

This applet will kill the "MagicCookie" file that Netscape deposits in your Netscape file in the preferences folder in your system. This applet should handle result messages better than the first version. This is version 1.1.1 If you get an error message that states that Netscape cannot be found, then where it says "Netscape Navigator 2.02" enter "Netscape Navigator" and run the script and the script will ask you where Netscape is. Take the script there and viola, the script should work. You should use this script to quit Netscape at which time it will quit Netscape and look for the MagicCookie file to delete it.
