

Minimum System Requirements:

Mac Plus or higher, 1mb of RAM (2mb recommended), hard disk installable or can be run from floppy disk, 1.44mb floppy, color or monochrome monitor, System 6.08 or higher. Toolkit™ is Power PC compatible but does not run native.

Product Limitations:

DRT™ is not compatible with AT drives or disks that have volume-level compression such as Stacker or X2. It is absolutely compatible with file-level compression such as DiskDoubler®, AutoDoubler®, Stuffit® and similar products. It is not installable to Bernoulli 44, 90, 150 or 230mb media but will recover and protect the data on these disks. The recovery routines have been tested on Zip media, but we have not tried installing the software to Zip media. We have tested the product with most extensions and control panels in order to verify compatibility. DRT™ has been tested with virtual memory and memory doubling products. At this writing we have no known conflicts with any other product.

Data Recovery Toolkit™ is a protected product. The software has to be installed from the master disk through an install/uninstall routine. Once the software has been installed and the disk you are installing the program to has been authorized, the program will operate normally. The protection routines are installed during this process as well. You can run DRT™ from the floppy disk without installing to other media. **DO NOT ATTEMPT TO MAKE A COPY OF THE DISK FOR BACKUP PURPOSES.** We have a procedure in place for replacing corrupted media. Attempting to install or use a copy of the master disk will give unexpected results and could cause data corruption. The recovery functions will work five (5) times before requiring renewal. The TrashGuard™ and AdvancedUndelete™ functions are not key protected and can be used an unlimited amount of times.
