

**Target printer driver setup**

- ▶ Using the Printers folder (or Print Manager in Windows NT) or the Masquerade Setup button, make sure all printer hardware-specific options on your target printer driver are correctly set. This would include the correct model and resolution (if your target driver offers multiple choices).

## **Typeface setup**

### **If you plan to use typefaces from TrueType:**

- ▶ Make sure your font selection is up to date. If your target driver is a SuperDriver, make sure TrueType is checked *on* in the Font Engines section of the SuperDriver Tricks dialog.

### **If you plan to use typefaces from Adobe Type Manager (Windows 95 only):**

- ▶ Make sure ATM is turned on in the ATM Control Panel and that your font selection is up to date.

**Loading a PostScript driver**

If you already have a PostScript printer (such as Apple LaserWriter) installed, you can skip this action. If not, use the Add Printer Wizard in Windows 95 (or the Add Printer function in Windows NT) to install a PostScript driver. Any of the Apple LaserWriters will do. You will need to have your Windows installation disk(s) handy.

### **Creating a new driver**

- 1 Start Masquerade by choosing its icon.
- 2 Highlight the target driver from the **Non-PostScript Printers** list box.
- 3 Highlight your choice from among the available **PostScript Drivers**.
- 4 Click on the **Install** button.

When it Masquerade is finished processing, a new listing will appear in the **Installed ZScript Printers** list box. That's it! Your new ZScript-specific printer driver will now appear in the Printers folder in Windows 95 (or the Print Manager in Windows NT), and every application that allows you to choose from among Windows printer drivers will also list the new driver.

### Updating an existing driver

If you have added or removed typefaces from your target Windows printer driver or from TrueType or ATM, you'll want to update your Masquerade-generated PostScript driver. To do so:

- 1 Make sure all printer hardware-specific options on your target printer driver are correctly set.
- 2 Make sure your font selection is up to date and a PostScript driver is installed.
- 3 Start Masquerade.
- 4 Choose the driver you want to update from the **Installed ZScript Printers** list box.
- 5 Click the **Update Font List** button.

Masquerade will build a new list of "Softfonts" and will generate a new PPD file.

[Related Topics](#)

### **Removing an existing driver**

- 1 Start Masquerade.
- 2 Choose the driver you want to update from the **Installed ZScript Printers** list box.
- 3 Click the **Remove** button.

This has the same effect as removing the driver from the Printers folder in Windows 95 or the Print Manager in Windows NT.

**Making the new driver the default**

If you plan to do most of your printing through ZScript using this new printer driver, you can make it the Windows default by clicking on the **Set as Default Printer** button. This has the exact same effect as setting the default printer in the Printers folder in Windows 95 or the Print Manager in Windows NT.

### **Undoing everything Masquerade has done**

There may be a situation where you want to remove all the Masquerade-generated PFM and PPD files, and WIN.INI driver and font entries (de-installing SuperPrint would be one such instance). For that purpose, we have provided a **Reset** button.

A confirmation box pops up when you click **Reset**, giving you an opportunity to cancel the request. If you click **OK**, Masquerade removes almost all traces that it was ever run.

## **Button reference**

### **Update Font List**

This command causes Masquerade to examine the currently available fonts for the selected driver and update WIN.INI and PPD files.

### **Set as Default Printer**

This button does exactly the same thing as setting the same function in Windows 95's Printers folder or Windows NT's Print Manager.

### **Remove**

This button eliminates the chosen Masquerade-generated PostScript driver from your system.

### **Install**

This button creates a new PostScript driver based on the chosen Non-PostScript printer driver, and adds it to the list of Installed ZScript Printers.

### **Exit**

Closes Masquerade.

### **Setup**

**Setup** lets you set the options for any Windows printer driver by automatically calling the Printers folder in Windows 95 or Print Manager in Windows NT. If you're about to **Install** a new Masquerade-generated driver, or use **Update Font List** on an existing one, you can use **Setup** to check that all the desired options (such as paper sizes and trays or resolution) are correct.

### **Reset**

This button removes all Masquerade generated drivers and their corresponding files.

### **Help**

Brings up this help file.

## **Control menu**

In addition to the typical Windows Control menu selections (**Restore, Move, Minimize, Close,** and **Switch to...**), Masquerade's Control menu has two additional items: **Logging...** and **About Masquerade...**

When you choose **Logging**, a dialog appears that allows you to enable Masquerade's logging features and automatically view the resulting logs. There are three types of log files: Error, Font, and PPD. Error logs are always generated when Masquerade encounters a problem while operating. If you are interested in details regarding PPD creation or font enumeration, turn on the appropriate log before clicking the **Install** button. Once installation of your chosen driver is finished, you can come back to this dialog to view the resulting log files.

**About Masquerade** gives you information about the fine makers of Masquerade. You can also find the version number here, which may be needed if you ever need to contact Zenographics for technical support.
