size from the icon is used. When this message is replied, this field contains a boolean, which indicates the success of the

action.

wbsm_Prio

Priority of the new process. Must be in the range -128..127.

wbsm_NumArgs

Number of arguments in wbsm_ArgList. May be 0.

wbsm_ArgList

Pointer to an array of WB Arguments. These arguments contain lock on a directory and a pointer to a file name, which is relative to the directory. Look into <workbench/startup.h> for the definition of this data structure.

Look into the C source for WBStarter for the details.

Compilation

This program was compiled with DICE, Matt Dillon's superb C compiler. Just say "DMake" and it will produce the binary.

History

1.3 (27.06.1993)

- The handler now copies the path from the WB process. This solves the problems with programs which use WB2CLI() or similiar functions to get the WB path list, e.g. SYS:System/CLI.
My apologies to Michael Sinz, Michael B. Smith and the GRn beta testers.
- The handler now scans the path list when it tries to load a program.
- The handler now uses NewLoadSeg() instead of LoadSeg().
- Major source cleanup.

1.2 (21.09.1992)

- corrected version strings

1.1 (13.09.1992)

- Fixes weird return bug in WBStart
- Fixes "Insert volume PROGDIR:..." bug

1.0 (24.11.1991)

- Initial release
