# **Buddy API 3.31**

Buddy API contains an Xtra for use with Macromedia Director and Authorware and a UCD for use with Authorware which allows access to Windows API functions.

Installation
Distributing your applications
Loading Buddy API Functions
What's new in this release

Buddy API contains the following the following functions:

Information functionsSystem functionsFile functionsWindow functions

**Registration functions** 

**Alphabetical function list** 

## **Installation**

Buddy API contains 5 files - Budapi.x16 16 bit Xtra

Budapi.x32 32 bit Xtra
Budapi.ucd 16 bit ucd
Budapi.u32 32 bit u32
Budapi.hlp this help file

#### Xtra installation

The Xtra version can be used with Director 5, 6 or 7 and Authorware 4 or 5. Buddy API comes in two versions - 16 and 32 bit. These can only be used with the equivalent versions of Director or Authorware. Place the Xtra into the Xtras folder inside your Director folder or Authorware folder. The ucd and u32 files are not used in the Xtra version.

#### **UCD** installation

The ucd/u32 version can only be used with Authorware - any version. Buddy API comes in two versions - 16 and 32 bit. These can only be used with the equivalent versions of Authorware. Place the UCD and U32 files into your Authorware folder. The Xtra files are not used.

#### **Important Information**

You should carefully read the following terms and conditions before using this software. Your use of this software indicates your acceptance of these terms and conditions.

#### **Disclaimer of Warranty**

This software and the accompanying files are provided "as is" and without warranties as to performance of merchantability or any other warranties whether expressed or implied.

The user must assume the entire risk of using Buddy API.

8th March 1999

# **Loading Buddy Functions**

#### Xtra - Director

After placing the Xtra in your Xtras folder and restarting Director, the Buddy API functions will become available for use. All the functions are global functions and can be called without using the lingo **openxlib** or **new** commands. You can enter code as provided in this help file in any Director script. You can also test the functions in the Message window.

#### **Xtra - Authorware**

After placing the Xtra in your Xtras folder and restarting Authorware, the Buddy API functions will become available for use. You can type the code directly into a calculation icon. The list of functions can be viewed by selecting 'Functions' from the 'Window' menu, then choosing 'Xtra BudAPI' from the category list.

#### **Ucd - Authorware**

To load the required function, select Load Function from the Data menu. A file dialog box will appear - locate the file Budapi.ucd if you are using the 16 bit version of Authorware, or Budapi.u32 if you are using the 32 bit Authorware. Click "OK".

Another dialog box will appear. This will contain the names of all the functions contained in BudAPI. Click on the desired entry (or entries), then click the 'Load' button.

To use the function, place a calculation icon on the flowline, then type in the code as provided in the examples.

## **Distributing your applications**

#### Xtra distribution

The Buddy API Xtra actually consists of two files - an Xtra and a DLL. Both files need to be distributed. The Xtra file contains an embedded copy of the DLL, which will be automatically extracted if needed. You can find a copy of the DLL files - budapi32.dll and budapi16.dll - In your Director/Authorware Xtras folder; they will have been extracted during authoring.

There are a number of ways the Xtra can be distributed with your projector. You can place both the Xtra and the DLL in a folder called Xtras in the same folder as your application. This is the recommeded method, particularly if your application will run from a slow medium such as CD-ROM. This method will provide the fastest loading application, because the Xtra and the DLL will not need to be extracted every time your application runs.

You can place the Xtra file in a folder called Xtras in the same folder as your application. When your application is run, the Xtra will unpack the DLL, and delete it when your application closes. If your application is running from a read-only medium, then the DLL will be extracted into a temporary folder on the users hard drive.

In Director 6 and 7, you can embed the Xtra into the projector. Embedding the Xtra in Director 6 and 6.5 is not recommended - these versions of Director have problems in this area. Embedding in Director 7 is much more reliable. To embed the xtra, you need to manually add it to the list of Xtras to be embedded. Choose the Modify -> Movie -> Xtras menu. A dialog box will appear. Click the Add button, and select budapi.x32. In Director 7, make sure that the *Include in projector* option is checked. In Director 6/6.5, you also need to check the *Check movie for xtras* option when creating a projector. If you want to make a Director 6/6.5 16 bit projector and embed the Xtra, you will need to add this line to the xtrainfo.txt file located in the Director folder.

[#nameW32:"Budapi.x32", #nameW16:"Budapi.x16", #nameFAT:"Buddy API Xtra", #type:#lingo]

#### **Ucd distribution**

When distributing Buddy API with your application, you need to the ucd or u32 files in the same folder as your packaged file. If you have packaged your file as 16 bit, include the Budapi.ucd file; if you packaged as 32 bit, include the Budapi.u32 file.

A-D <u>E-F</u> <u>G-P</u> <u>R-S</u> <u>T-X</u>

ActivateWindow activates the specified window returns the active window

AddSysItemsadds System menu, min and max boxesAw2Windowreturns the Authorware presentation window

## A-D E-F G-P R-S T-X

**ReadIni** reads Windows ini file

**ReadRegNumber** reads Registry number value reads Registry string value

**RecycleFile** places a file in the Win95/NT recycle bin.

**RefreshDesktop** refreshes the desktop icons

**RegKeyList** returns a list of sub-keys inside a registry key returns a list of values inside a registry key removeSysItems removes System menu, min and max boxes

**RenameFile** renames a file

**ResolveShortcut** returns the file a shortcut points to

**<u>RestrictCursor</u>** restricts the cursor to a specific screen area

**RunProgram** runs an external program

<u>ScreenInfo</u> gets information (width, height, etc) of the screen

**ScreenSaverTime** sets the screen saver time out

**SendKeys** sends simulated key presses to the active window

SendMsgsends a windows message to a windowSetCurrentDirchanges the DOS current directorySetDisplaysets the screen size and depthSetFileAttributessets the attributes of a fileSetPatternsets the desktop pattern

<u>SetPrinter</u> changes settings for the default printer

<u>SetScreenSaver</u> sets the screen saver <u>SetSystemTime</u> sets the system time/date

SetVolume sets the volume of wave and midi files and audio CD

**SetWallpaper** sets the desktop wallpaper

**SetWindowDepth** sets the z-order depth of a window minimises, maximises, hides a window

**SetWindowTitle** set the caption of a window

**Shell** executes a file

ShortFileNamereturns the DOS version of a Win95 long file nameSleeppauses the calling Director/Authorware program

**SoundCard** checks whether a sound card is installed

**StageHandle** returns the Director stage window

**SysFolder** returns location of system folders (windows, system, temp, etc)

**SystemTime** returns the current system time/date

Information functions
File functions

System functions
Window functions

**Registration functions** 

A-D E-F G-P R-S T-X

<u>TempFileName</u> returns a temporary file name guaranteed not to exist <u>Version</u> returns version info (Windows, NT, DOS, QuickTime, VFW)

<u>WaitForWindow</u> waits until a specified window is in a specified state waits until a specified window becomes the active one

**WindowDepth** gets the z-order depth of a window **WindowExists** checks that a window handle is valid

<u>WindowInfo</u> returns info (state, size, position, title, class) of a window

WindowListreturns a list of all windows with given title or classWindowToBacksends a window to the back of other windowsWindowToFrontbrings a window to the front of other windows

<u>WinHandle</u> returns the main Director or Authorware presentation window

<u>WinHelp</u> shows a Windows help file

WriteIniwrites an entry to a Windows ini fileWriteRegNumberwrites number value to the RegistryWriteRegStringwrites string value to the Registry

**<u>XCopy</u>** copies multiple files with wildcard matching, including sub-

directories.

**XDelete** deletes files with wildcard matching, including sub-directories

## Information functions

Versionreturns version info (Windows, NT, DOS, QuickTime, VFW)SysFolderreturns location of system folders (windows, system, temp, etc)Cpulnfogets information (type, speed) about the processor installedDiskInfogets information (type, size, name, number) about a disk

<u>MemoryInfo</u> gets information about system memory

**FindApp** finds the application associated with a file type

**ReadIni** reads Windows ini file

<u>WriteIni</u> writes an entry to a Windows ini file

<u>FlushIni</u> forces Windows to write an ini file to disk.

**<u>ReadRegString</u>** reads Registry string value

**WriteRegString** writes string value to the Registry **ReadRegNumber** reads Registry number value

**WriteRegNumber** writes number value to the Registry

**<u>DeleteReg</u>** deletes Registry entry

RegKeyListreturns a list of sub-keys inside a registry keyRegValueListreturns a list of values inside a registry keySoundCardchecks whether a sound card is installed

**FontInstalled** checks whether a font is installed returns a list of installed fonts

**FontStyleList** returns a list of available styles for a truetype font

**CommandArgs** returns the command line arguments the application was started

with

<u>Previous</u> checks whether a previous instance is running

<u>ScreenInfo</u> gets information (width, height, etc) of the screen

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## Version

**Description:** baVersion returns a string containing version information.

**Usage:** Result = baVersion( VersionType )

**Arguments:** String.

VersionType is the type of version you are interested in.

Can be one of the following:

"os" the current operating system

"windows" windows version
"nt" version of Windows NT

"dos" DOS version

"vfw" Video for Windows version "qt" QuickTime 2 version "qt3" QuickTime 3 version

**Returns:** String.

Returns the version information requested.

The return for "os" will be either "Win16", "Win95", "Win98, or "WinNT".

**Examples:** Director:

set WinVer = baVersion( "windows" )

Authorware:

WinVer := baVersion( "windows" )

**Notes:** The NT information is provided to enable programs to tell whether or not

they are running under Windows NT. For example, baVersion( "windows" ) will return 4.0 for both Windows 95 and Windows NT 4.0 under 32 bit. If the program is running under NT, then baVersion( "nt" ) will also return 4.0, but

will return 0 if running under Windows 95.

This function also allows 16 bit programs to tell what version of NT they are running under. A 16 bit program running under NT will return 3.10 for baVersion( "windows" ), but baVersion( "nt" ) will return the correct NT

version.

Here is a table of the possible baVersion return values:

	Win 3.1	Win 95	Win 98	Win NT
16 bit "windows"	3.0, 3.10	3.95	3.98	3.10
16 bit "nt"	0	0	0	3.1, 3.5, 3.51, 4.0
16 bit "dos"	all DOS versions	7.0	7.10	5.0
32 bit "windows"		4.0	4.10	3.51, 4.0
32 bit "nt"		0	0	3.51, 4.0
32 bit "dos"		0	0	0

Apple made considerable changes to QuickTime between versions 2 and 3, and both may co-exist on the same system. "qt" will report the version of QuickTime prior to version 3. The version of QuickTime returned will match the Xtra/UCD version used - the 16bit Xtra/UCD will return the version of 16 bit QuickTime; the 32 bit will return the version of 32 bit QuickTime. "qt3"

returns the version of QuickTime 3 or later. "qt3" is only available in 32 bit.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **CpuInfo**

**Description:** baCpuInfo returns information about the processor installed.

**Usage:** Result = baCpuInfo(InfoType)

**Arguments:** String.

InfoType is the type of information to get. Can be:

"vendor" the processor manufacturer
"type" returns the type of processor
"model" the model of the processor
"stepping" the stepping revision number
"speed" the speed of the processor in mHz

**Returns:** Integer or string depending on the InfoType.

See the Notes section for details on interpreting the results.

**Examples:** Director:

set Cpu = baCpuInfo( "type" )

Authorware:

Cpu := baCpuInfo( "type" )

**Notes:** The "vendor" option returns a string containing the name of the

manufacturer of the processor. This will be a 12 character string, the most common returns will be "GenuineIntel", "AuthenticAMD" and "CryixInstead" but there will be others for chips from IBM, Compaq, DEC and others.

This function contains identification code from Intel and AMD and is only reliable with those processors. Other brands will report that they are equivalent to an Intel processor, but that will not necessarily be a valid comparison.

To determine the actual processor model, you need to interpret both the "type" and "model" options. The "type" option will identify a general family of processor eg: 486, Pentium or K6. The "model" option will give specific information about the model within a particular family. "stepping" is the revision number of a specific model, and will not generally be useful. Refer to the following table to determine a processor.

Description	Type	Model
486 DX	4	0, 1
486 SX	4	2
486 DX2	4	3, 7
486 SL	4	4
486 SX2	4	5
486 DX4	4	8
Pentium	5	1, 2
Pentium	5	3
Pentium MMX	5	4
Pentium Pro	6	ĺ
Pentium II (r1)	6	3
Pentium II (r2)	6	5
Celeron (r1)	6	5

Celeron (r2)	6	6
Pentium III	6	7

Note that the first release of the Celeron has the same numbers as the second Pentium II release.

#### **AMD CPUs**

Description	Type	Model
AMD K5	5	<6
AMD K6	5	6, 7
AMD K6-II	5	8
AMD K6-III	5	9
AMD K7 Athlon	6	

The "speed" returned is only an approximation within a variation of about 10%. If the processor has been overclocked, the speed it is running at will be returned. Intel specifically warn against quoting this number to users, because it can not be guaranteed to be accurate. Use this number as a guide only.

In the 16 bit Xtra, only Intel processors are supported.

This function is not present in the UCD version.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **SysFolder**

**Description:** baSysFolder gets the location of a special Windows directory.

**Usage:** Result = baSysFolder( Folder )

Arguments: string.

Folder is the name of the folder to return. Can be one of the following:

"windows" returns the Windows folder

"system" the System folder

"system16" the System folder for 16 bit files system32" the System folder for 32 bit files the folder used for temporary files

"current" the current DOS directory

These additional folders are available in 32 bit.

"desktop" the desktop folder

"common desktop" the common desktop folder for all users
"groups" the program groups folder in the start menu
"common groups" the common program groups folder for all users

"start menu" the start menu folder

"common start menu" the common start menu for all users

"personal" the users personal documents folder

"favorites" the users favorites folder

"startup" the 'Start Up' program group folder "common startup" the common startup folder for all users

"recent" the 'Recent documents' folder

"sendto" the 'Send To' folder

"network" the 'Network Neighborhood' folder

"fonts" the 'Fonts' folder

"shellnew" the new documents template folder

"program files" the program files folder

"common files" the common folder in the program files folder

**Returns:** String.

Returns the requested folder.

**Examples:** Director:

set WinDir = baSysFolder( "windows" )

Authorware:

WinDir := baSysFolder( "windows" )

**Notes:** The string that is returned will have a "\" at the end.

The "system16" and "system32" options are for use with Windows NT. On other versions of windows, they will return the same as "system". These options allow a 16 bit exe to get the windows\system32 folder; and a 32 bit

exe to get the windows\system folder.

The common startup, desktop, start menu and groups options are normally

only available under Windows NT, but will also be available on 95/98

systems set up for multiple users.

File functions Window functions

**Alphabetical function list** 

# **FindApp**

**Description:** baFindApp returns the application associated with a file type.

**Usage:** Result = baFindApp( Extension )

**Arguments:** String.

Extension is the extension of the file type.

**Returns:** String.

Returns the full path name to the application. Returns an empty string if the extension is not associated with or a program, or the associated program

does not exist.

**Examples:** Director:

set Notepad = baFindApp( "txt" )

Authorware:

Notepad := baFindApp( "txt" )

**Notes:** In 32bit Windows, Microsoft guidelines state that if a program registers a

file extension, and the path to the executable file is a long file name, then that name must be included in quotes. If an installation program doesn't follow these guidelines, then this function may fail. Specifically, if the path name to the executable contains a space, then this function will not be able

to return the path to the executable. Adobe Acrobat Reader 3 is one program that does not register itself correctly - it does not place quotes around the executable name in the registry. The baFindApp function has been written around this particular problem with Acrobat, and will use other methods to locate Acrobat if it is asked to find the app associated with "pdf"

files.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## ReadIni

**Description:** baReadIni gets a string from a Windows ini file.

**Usage:** Result = baReadIni( Section, Keyname, Default, IniFile )

**Arguments:** String, string, string, string.

Section is the section name of the ini file.

Keyname is the name of the key

Default is the string that is returned if the file, section or key doesn't exist.

IniFile is the name if the ini file to use.

**Returns:** String.

Returns the value associated with the Keyname. If the IniFile, Section or

Keyname doesn't exist, then the return will be the Default string.

**Examples:** Director:

set Name = baReadIni( "CurrentUser", "UserName", "Error", "Userdat.ini" )

Authorware:

Name := baReadIni( "CurrentUser", "UserName", "Error", "Userdat.ini" )

**Notes:** An entry in a Windows ini file has the following format:

[Section]

Keyname=string

This function will return the string after the equals sign. When using this function, the Section name you use should not include the square brackets around the name. The Keyname should not include the equals sign. For example the ini file for the example above might look something like this

[CurrentUser]

UserName=Gary Smith Password=mypw ModulesCompleted=4

The IniFile can be in any directory. If the IniFile is not in the Windows directory, then the full path name to the file must be supplied. The ini file does not have to have an .ini extension: any extension can be used.

This function returns a maximum of 2000 characters.

See also: <u>baWriteIni</u>

<u>baFlushIni</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## WriteIni

**Description:** baWriteIni writes a string into a Windows ini file.

**Usage:** Result = baWritelni( Section, Keyname, NewValue, IniFile )

**Arguments:** String, string, string, string.

Section is the section name of the ini file.

Keyname is the name of the key

NewValue is the string to write into the file. IniFile is the name if the ini file to use.

**Returns:** Integer.

Returns 1 if the function was successful, else 0.

**Examples:** Director:

set OK = baWriteIni( "CurrentUser", "UserName", "Gary Smith",

"Userdat.ini" )

Authorware:

OK := baWriteIni( "CurrentUser", "UserName", "Gary Smith", "Userdat.ini" )

**Notes:** An entry in a Windows ini file has the following format:

[Section]

Keyname=string

This function will write the string after the equals sign. When using this function, the Section name you use should not include the square brackets around the name. The Keyname should not include the equals sign. For example the ini file for the example above might look something like this

[CurrentUser]

UserName=Gary Smith Password=mypw ModulesCompleted=4

The IniFile can be in any directory. If the IniFile is not in the Windows directory, then the full path name to the file must be supplied. The ini file does not have to have an .ini extension: any extension can be used. If the

ini file does not exist, then it will be created.

On Win95, strings written to an ini file can not contain a tab character.

See also: baReadIni

<u>baFlushIni</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## FlushIni

**Description:** baFlushIni forces Windows to write an ini file to disk.

**Usage:** baFlushIni( Filename )

**Arguments:** String.

Filename is the name of the ini file to flush.

**Returns:** Void.

**Examples:** Director:

baFlushIni( the moviePath & "data.ini" )

Authorware:

baFlushIni( FileLocation ^ "data.ini" )

Notes: This function is for use with the other ini file functions. When Windows

writes an ini file it keeps it cached for a short time. This does not cause problems when using only the ini functions. However, if you want to write an ini file, then immediately do something else with it, say, encrypt it, then you should use this function to force Windows to write the file to disk before

you use it.

eg.

baWriteIni( "data", "password", pw, iniFile ) -- write ini file

baFlushIni( iniFile ) -- force it to disk baEncryptFile( iniFile, key ) -- encrypt it

This functions is not needed if you are only using baWritelni and baReadIni

on your ini files.

See also: <u>baReadIni</u>

<u>baWriteIni</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## ReadRegString

**Description:** baReadRegString gets a string from the Windows Registry.

**Usage:** Result = baReadRegString( KeyName, ValueName, Default, Branch )

**Arguments:** String, string, string, string.

KeyName is the name of the key.

ValueName is the name of the value. Under 16 bit, this value is ignored. Default is the string that is returned if the key/value doesn't exist. Branch is the branch of the registry to use. Can be one of the following:

"HKEY\_CLASSES\_ROOT"
"HKEY\_CURRENT\_USER"
"HKEY\_LOCAL\_MACHINE"
"HKEY\_USERS"
"HKEY\_CURRENT\_USER"
"HKEY\_DYN\_DATA"

Under 16 bit, only the HKEY\_CLASSES\_ROOT branch is accessible - the

Branch setting is ignored.

**Returns:** String.

Returns the value associated with the Keyname. If the Keyname doesn't

exist, then the return will be the Default string.

**Examples:** Director:

set Name = baReadRegString( "Courses\Computers\101", "CurrentUser",

"Error", "HKEY CLASSES ROOT")

Authorware:

Name := baReadRegString( "Courses\\Computers\\101", "CurrentUser",

"Error", "HKEY CLASSES ROOT")

**Notes:** A Registry entry consists of keys and sub-keys, similar to the directories and

sub-directories in the Windows file system. 32 bit Windows adds Values to the registry. These can be thought of as files within the key. These Values are not available under 16 bit - the ValueName argument is ignored.

To get the (Default) value of a key in 32 bit use an empty string for the ValueName argument. If the (Default) value does not have a value set, the return will be an empty string. In Buddy API versions prior to 3.31, under NT, a (Default) value without a value set returned the Default value passed in the the forestime which the strength of the stre

in to the function, while under 95/98 an empty string was returned.

Although this was correct according to Windows API, this function has been changed to return an empty string under NT in order to provide consistency

over all 32 bit Windows versions.

In 16 bit, this function can only obtain values from keys located in the

HKEY\_CLASSES\_ROOT branch of the Registry.

Under Windows 3.1, the KeyName can not contain any spaces.

This function returns a maximum of 2000 characters.

**See also:** <u>baWriteRegString</u>

<u>baReadRegNumber</u>

baWriteRegNumber baDeleteReg baRegKeyList baRegValueList

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## WriteRegString

**Description:** baWriteRegString writes a string into the Windows Registry.

**Usage:** Result = baWriteRegString( KeyName, ValueName, Data, Branch )

**Arguments:** String, string, string,

KeyName is the name of the key.

ValueName is the name of the value. In 16 bit this value is ignored.

Data is the string to write into the registry.

Branch is the branch of the registry to use. Can be one of the following:

"CLASSES\_ROOT"

"HKEY\_CURRENT\_USER"
"HKEY\_LOCAL\_MACHINE"
"HKEY\_USERS"
"HKEY\_CURRENT\_USER"

"HKEY\_CURRENI\_USER"
"HKEY DYN DATA"

Under 16 bit Windows, only the HKEY CLASSES ROOT branch is accessible -

the Branch setting is ignored.

**Returns:** Integer.

Returns 1 if the function is successful, otherwise 0.

**Examples:** Director:

set OK = baWriteRegString( "Courses\Computers\101", "CurrentUser", "Gary

Smith", "HKEY CLASSES ROOT")

Authorware:

OK := baWriteRegString( "Courses\\Computers\\101", "CurrentUser", "Gary

Smith", "HKEY CLASSES ROOT")

**Notes:** A Registry entry consists of keys and sub-keys, similar to the directories and

sub-directories in the Windows file system. 32 bit Windows adds Values to the registry. These can be thought of as files within the key. These Values are not available under 16 bit - the ValueName argument is ignored.

To set the (Default) value of a key in 32 bit use an empty string for the

ValueName argument.

Also in 16 bit, this function can only obtain values from keys located in the

HKEY\_CLASSES\_ROOT branch of the Registry.

Under Windows 3.1, the KeyName can not contain any spaces.

**See also:** <u>baReadRegString</u>

<u>baReadRegNumber</u> <u>baWriteRegNumber</u>

<u>baDeleteReg</u> <u>baRegKeyList</u> <u>baRegValueList</u>

# **Alphabetical function list**

## ReadRegNumber

**Description:** baReadRegNumber gets a number from the Windows Registry.

**Usage:** Result = baReadRegNumber( KeyName, ValueName, Default, Branch )

**Arguments:** String, string, integer, string.

KeyName is the name of the key. ValueName is the name of the value.

Default is the string that is returned if the key/value doesn't exist. Branch is the branch of the registry to use. Can be one of the following:

"HKEY\_CLASSES\_ROOT"
"HKEY\_CURRENT\_USER"
"HKEY\_LOCAL\_MACHINE"
"HKEY\_USERS"
"HKEY\_CURRENT\_USER"
"HKEY\_DYN\_DATA"

**Returns:** Integer.

Returns the value associated with the Keyname. If the Keyname doesn't

exist, then the return will be the Default value.

**Examples:** Director:

set Name = baReadRegNumber( "Courses\Computers", "Course", 0,

"HKEY\_CLASSES\_ROOT" )

Authorware:

Name := baReadRegNumber( "Courses\\Computers", "Course", 0,

"HKEY CLASSES ROOT" )

**Notes:** This function does not work in 16 bit - the 16 bit registry can not contain

numbers. If used in 16 bit, the Default value will always be returned.

A Registry entry consists of keys and sub-keys, similar to the directories and sub-directories in the Windows file system. 32 bit Windows adds Values to

the registry. These can be thought of as files within the key.

**See also:** <u>baReadRegString</u>

baWriteRegString baWriteRegNumber

<u>baDeleteReg</u> <u>baRegKeyList</u> <u>baRegValueList</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## WriteRegNumber

**Description:** baWriteRegNumber writes a number into the Windows Registry.

**Usage:** Result = baWriteRegNumber( KeyName, ValueName, NewData, Branch )

**Arguments:** String, string, integer, string.

KeyName is the name of the key. ValueName is the name of the value.

NewData is the number that will be written to the registry.

Branch is the branch of the registry to use. Can be one of the following:

"HKEY CLASSES ROOT" "HKEY CURRENT USER" "HKEY LOCAL MACHINE" "HKEY USERS" "HKEY CURRENT USER" "HKEY DYN DATA"

**Returns:** Integer.

Returns 1 if the function is successful, otherwise 0.

**Examples:** Director:

set OK = baWriteRegNumber( "Courses\Computers", "Course", 101,

"HKEY CLASSES ROOT")

Authorware:

OK := baWriteRegNumber( "Courses\\Computers", "Course", 101,

"HKEY CLASSES ROOT" )

Notes: This function does not work in 16 bit - the 16 bit registry can not contain

numbers. If used in 16 bit, the function does nothing.

A Registry entry consists of keys and sub-keys, similar to the directories and sub-directories in the Windows file system. 32 bit Windows adds Values to

the registry. These can be thought of as files within the key.

**Alphabetical function list** 

## **DeleteReg**

**Description:** baDeleteReg deletes a key or value from the Windows Registry.

**Usage:** Result = baDeleteReg( KeyName, ValueName, Branch )

**Arguments:** String, string, string.

KeyName is the name of the key.

ValueName is the name of the value. A empty string will delete the entire

KeyName.

Branch is the branch of the registry to use. Can be one of the following:

"HKEY\_CLASSES\_ROOT"
"HKEY\_CURRENT\_USER"
"HKEY\_LOCAL\_MACHINE"
"HKEY\_USERS"
"HKEY\_CURRENT\_USER"

"HKEY\_CURRENI\_USER
"HKEY DYN DATA"

**Returns:** Integer.

Returns 1 if the function is successful, otherwise 0.

**Examples:** Director:

set OK = baDeleteReg( "Courses\Computers", "Course",

"HKEY CLASSES ROOT" )

Authorware:

OK := baDeleteReg( "Courses\\Computers", "Course",

HKEY\_CLASSES\_ROOT" )

**Notes:** In 16 bit, the ValueName and Branch parameters are ignored - the 16 bit

registry can not have values or branches.

Under Windows NT, a Key can only be deleted if it is empty. Under Windows

95 or 3.1, all sub keys will also be deleted.

**See also:** <u>baReadRegString</u>

baWriteRegString baReadRegNumber baReadRegNumber baRegKeyList baRegValueList

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **RegKeyList**

**Description:** baRegKeyList returns a list of sub-keys inside a registry key.

**Usage:** Result = baRegKeyList( KeyName, Branch )

**Arguments:** String, string.

KeyName is the name of the key.

Branch is the branch of the registry to use. Can be one of the following:

"HKEY\_CLASSES\_ROOT" "HKEY\_CURRENT\_USER" "HKEY\_LOCAL\_MĀCHINE"

"HKEY\_USERS"
"HKEY\_CURRENT\_USER"
"HKEY\_DYN\_DATA"

List (Xtra) or String (UCD). **Returns:** 

Returns a list of the keys, or an empty list/string if the key doesn't exist or is

empty.

**Examples:** Director:

set keyList = baRegKeyList( "Software\Adobe", "HKEY LOCAL MACHINE" )

Authorware:

keyList := baRegKeyList( "Software\\Adobe", "HKEY LOCAL MACHINE" )

Notes: The 16 bit version can only read from the HKEY CLASSES ROOT branch.

See also: baReadRegString

**baWriteRegString** <u>baReadRegNumber</u> <u>baReadRegNumber</u> **baDeleteReg** 

**baRegValueList** 

**Information functions System functions File functions Window functions** 

**Alphabetical function list** 

## RegValueList

**Description:** baRegValueList returns a list of values inside a registry key.

**Usage:** Result = baRegValueList( KeyName, Branch )

**Arguments:** String, string.

KeyName is the name of the key.

Branch is the branch of the registry to use. Can be one of the following:

"HKEY\_CLASSES\_ROOT" "HKEY\_CURRENT\_USER" "HKEY\_LOCAL\_MĀCHINE"

"HKEY\_USERS"
"HKEY\_CURRENT\_USER"
"HKEY\_DYN\_DATA"

**Returns:** List (Xtra) or String (UCD).

Returns a list of the keys, or an empty list/string if the key doesn't exist or is

empty.

**Examples:** Director:

set valueList = baRegValueList( "Netscape\Netscape Navigator",

"HKEY LOCAL MACHINE")

Authorware:

valueList := baRegValueList( "Software\\Adobe", "HKEY LOCAL MACHINE" )

Notes: This function is not available in the 16 bit version - the 16 bit registry can

not contain values.

See also: baReadRegString

> **baWriteRegString** <u>baReadRegNumber</u> <u>baReadRegNumber</u>

baDeleteReg <u>baRegKeyList</u>

**Information functions System functions File functions Window functions** 

**Alphabetical function list** 

#### **Previous**

**Description:** baPrevious checks whether a previous instance of a projector or packaged

file is running.

**Usage:** Result = baPrevious( Activate )

**Arguments:** Integer.

If Activate is true, the previous instance is activated and brought to the

front.

**Returns:** Integer.

Returns the window handle of the previous instance if one is running, else

0.

**Examples:** Director:

if baPrevious( true ) <> 0 then guit

Authorware:

if baPrevious( true ) <> 0 then quit(0)

**Notes:** Both Director and Authorware open their display windows before scripts are

executed. This means that the window of the second instance will appear

before the previous one can be activated.

Under Windows NT, this function will only find the first instance opened. For example, if you open three copies of a projector, then quit the first one, baPrevious in the third projector will return 0 - it can not recognise the second projector as a previous instance. Under Windows 95 and 3.1, the third projector will be able to identify the second projector as a previous

instance.

If you are running a full screen Director projector use this script to activate the previous instance. The example given above will make the stage move

to a new position.

```
set wnd = baPrevious( false )
if wnd <> 0 then
   baWindowToFront( wnd )
   quit
end if
```

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **SoundCard**

**Description:** baSoundCard checks whether a sound card is installed.

**Usage:** Result = baSoundCard()

**Arguments:** Void.

**Returns:** Integer.

Returns 1 if a sound card is installed, else 0.

**Examples:** Director:

set Sound = baSoundCard( )

Authorware:

Sound := baSoundCard()

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **FontInstalled**

**Description:** baFontInstalled reports whether or not a TrueType or Bitmap font is

installed.

**Usage:** Result = baFontInstalled( FontName, Style )

**Arguments:** String, string.

FontName is the name of the font family eg "Arial".

Style is the specific style eg "Bold". Use an empty string ("") to see if the basic font is installed. The style is ignored if FontName is a Bitmap font.

**Returns:** Integer.

Returns 1 if the font is presently installed, otherwise 0.

**Examples:** Director:

set FontOK = baFontInstalled( "Arial", "Bold Italic" )

Authorware:

FontOK := baFontInstalled( "Arial", "Bold Italic" )

**Notes:** If you ask for a specific font style, then the function will only return true if

that style is present. For example, if you ask for "Arial", "Bold" and only the normal Arial is installed, this function will return 0. Some fonts may have different names for the styles, eg "Black" for bold and "Oblique" for italic.

You must use the names built into the font.

**See also:** baFontStyleList

<u>baFontList</u> <u>baInstallFont</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **FontList**

**Description:** baFontList returns a list of all installed fonts.

**Usage:** Result = baFontList( FontType )

**Arguments:** String.

FontType is the type of fonts to list. Can be:

"All" all fonts

"TrueType" only true type fonts only bitmap fonts

"Device" only device or printer fonts

"Vector" only vector fonts

**Returns:** List (Xtra) or String (UCD)

Returns the list of fonts found.

**Examples:** Director:

set ttList = baFontList( "TrueType" )

Authorware:

fontList := baFontList( "All" )

**Notes:** Postscript fonts handled by ATM are listed as device fonts.

The UCD version returns a string with each font on a separate line.

See also: <u>baFontStyleList</u>

<u>baFontInstalled</u> <u>baInstallFont</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **FontStyleList**

**Description:** baFontStyleList returns a list of available styles for a truetype font.

**Usage:** Result = baFontStyleList( FontName )

**Arguments:** String.

FontName is the name of the font.

**Returns:** List (Xtra) or String (UCD)

Returns the list of font styles found.

**Examples:** Director:

set styleList = baFontStyleList( "Arial" )

Authorware:

styleList := baFontStyleList( "Arial" )

**Notes:** This function is only applicable to truetype fonts - other types of fonts will

return an empty list or string. Only styles that are actually installed will be

returned. Styles created on-the-fly by Windows will not.

The UCD version returns a string with each font on a separate line.

**See also:** <u>baFontList</u>

<u>baFontInstalled</u> <u>baInstallFont</u>

**Alphabetical function list** 

# **CommandArgs**

**Description:** baCommandArgs returns the arguments the application was started with.

**Usage:** Result = baCommandArgs()

**Arguments:** Void.

**Returns:** String.

Returns the command line arguments, or an empty string if there were

none.

**Examples:** Director:

set Args = baCommandArgs( )

Authorware:

Args := baCommandArgs( )

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **DiskInfo**

**Description:** baDiskInfo returns the information about a disk.

**Usage:** Result = baDiskInfo( Drive, InfoType )

**Arguments:** String, string

Drive is the letter of the drive to get the information of. InfoType is the type of information to get. Can be:

"type" returns the type of drive
"name" returns the volume name
"size" returns the size of the disk in Kb
"free" returns the amount of free space in Kb
"number" returns the serial number of the disk

**Returns:** Depends on InfoType.

"type" string

The type of drive. Can be:
"Hard" Fixed hard drive.
"Floppy" Floppy disk drive.
"CD-ROM" CD-ROM drive.
"Network" Network drive.

"Removable" Removable drive eg Zip, Syquest.

"RAM" RAM drive.

"Invalid" Drive doesn't exist, or is of unknown type.

"name" string

The name of the disk or an empty string if the disk doesn't exist.

"size" integer

The size of the disk in Kb, or 0 if the disk doesn't exist.

"free" integer

The amount of free space on the disk in Kb, or 0 if the disk doesn't exist.

"number" integer

The serial number of the disk, or 0 if the disk doesn't exist.

**Examples:** Director:

set Size = baDiskInfo( "a" , "size" )
set Label = baDiskInfo( "k" , "name" )

Authorware:

Size := baDiskInfo( "c" , "size" )
Label := baDiskInfo( "k" , "name" )

**Notes:** The original Windows API DriveType function reported that a CD-ROM drive

was a remote (network) drive when used under Windows 3.1. This function

has been altered to report correctly.

The 32 bit version reports Floppy drives as Removable.

The 16 bit Xtra/UCD will give inaccurate results on drives greater than 2gb. The 32 bit Xtra/U32 will report the correct size and free space when used on

FAT32 or NTFS drives greater than 2gb.

**See also:** baFindDrive

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **MemoryInfo**

**Description:** baMemoryInfo returns information about system memory.

**Usage:** Result = baMemoryInfo( InfoType )

**Arguments:** String.

InfoType is the type of information to get. Can be:

"ram" the amount of physical ram installed

"free ram" the amount of physical ram not being used

"swap" the size of the current swap file

"free swap" the amount of the swap file not being used

**Returns:** Integer.

Returns the information in bytes.

**Examples:** Director:

set ram = baMemoryInfo( "ram" )

Authorware:

free := baMemoryInfo( "free ram" )

**Notes:** The "free swap" option is not available in the 16 bit version.

The "swap" option in the 16 bit version when running under Windows 95 will

return the smaller of the physical ram or the swap file size.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### ScreenInfo

**Description:** baScreenInfo returns information about the screen.

**Usage:** Result = baScreenInfo( InfoType )

**Arguments:** String.

The type of information to get. Can be:

"height" the height of the screen in pixels
"width" the width of the screen in pixels
"depth" the colour depth of the screen in bits
"fontheight" the height of the system font in pixels
"titlebar height" the height of the system title bars
"menubar height" the height of system menus

**Returns:** Integer.

**Examples:** Director:

set ScrHgt = baScreenInfo( "height" )

Authorware:

ScrHgt := baScreenInfo( "height" )

**Notes:** The values that are returned will be accurate even if the screen size is

changed while the projector or packaged file is running.

## **DisableDiskErrors**

**Description:** baDisableDiskErrors allows you to suppress the Windows 'drive not ready'

error message.

**Usage:** baDisableDiskErrors( State )

**Arguments:** Integer.

State determines whether or not the error messages are shown. Can be

either true or false.

**Returns:** Void.

**Examples:** Director:

baDisableDiskErrors( true )

Authorware:

baDisableDiskErrors( true )

**Notes:** This function disables the 'drive not ready' error message that occurs when

Windows tries to access a file when there isn't a disk in the drive. This is a system wide setting and you should enable the disk errors again as soon as

possible after disabling them.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **DisableKeys**

**Description:** baDisableKeys allows you to disable key presses.

**Usage:** Result = baDisableKeys( Disable , WindowHandle )

**Arguments:** Integer, integer.

WindowHandle is the handle of the window to disable. To disable the keys

on all windows, use 0.

If Disable is true, key presses will be disabled.

If Disable is false, key presses will be enabled again - the WindowHandle

argument is ignored.

**Returns:** Integer.

When disabling the keys, returns 1 if the function was successful, otherwise

0.

When enabling the keys, will always return 1.

**Examples:** Director:

set KeysOff = baDisableKeys( true , baWinHandle() )

Authorware:

KeysOff := baDisableKeys( true , baWinHandle() )

**Notes:** If you disable the keys using this function, make sure that you enable the

function before your application quits.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **DisableMouse**

**Description:** baDisableMouse allows you to disable mouse clicks.

**Usage:** Result = baDisableMouse( Disable , WindowHandle )

**Arguments:** Integer, integer.

WindowHandle is the handle of the window to disable. To disable clicks on

all windows, use 0.

If Disable is true, mouse clicks will be disabled.

If Disable is false, mouse clicks will be enabled again - the WindowHandle

argument is ignored.

**Returns:** Integer.

When disabling the mouse, returns 1 if the function was successful,

otherwise 0.

When enabling the mouse, will always return 1.

**Examples:** Director:

set MouseOff = baDisableMouse( true , baWinHandle() )

Authorware:

MouseOff := baDisableMouse( true , baWinHandle() )

**Notes:** If you disable the mouse using this function, make sure that you enable the

function before your application quits.

Note that the cursor will still be visible and movable.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **DisableSwitching**

**Description:** baDisableSwitching disables the task switching keys - Alt-Tab, Alt-Esc, and

Ctrl-Esc. On Windows 95, the Ctrl-Alt-Del command is also disabled.

**Usage:** baDisableSwitching( On )

**Arguments:** Integer.

If On is true, then task switching will be disabled.

**Returns:** Void

**Examples:** Director:

baDisableSwitching( true )

Authorware:

baDisableSwitching( true )

**Notes:** If you disable switching, you should restore it again before your application

quits. If you fail to do so, under Windows 95 the system keys will remain disabled. Under Windows 3.1, at best there will be loss of system resources;

more likely, a complete system crash.

For this function to work, you must first set the Director property exitLock to true. Add this code set the exitLock to true before you call this function. This will also mean that your user can not quit the application using Alt-F4,

Esc, etc.

Under Windows 95, if a password protected screen saver is activated after this function is called, task switching will be possible after the password has

been entered.

This function will not work under Windows NT.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **DisableScreenSaver**

**Description:** baDisableScreenSaver allows you to enable/disable the screen saver.

**Usage:** Result = baDisableScreenSaver( State )

**Arguments:** Integer.

State can be either true or false.

**Returns:** Integer.

Returns 1 if the screen saver was previously active, or 0 if is was inactive.

**Examples:** Director:

set OldSS = baDisableScreenSaver( false )

Authorware:

OldSS := baDisableScreenSaver( false )

**Notes:** This function does not actually start the screen saver. It just determines

whether or not the screen saver will appear after it's time out period has passed. If your user has previously elected not to have a screen saver

active, then this function will have no effect.

**See also:** <u>baScreenSaverTime</u>

<u>baSetScreenSaver</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **ScreenSaverTime**

**Description:** baScreenSaverTime allows you to set the screen saver time out.

**Usage:** Result = baScreenSaverTime( Time )

**Arguments:** Integer.

Time is the value to set the screen saver time out to, in seconds.

**Returns:** Integer.

Returns the previous time out value.

**Examples:** Director:

set OldTime = baScreenSaverTime( 120 )

Authorware:

OldTime := baScreenSaverTime( 120 )

**See also:** <u>baDisableScreenSaver</u>

baSetScreenSaver

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **SetScreenSaver**

**Description:** baSetScreenSaver allows you to set the screen saver file.

**Usage:** Result = baSetScreenSaver( FileName )

**Arguments:** String.

FileName is the file name of the screen saver.

**Returns:** String.

Returns the file name of the previous screen saver.

**Examples:** Director:

set OldSS = baSetScreenSaver( "c:\windows\ss.scr" )

Authorware:

OldSS := baSetScreenSaver( "c:\\windows\\ss.scr" )

**Notes:** You should use the full path name of the screen saver. A empty string will

disable screen saving. This function will also enable the screen saver.

**See also:** <u>baDisableScreenSaver</u>

<u>baScreenSaverTime</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **SetWallpaper**

**Description:** baSetWallpaper allows you to set the desktop wallpaper.

**Usage:** Result = baSetWallpaper( FileName , Tile )

**Arguments:** String, integer

FileName is the file name of the wallpaper. If Tile is true, the wallpaper will be tiled.

**Returns:** String.

Returns the file name of the previous wallpaper.

**Examples:** Director:

set Old = baSetWallpaper( "c:\windows\arcade.bmp" )

Authorware:

Old := baSetWallpaper( "c:\\windows\\arcade.bmp" )

**Notes:** You should use the full path name of the wallpaper. A empty string will

remove the wallpaper.

**See also:** <u>baSetPattern</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **SetPattern**

**Description:** baSetPattern allows you to set the desktop pattern.

**Usage:** Result = baSetPattern( Name , Pattern )

**Arguments:** String, string.

Name is the name of the pattern.

Pattern is a string containing the pattern.

**Returns:** String.

Returns the previous pattern.

**Examples:** Director:

set Old = baSetPattern( "Bricks" , "187 95 174 93 186 117 234 245" )

Authorware:

Old := baSetPattern( "Bricks", "187 95 174 93 186 117 234 245")

**Notes:** The standard Windows patterns are listed in the contol.ini file.

See also: baSetWallpaper

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **SetDisplay**

**Description:** baSetDisplay sets the screen size and depth.

**Usage:** Result = baSetDisplay( Width , Height , Depth , Mode , Force )

**Arguments:** Integer, integer, string, integer.

Width is the new width of the screen in pixels. Height is the new height of the screen in pixels. Depth is the new depth of the screen in bits.

Mode is the way in which the new display is set. Can be:

"temp" temporarily change the display settings.
"perm" permanently change the display settings.

"test" tests whether the display can be set without restarting.

If Force is true, forces the display to change.

**Returns:** Integer.

Returns 0 if the display was changed or can be changed without restarting. Returns 1 if Windows will need to be restarted for the change to take effect.

Returns less than 0 if another error occurred, eg invalid screen size.

**Examples:** Director:

set OK = baSetDisplay(640,480,8,"temp", false)

Authorware:

OK := baSetDisplay( 640 , 480 , 8 , "temp" , false )

**Notes:** This function will not work under Windows 3.1 - it will always return 0.

Not all display cards and drivers support screen changing without

restarting.

The force option is not officially supported by Microsoft. It forces the display to change without restarting. This may work correctly with some video cards and drivers, but can cause palette problems on others, and crash the

system on some. You are advised to only use this option on known

hardware and after extensive testing.

If you use the "temp" mode, then the user's preferred screen display will be returned when the system is restarted. You can not set a "temp" mode

unless it can be changed without restarting Windows.

**See also:** <u>baScreenInfo</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **ExitWindows**

**Description:** baExitWindows exits or restarts Windows.

**Usage:** baExitWindows( Option )

**Arguments:** String.

Option is the type of exit. Can be:
"reboot" reboots the system
"restart" restarts Windows
"logoff" logs off Windows

"shutdown" shuts down the system

**Returns:** Void.

**Examples:** Director:

baExitWindows( "reboot" )

Authorware:

baExitWindows( "reboot" )

**Notes:** Not all versions of Windows support all the restarting options. If a particular

function is not available, then another mode will be substituted according to

the following table.

The system security settings may prohibit some of these options from

operating.

	Windows 3.1	Windows 95	Windows NT
16 bit "reboot"	reboot	reboot	logoff
16 bit "restart"	restart	restart	logoff
16 bit	restart	shutdown	logoff
"shutdown"			
16 bit "logoff"	restart	logoff	logoff
32 bit "reboot"		reboot	reboot
32 bit "restart"		restart	reboot
32 bit		shutdown	shutdown
"shutdown"			
32 bit "logoff"		logoff	logoff

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **RunProgram**

**Description:** baRunProgram runs an external application and can optionally wait until the

other program quits before continuing.

**Usage:** Result = baRunProgram( Program , State, Wait )

**Arguments:** String, string, integer.

Program is the name of the program to run.

State is how the program is to appear. Can be one of the following:

"Normal" shows in its usual state.

"Hidden" is not visible.

"Maximised" shows as a maximised window.
"Minimised" shows as an minimised icon.

Wait determines whether the Authorware program continues, or if it waits for the external program to finish before continuing. Can be either true or false.

#### **Returns:** Integer.

In 16 bit, returns the instance handle of the program. If this is greater than 31, then the program started successfully. In 32 bit, returns a meaningless number greater than 31.

If the return is less than 32, then an error occurred. Some possible error numbers are listed here.

- O System was out of memory, executable file was corrupt, or relocations were invalid.
- 1 Unspecified error.
- 2 File was not found.
- 3 Path was not found.
- 5 Attempt was made to dynamically link to a task, or there was a sharing or network-protection error.
- 6 Library required separate data segments for each task.
- 8 There was insufficient memory to start the application.
- 10 Windows version was incorrect.
- 11 Executable file was invalid. Either it was not a Windows application or there was an error in the .EXE image.
- 12 Application was designed for a different operating system.
- 13 Application was designed for MS-DOS 4.0.
- 14 Type of executable file was unknown.
- 15 Attempt was made to load a real-mode application (developed for an earlier version of Windows).
- 16 Attempt was made to load a second instance of an executable file containing multiple data segments that were not marked read-only.
- 19 Attempt was made to load a compressed executable file. The file must be decompressed before it can be loaded.
- 20 Dynamic-link library (DLL) file was invalid. One of the DLLs required to run this application was corrupt.
- 21 Application requires 32-bit extensions.

#### **Examples:** Director:

set OK = baRunProgram( "Notepad.exe", "maximised", false )

#### Authorware:

OK := baRunProgram( "Notepad.exe", "maximised", false )

## **Notes:** Where possible, the complete path to the program should be specified. If a

path is not provided, then Windows searches for the file in the following

#### order:

- 1 The current directory.
- 2 The Windows directory.
- 3 The Windows system directory.
- 4 The directory containing the executable file for the current task.
- 5 The directories listed in the PATH environment variable.
- 6 The directories mapped in a network.

You are not limited to supplying just an executable file name; you can add any other command line parameters that the executable supports. For example, to load the Adobe Acrobat Reader with mydoc.pdf, use the following call:

baRunProgram( "acroread.exe mydoc.pdf", "maximised", false )

To print an Acrobat file, you can use baRunProgram( "acroread.exe /p mydoc.pdf", "Hidden", true )

If used with the Wait option, this function will not return control to Authorware/Director until the jumped to program has quit. If your user switches back to the Authorware program, it will appear to have frozen. You may choose to display an on-screen message to inform your user of this. You can also use the <a href="WaitTillActive">WaitTillActive</a> function to pause execution until the Authorware/Director window becomes active again.

See also: <u>baWaitTillActive</u>

<u>baWaitForWindow</u> <u>baNextActiveWindow</u>

<u>baOpenFile</u> <u>baShell</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### Shell

**Description:** baShell executes a file.

**Usage:** Result = baShell( Operation, Filename, Args, WorkDir, State )

**Arguments:** String, string, string, string.

Operation is the action to perform on the file.

Filename is the name of the file the shortcut will point to.

Args is any command line arguments to use. WorkDir is the working directory to set. State is the state to start the program in.

### **Returns:** Integer.

Returns a number larger than 32 if successful.

Returns an error code. If the return is less than 32 than an error occurred.

Possible errors include:

- 0 System was out of memory.
- 2 File was not found.
- 3 Path was not found.
- 5 Sharing or network-protection error.
- 6 Library required separate data segments for each task.
- 8 There was insufficient memory to start the application.
- 10 Windows version was incorrect.
- 11 Executable file was invalid. Either it was not a Windows application or there was an error in the .EXE image.
- 12 Application was designed for a different operating system.
- 13 Application was designed for MS-DOS 4.0.
- 14 Type of executable file was unknown.
- 15 Attempt was made to load a real-mode application (developed for an earlier version of Windows).
- 16 Attempt was made to load a second instance of an executable file containing multiple data segments that were not marked read-only.
- 19 Attempt was made to load a compressed executable file. The file must be decompressed before it can be loaded.
- 20 Dynamic-link library (DLL) file was invalid. One of the DLLs required to run this application was corrupt.
- 21 Application requires 32-bit extensions.
- 26 A sharing violation occurred.
- 27 The filename association is incomplete or invalid.
- 29 The DDE transaction failed.
- 30 The DDE transaction could not be completed because other DDE transactions were being processed.
- 31 There is no application associated with the given filename

#### **Examples:** Director:

```
set ok = baShell( "open", "c:\windows\notepad.exe", "myfile.txt" , "",
"normal" )
set ok = baShell( "edit", "myfile.htm" , "", "", "normal" )
```

#### Authorware:

set ok = baShell( "open", "myfile.doc", "" , "", "normal" )

#### **Notes:**

This function can execute either a document or a program file. If it opens a document file, the Args parameter is ignored. The Operation can be any action that is registered with the document type, most commonly 'open' and 'print'. If the specified action is not registered to the document, the function will return 31. Only the 'open' action works on program files.

<u>baOpenFile</u> <u>baPrintFile</u> <u>baRunProgram</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## WinHelp

**Description:** baWinHelp displays a windows Help file.

**Usage:** Result = baWinHelp(Cmd, HelpFile, Data )

**Arguments:** String, string, string.

Cmd is the help file command. Can be one of the following:

"Contents" shows the Contents page.

"Context" shows the page with the "Data" context number.

"PopUp" shows the page with the "Data" context number in a pop-up window.
"Show" shows the topic found that matches "Data" if there is one exact match. If there is more than one match, then the Search dialog box is displayed. If

there is no exact match, then an error message will appear.

"Search" shows the topic found that matches "Data" if there is one exact match. If there is more than one match, then the Search dialog box is displayed. If there is no match, then the Search dialog box appears.

"Quit" closes the Help file.

"Help" shows the Help-On-Help page.

"Macro" executes the Help macro named in "Data".

HelpFile is the name of the Help file to display. This should include the complete path to the help file.

Data is a string containing extra information. This will vary according to the Cmd used. Note that even if a number is required, this must be passed as a string.

"Contents" Data should be "".

"Context" Data is the context number, eg "4".

"PopUp" Data is the context number, eg "4".

"Show" Data is the topic string to show, eg "About BudAPI".
"Search" Data is the topic string to search for, eg "About BudAPI".

"Quit" Data should be "".
"Help" Data should be "".

"Macro" Data should be the name of the macro to execute, eg "PlayMovie".

**Returns:** Integer.

Returns 1 if successful, else 0. Not finding the Help file is not considered a

failure.

**Examples:** Director:

set OK = WinHelp( "Show", the pathName & "myhelp.hlp", "Flowers" )
set OK = WinHelp( "Quit", the pathName & "myhelp.hlp", "" )

Authorware:

OK := WinHelp( "Show", FileLocation ^ "myhelp.hlp", "Flowers" )

OK := WinHelp( "Quit", FileLocation ^ "myhelp.hlp", "" )

Information functionsSystem functionsFile functionsWindow functions

#### **Alphabetical function list**

## **MsgBox**

**Description:** baMsgBox displays a standard Windows MessageBox

**Usage:** Result = baMsgBox( Message, Caption, Buttons, Icon, DefButton )

**Arguments:** String, string, string, integer.

Message is the message to display. This can contain more than one line.

Caption is the caption to show in the Title bar.

Buttons is the type of buttons to display. This can be one of the following:

"OK"
"OKCancel"
"RetryCancel"
"AbortRetryIgnore"
"YesNo"

Icon is the type of icon to display. This can be one of the following:

"Stop"

"Information"
"Question"
"Exclamation"
"Nolcon"

"YesNoCancel"

DefButton is the number of the default (selected) button. Can be 1, 2, or 3 depending on the number of buttons. The button on the left hand side is 1.

**Returns:** String.

Returns the name of the button clicked eg "OK" or "Ignore".

**Examples:** Director:

set Answer = baMsgBox( "Is this is a test message?", "A question" ,

"YesNo", "Question", 1)

if Answer = "Yes" then baMsgBox("Correct!", "The answer", "OK",

"Information". 1)

Authorware:

Answer := baMsgBox( "Is this is a test message?", "A question", "YesNo",

"Question", 1)

if Answer = "Yes" then baMsgBox("Correct!", "The answer", "OK",

"Information", 1)

Information functionsSystem functionsFile functionsWindow functions

#### **Alphabetical function list**

# Sleep

**Description:** baSleep pauses the calling Director/Authorware program.

**Usage:** baSleep( milliSecs )

**Arguments:** Integer.

milliSecs is the time to sleep for, in thousandths of a second.

**Returns:** Void.

**Examples:** Director:

baSleep(200)

Authorware: baSleep( 200 )

**Notes:** This function is most useful for 'lowering' the priority of Director to allow

other programs a larger slice of available processing time - for example when playing a mpeg movie. Calling this function in a loop such as in a on exitFrame handler, will give other processes a chance to run while still allowing Director to process events such as mouse clicks. Larger numbers will give other programs more time, but slow down Director responses.

Values between 50 and 200 would be a good starting point for

experimentation.

This function is available in 16 bit, but its' effectiveness is limited because

16 bit Windows has limited multitasking ablilites.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **HideTaskBar**

**Description:** baHideTaskBar shows/hides the Win95 task bar.

**Usage:** Result = baHideTaskBar( Hide )

**Arguments:** Integer.

If Hide is true, the task bar is hidden, else it will be visible.

**Returns:** Integer

Returns the previous state of the task bar - 1 if it is visible, 0 if it isn't.

**Examples:** Director:

set showing = baHideTaskBar( true )

Authorware:

showing := baHideTaskBar( true )

**Notes:** This function will not change the users task bar settings - the 'Always on

top' and 'Auto hide' settings.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **SetCurrentDir**

**Description:** baSetCurrentDir sets the current directory.

**Usage:** Result = baSetCurrentDir( Dir )

**Arguments:** String.

Dir is the full path name of the directory to make current.

**Returns:** Integer.

Returns 1 if successful, else 0.

**Examples:** Director:

set OK = baSetCurrentDir( "c:\temp" )

Authorware:

OK := baSetCurrentDir( "c:\\temp" )

**Notes:** This function is useful when running external programs using the

<u>RunProgram</u> function. Some programs, particularly DOS ones, require the current directory to be set first. The current directory can be retrieved using

the <u>SysFolder</u> function.

**See also:** SysFolder

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# CopyText

**Description:** baCopyText copies text to the clipboard.

**Usage:** Result = baCopyText( ClipText )

**Arguments:** String.

ClipText is the text to copy to the clipboard.

**Returns:** Integer.

Returns 1 if the function is successful, otherwise 0.

**Examples:** Director:

set OK = baCopyText( UserName )

Authorware:

OK := baCopyText( UserName )

See also: <u>baPasteText</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **PasteText**

**Description:** baPasteText copies text from the clipboard.

**Usage:** Result = baPasteText()

**Arguments:** Void.

**Returns:** String.

Returns the text currently in the clipboard. If the clipboard is empty or

unavailable, returns an empty string.

**Examples:** Director:

set ClipText = baPasteText()

Authorware:

ClipText := baPasteText()

**See also:** <u>baCopyText</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **EncryptText**

**Description:** baEncryptText encrypts a text string.

**Usage:** Result = baEncryptText( String , Key )

**Arguments:** String, string.

String is the text to encrypt.

Key is the string to use as the encryption key.

**Returns:** String.

Returns the encrypted string.

**Examples:** Director:

set text = baEncryptText( "MyPassword" , "This is my key" )

Authorware:

test := baEncryptText( "MyPassword" , "This is my key" )

**Notes:** This function uses an xor routine to encrypt the text. To decrypt the text,

use the <u>baDecryptText</u> function using the same key. This will return the

original text.

As well as encrypting the text, this function also puts the text through a uuencode type function to ensure that the encrypted string contains only printable characters. This means that the encrypted string will not be the

same length as the original string.

The maximum size of the string that can be encrypted is 2000 characters.

**See also:** <u>baDecryptText</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **DecryptText**

**Description:** baDecryptText decrypts a string encrypted with <u>baEncryptText</u>

**Usage:** Result = baDecryptText( String , Key )

**Arguments:** String, string.

String is the text to decrypt.

Key is the string that was used as the encryption key.

**Returns:** String.

Returns the decrypted string.

**Examples:** Director:

set text = baDecryptText( "MyEncryptedPassword" , "This is my key" )

Authorware:

text := baDecryptText( "MyEncryptedPassword" , "This is my key" )

See also: <u>baEncryptText</u>

Information functionsSystem functionsFile functionsWindow functions

## **PlaceCursor**

**Description:** baPlaceCursor positions the cursor on the screen.

**Usage:** baPlaceCursor( X, Y )

**Arguments:** Integer, integer.

X an Y is the new position of the cursor, measured from the top left corner

of the screen.

**Returns:** Void.

**Examples:** Director:

baPlaceCursor( 200 , 300 )

Authorware:

baPlaceCursor(200,300)

**See also:** <u>baRestrictCursor</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### RestrictCursor

**Description:** baRestrictCursor restricts the cursor to a specified part of the screen.

**Usage:** baRestrictCursor( Left, Top, Right, Bottom )

**Arguments:** Integer, integer, integer.

Left, Top, Right, Bottom define the rectangle that the cursor will be restricted to. They are measured in pixels from the top left corner of the

screen.

**Returns:** Void.

**Examples:** Director:

baRestrictCursor( 100, 100, 200, 200 )

Authorware:

baRestrictCursor( 100, 100, 200, 200 )

**Notes:** Use the <u>baFreeCursor</u> function to return the cursor to its normal state.

**See also:** <u>baFreeCursor</u>

baPlaceCursor

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **FreeCursor**

**Description:** baFreeCursor allows the cursor to move anywhere on the screen. It is used

to free the cursor after using baRestrictCursor.

**Usage:** baFreeCursor()

**Arguments:** Void.

**Returns:** Void.

**Examples:** Director:

baFreeCursor()

Authorware: baFreeCursor()

**See also:** <u>baRestrictCursor</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **SetVolume**

**Description:** baSetVolume sets the volume level of the sound card for wave files and

audio CD.

**Usage:** Result = baSetVolume( Device, Volume )

**Arguments:** String, integer.

Device is the device to change. Can be:

"master" sets the master volume

"wave" sets the volume of wave and video files
"cd" sets the volume of audio CD playback
"midi" sets the volume of an external midi device
"synth" sets the volume of the internal FM synthesizer

"master mute" controls the master mute
"wave mute" controls the wave mute
"cd mute" controls the CD mute

"synth mute" controls the built-in synthesizer mute

Volume is the volume level to set. The volume level can be between 0 (silence) and 100 (maximum). For the mute devices, Volume can be either 1

for mute on, or 0 for mute off.

**Returns:** Integer.

Returns 1 if successful, else 0.

**Examples:** Director:

set OK = baSetVolume( "cd", 50)

Authorware:

OK := baSetVolume( "cd", 50)

**Notes:** Not all sound cards support this function. some cards will only support some

of the device types. They will return 0 if the function is not supported.

The function will set the volume on the first sound card found.

The master volume and the mute options are only available under 32 bit,

and then only if the system has a mixer device installed.

Some sound cards do not set the volume precisely. For example, if you set the volume to 50, then call the <u>baGetVolume</u> function, it may return 48 or

49.

**See also:** <u>baGetVolume</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **GetVolume**

**Description:** baGetVolume gets the current volume level of wave files and audio CD.

**Usage:** Result = baGetVolume( Device )

**Arguments:** String.

Device is the device to get the volume of. Can be:

"wave" gets the volume of wave and video files

"cd" gets the volume of audio CD playback

"midi" gets the volume of an external midi device

"synth" gets the volume of the internal FM synthesizer

"master mute" gets the master mute state
"wave mute" gets the wave mute state
"cd mute" gets the CD mute state

"synth mute" gets the built-in synthesizer mute state

**Returns:** Integer.

Returns the volume of the requested device. The volume level can be between 0 (silence) and 100 (maximum). The mute options will return 1 if

the mute is on, or 0 if it isn't.

Returns -1 if the function is not supported.

**Examples:** Director:

set Volume = baGetVolume( "wave" )

Authorware:

Volume := baGetVolume( "wave" )

**Notes:** Not all sound cards support this function. Some cards will only support

some of the device types. They will return -1 if the function is not

supported.

The function will get the volume from the first sound card found.

The master volume and the mute options are only available under 32 bit,

and then only if the system has a mixer device installed.

If the left and right channels are at different levels, then the average of the

two is returned.

Some sound cards do not set the volume precisely. For example, if you set the volume to 50 using the <u>baSetVolume</u> function, then call this function, it

may return an 48 or 49.

**See also:** <u>baSetVolume</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### InstallFont

**Description:** balnstallFont installs a TrueType or Bitmap font.

**Usage:** Result = balnstallFont( FontFile , FontName )

**Arguments:** FontFile is the .ttf or .fon file to install.

FontName is the name of the font.

**Returns:** Integer.

Returns 0 if font installs OK. Otherwise returns one of:

1 A font file with that name already exists.

The font file was not found.Error copying font file.

4 Windows couldn't install the font.5 The font file is an invalid name.

**Examples:** Director:

set OK = balnstallFont( "arialb.ttf" , "Arial Bold" )

Authorware:

OK := balnstallFont( "arialb.ttf" , "Arial Bold" )

**Notes:** Most fonts are copyrighted material. You should not install a font unless you

are legally allowed to do so.

The name of the font should be taken from the Fonts Control Panel. The name that Windows identifies the font to applications is taken from

information incide the fant file not the name you give it

information inside the font file, not the name you give it. You should use the <u>FontInstalled</u> command to check whether or not a particular font is already installed before you try to install a new copy.

particular font is already installed before you try to install a new copy.

Director does not rebuild it's font list after it has been started. This means that the font will not be available to the projector that installed it unless it is

restarted. All versions of Authorware should be able to use the font

immediately. There is usually no need to restart Windows.

See also: <u>baFontInstalled</u>

<u>baFontStyleList</u> <u>baFontList</u>

# **KeyIsDown**

**Description:** baKeyIsDown checks whether a key is currently down.

**Usage:** Result = baKeyIsDown( Key )

**Arguments:** Integer.

Key is the virtual key code of the key to test.

**Returns:** Integer.

Returns 1 if Key is being held down, else 0.

**Examples:** Director:

set KeyDown = baKeyIsDown(65) -- check if the "a" key is down

Authorware:

KeyDown := baKeyIsDown(65) -- check if the "a" key is down

**Notes:** A list of <u>Virtual Key Codes</u> is supplied. Some of these keys are not available

in different versions of Windows.

See also: <u>baKeyBeenPressed</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **KeyBeenPressed**

**Description:** baKeyBeenPressed checks whether a key has been pressed since the last

time the function was called.

**Usage:** Result = baKeyBeenPressed( Key )

**Arguments:** Integer.

Key is the virtual key code of the key to test.

**Returns:** Integer.

Returns 1 if Key has been pressed since the last time the function was

called, else 0.

**Examples:** Director:

set KeyBeenPressed = baKeyBeenPressed( 65 ) -- check if the "a" key has

been pressed

Authorware:

KeyBeenPressed := baKeyBeenPressed( 65 ) -- check if the "a" key has been

pressed

**Notes:** A list of <u>Virtual Key Codes</u> is supplied. Some of these keys are not available

in different versions of Windows.

This function tracks key presses in all applications, not just yours.

# **SystemTime**

**Description:** baSystemTime returns the current time/date.

**Usage:** Result = baSystemTime( Format )

**Arguments:** String.

Format is the time/date format to return.

**Returns:** String.

Returns the requested time/date.

**Examples:** Director:

set theTime = baSystemTime( "date" )

Authorware:

theTime := baSystemTime( "Today is %A" ) -- returns the day eg "Today is

Tuesday"

**Notes:** There are two predefined formats - "time" and "date"

"time" will return the current time in 24 hour format with leading zeros - hours, minutes and seconds eg "230412". It will always be 6 characters

long.

"date" will return the date in year, month, day eg "19980321". It will always

be 8 characters long,

Other formatting is available. Any of these constants will be replaced by the

appropriate time/date - any other characters will be returned as is.

%a Abbreviated weekday name

%A Full weekday name

%b Abbreviated month name

%B Full month name

%d Day of month as decimal number (1 - 31)

%0d Day of month with leading 0

%H Hour in 24-hour format (0 - 23) %OH Hour in 24-hour format with leading 0

%j Day of year as decimal number (1 - 366)

%0j Day of year as decimal number with leading 0

%m Month as decimal number (1 - 12)

%0m Month as decimal number with leading 0

%M Minute as decimal number (0 - 59)

%0M Minute as decimal number with leading 0

%S Second as decimal number (0 - 59)

%0S Second as decimal number with leading 0

%w Weekday as decimal number (0 - 6; Sunday is 0)

%y Year without century, as decimal number (00 - 99)

%Y Year with century, as decimal number

Examples:

"It is %M past %H on %A" 
"It is 23 past 10 on Tuesday"

**See also:** baSetSystemTime

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **SetSystemTime**

**Description:** baSetSystemTime sets the current time/date.

**Usage:** Result = baSetSystemTime( Format, NewTime )

**Arguments:** String, string.

Format is the time/date format to set. Can be either "time" or "date".

NewTime is the time/date to set.

**Returns:** Integer.

Returns 1 if successful, otherwise 0.

**Examples:** Director:

set ok = baSetSystemTime( "date", "19980523" ) - sets the date to 23 June

1998

Authorware:

set ok = baSetSystemTime( "time", "102300" ) - sets the time to 23 past 10

**Notes:** The format for the time or date must be as follows:

"time" is in 24 hour format with leading zeros - hours, minutes and seconds

and must be 6 characters

"date" is in year, month, day with leading zeros and must be 8 characters

long,

The "date" and "time" formats are the same as those returned by

<u>baSystemTime</u>

**See also:** <u>baSystemTime</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **PrinterInfo**

**Description:** baPrinterInfo returns information about the installed printers.

**Usage:** Result = baPrinterInfo( Info )

**Arguments:** String.

Info is the type of information required.

Can be

"installed" returns full list of installed printers, drivers and ports

"list" list of the names of installed printers

"default" the current default printer

"orientation" the orientation of the default printer

"paper" the current paper size of the defauilt printer

"papers" the list of paper sizes supported by the default printer "papername" the name of the current paper of the default printer "papernames" the list of paper names of the default printer

"paperlength" the length of the paper in the default printer in 1/1000 mm "paperwidth" the width of the paper in the default printer in 1/1000 mm

"copies" the number of copies to print

**Returns:** Depends on Info type.

Xtra: "installed", "list", "papers", "papernames" return a list; "default", "orientation", "paper", "papername" return a string; "paperlength", "paperwidth" and "copies" return an integer.

UCD: always returns a string.

**Examples:** Director:

set printer = baPrinterInfo( "default" )

Authorware:

printerList := baPrinterInfo( "list" )

Notes: The "installed" info type returns a list (Xtra) or a string (UCD) - one list

element or line for each printer. Each element will consist of the printer

name, then the driver, then the port, all seperated by commas. eg.

["EPSON Stylus COLOR 400,EPS400,LPT1:", "Acrobat

PDFWriter, PDFWRITR, DISK: "] (Xtra)

"EPSON Stylus COLOR 400, EPS400, LPT1:\rAcrobat

PDFWriter, PDFWRITR, DISK: "(UCD)

The "list" Info type returns a list with just the printer names, eq.

["EPSON Stylus COLOR 400", "Acrobat PDFWriter"]

The "orientation" Info type will return "Landscape", "Portrait" or "Unknown".

The "paper" Info type returns the size of the selected paper. It will be one of the following values:

"Letter", "LetterSmall", "Tabloid", "Ledger", "Legal", "Statement", "Executive", "A3", "A4", "A4Small", "A5", "B4", "B5", "Folio", "Quarto", "10x14", "11x17", "Note", "Envelope9", "Envelope10", "Envelope11", "Envelope12", "Envelope14", "CSheet", "Envelope14", "Envelope1 "DSheet", "ESheet", "EnvelopeDL", "EnvelopeC5", "EnvelopeC3", "EnvelopeC4", "EnvelopeC6", "EnvelopeC65", "EnvelopeB4", "EnvelopeB5", "EnvelopeB6",

"EnvelopeItaly", "EnvelopeMonarch", "EnvelopePersonal", "FanFoldUS", "FanFoldStdGerman", "FanFoldLegalGermany", "User", "Unknown".

The "papers" info type returns a list (Xtra) or string( UCD) of the paper sizes

supported by the default printer.

The "papername" type returns the name of the selected paper as shown by the printer driver.

The "papernames" type returns a list of the papers supported by the default printer, as listed by the printer driver.

The "paper" option uses paper sizes pre-defined by Windows. Printer drivers may define thier own page sizes and names - if the selected paper is a printer-defined size, the function will return "Unknown".

The "papername" will return the name of the paper as displayed by the printer driver - this will be the name the user sees in printer setup dialog boxes.

**See also:** <u>baSetPrinter</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **SetPrinter**

**Description:** baSetPrinter changes settings for the default printer.

**Usage:** Result = baSetPrinter(Info, Data)

**Arguments:** String, any (Xtra) or string (UCD)

Info is the type of information to set.

Can be

"default" set the current default printer (string)
"orientation" the orientation of the default printer (string)

"paper" the selected paper size of the defauilt printer (string)
"papername" the name of the selected paper of the defauilt printer (string)
"copies" the number of copies to print (integer - Xtra, string - UCD)

Data is the data to set - the format depends on the info type. The UCD

version will always be a string.

**Returns:** Integer

Returns 1 if successful, otherwise 0.

**Examples:** Director:

set ok = baSetPrinter( "default", "Epson 400 Stylus Color" )

set ok = baSetPrinter( "copies", 2)

Authorware:

ok := baSetPrinter( "orientation", "landscape" )

ok := baSetPrinter( "copies", "2" )

**Notes:** The "default" option only requires the name of the printer, not the port or

driver.

The "paper" option uses the same names as the <u>baPrinterInfo</u> "paper". The "papername" option uses the same names as the <u>baPrinterInfo</u>

"papername".

# RefreshDesktop

**Description:** baRefreshDesktop refreshes the desktop icons.

**Usage:** baRefreshDesktop( Wait )

**Arguments:** Integer.

If Wait is true, then the function will wait until the update is complete before

returning.

**Returns:** Void.

**Examples:** Director:

baRefreshDesktop( true )

Authorware:

baRefreshDesktop( false )

**Notes:** This function would typically be used after making registry changes that

affect the icons displayed by files, such as changing a file association. This function only works in the 32 bit Xtra/UCD. If used in 16 bit, it will do

nothing.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **DeletePMGroup**

**Description:** baDeletePMGroup deletes a Program Manager or Start Menu group.

**Usage:** Result = baDeletePMGroup( Group )

**Arguments:** String.

Group is the name of the group to delete.

**Returns:** Integer.

Returns 1 if successful, else 0.

**Examples:** Director:

set OK = baDeletePMGroup( "Multimedia World" )

Authorware:

OK := baDeletePMGroup( "Multimedia World" )

**Notes:** The group does not have to be empty for it to be deleted.

**See also:** <u>baCreatePMGroup</u>

baPMGroupList baCreatePMIcon baDeletePMIcon baPMIconList

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **PMGroupList**

**Description:** baPMGroupList returns a list of all Program Manager or Start Menu groups.

**Usage:** Result = baPMGroupList()

**Arguments:** Void.

**Returns:** List (Xtra) or String (UCD).

Returns a list or string containing all Program Manager groups.

**Examples:** Director:

set GroupList = baPMGroupList( )

Authorware:

GroupList := baPMGroupList()

**Notes:** The return for the UCD version is a string with each group on a seperate

line. You can use the Authorware GetLine function to retrieve each group.

**See also:** <u>baPMSubGroupList</u>

baCreatePMGroup baDeletePMGroup baCreatePMIcon baDeletePMIcon baPMIconList

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **PMSubGroupList**

**Description:** baPMSubGroupList returns a list of Start Menu groups inside another group.

**Usage:** Result = baPMSubGroupList( GroupName )

**Arguments:** GroupName.

Group is the name of the group to get the list of

**Returns:** List (Xtra) or String (UCD).

Returns a list or string containing the groups.

**Examples:** Director:

set GroupList = baPMSubGroupList( "Accessories" )

Authorware:

GroupList := baPMSubGroupList( "Accessories " )

**Notes:** This function returns the groups inside a group. These 'nested groups' are

only possible in Windows 95/NT, and this function is only available in the 32

bit Xtra/UCD. If used in 16 bit, it will return an empty string/list.

To get the contents of a group inside a group, place a "\" between the

groups ("\\" in Authorware) eg

baPMSubGroupList( "Accessories\Multimedia" ).

The return for the UCD version is a string with each group on a seperate line. You can use the Authorware GetLine function to retrieve each group.

See also: <u>baPMGroupList</u>

baCreatePMGroup baDeletePMGroup baCreatePMIcon baDeletePMIcon baPMIconList

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **CreatePMIcon**

**Description:** baCreatePMIcon creates a Program Manager or Start Menu icon.

**Usage:** Result = baCreatePMIcon( Command, Title, Icon, IconNumber )

**Arguments:** String, string, integer.

Command is the command line to use in the icon. Title is the name that appears under the icon.

Icon is the name of the icon to use.

IconNumber is the number of the icon to use.

**Returns:** Integer.

Returns 1 if successful, else 0.

**Examples:** Director:

set OK = baCreatePMIcon( "d:\mterms.exe", "Multimedia Terms" , "d:\

mterms.ico", 0)

Authorware:

OK := baCreatePMIcon( "d:\\mterms.exe", "Multimedia Terms" , " d:\\

mterms.ico", 0)

**Notes:** The icon will be added to the active Program Manager group. To ensure that

the group you want to add the icon to is active, you should always call <u>baCreatePMGroup</u> before you use this function (even if the group already exists). This will make the group the active one. If you are adding multiple icons, you only need to make one call to baCreatePMGroup before you start

adding.

If you create a group, and want to add icons to it, you should allow enough time for Windows to create the group before you try to add an icon to it. A wait of one second should be enough, but slow machines running Win95

may take longer.

The Icon parameter can be either an .ico, .exe or .dll file. If the file is a .ico, then the IconNumber parameter is ignored. If it is a .exe or .dll file, then the IconNumber is the number of the icon in that file to use. If the Icon is an empty string (""), then the first icon in the Command .exe file will be used.

For example:

baCreatePMIcon("d:\mterms.exe", "Multimedia Terms", "", 0)

will use the default icon for d:\mterms.exe.

baCreatePMIcon( "d:\mterms.exe", "Multimedia Terms" , "d:\mterms.ico" ,

0)

will use the d:\mterms.ico icon.

baCreatePMIcon( "d:\mterms.exe", "Multimedia Terms" , "c:\windows\

moreicons.dll", 5)

will use the fifth icon in moreicons.dll.

### **DeletePMIcon**

**Description:** baDeletePMIcon deletes a Program Manager or Start Menu icon.

**Usage:** Result = baDeletePMIcon( Icon )

**Arguments:** String.

Icon is the name of the icon to delete.

**Returns:** Integer.

Returns 1 if successful, else 0.

**Examples:** Director:

set OK = baDeletePMIcon( "Multimedia Terms" )

Authorware:

OK := baDeletePMlcon( "Multimedia Terms" )

**Notes:** The icon will be deleted from the active Program Manager group. To ensure

that the group you want to delete the icon from is active, you should always call <u>baCreatePMGroup</u> before you use this function (even if the group already exists). This will make the group the active one. If you are deleting multiple icons, you only need to make one call to baCreatePMGroup before

you start deleting.

**Alphabetical function list** 

### **PMIconList**

**Description:** baPMIconList returns a list containing all the icons in a Program Manager

group.

**Usage:** Result = baPMlconList( Group )

**Arguments:** String.

Group is the name of the group to get the icons of.

**Returns:** List (Xtra) or String (UCD).

Returns a list or string containing all the icons in Group.

If Group does not exist or it empty, then an empty list or string will be

returned.

**Examples:** Director:

set IconList = baPMIconList( "Macromedia" )

Authorware:

lconList := baPMlconList( "Macromedia" )

**Notes:** The return for the UCD version is a string with each icon on a seperate line.

You can use the Authorware GetLine function to retrieve each group. In 32 bit, you can also get the contents of a nested group, by placing a "\" ("\\" in Authorware) between the groups. eg baPMIconList( "Accessories\ Multimedia") will get the contents of the Multimedia group, inside the

Accessories group.

FileAgereturns the age of a fileFileExistschecks whether a file existsFolderExistschecks whether a folder exists

<u>CreateFolder</u> creates a new folder <u>DeleteFolder</u> deletes an empty folder

**RenameFile** renames a file **DeleteFile** deletes a file

**DeleteXFiles** deletes files with wildcard matching

**XDelete** deletes files with wildcard matching, including sub-directories

FileDatereturns the date of a fileFileSizereturns the size of a fileFileAttributesreturns the attributes of a file

**SetFileAttributes** sets the attributes of a file places a file in the Win95/NT recycle bin.

**CopyFile** copies a file.

**CopyXFiles** copies multiple files with wildcard matching.

**XCopy** copies multiple files with wildcard matching, including sub-

directories.

FileVersionreturns the version of a file.FileListreturns a list of files in a folder.FolderListreturns a list of folders in a folder.GetFilenamedisplays a file selection dialog.GetFolderdisplays a folder selection dialog.

FindFirstFile searches for the first file matching a specification searches for the next file matching a specification finishes a search started with baFindFirstFile

EncryptFile encrypts/decrypts a file

**FindDrive** searches all drives for a specified file

**Shell** executes a file

OpenFileopens a file using it's associated programOpenURLopens a URL using the default browserPrintFileprints a file using it's associated program

**ShortFileName** returns the DOS version of a Win95 long file name returns a temporary file name guaranteed not to exist

MakeShortcutcreates a Win95/NT shortcutMakeShortcutExcreates a Win95/NT shortcut

**ResolveShortcut** returns the file a shortcut points to

Information functionsSystem functionsFile functionsWindow functions

Alphabetical function list

# **FileAge**

**Description:** baFileAge returns the date of a file in seconds.

**Usage:** Result = baFileAge( FileName )

**Arguments:** String

FileName is the file to get the age of.

**Returns:** Integer.

Returns the age of the file in seconds.

**Examples:** Director:

set Age = baFileAge( "student.dat" )

Authorware:

Age := baFileAge( "student.dat" )

**Notes:** The number returned is the number of seconds since an arbitrary date. The

number means little by itself, but can be used to compare the dates of two

files. The file with higher number is the newer file. For example:

if baFileAge( "c:\\data\\student.dat"" ) > baFileAge( "a:\\student.dat" ) then

-- file on "C" drive is newer than the one on "A" drive.

**See also:** <u>baFileDate</u>

**baFileVersion** 

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **FileExists**

**Description:** baFileExists reports whether or not a specific file exists.

**Usage:** Result = baFileExists( FileName )

**Arguments:** String.

FileName is the name of the file. It should include the full path name.

**Returns:** Integer.

Returns 1 if the file exists, otherwise 0.

**Examples:** Director:

set File = baFileExists( the pathname & "test.dat" )

Authorware:

File := baFileExists( FileLocation ^ "test.dat" )

See also: <u>baRenameFile</u>

baFolderExists

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **FolderExists**

**Description:** baFolderExists checks whether or not a folder exists.

**Usage:** Result = baFolderExists( FolderName )

**Arguments:** String

FolderName is the folder to check for.

**Returns:** Integer.

Returns 1 if the folder exists, else 0.

**Examples:** Director:

set OK = baFolderExists( "c:\data" )

Authorware:

OK := baFolderExists( "c:\\data" )

**See also:** baCreateFolder

<u>baDeleteFolder</u> <u>baFileExists</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## CreateFolder

**Description:** baCreateFolder creates a new folder.

**Usage:** Result = baCreateFolder( FolderName )

**Arguments:** String

FolderName is the folder to create.

**Returns:** Integer.

Returns 1 if the folder was successfully created or already exists, else 0.

**Examples:** Director:

set OK = baCreateFolder( "c:\data\courses" )

Authorware:

OK := baCreateFolder( "c:\\data\\courses" )

**Notes:** This function will create any intermediate folders that are needed. For

example, baCreateFolder( "c:\data\courses\biology" ) will create "c:\data",

then "c:\data\courses", then "c:\data\courses\biology".

See also: <u>baFolderExists</u>

<u>baDeleteFolder</u>

**Alphabetical function list** 

## **DeleteFolder**

**Description:** baDeleteFolder deletes an empty folder.

**Usage:** Result = baDeleteFolder( FolderName )

**Arguments:** String

FolderName is the folder to delete.

**Returns:** Integer.

Returns 1 if the folder was successfully deleted or doesn't exist, else 0.

**Examples:** Director:

set OK = baDeleteFolder( "c:\data" )

Authorware:

OK := baDeleteFolder( "c:\\data" )

**Notes:** This function will only delete a folder that doesn't contain any files or sub-

directories.

**See also:** <u>baFolderExists</u>

<u>baCreateFolder</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### RenameFile

**Description:** baRenameFile renames a file.

**Usage:** Result = baRenameFile( FileName , NewName )

**Arguments:** String

FileName is the file to rename.

NewName is the new name for the file.

**Returns:** Integer.

Returns 1 if the file was successfully renamed, else 0.

**Examples:** Director:

set OK = baRenameFile( "c:\data\student.dat" , "c:\data\student.bak" )

Authorware:

OK := baRenameFile( "c:\\data\\student.bak" )

**Notes:** This function will fail if a file called NewName already exists. The full path

name to both the FileName and the NewName should be given.

**See also:** <u>baFileExists</u>

baDeleteFile

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **DeleteFile**

**Description:** baDeleteFile deletes a file.

**Usage:** Result = baDeleteFile( FileName )

**Arguments:** String

FileName is the file to delete.

**Returns:** Integer.

Returns 1 if the file was successfully deleted or doesn't exist, else 0.

**Examples:** Director:

set OK = baDeleteFile( "c:\data\student.bak" )

Authorware:

OK := baDeleteFile( "c:\\data\\student.bak" )

**See also:** <u>baDeleteXFiles</u>

<u>baRenameFile</u> <u>baRecycleFile</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **DeleteXFiles**

**Description:** baDeleteXFiles deletes files with wildcard matching.

**Usage:** Result = baDeleteXFiles( DirName , FileSpec )

**Arguments:** String, string.

DirName is the folder to delete the files from. FileSpec determines what files are deleted.

**Returns:** Integer.

Returns 1 if all the matching files were successfully deleted or if DirName

doesn't exist, else 0.

**Examples:** Director:

set OK = baDeleteXFiles( "c:\data" , "\*.bak" )

Authorware:

OK := baDeleteXFiles( "c:\\data" , "\*.bak" )

**Notes:** The FileSpec argument follows normal DOS wildcard rules. A \* means match

any character in the file name.

So \*.\* deletes all files in the directory; \*.bmp deletes all files with a .bmp

extension; T\*.\* deletes all files starting with the letter T.

**See also:** <u>baDeleteFile</u>

<u>baFileExists</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **XDelete**

**Description:** baXDelete deletes files with wildcard matching, including sub-directories.

**Usage:** Result = baXDelete( DirName , FileSpec )

**Arguments:** String, string.

DirName is the folder to delete the files from. FileSpec determines what files are deleted.

**Returns:** Integer.

Returns 1 if all the matching files were successfully deleted or if DirName

doesn't exist, else 0.

**Examples:** Director:

set OK = baXDelete( "c:\data" , "\*.bak" )

Authorware:

OK := baXDelete( "c:\\data , "\*.bak" )

**Notes:** Any empty directories that are left will also be deleted.

T he FileSpec argument follows normal DOS wildcard rules. A \* means match

any character in the file name.

So \*.\* deletes all files in the directory; \*.bmp deletes all files with a .bmp

extension; T\*.\* deletes all files starting with the letter T.

**See also:** <u>baDeleteFile</u>

<u>baDeleteXFiles</u> <u>baFileExists</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **FileDate**

**Description:** baFileDate returns the date of a file as a string.

**Usage:** Result = baFileDate( FileName , DateFormat , TimeFormat )

**Arguments:** String, string, string

FileName is the file to get the date of.

DateFormat is the desired format of the date, TimeFormat is the desired format of the time.

**Returns:** String.

Returns the date of the file, or an empty string if the file doesn't exist.

**Examples:** Director:

set OK = baFileDate( "c:\data\student.dat" , "dd-mm-yy" , "hh:nn:ss" )

Authorware:

OK := baFileDate( "c:\\data\\student.dat" , "dd-mm-yy" , "hh:nn:ss" )

**Notes:** The date format can consist of "d" for day, "m" for month, "y" for year.

The time format can consist of "h" for hours, "n" for minutes, "s" for

seconds. (Note the "n" for minutes.)

A single letter ("d") returns the exact number eg "5".

A double letter ("dd") returns the number with a leading zero if required eg

"05".

A triple letter ("ddd") returns the short name eg "Mon". A quad letter ("dddd") returns the full name eg "Monday".

Any letters other than those listed above will returned as is - they can be used for separators eg "dd-mm-yy" returns "05-11-97"; "d mmmm, yyyy"

returns "5 November, 1997"

If the format is an empty string, then the date or time will not be returned.

**See also:** <u>baFileAge</u>

**baFileVersion** 

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **FileSize**

**Description:** baFileSize returns the size of a file.

**Usage:** Result = baFileSize( FileName )

**Arguments:** String.

FileName is the file to get the size of.

**Returns:** Integer.

Returns the size of the file in bytes, or -1 if the file doesn't exist.

**Examples:** Director:

set size = baFileSize( "c:\data\student.dat" )

Authorware:

size := baFileSize( "c:\\data\\student.dat" )

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **FileAttributes**

**Description:** baFileAttributes returns the attributes of a file.

**Usage:** Result = baFileAttributes( FileName )

**Arguments:** String.

FileName is the file to get the attributes of.

**Returns:** String.

Returns a string containing all the the attributes that are set.

Can be any combination of:

"r" read-only
"a" archive
"h" hidden
"s" system

Returns an empty string if FileName doesn't exist.

**Examples:** Director:

set att = baFileAttributes( "c:\data\student.dat" )

Authorware:

att := baFileAttributes( "c:\\data\\student.dat" )

**Notes:** You can use the Director **contains** or Authorware **Find** function to test

whether a particular attribute is set. eg.

if Find( "r" , baFileAttributes( FileName ) ) <> 0 then -- file is read only

if baFileAttributes(FileName) contains "r" then -- file is read only

**See also:** <u>baSetFileAttributes</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **SetFileAttributes**

**Description:** baSetFileAttributes sets the attributes of a file.

**Usage:** Result = baSetFileAttributes( FileName , Attributes )

**Arguments:** String, string.

FileName is the file to get the attributes of.

Attributes are the attributes to set.

Can be any combination of:

"r" read-only
"a" archive
"h" hidden
"s" system

An empty string removes all attributes.

**Returns:** Integer.

Returns 1 if successful, else 0.

**Examples:** Director:

set OK = baSetFileAttributes( "c:\data\student.dat" , "rh" ) -- make file

hidden and read-only

Authorware:

OK := baSetFileAttributes( "c:\\data\\student.dat" , "" ) -- clear all attributes

See also: <u>baFileAttributes</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# RecycleFile

**Description:** baRecycleFile places a file in the Win95/NT recycle bin.

**Usage:** Result = baRecycleFile( FileName )

**Arguments:** String

FileName is the file to recycle.

**Returns:** Integer.

Returns 1 if the file was successfully recycled or doesn't exist, else 0.

**Examples:** Director:

set OK = baRecycleFile( "c:\data\student.bak" )

Authorware:

OK := baRecycleFile( "c:\\data\\student.bak" )

**Notes:** This function only works in 32 bit. If used in 16 bit, the file will be

immediately deleted.

See also: <u>baDeleteFile</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## CopyFile

**Description:** baCopyFile copies a file.

**Usage:** Result = baCopyFile( SourceFile , DestFile , Overwrite )

**Arguments:** String, string, string.

> SourceFile is the file to copy. DestFile is the name to copy it to.

Overwrite determines how the copy is done. Can be:

"Always" always copies the file
"IfNewer" copies the file if SourceFile is newer than DestFile copies only if DestFile does not already exist

**Returns:** Integer.

Returns 0 if the file was copied successfully, otherwise one of these:

1 Invalid Source file name

2 Invalid Dest file name

Error reading the Source file 4 Error writing the Dest file

5 Couldn't create directory for Dest file

6 Dest file exists

7 Dest file is newer that Source file

**Examples:** Director:

> set OK = baCopyFile( "c:\data\student.dat" , "c:\data\backup\student.dat" , "IfNewer" )

Authorware:

OK := baCopyFile( "c:\\data\\student.dat" , "c:\\data\\backup\\student.dat" , "IfNewer" )

**Notes:** By default, this function will not overwrite an existing file if that file is

marked as read-only. However, by adding "+" to the "Always" and

"IfNewer" options (eg "Always+" or "IfNewer+"), the files will be overwritten

if they are read-only.

A return value of 6 (Dest file exists) can only be returned when Overwrite is

"IfNotExist".

A return value of 7 (Dest file is newer than Source file) can only be returned when Overwrite is "IfNewer". The other return values can be returned for all

Overwrite options.

The "IfNewer" option operates as follows: if both files have internal version. numbers, then these numbers are used for comparison, otherwise the dates

of the two files are used for comparison.

The DestFile must contain the full name of the file, not just the name of the

folder it is being copied to.

The 16 bit version will not copy system or hidden files, but the 32 bit version can. The 16 bit version will return 1 if you attempt to copy a hidden

The new file will be set to archive and not read-only.

See also: **baCopyXFiles** 

baXCopy

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **CopyXFiles**

**Description:** baCopyXFiles copies multiple files from one folder to another folder, with

wildcard matching.

**Usage:** Result = baCopyXFiles( SourceDir , DestDir , FileSpec , Overwrite )

**Arguments:** String, string, string, string.

SourceDir is the folder to copy from. DestDir is the folder to copy to.

FileSpec determines what files are copied.

Overwrite determines how the copy is done. Can be:

"Always" always copies the file

"IfNewer" copies the file if SourceFile is newer than DestFile "IfNotExist" copies only if DestFile does not already exist

**Returns:** Integer.

Returns 0 if all the files were copied successfully, otherwise one of these:

1 Invalid SourceDir name

2 Invalid DestDir file name

3 Error reading a Source file4 Error writing a Dest file

4 Error writing a Dest file

5 Couldn't create directory for Dest files

6 Dest file exists

7 Dest file is newer that Source file

8 No files matched the specified wildcard

**Examples:** Director:

set OK = baCopyXFiles( "c:\data" , "d:\backup" , "\*.dat " , "IfNewer" )

Authorware:

OK := baCopyXFiles( "c:\\data" , "d:\\backup" , "\*.dat" , "IfNewer" )

**Notes:** By default, this function will not overwrite an existing file if that file is

marked as read-only. However, by adding "+" to the "Always" and

"IfNewer" options (eg "Always+" or "IfNewer+"), the files will be overwritten

if they are read-only.

The return value will not be 0 if any file is not copied. For example, if you

specify

baCopyXFiles( "c:\data" , "d:\backup" , "\*.\*" , "IfNewer" )

and any of the files in c:\data are newer than the ones in d:\backup, the return result will be 7 (Dest file is newer than Source). A result of 0 will be returned only if none of the files in c:\data is newer than d:\backup.

The FileSpec argument follows normal DOS wildcard rules. A \* means match any character in the file name.

So \*.\* copies all files; \*.bmp copies all files with a .bmp extension; T\*.\* copies all files starting with the letter T.

A return value of 6 (Dest file exists) can only be returned when Overwrite is "IfNotExist".

A return value of 7 (Dest file is newer than Source file) can only be returned when Overwrite is "IfNewer". The other return values can be returned for all Overwrite options.

The "IfNewer" option operates as follows: if both files have internal version

numbers, then these numbers are used for comparison, otherwise the dates of the two files are used for comparison.

The 16 bit version can not copy system or hidden files, but the 32 bit version can. The new files will be set to archive and not read-only.

See also: <u>baCopyFile</u> <u>baXCopy</u>

**Information functions System functions File functions Window functions** 

**Alphabetical function list** 

## **XCopy**

**Description:** baXCopy copies multiple files from one folder to another folder, with

wildcard matching, including sub-directories.

**Usage:** Result = baCopyX( SourceDir , DestDir , FileSpec , Overwrite, MakeDir )

**Arguments:** String, string, string, integer.

SourceDir is the folder to copy from. DestDir is the folder to copy to.

FileSpec determines what files are copied.

Overwrite determines how the copy is done. Can be:

"Always" always copies the file

"IfNewer" copies the file if SourceFile is newer than DestFile "IfNotExist" copies only if DestFile does not already exist

If MakeDir is true, any empty directories will be created.

#### **Returns:** Integer.

Returns 0 if all the files were copied successfully, otherwise one of these:

- 1 Invalid SourceDir name
- 2 Invalid DestDir file name
- 3 Error reading a Source file
- 4 Error writing a Dest file
- 5 Couldn't create directory for Dest files
- 6 Dest file exists
- 7 Dest file is newer that Source file
- 8 No files matched the specified wildcard

#### **Examples:** Director:

set OK = baXCopy( "c:\data" , "d:\backup" , "\*.dat " , "IfNewer" , true )

#### Authorware:

OK := baXCopy( "c:\\data" , "d:\\backup" , "\*.\*" , "Always" , false )

# **Notes:** By default, this function will not overwrite an existing file if that file is

marked as read-only. However, by adding "+" to the "Always" and "IfNewer" options (eg "Always+" or "IfNewer+"), the files will be overwritten

if they are read-only.

The return value will not be 0 if any file is not copied. For example, if you specify

baXCopy( "c:\data" , "d:\backup" , "\*.\*" , "IfNewer" )

and any of the files in c:\data are newer than the ones in d:\backup, the return result will be 7 (Dest file is newer than Source). A result of 0 will be returned only if none of the files in c:\data is newer than d:\backup.

The FileSpec argument follows normal DOS wildcard rules. A \* means match any character in the file name.

So \*.\* copies all files; \*.bmp copies all files with a .bmp extension; T\*.\* copies all files starting with the letter T.

A return value of 6 (Dest file exists) can only be returned when Overwrite is "IfNotExist".

A return value of 7 (Dest file is newer than Source file) can only be returned when Overwrite is "IfNewer". The other return values can be returned for all Overwrite options.

The "IfNewer" option operates as follows: if both files have internal version numbers, then these numbers are used for comparison, otherwise the dates

of the two files are used for comparison.

The 16 bit version can not copy system or hidden files, but the 32 bit version can. The new files will be set to archive and not read-only.

<u>baCopyFile</u> <u>baCopyXFiles</u> See also:

**System functions Information functions File functions Window functions** 

**Alphabetical function list** 

### **FileVersion**

**Description:** baFileVersion returns a string containing the version of a file.

**Usage:** Result = baFileVersion( FileName )

**Arguments:** String.

FileName is the name of the file to obtain version information of.

**Returns:** String.

Returns the version of the file. If the file doesn't contain version information

or doesn't exist, then an empty string is returned.

**Examples:** Director:

set AcroVer = baFileVersion( "c:\acroread\acroread.exe" )

Authorware:

AcroVer := baFileVersion( "c:\\acroread\\acroread.exe" )

**Notes:** The version of a 32 bit file (dll, exe, etc) is not available to a 16 bit exe

under Windows NT.

See also: <u>baFileDate</u>

<u>baFileAge</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **FileList**

**Description:** baFileList returns a list of files in a folder.

**Usage:** Result = baFileList( Folder, FileSpec )

**Arguments:** String, string.

Folder is the name of the folder to list. FileSpec is the pattern of files to match.

**Returns:** List (Xtra) or String (UCD).

Returns the list of matching files. If Folder doesn't exist, then an empty

list/string is returned.

**Examples:** Director:

set Files = baFileList( "c:\windows", "\*.\*" )

Authorware:

Files := baFileList( "c:\\temp", "\*.bmp" )

**See also:** <u>baFolderList</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **FolderList**

**Description:** baFolderList returns a list of folders in a folder.

**Usage:** Result = baFolderList( Folder )

**Arguments:** String.

Folder is the name of the folder to list.

**Returns:** List (Xtra) or String (UCD).

Returns the list of folders. If Folder doesn't exist, then an empty list/string is

returned.

**Examples:** Director:

set Folders = baFolderList( "c:\windows" )

Authorware:

Files := baFolderList( "c:\\temp" )

See also: <u>baFileList</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **GetFilename**

**Description:** baGetFilename displays a file dialog box and returns the filename selected.

**Usage:** Result = baGetFilename( Operation, StartDir, Filename, Filter, Flags,

Instruction, NoFolders, X, Y)

**Arguments:** String, string, string, integer, string, integer, integer, integer.

Operation is the type of dialog to show. Can be "open" or "save". StartDir is the initial directory. Use "" for the current directory.

Filename is the initial file name to display.

Filter is the type of files to display. Use "" to show all files.

Flags modifies the behaviour of the dialog.

Instruction is the instruction to display to the user.

If NoFolders is true, the folder selection controls will not be shown.

X is horizontal position of the dialog. Y is the vertical position of the dialog.

**Returns:** String.

Returns the file name selected, or "" if the user cancelled.

**Examples:** Director:

set filename = baGetFilename( "save", "c:\temp", "newfile.txt", "Text files|
\*.txt", 0, "Save new file", false, 100, 100 )

Authorware:

file := baGetFilename( "open", "c:\\temp", "", "", 0, "Select data file to open", true, -1, 0)

**Notes:** The filter argument consists of a series of strings seperated by "|"

characters. The strings are divided into pairs, the first half of a pair is the description that appears in the drop down box, the second half is the wildcard for the files. Separate multiple wildcards with semi-colons.

"Text files|\*.txt" -- shows only text files

"Text files|\*.txt"|All files|\*.\*" -- allows the user to display either text files or all files

"Images|\*.bmp;\*.tif;\*.jpg" -- shows different image files

Setting the NoFolders option to true will mean that the user will not be able to change the initial directory, and folders will not be shown.

The X and Y values are the number of pixels from the top left corner of the screen. Set X to -1 to position the dialog in the center of the calling Director/Authorware window. Set X to -2 to position the dialog in the center of the screen.

The flags argument allows you to change the way the dialog box looks and behaves. It can be the combination of any of these values.

- 1 OFN\_READONLY
  - Causes the Read Only check box to be checked initially when the dialog box is created.
- 2 OFN\_OVERWRITEPROMPT
  - Causes the Save As dialog box to generate a message box if the selected file already exists. The user must confirm whether to overwrite the file.
- 4 OFN\_HIDEREADONLY

Hides the Read Only check box.

8 OFN NOCHANGEDIR

Restores the current directory to its original value if the user changed the directory while selecting a file.

32 OFN\_ADDEXTENSION

If the user enters a name without an extension, the first extension listed in the Filter argument will be added to the end of the returned filename.

512 OFN\_ALLOWMULTISELECT

Specifies that the File Name list box allows multiple selections.

2048 OFN PATHMUSTEXIST

Specifies that the user can type only valid paths and filenames. If this flag is used and the user types an invalid path and filename in the File Name entry field, the dialog box function displays a warning in a message box.

4096 OFN FILEMUSTEXIST

Specifies that the user can type only names of existing files in the File Name entry field. If this flag is specified and the user enters an invalid name, the dialog box procedure displays a warning in a message box.

8192 OFN\_CREATEPROMPT

Specifies that the dialog box function should ask whether the user wants to create a file that does not currently exist.

32768 OFN NOREADONLYRETURN

Specifies that the returned file does not have the Read Only check box checked and is not in a write-protected directory.

131072 OFN\_NONETWORKBUTTON

Hides and disables the Network button.

262144 OFN NOLONGNAMES

Specifies that long filenames are not displayed in the File Name list box. This value is ignored if OFN\_EXPLORER is set.

These values are availble in 32 bit only

524288 OFN EXPLORER

Creates an Open or Save As dialog box that uses user-interface features similar to the Windows Explorer.

1048576 OFN\_NODEREFERENCELINKS

Directs the dialog box to return the path and filename of the selected shortcut (.LNK) file. If this value is not given, the dialog box returns the path and filename of the file *referenced by* the shortcut.

2097152 OFN\_LONGNAMES

Causes the Open or Save As dialog box to display long filenames. If this flag is not specified, the dialog box displays filenames in 8.3 format. This value is ignored if OFN\_EXPLORER is set.

To use these values, add the appropriate values together eg
OFN\_CREATEPROMPT + OFN\_HIDEREADONLY + OFN\_NONETWORKBUTTON

If OFN\_ALLOWMULTISELECT is selected and the user selects more than one file, the return will be a series of strings, separated by returns. The first line will be the directory selected, the remaining lines will be the selected filenames. In Director, use "the line of" function to retrieve each line. In Authorware, use the "GetLine" function.

The OFN\_EXPLORER flag can not be used with the NoFolders option.

To make it easier to enter the constants, here are some scripts:

#### Director:

set OFN READONLY = 1

set OFN OVERWRITEPROMPT = 2

set OFN\_HIDEREADONLY = 4

set OFN\_NOCHANGEDIR = 8

set OFN\_ALLOWMULTISELECT = 512
set OFN\_PATHMUSTEXIST = 2048
set OFN\_FILEMUSTEXIST = 4096
set OFN\_CREATEPROMPT = 8192
set OFN\_NOREADONLYRETURN = 32768
set OFN\_NONETWORKBUTTON = 131072
set OFN\_NOLONGNAMES = 262144
-- 32 bit only
set OFN\_EXPLORER = 524288
set OFN\_NODEREFERENCELINKS = 1048576
set OFN\_LONGNAMES = 2097152

Authorware:

OFN READONLY:= 1

OFN\_OVERWRITEPROMPT := 2
OFN\_HIDEREADONLY := 4
OFN\_NOCHANGEDIR := 8
OFN\_ALLOWMULTISELECT := 512
OFN\_PATHMUSTEXIST := 2048
OFN\_FILEMUSTEXIST := 4096
OFN\_CREATEPROMPT := 8192
OFN\_NOREADONLYRETURN := 32768

OFN\_NOREADONLYRETURN := 32/68
OFN\_NONETWORKBUTTON := 131072

OFN\_NOLONGNAMES := 262144

-- 32 bit only

OFN EXPLORER := 524288

OFN\_NODEREFERENCELINKS := 1048576

OFN\_LONGNAMES := 2097152

**See also:** <u>baGetFolder</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **GetFolder**

**Description:** baGetFolder displays a directory dialog box and returns the folder selected..

**Usage:** Result = baGetFolder( StartDir, Instruction, Flags, Caption, X, Y )

**Arguments:** String, string, integer, string, integer, integer.

StartDir is the initial directory. Use "" for the current directory.

Instruction is the instruction to display to the user.

Flags modifies the behaviour of the dialog.

Caption is the caption of the dialog.

X is the horizontal position of the dialog.

Y is the vertical position of the dialog.

**Returns:** String.

Returns the folder selected, or "" if the user cancelled.

**Examples:** Director:

set folder = baGetFolder( "c:\temp", "Please select a folder to install into:",

1, "Select a folder", -1, 0)

Authorware:

folder := baGetFolder( "c:\\temp", "Select installation directory", 0, "", 200,

200)

**Notes:** The flags argument allows you to change the way the dialog box looks and

behaves. The following flags are defined.

1 ODN EXPLORER

Makes the dialog box a 32 bit Explorer style. If this style is not available, for example if running under Windows 3.1, then a 16 bit style dialog will be shown.

The 16 bit Xtra/UCD ignores this style - it will always show the 16 bit style dialog.

2 ODN NEWBUTTON

Displays a New button to allow the user to create a new folder. This style is only available with the 16 bit style dialog. It cannot be combined with

available with the 16 bit style dialog. It cannot be combined with ODN EXPLORER.

The Caption argument is only used if a 32 bit dialog box is used. If it is an empty string, then the default "Browse for Folder" will be displayed.

The X and Y values are the number of pixels from the top left corner of the

screen. Set X to -1 to position the dialog in the center of the calling

Director/Authorware window. Set X to -2 to position the dialog in the center

of the screen.

### **FindFirstFile**

**Description:** baFindFirstFile searches for the first file matching a specification.

**Usage:** Result = baFindFirstFile( StartDir, FileSpec )

**Arguments:** String, string.

StartDir is the directory to start seaching in.

FileSpec is the pattern to search for.

**Returns:** String

Returns the full path to the first file found

**Examples:** Director:

set file = baFindFirstFile( "c:\", "netscape.exe" ) -- searches drive c for

netscape.exe

Authorware:

file := baFindFirstFile( "c:\\windows", "\*.ttf" ) -- searches for fonts

**Notes:** All sub-directories of the starting directory will be included in the search.

This function can be used with baFindNextFile to find all files. When you are finished finding all the files you are interested in, you must call baFindClose

to free memory allocated by baFindFirstFile.

Here are examples of searching the C drive for all copies of "netscape.exe"

Director:

```
set fileList = [] -- a list to contain the found files
set file = baFindFirstFile( "c:\", "netscape.exe" )
-- loop through all found files and add to the list
repeat while file <> ""
    append( fileList, file )
    set file = baFindNextFile()
end repeat
baFindClose()
```

#### Authorware Xtra:

```
fileList := [] -- a list to contain the found files
file := baFindFirstFile( "c:\\", "netscape.exe" )
repeat while file <> ""
   AddLinear( fileList, file )
   file := baFindNextFile()
end repeat
baFindClose()
```

#### Authorware UCD:

```
fileList := ""
file := baFindFirstFile( "c:\\", "netscape.exe" )
repeat while file <> ""
```

```
-- add names to fileList with returns between file names
if fileList = "" then
        fileList := file
    else
        fileList := fileList ^ Return ^ file
    end if
    -- get next file
    file := baFindNextFile()
end repeat
baFindClose()
```

**See also:** <u>baFindNextFile</u>

<u>baFindClose</u>

**Alphabetical function list** 

### **FindNextFile**

**Description:** baFindNextFile continues a search started with baFindFirstFile.

**Usage:** Result = baFindNextFile()

**Arguments:** Void

**Returns:** String

Returns the full path to the next file found

**Examples:** Director:

set file = baFindNextFile()

Authorware:

file := baFindNextFile()

**Notes:** You must call baFindFirstFile before calling this function. baFindFirstFile sets

up the search criteria, and allocates the required memory. When you are

finished finding all the files you are interested in, you should call

baFindClose to free memory allocated by baFindFirstFile.

See also: <u>baFindFirstFile</u>

baFindClose

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **FindClose**

baFindClose finishes a search started with baFindFirstFile. **Description:** 

**Usage:** baFindClose( )

**Arguments:** Void

**Returns:** Void

**Examples:** Director:

baFindClose( )

Authorware: baFindClose( )

This function frees memory allocated by baFindFirstFile. After calling this function, you must call baFindFirstFile to start a new search. Notes:

See also: <u>baFindFirstFile</u>

<u>baFindNextFile</u>

**Information functions System functions File functions Window functions** 

**Alphabetical function list** 

## **EncryptFile**

**Description:** baEncryptFile encrypts/decrypts a file.

**Usage:** Result = baEncryptFile( FileName , Key )

**Arguments:** String, string.

FileName is the file to encrypt/decrypt.

Key is the string to use as the encryption key.

**Returns:** Integer.

Returns 1 if successful, else 0.

**Examples:** Director:

set OK = baEncryptFile( "d:\results.dat" , "This is my key" )

Authorware:

OK := baEncryptFile( "d:\results.dat" , "This is my key" )

**Notes:** This function uses an xor routine to encrypt a file. To decrypt the file, run

the function again using the same key. This will return it to it's original

state.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **FindDrive**

**Description:** baFindDrive searches all drives looking for a specified file.

**Usage:** Result = baFindDrive( StartDrive, FileName )

**Arguments:** String, string.

StartDrive is the letter of the drive to start searching on.

FileName is the name of the file to search for.

**Returns:** String.

Returns the letter of the Drive where the file was found. If the file is not

found, returns an empty string.

**Examples:** Director:

set Drive = baFindDrive( "c", "myfile.id" )

Authorware:

Drive := baFindDrive( "c", "myfile.id" )

**Notes:** The StartDrive option can be used to avoid searching floppy disks.

The FileName can consist of a pathname as well as the filename. For example, FindDrive( "c", "data\avi\cn232.avi" ) will search for "c:\data\avi\cn232.avi", "d:\data\avi\cn232.avi", "e:\data\avi\cn232.avi", etc. If a path is not included, then the root directory of the drive will be used in the search.

The search is done in alphabetical order.

This function can be used to search for content that is stored separately

from the main packaged file eg on a CD or network drive.

See also: <u>baDiskInfo</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **OpenFile**

**Description:** baOpenFile opens a document, using the program that the file is associated

with.

**Usage:** Result = baOpenFile( FileName , State )

**Arguments:** String, string.

FileName is the name of the file to open. The full path name should be

supplied.

State is the window state to open the file with.

Can be one of these:

"Normal" shows in its usual state.

"Hidden" is not visible.

"Maximised" shows as a maximised window.
"Minimised" shows as an minimised icon.

#### **Returns:** Integer.

Returns an error code. If the return is less than 32 than an error occurred.

Possible errors include:

0 System was out of memory.

- 2 File was not found.
- 3 Path was not found.
- 5 Sharing or network-protection error.
- 6 Library required separate data segments for each task.
- 8 There was insufficient memory to start the application.
- 10 Windows version was incorrect.
- 11 Executable file was invalid. Either it was not a Windows application or there was an error in the .EXE image.
- 12 Application was designed for a different operating system.
- 13 Application was designed for MS-DOS 4.0.
- 14 Type of executable file was unknown.
- 15 Attempt was made to load a real-mode application (developed for an earlier version of Windows).
- 16 Attempt was made to load a second instance of an executable file containing multiple data segments that were not marked read-only.
- 19 Attempt was made to load a compressed executable file. The file must be decompressed before it can be loaded.
- 20 Dynamic-link library (DLL) file was invalid. One of the DLLs required to run this application was corrupt.
- 21 Application requires 32-bit extensions.
- 26 A sharing violation occurred.
- 27 The filename association is incomplete or invalid.
- 29 The DDE transaction failed.
- 30 The DDE transaction could not be completed because other DDE transactions were being processed.
- 31 There is no application associated with the given filename

### **Examples:** Director

set OK = baOpenFile( the pathName & "test.txt", "maximised")

Authorware:

OK := baOpenFile( FileLocation ^ "test.txt" , "maximised" )

**See also:** <u>baPrintFile</u>

<u>baShell</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **OpenURL**

**Description:** baOpenURL opens an internet document, using the default browser.

**Usage:** Result = baOpenURL( URL , State )

**Arguments:** String, string.

URL is the name of the document to open.

State is the window state to open the browser with.

Can be one of these:

"Normal" shows in its usual state.

"Hidden" is not visible.

"Maximised" shows as a maximised window.
"Minimised" shows as an minimised icon.

**Returns:** Integer.

Returns 1 if successful, else 0. Success means that there is a browser associated with .htm files, and it can be started. If opening a local HTML file under Windows 95 the function will fail if the file does not exist; under Windows 3.1, the browser will open with an error message, but the function

will return 1.

**Examples:** Director:

set OK = baOpenURL( "http://www.macromedia.com" , "maximised" )

Authorware:

OK := baOpenURL( "http://www.macromedia.com" , "maximised" )

**Notes:** The URL can be any valid internet URL. The function will also work with local

HTML files, however using the <u>OpenFile</u> function will be more reliable. This function has been written for use with Netscape Navigator and Microsoft Internet Explorer, but it may work with other browsers.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **PrintFile**

**Description:** baPrintFile prints a document, using the program that the file is associated

with.

**Usage:** Result = baPrintFile( FileName )

**Arguments:** String.

FileName is the name of the file to print. The full path name should be

supplied.

**Returns:** Integer.

Returns an error code. If the return is less than 32 than an error occurred.

Possible errors include:

0 System was out of memory.

2 File was not found.3 Path was not found.

5 Sharing or network-protection error.

6 Library required separate data segments for each task.

8 There was insufficient memory to start the application.

10 Windows version was incorrect.

11 Executable file was invalid. Either it was not a Windows application or there was an error in the .EXE image.

12 Application was designed for a different operating system.

13 Application was designed for MS-DOS 4.0.

14 Type of executable file was unknown.

15 Attempt was made to load a real-mode application (developed for an earlier version of Windows).

16 Attempt was made to load a second instance of an executable file containing multiple data segments that were not marked read-only.

19 Attempt was made to load a compressed executable file. The file must be decompressed before it can be loaded.

20 Dynamic-link library (DLL) file was invalid. One of the DLLs required to run this application was corrupt.

21 Application requires 32-bit extensions.

26 A sharing violation occurred.

27 The filename association is incomplete or invalid.

29 The DDE transaction failed.

30 The DDE transaction could not be completed because other DDE transactions were being processed.

31 There is no application associated with the given filename extension.

**Examples:** Director:

set OK = baPrintFile( the pathName & "test.txt" )

Authorware:

OK := baPrintFile( FileLocation ^ "test.txt" )

See also: baOpenFile

<u>baShell</u>

Information functionsSystem functionsFile functionsWindow functions

# **Alphabetical function list**

### **ShortFileName**

**Description:** baShortFileName returns the DOS 8.3 name of a Windows 95 long filename.

**Usage:** Result = baShortFileName(LongFileName)

**Arguments:** String.

LongFileName is the name of the file. You must supply the full path name to

the file.

**Returns:** String.

Returns the file name in DOS format. If the file doesn't exist, then the return

will be an empty string.

**Examples:** Director:

set ShortName = baShortFileName( "c:\Program Files\Accessories\

Wordpad.exe")

Authorware:

ShortName := baShortFileName( "c:\\Program Files\\Accessories\\

Wordpad.exe")

**Notes:** In 16 bit, this function works in Windows 95; but under Windows 3.x or NT

the function will return the FileName exactly the same as it was.

Under 32 bit, the function will work under 95 or NT.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **TempFileName**

**Description:** baTempFileName returns a temporary file name that is guaranteed not to

exist.

**Usage:** Result = baTempFileName( Prefix )

**Arguments:** String.

Prefix is a string of up to 3 characters that is used to generate the filename.

**Returns:** String.

Returns the file name, including the path.

**Examples:** Director:

set FileName = TempFileName( "gaz" )

Authorware:

FileName := TempFileName( "gaz" )

**Notes:** The file name will consist of the path name, a tilde "~" followed by the

prefix, then a four digit number, with a ".tmp" extension; eg "c:\temp\

~gaz1257.tmp".

The baTempFileName function gets the temporary file path as follows::

**16 bit:** 1. The path specified by the TEMP environment variable

2. Root directory of the first hard disk, if TEMP is not defined.

**32 bit:** 1. The path specified by the TMP environment variable.

2. The path specified by the TEMP environment variable, if TMP is not defined.

3. The current directory, if both TMP and TEMP are not defined.

This function does not create the file. Files created using file names returned by this function are not automatically deleted when Windows shuts down.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **MakeShortcut**

**Description:** baMakeShortcut creates a Windows 95/NT shortcut.

**Usage:** Result = baMakeShortcut( FileName , Path , Title )

**Arguments:** String, string, string.

FileName is the file that the shortcut will point to. Path is the folder that the shortcut will be created in.

Title is the name of the shortcut.

**Returns:** Integer.

Returns 1 if successful, else 0.

**Examples:** Director:

set OK = baMakeShortcut( "d:\mworld.exe" , "c:\windows\desktop" ,

"Multimedia World" )

Authorware:

OK := baMakeShortcut( "d:\\mworld.exe" , "c:\\windows\\desktop" ,

"Multimedia World" )

**Notes:** This function is only available in the 32 bit version running under Windows

95 or NT 4. If used in 16 bit or under earlier versions of NT, it will do nothing

and return 0.

**See also:** <u>baMakeShortcutEx</u>

baResolveShortcut

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **MakeShortcutEx**

**Description:** baMakeShortcutEx creates a Windows 95/NT shortcut.

**Usage:** Result = baMakeShortcutEx( FileName, Path, Title, Args, WorkDir, Icon,

IconNumber, Hotkey, State )

**Arguments:** String, string, string, string, string, integer, integer, string.

Filename is the name of the file the shortcut will point to.

Path is the folder to create the shortcut in.

Title is the name of the shortcut.

Args is any command line arguments to use. WorkDir is the working directory to set.

Icon is the name of the icon file.

IconNumber is the number of the icon in Icon to use.

Hokey is the virtual key code of the hotkey to assign to the shortcut. State is the state to start the program in. Can be "normal", "min", "max"

**Returns:** Integer.

Returns 1 if successful, else 0.

**Examples:** Director:

set ok = baMakeShortcutEx( "c:\windows\notepad.exe", "c:\temp", "My
Notepad", "", "c:\windows", "c:\windows\moricons.dll", 12, 65, "normal")

Authorware:

ok := baMakeShortcutEx( "c:\\window\\notepad.exe",

baSysFolder( "desktop" ), "My Document", docpath ^ "theFile.txt", "", "", 0,

65, "max")

**Notes:** This function is only available in the 32 bit version running under Windows

95 or NT 4. If used in 16 bit or under earlier versions of NT, it will do nothing

and return 0.

This function is an extended version of <u>baMakeShortcut</u>. Only the first three arguments are required - if any of the others are an empty string or 0, they

will be ignored.

The Icon parameter can be either an .ico, .exe or .dll file. If the file is a .ico, then the IconNumber parameter is ignored. If it is a .exe or .dll file, then the IconNumber is the number of the icon in that file to use. If the Icon is an empty string (""), then the first icon in the Command .exe file will be used.

The Hotkey is a number that represents the virtual key code to use as the hotkey. The actual hotkey will be Ctrl + Alt + the key. eg a value of 65 will produce a hotkey of Ctrl+Alt+A. If the value is negative then Shift will also be used. eg -66 will produce Ctrl+Alt+Shift+B. A list of <u>Virtual Key Codes</u> is

supplied.

**See also:** <u>baMakeShortcut</u>

baResolveShortcut

File functions Window functions

**Alphabetical function list** 

### ResolveShortcut

**Description:** baResolveShortcut returns the file a Window 95/NT shortcut. points to.

**Usage:** Result = baResolveShortcut( Shortcut )

**Arguments:** String.

Shortcut is the name of the shortcut.

**Returns:** String.

Returns the file name, or an empty string if the shortcut doesn't exist or

isn't a shortcut.

**Examples:** Director:

set filename = baResolveShortcut( "c:\temp\My Shortcut" )

Authorware:

filename := baResolveShortcut( "c:\\temp\\My Shortcut" )

**Notes:** This function is only available in the 32 bit version running under Windows

95 or NT 4. If used in 16 bit or under earlier versions of NT, it will do nothing

and return an empty string.

The file extension fo shortcuts is .lnk, which Windows does not display. If does not matter whether or not you include this extension in your shortcut

name.

**Aw2Window** returns the Authorware presentation window

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### WindowInfo

**Description:** baWindowInfo returns information about a window.

**Usage:** Result = baWindowInfo( WindowHandle , InfoType )

**Arguments:** Integer, string

WindowHandle is the handle of the window.

InfoType is the type of information required. Can be one of the following:

"title" the caption of the window "class" the class name of the window

"state" the present state of the window. Return can be:

"hidden" the window is hidden

"min" minimised "max" maximised "normal" normal state

"text" the window's text

"left" the left edge of the window in pixels

"right" the right edge

"top" the top edge of the window in pixels

"bottom" the bottom edge
"height" the height of the window
"width" the width of the window

"client height" the height of the client area of the window "client width" the width of the client area of the window

**Returns:** String.

Returns the information requested, or "Invalid" if the window doesn't exist..

**Examples:** Director:

set State = baWindowInfo( Window, "state" )

Authorware:

State := baWindowInfo( Window, "state" )

**Notes:** The "text" option can be used to retrieve the text in an edit control window.

The client area of the window is the area of the window available for

drawing on; the window minus the window borders, title bar and menu bar.

**See also:** <u>baSetWindowTitle</u>

<u>baMoveWindow</u> <u>baSetWindowState</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### **FindWindow**

**Description:** baFindWindow returns the handle of a window. This handle can then be

used in other window management functions.

**Usage:** Result = baFindWindow( Class, Title )

**Arguments:** String, string.

Class is the class name of the window. Title is the text in the window's caption.

The function can use either or both arguments. If one of the arguments is blank, then only the other argument will be used in searching for the

window.

**Returns:** Integer.

Returns the window handle. If the window isn't found, then returns 0.

**Examples:** Director:

set WinHandle = baFindWindow( "" , "Calculator" )

Authorware:

WinHandle := baFindWindow( "" , "Calculator" )

**Notes:** A window handle is an number that Windows uses to identify windows.

Every window has a unique handle. You can use this handle to manipulate

the window; bring it to the front, close it, etc.

Every window also has a class name. This is assigned by the programmer, and can be used to find a specific window. For example, the Class window for the main MS Word window is "OpusApp". To find the handle for the Word

window, you could use FindWindow( "OpusApp", "" ).

If you know the text in the window's caption, you can use this to find the

window. For example, FindWindow( "", "Notepad - mydoc.txt").

See also: <u>baWindowList</u>

baGetWindow

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

### WindowList

**Description:** baWindowList returns a list of the handles of open windows. These handles

can then be used in other window management functions.

**Usage:** Result = baWindowList( Class , Caption , MatchCaption )

**Arguments:** String, string, integer.

Class is the Class name of the windows to find. Caption is the Caption of the windows to find.

If MatchCaption is true, then Caption must match the window caption exactly (apart from case). If it is false, then any window which contains Caption will be returned. If Caption is an empty string, then MatchCaption is

ignored.

The function can use either or both Class and Caption arguments. If one of the arguments is empty, then only the other argument will be used in

searching for the windows.

**Returns:** List (Xtra) or String (UCD).

Returns a list or string of all matching window handles.

**Examples:** Director:

set WndList = baWindowList( "" , "Netscape" , false ) -- return list of all

windows with a caption containing "Netscape"

Authorware:

WndList := baWindowList( "Notepad" , "" , false ) -- return list of all

Notepad windows

**Notes:** The return for the UCD version is a string with each window handle on a

separate line. You can use the Authorware GetLine function to retrieve each

window handle.

The windows will be listed in front-to-back order - the first window in the list will be the one at the front, while the last one in the list will be behind all

other windows in the list.

See also: <u>baFindWindow</u>

<u>baChildWindowList</u> <u>baGetWindow</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **ChildWindowList**

**Description:** baChildWindowList returns a list of a window's child windows.

**Usage:** Result = baChildWindowList( ParentWnd, Class, Caption, MatchCaption )

**Arguments:** Integer, string, string, integer.

ParentWnd is the window to get the children of. Class is the class of child windows to include.

Caption is the window title of child windows to include.

If MatchCaption is true, then Caption must match the window caption exactly (apart from case). If it is false, then any window which contains Caption will be returned. If Caption is an empty string, then MatchCaption is

ignored.

The function can use either or both Class and Caption arguments. If one of the arguments is empty, then only the other argument will be used in

searching for the windows.

**Returns:** List (Xtra) or String (UCD).

Returns a list or string of all found window handles.

**Examples:** Director:

set wndList = baChildWindowList( 1234, "", "", 0 ) -- return list of all child

windows of window 1234

Authorware:

wndList := baChildWindowList( 1234, "Edit", "", 0 ) -- return list of all edit

controls of window 1234

**Notes:** The return for the UCD version is a string with each window handle on a

separate line. You can use the Authorware GetLine function to retrieve each

window handle.

This function will return all child windows of the parent window and all its'

children.

See also: <u>baFindWindow</u>

baWindowList baGetWindow

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **ActiveWindow**

**Description:** baActiveWindow returns the handle of the currently active window.

**Usage:** Result = baActiveWindow()

**Arguments:** Void.

**Returns:** Integer.

Returns the handle of the active window.

**Examples:** Director:

set WinHandle = baActiveWindow()

Authorware:

WinHandle := baActiveWindow()

**Notes:** Under some conditions, this function can return 0. This would typically

happen during the time an application starts up - the app may have control,

but not yet opened its main window. Do not use a loop such as this:

set wnd = 0

baRunProgram( "other.exe" , "normal" , false )

repeat while wnd <> baWinHandle()

set wnd = baActiveWindow() -- ActiveWindow could return 0

end repeat

In the case above, it is possible that wnd will equal 0, not the window handle of the new application. A better way to achieve this is to use the

baNextActiveWindow function.

See also: <u>baNextActiveWindow</u>

baWaitForWindow

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## CloseWindow

**Description:** baCloseWindow closes the specified window.

**Usage:** Result = baCloseWindow( WinHandle )

**Arguments:** Integer.

WinHandle is the handle of the window to close.

**Returns:** Integer.

Returns 1 if successful, otherwise 0.

**Examples:** Director:

set OK = baCloseWindow( WinHandle )

Authorware:

OK := baCloseWindow( WinHandle )

See also: <u>baCloseApp</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **CloseApp**

**Description:** baCloseApp closes the application owning a specified window.

**Usage:** Result = baCloseApp( WinHandle )

**Arguments:** Integer.

WinHandle is the handle of the window to close.

**Returns:** Void.

**Examples:** Director:

baCloseApp( WinHandle )

Authorware:

baCloseApp( WinHandle )

**Not** all applications react kindly to being closed by other applications, and

may leave the system unstable - particularly in 16 bit Windows. If you use this function, be sure to test thoroughly. If possible, use the <u>baCloseWindow</u>

function instead.

See also: <u>baCloseWindow</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **SetWindowTitle**

**Description:** baSetWindowTitle sets the title of a specified window.

**Usage:** baSetWindowTitle( WinHandle, Title )

**Arguments:** Integer, string.

WinHandle is the handle of the window to change the title of.

Title is the string to change the window title to.

**Returns:** Void.

**Examples:** Director:

baSetWindowTitle( Window, "Module 1" )

Authorware:

baSetWindowTitle( Window, "Module 1" )

**Notes:** If the WinHandle is 0, or is not the valid handle of a window, then the

function will act on the active window.

See also: <u>baWindowInfo</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **MoveWindow**

**Description:** baMoveWindow moves or resizes the specified window.

**Usage:** baMoveWindow( WinHandle, Left , Top , Width , Height , Activate )

**Arguments:** Integer, integer, integer, integer, integer.

WinHandle is the handle of the window to move.

Left is the new left position of the window. Top is the new top position of the window. Width is the new width of the window. Height is the new height of the window.

If Activate is true then the window will be activated.

**Returns:** Void.

**Examples:** Director:

baMoveWindow( Wnd, 20, 20, 400, 400, true )

Authorware:

baMoveWindow( Wnd, 20, 20, 400, 400, true )

**Notes:** If both Left and Top arguments are -1, then the windows current position will

not be changed.

If both Width and Height are -1, then the windows current size will not be

changed.

**See also:** <u>baWindowInfo</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## WindowToFront

**Description:** baWindowToFront brings the specified window to the front of all other

windows.

**Usage:** Result = baWindowToFront( WinHandle )

**Arguments:** Integer.

WinHandle is the handle of the window to bring to the front. To bring the Director or Authorware window to the front, use the baWinHandle()

function.

**Returns:** Integer.

Returns 1 if successful, otherwise 0.

**Examples:** Director:

set OK = baWindowToFront( baWinHandle() )

Authorware:

OK := baWindowToFront( baWinHandle() )

See also: <u>baWindowToBack</u>

<u>baWindowDepth</u> <u>baSetWindowDepth</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## WindowToBack

**Description:** baWindowToBack sends the specified window to the back of all other

windows.

**Usage:** Result = baWindowToBack( WinHandle )

**Arguments:** Integer.

WinHandle is the handle of the window to send to the back. To send the Director or Authorware window to the back, use the baWinHandle()

function.

**Returns:** Integer.

Returns 1 if successful, otherwise 0.

**Examples:** Director:

set OK = baWindowToBack( baWinHandle() )

Authorware:

OK := baWindowToBack( baWinHandle() )

See also: <u>baWindowToFront</u>

<u>baWindowDepth</u> <u>baSetWindowDepth</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **WindowDepth**

**Description:** baWindowDepth gets the z-order depth of the specified window.

**Usage:** Result = baWindowDepth( WinHandle )

**Arguments:** Integer.

WinHandle is the handle to get the depth of.

**Returns:** Integer.

Returns the depth, or 0 if WinHandle doesn't exist.

**Examples:** Director:

set depth = baWindowDepth( baWinHandle() )

Authorware:

depth := baWindowDepth( baWinHandle() )

**Notes:** Only windows that are visible are counted in the depth. If a window's state

is hidden, then it will be ignored by this function. Windows that are set as topmost or stay-on-top will be counted before normal windows - even if

they are minimised.

**See also:** <u>baSetWindowDepth</u>

<u>baWindowToFront</u> <u>baWindowToBack</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **SetWindowDepth**

**Description:** baSetWindowDepth sets the z-order depth of the specified window.

**Usage:** baSetWindowDepth( WinHandle , Depth )

**Arguments:** Integer, integer.

WinHandle is the handle to set the depth of. Depth is the new depth to set the window to.

**Returns:** Void.

**Examples:** Director:

baSetWindowDepth( baWinHandle() , 2 ) -- sets the Director window to

below the top window, but in front of all other windows

Authorware:

baSetWindowDepth(3124,5)

**Notes:** Setting a depth greater than the number of visible windows is allowed - the

window will be sent to the back of all other windows.

See also: <u>baWindowDepth</u>

<u>baWindowToFront</u> <u>baWindowToBack</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **GetWindow**

**Description:** baGetWindow gets a window that is related to another window.

**Usage:** Result = baGetWindow( WindowHandle , Relation )

**Arguments:** Integer, string.

WindowHandle is the handle of the window.

Relation is the type of relationship to look for. Can be one of the following:

"child" gets the first child window gets the first window gets the last window gets the last window gets the next window "previous" gets the previous window gets the window's owner gets the window's parent

**Returns:** Integer.

Returns the handle of the found window, or 0 if the requested window could

not be found.

**Examples:** Director:

set wnd = baGetWindow( 2349 , "parent" )

Authorware:

wnd := baGetWindow( 2349 , "parent" )

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **WaitForWindow**

**Description:** baWaitForWindow waits until a window is in a specified state, with an

optional timeout.

**Usage:** Result = baWaitForWindow( WinHandle , State , TimeOut )

**Arguments:** Integer, string, integer

WinHandle is the handle of the window to wait for.

State is the state to wait for. Can be:

"inactive" waits until the window is inactive waits until the window is active closed" waits until the window is closed

TimeOut is the maximum amount of time to wait in ticks. A tick is equal to 1/60th of a second. If TimeOut is 0, the function will wait indefinitely.

**Returns:** Integer.

Returns 0 if the window doesn't exist, or the timeout occurs before the

window reaches the specified state.

Returns 1 if the window reached the specified state.

**Examples:** Director:

set OK = baWaitForWindow( baWinHandle() , "active" , 300 ) -- waits for the

Director window to become active, for a maximum of 5 seconds

Authorware:

OK := baWaitForWindow( 3248, "closed" , 600 ) -- waits for the window

3248 to be closed, for a maximum of 10 seconds

**Notes:** The "inactive" option is useful for waiting until the Director/Authorware

window is inactive after starting another program. When the

Director/Authorware window is no longer active, then the other program

has opened and has focus.

For example, here is some code to open a readme file in Authorware, and

wait until the user has finished with it.

if baOpenFile( "readme.txt" , "normal" ) > 32 then -- open readme file wnd := baNextActiveWindow( 0 ) -- get handle of Notepad window

wnd := baNextActiveWindow( 0 ) -- get handle of Notepad window baWaitForWindow( baWinHandle() , "active" , 0 ) -- wait till the

Authorware window is active i.e. Notepad has been closed or user switched

back to Authorware

if baWindowExists( wnd ) then baCloseWindow( wnd ) -- close

Notepad end if end if

**See also:** <u>baWaitTillActive</u>

baNextActiveWindow baActiveWindow

Information functionsSystem functionsFile functionsWindow functions

# **Alphabetical function list**

## WaitTillActive

**Description:** baWaitTillActive pauses execution until a specified window becomes the

active one.

**Usage:** baWaitTillActive( WindowHandle )

**Arguments:** Integer.

WindowHandle is the handle of the window to wait for.

**Returns:** Void.

**Examples:** Director:

baWaitTillActive( baWinHandle() ) -- wait till Director window becomes the

active one

Authorware:

baWaitTillActive( baWinHandle() ) -- wait till Authorware window becomes

the active one

**Notes:** This function is mainly intended to be used with the <u>RunProgram</u> function.

The RunProgram function can pause execution until the jumped to program

guits. This may cause a problem if the user switches back to the

Authorware program without quitting the jumped to program. If you use the RunProgram without the pause option, you can use this function (after a

short wait) to resume the program if the user switches back to it. This function is provided for compatibility with older versions. New

applications should use the <u>baWaitForWindow</u> function.

**See also:** baWaitForWindow

<u>baNextActiveWindow</u> <u>baActiveWindow</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **NextActiveWindow**

**Description:** baNextActiveWindow returns the next window to become active.

**Usage:** Result = baNextActiveWindow( TimeOut )

**Arguments:** Integer

TimeOut is the maximum amount of time to wait in ticks. A tick is equal to 1/60th of a second. If TimeOut is 0, the function will wait indefinitely.

**Returns:** Integer.

Returns the handle of the next active window.

Returns 0 if the timeout occurs before another window becomes active.

**Examples:** Director:

set wnd = baNextActiveWindow( 300 ) -- waits for the next window to

become active, for a maximum of 5 seconds

Authorware:

wnd := baNextActiveWindow( 600 )

**Notes:** This function will not operate with versions of Authorware earlier than 3.0.

The next active window is defined as the next window that isn't the window of the Director/Authorware calling program, or a dialog box or a splash screen. It would be typically used after a baRunProgram or baOpenFile call to get the handle of the window the program opens, and is particularly useful for applications such as Netscape and Acrobat that open splash

screens.

Here is an example of opening an Acrobat file in Director, and closing it

when the user is finished with it.

if baOpenFile( "readme.pdf", "normal") > 32 then -- open acrobat file set wnd = baNextActiveWindow(0) -- get handle of Acrobat window baWaitForWindow(baWinHandle(), "active", 0) -- wait till the Director window is active i.e. Acrobat has been closed or user switched

back to Director

if baWindowExists( wnd ) then baCloseWindow( wnd ) -- close Acrobat

end if end if

See also: <u>baWaitTillActive</u>

baWaitForWindow baActiveWindow

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **WindowExists**

**Description:** baWindowExists checks if a window handle is valid.

**Usage:** Result = baWindowExists( WinHandle )

**Arguments:** Integer.

WindowHandle is the handle of the window to check for.

**Returns:** Integer.

Returns 1 if the window exists, else 0.

**Examples:** Director:

set OK = baWindowExists( 3248 )

Authorware:

OK := baWindowExists( 3248 )

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **SendKeys**

**Description:** baSendKeys sends a series of keystrokes to the active window.

**Usage:** Result = baSendKeys( Keys )

**Arguments:** String.

Keys is the string of keys to send. See the notes section for a full

description.

**Returns:** Integer.

Returns an error code.

0 success.

invalid character in string

2 window unavailable 3 unknown error

4 another SendKeys function is still under way

**Examples:** Director:

set OK = baSendKeys( "hello" ) -- sends "hello"
set OK = baSendKeys( "^C" ) -- sends Control C

set OK = baSendKeys( "{F1}") -- sends the F1 key

set OK = baSendKeys( "fname.txt{ENTER}" ) -- sends "fname.txt" then

Enter

Authorware:

OK := baSendKeys( "hello" ) -- sends "hello"
OK := baSendKeys( "^C" ) -- sends Control C

OK := baSendKeys( "{F1}" ) -- sends the F1 key

OK := baSendKeys( "fname.txt{ENTER}" ) -- sends "fname.txt" then Enter

**Notes:** The string sent can contain any alphanumeric character.

Use "@" for the Alt key, "~" for the Shift key, and "^" for the Control key. If you need to send these actual keys, use a combination of Shift and the

required letter eg to send "@" use "~2".

Other special keys can be sent as follows: (include the curly brackets)

{F1}, {F2}, etc to {F12}

{INSERT} {DELETE} {HOME} {END}

{PGDN} {TAB} {ENTER}

{PGUP}

{BKSP} {PRTSC} {ESCAPE}

{LEFT} {RIGHT} {UP} {DOWN}

# **Alphabetical function list**

## **SendMsg**

**Description:** baSendMsg sends a Windows message to a window.

**Usage:** Result = baSendMsg( WindowHandle , Message , wParam , IParam , Wait )

**Arguments:** Integer, integer, integer, integer.

WindowHandle is the handle of the window to send the message to.

Message is the message to send.

wParam is additional message information. IParam is additional message information.

If Wait is true, execution is paused until the window processes the message.

**Returns:** Integer.

If Wait is true, the return value specifies the result of the message

processing and depends on the message sent.

If Wait is false, returns 1 is the message was successfully posted to the

window, else 0.

**Examples:** Director:

set Result = baSendMsg( 65535, 26, 0, 0, true ) -- send a

WM WININCHANGE message to all windows.

Authorware:

Result := baSendMsg( 65535, 26, 0, 0, true )

**Notes:** To use this function, you will need access to Windows API information about

messages.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **AddSysItems**

**Description:** baAddSysItems is a function which adds the system menu, minimise and

maximise buttons to a window.

**Usage:** baAddSysItems( WindowHandle, SystemMenu, MinBox, MaxBox )

**Arguments:** Integer, integer, integer.

WindowHandle is the handle of the window to change. If SystemMenu is true, the system menu is added. If MinBox is true, the minimize button is added. If MaxBox is true, the maximize button is added.

**Returns:** Void.

**Examples:** Director:

baAddSysItems(baWinHandle() , false , true , false )

Authorware:

baAddSysItems(baWinHandle(), false, true, false)

**Notes:** Use this function with care. Some windows do not react kindly to having

their window style changed. Some windows will ignore this call.

This function is limited in 32 bit Windows - only the Director/Authorware window can be changed, and you can only have all the items or none of the

items.

**See also:** <u>baRemoveSysItems</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## RemoveSysItems

**Description:** baRemoveSysItems is a function which removes the system menu,

minimise and maximise buttons from a window.

**Usage:** baRemoveSysItems( WindowHandle, SystemMenu, MinBox, MaxBox )

**Arguments:** Integer, integer, integer.

WindowHandle is the handle of the window to change. If SystemMenu is true, the system menu is removed. If MinBox is true, the minimize button is removed. If MaxBox is true, the maximize button is removed.

**Returns:** Void.

**Examples:** Director:

baRemoveSysItems(1356, true, false, false) -- remove the system menu

from window 1356

Authorware:

baRemoveSysItems(1356, true, false, false) -- remove the system menu

from window 1356

**Notes:** Use this function with care. Some windows do not react kindly to having

their window style changed. Some windows will ignore this call.

This function is limited in 32 bit Windows - only the Director/Authorware window can be changed, and you can only have all the items or none of the

items.

See also: <u>baAddSysItems</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## WinHandle

**Description:** baWinHandle returns the main Director window or the Authorware

presentation window.

**Usage:** Result = baWinHandle()

**Arguments:** Void.

**Returns:** Integer.

**Examples:** Director:

set Win = baWinHandle()

Authorware:

Win := baWinHandle()

**Notes:** Use this function to get the Director window for use with the other window

manipulation functions.

In the UCD version, this function returns the Authorware presentation window when packaged, but the main Authorware window during authoring. When using Buddy window functions on the Authorware window, you should

use baWinHandle() rather than the system WindowHandle variable.

This is necessary because in authoring mode, the presentation window is a child of the main Authorware window. This causes problems with functions that rely on a specific window being active, because Windows thinks the active window is actually the main Authorware window, not the

presentation window. By using this function instead of the system

WindowHandle variable, you can create a file that behaves correctly in both

authoring and runtime modes.

For example, if the presentation window is active, **baActiveWindow()** and **WindowHandle** will not be the same during authoring, but will be when packaged.

However, baActiveWindow() and baWinHandle() will be the same in

both authoring and packaged modes.

The baWinHandle function only works in version 3.0 or later of Authorware -

use the <u>baAw2Window</u> function in earlier versions.

**See also:** baStageHandle

baAw2Window

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **StageHandle**

**Description:** baStageHandle returns the Director stage window.

**Usage:** Result = baStageHandle()

**Arguments:** Void.

**Returns:** Integer.

**Examples:** Director:

set Win = baStageHandle()

Authorware:

N/A

**Notes:** Use this function to get the Director stage window. You should use

<u>baWinHandle</u> if you want to use the other Buddy window manipulation

functions on the Director window.

If used in Authorware, this function will return the main presentation

window.

**See also:** <u>baWinHandle</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## Aw2Window

**Description:** baAw2Window returns the handle of the Authorware presentation window.

**Usage:** Result = baAw2Window( WindowHandle )

**Arguments:** Integer.

WindowHandle is the system Authorware variable.

**Returns:** Integer

Returns the handle of the Authorware presentation window when packaged;

the handle of the main Authorware window when authoring..

**Examples:** Director:

Not avaialable

Authorware:

WinHandle := baAw2Window( WindowHandle )

**Notes:** This function is not available in the Xtra version. The <u>baWinHandle</u> function

can be used to retrieve this value in the Xtra version.

This function will work in all versions of Authorware, however Versions 3.0

or later of Authorware should use the <u>baWinHandle</u> function.

See also: <u>baWinHandle</u>

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **SetWindowState**

**Description:** baSetWindowState allows you to manipulate the specified window.

**Usage:** baSetWindowState(WinHandle, State)

**Arguments:** Integer, string.

WinHandle is the handle of the window to change. To change the Director or

Authorware window, use the baWinHandle() function.

State is the window's new state. Can be one of the following:

"Hidden" Hides the window and passes activation to another window. "Restored" Activates and displays a window. If the window is minimized or maximized, it is restored to its original size and position.

"Normal" Activates a window and displays it in its current size and position. "Maximised" Activates a window and displays it as a maximized window.

"Minimised" Activates a window and displays it as an icon.

"MinNotActive" Displays a window as an icon. The window that is currently active

remains active.

"NotActive" Displays a window in its current state. The window that is currently

active remains active.

"ShowNotActive" Displays a window in its most recent size and position. The

window that is currently active remains active. Makes the window stay on top of all other windows. "DontStayOnTop" Allows the window to go behind other windows.

**Returns:** Void.

**Examples:** Director:

baSetWindowState( baWinHandle(), "StayOnTop" )

Authorware:

"StavOnTop"

baSetWindowState( baWinHandle(), "StayOnTop" )

Notes: If the WinHandle is 0, or is not the valid handle of a window, then the

function will act on the active window.

See also: <u>baWindowInfo</u>

**baActivateWindow** 

**Information functions System functions File functions Window functions** 

**Alphabetical function list** 

## **ActivateWindow**

**Description:** baActivateWindow activates the specified window.

**Usage:** Result = baActivateWindow( WinHandle )

**Arguments:** Integer.

WinHandle is the handle of the window to activate. To activate the Director

or Authorware window, use the baWinHandle() function.

**Returns:** Integer.

Returns 1 if successful, otherwise 0.

**Examples:** Director:

set OK = baActivateWindow( baWinHandle() )

Authorware:

OK := baActivateWindow( baWinHandle() )

**Notes:** Microsoft has introduced a change to the way this function operates under

Win 98 and NT 5. If your user is presently typing in a window, then you can not force another window to become the active one. Instead, the button for that window will flash on the Taskbar to alert the user that a program needs

attention.

# **Registration functions**

About shows information about Buddy API

**Register** registers Buddy API

**SaveRegistration** saves your registration information retrieves your registration information

**Functions** retrieves the number of functions you are licenced to use

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **About**

**Description:** baAbout shows information about Buddy API.

**Usage:** baAbout()

**Arguments:** Void.

**Returns:** Void.

**Examples:** Director:

baAbout()

Authorware: baAbout()

**Notes:** This function displays a message box showing the version of Buddy API,

who the version is registered to, and the number of functions licenced for

use.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

# **Register**

**Description:** baRegister registers Buddy API.

**Usage:** Result = baRegister( UserName , RegNumber )

**Arguments:** String, integer.

UserName is the user name you received when you registered.

RegNumber is your registration number.

**Returns:** Integer.

Returns the number of functions licenced for use.

**Examples:** Director:

set funcs = baRegister( "My name" , 111111 )

Authorware:

funcs := baRegister( "My name" , 111111 )

**Notes:** You need to use this function before you call any other Buddy functions. For

Director, the best place to do this is in your startMovie handler. In

Authorware, place this into a calculation icon near the start of the flowline.

Information functionsSystem functionsFile functionsWindow functions

**Alphabetical function list** 

## **SaveRegistration**

**Description:** baSaveRegistration saves your Buddy API registration information

**Usage:** Result = baSaveRegistration( UserName , RegNumber )

**Arguments:** String, integer.

UserName is the user name you received when you registered.

RegNumber is your registration number.

**Returns:** Integer.

Returns 1 if successfully saved, else 0.

**Examples:** Director:

set OK = baSaveRegistration( "My name", 111111)

Authorware:

OK := baSaveRegistration( "My name" , 111111 )

**Notes:** This function is designed to be used with the <u>baGetRegistration</u> function to

make it easier for you to enter your registration code. In Director, you can

use the Message window to save the information. The function is only available in authoring mode. This function is not included in the UCD version.

<u>Alphabetical function list</u>

## **GetRegistration**

**Description:** baGetRegistration retrieves your Buddy API registration information

**Usage:** Result = baGetRegistration()

**Arguments:** Void.

**Returns:** String.

Returns your registration information.

**Examples:** Director:

set regstring = baGetRegistration( )

Authorware:

regstring := baGetRegistration( )

**Notes:** This function is designed to be used with the <u>baSaveRegistration</u> function to

make it easier for you to enter your registration code. The function also places the registration information on the clipboard ready to be pasted into

the desired handler or calculation icon. In Director, you can use the

Message window to get the information.

The function is only available in authoring mode. This function is not included in the UCD version.

# **Functions**

**Description:** baFunctions returns the number of functions you are licenced to use

**Usage:** Result = baFunctions()

**Arguments:** Void.

**Returns:** Integer.

Returns the number of licenced functions.

**Examples:** Director:

set number = baFunctions()

Authorware:

number := baFunctions( )

**Notes:** This function is not included in the UCD version.

## What's new in this release

### The following changes were new in version 3.31

Considerable changes made to the window handling functions for compatability with Director 7.02.

"vendor" and "model" options added for CpuInfo, and support for AMD chips added.

"client rect" and client "width" added to WindowInfo.

"menubar height" and "titlebar height" added to ScreenInfo

"common desktop", "common startup", "common start menu", "common groups" options added to SysFolder.

ReadRegString changed under NT so that a (Default) value with no value set returns an empty string rather than the passed in Default value

### The following bugs were fixed in version 3.31

Under Windows NT, using FileExists on a file would prevent DeleteFolder subsequently deleting the folder containing the file.

### The following changes were new in version 3.3

The Xtra version now contains an embedded copy of the DLL, and is distributed as a single file.

The GetFolder function has an option to allow the creation of a new folder.

The GetFilename function has the OFN ADDEXTENSION option added.

Some internal changes to the FindApp function to work around problems with applications that are not registered correctly in the registry.

The XCopy and CopyXFiles functions now retain the case of the original file names in 32 bit. FileList and FolderList now return the filenames with the same case as the original filenames in 32 bit.

An option to overwrite existing read-only files was added to the file copying functions.

### The following bugs were fixed in version 3.3

FindFirstFile could report the wrong path to the file, if the second file found was in the same folder as the first file found.

XCopy crashed when copying a file which had an embedded version resource, and the "IfNewer" option is specified, and the file already exists in the destination folder. bagetFilename showed a truncated dialog box when the stage/presentation window was smaller than about 350 pixels and the OFN\_EXPLORER flag was used.

## The following functions were new in version 3.2

**FlushIni** forces Windows to write an ini file to disk.

FindFirstFile searches for the first file matching a specification searches for the next file matching a specification finishes a search started with baFindFirstFile

**XCopy** copies multiple files with wildcard matching, including sub-

directories.

**XDelete** deletes files with wildcard matching, including sub-directories

**FontList** returns a list of installed fonts

FontStyleList returns a list of available styles for a truetype font

MakeShortcutEx creates a Win95/NT shortcut

**ResolveShortcut** returns the file a shortcut points to

**RegKeyList** returns a list of sub-keys inside a registry key returns a list of values inside a registry key returns a list a window's child windows

**GetFilename** displays a file selection dialog. **GetFolder** displays a folder selection dialog.

**Sleep** pauses the calling Directof/Authorware program

**SystemTime** returns the current system time/date

**SetSystemTime** sets the system time/date

<u>PrinterInfo</u> returns information about the installed printer

**SetPrinter** changes settings for the default printer

**Shell** executes a file

**RefreshDesktop** refreshes the desktop icons

### Changes to existing functions in 3.2:

baVersion( "os" ) will return "Win98" on Windows 98

baVersion( "windows" ) will return "4.10" (32 bit) and "3.98" (16 bit) on Windows 98

baVersion( "qt3" ) will return the version of QuickTime 3 installed (32 bit only)

baGetVolume/SetVolume have been changed to use the Win32 mixer functions if they are available. Some new options are now available. These new options are 32 bit only.

These are:

"master" controls the master volume
"master mute" controls the master mute
"wave mute" controls the wave mute

"cd mute" controls the CD mute

"synth mute" controls the built-in synthesizer mute

#### Bugs fixed in 3.2

baFileVersion failed on Word 97 and PowerPoint 97.

baCopyFile failed when copying to the root directory of a drive (introduced in 3.12 release). baCommandArgs could cut off the first letter of the argument if you define a file type to be associated with your projector/application, and a file of that type in a folder with a long file name is double-clicked in Exporer.

baFindApp failed when used on NT if the user did not have write access to the system folder.

### The following functions were added in version 3.12

**FileList** returns a list of files in a folder. **FolderList** returns a list of folders in a folder.

**MemoryInfo** gets information about system memory

### Changes to existing functions:

baShortFileName now works correctly under Windows 3.1.

Under NT, the registry functions now comply with the current user's security settings.

### The following functions were added in version 3.11

**PMSubGroupList** returns list of groups inside another Start Menu group

**DeleteReg** deletes Registry entry

### Changes to existing functions:

baFolderExists failed if used on an empty floppy disk, or an empty directory on a Novell server. This also caused baCopyFile to fail. This has been fixed.

baMovewindow did not work as documented in the help file. Using -1 for the new postion now keeps the windows current position.

baSendKeys has the cursor keys added - LEFT, RIGHT, DOWN, UP.

The free and size options for baDiskInfo have been updated to work with FAT32 drives larger than 2 gb.

baCopyXFiles now gives more 'time slices' to the system during the copy, This allows Windows and Director to update their displays more frequently.

## The following functions were added in version 3.1

**PMGroupList** returns list of Program Manager or Start Menu groups

**PMIconList** returns list of icons in a Program Manager or Start Menu group

<u>WindowList</u> returns a list of all windows with given title or class

<u>WaitForWindow</u> waits until a specified window is in a specified state

NextActiveWindowreturns the next window to become activeWindowExistschecks that a window handle is validWindowDepthgets the z-order depth of a windowSetWindowDepthsets the z-order depth of a windowCloseAppcloses the application owning a window

**<u>StageHandle</u>** returns the Director stage window

**Aw2Window** returns the Authorware presentation window

<u>FileAttributes</u>

<u>FileAttributes</u>

SetFileAttributes

returns the size of a file
returns the attributes of a file
sets the attributes of a file

**Functions** retrieves the number of functions you are licenced to use

### Changes to existing functions in version 3.1:

baFileExists now reports hidden files as existing in the 16 bit Xtra and UCD.

baFindApp checks if Acrobat Reader 3 has been installed into a folder containing a space and uses a different method to locate it if it does.

baSetScreenSaver converts the long file name of a screen saver in Windows 95 to a short file name before installing it.

### Changes in version 3.03:

Added "restart" option to baExitWindows for 32 bit Xtra and UCD in Windows 95. Internal changes to baCopyFile and baInstallFont to provide consistency between 16 and 32 bit versions.

### Changes in version 3.02:

Added baWinHandle to UCD version..

### **Bugs fixed in version 3.01:**

The Director window did not redraw itself during baWaitTillActive. The window functions (baMoveWindow, baActivateWindow, etc) did not always work correctly in Windows NT with the 32 bit Xtra.

## Other changes in version 3.01:

The maximum size string returned by the baReadIni and baReadRegString functions increased to 2000 characters.
