In case of trouble...

• Delete the file "Anthem Preferences."

A corrupted Preference file can cause stange behavior or even cause Anthem to crash.   Try deleting the preference file if there is no obvious solution to your problem. This file is located in the Preferences folder within the System folder (quit Anthem before you delete this file).   Use the "Preferences" menu to rebuild your preferences.

• Allocate more RAM to Anthem.

Anthem is designed to handle low-memory situations but in some rare circumstances this could cause problems.   To allocate more RAM, quit Anthem, click once on the Anthem program icon, and select "Get Info" from the File menu.   A small window appears.   Change the preferred size to a value larger than the suggested size.
