How to use the Clip Library: Overview

The Clip Library is a collection of files, called books, of cuttings.   Each book can contain any number of cuttings, and each cutting can be any amount of text, with an optional "hot spot".   If a hot spot is defined (using "\^"), the current selection is substituted at that point.   For example, if the current selection is:

A Heading

and the cutting is:

<H1> \^ </H1>

The result will be as shown, with the original text still selected:

< H1> A Heading </ H1>

Sample clip books are supplied for inserting HTML tags, and ANSI, control and HTML characters. These books can be modified, or you can create your own ones from scratch.

The Clip Library user interface consists of a drop-down list of books, and a scrolling list of the cuttings in the selected book.   The selected cutting can be inserted by double-clicking it, or by pressing the Enter key.   The library may be edited using the commands on its right click context menu.

The interface is turned on and off using the Clip Library command on the View menu, which uses Ctrl+F3 as a shortcut.   Keyboard-only users can also use the shortcut Alt+0 to make it the focus window, ESC to return the focus to the active document, and Shift+F10 to display its context menu.

Note:

These shortcuts will not be available if you have previously customized your command shortcuts.   The assignments can be made on the Keyboard tab of the Customize dialog box as follows:

Command:	Shortcut:	Purpose:
View/ViewClipLib	Ctrl+F3	Show or hide the clip library
View/ActivateClipLib	Alt+0	Give input focus to the clip library. This also displays it if it is not already visible.

Contributed Clip Libraries:

Visit http://www.textpad.com/addons.html to see the Clip Libraries that have been kindly contributed by our users.

Inserting Cuttings

Editing

How to use the Clip Library: Inserting Cuttings

Before you can use the Clip Library, you must first display it, and make it active.   To display it, select the Clip Library command on the View menu.   To make it active, either click it with the left mouse button, or type Alt+0.

To insert a cutting with a hot spot:

1. Either select the text to be substituted for the hot spot, or move the cursor to the insertion position in the document.
2. Double click or press Enter on the cutting to be inserted.

To insert a cutting without a hot spot:

1. Move the cursor to the insertion position in the document.
2. Double click or press Enter on the cutting to be inserted.

Note:

If the list of entries is sorted, you can quickly jump to an entry by typing the first letter of its name.

How to use the Clip Library: Editing

You can edit the Clip Library, using the following commands on its context menus.   To display the context menu, either right click the Clip Library, or type Shift+F10 on the list of books or list of cuttings.

Menu for list of books:

Command:	Action:
Save	Saves any changes made to the selected book.
Rename	Renames the selected book.
Delete	Deletes the selected book.
New book	Creates a new, empty book. You will be prompted for its file and display names. A clip book must have the extension .TCL, and will be stored in the folder specified on the <u>Folders</u> tab of the Preferences dialog box.
Refresh	Reloads all books. Use this command if you have modified any books externally.
Close	Closes the clip library.

Menu for list of cuttings:

Command:	Action:
Insert	Inserts the selected cutting in the active document.
Copy	Copies the cutting with the specified name to the clipboard.
Rename	Saves the changes made to the named book.
Delete	Deletes the cutting with the specified name.
Paste new cutting	Copies the contents of the clipboard to the open book. You will be prompted for a name for this cutting.
Sort	When checked, the entries are sorted alphabetically, otherwise they are displayed in the order they are written in the book. When sorted, you can quickly jump to an entry by typing the first letter of its name.
Refresh	Reloads all books. Use this command if you have modified any books externally.
Close	Closes the clip library.

Notes:

▪   The clip books that are provided with TextPad are stored in the Samples folder.   If you modify and save them, the changes will be saved in the folder specified for the Clip Library (User by default). This mechanism is designed to protect your changes from future updates of TextPad.

▪   The sample clip books use the convention of a trailing "^" in the names of cuttings that have hot spots.

<u>Direct Editing</u>

How to use the Clip Library: Direct Editing

Clip Books are plain text files with the extension .TCL.   If you are careful, you can use TextPad's main editor to create and maintain these files.   Each file consists of a header, followed by one or more cuttings.

Header:

!TCL=<id>, <comment>

!TITLE=<title>

!SORT=<y|n>

where:

<id>	is an identification number in the range 1-999 (numbers above that are reserved for our sample clip books). It must be unique for each clip book.
<comment>	is any text, such as the author's name.
<title>	is a short name that you will use to select this book.

Cuttings:

!TEXT=<title>

<cutting>

!

where:

<title>	is a short name that you will use to select this cutting, and to sort them, if required.
<cutting>	is any text, except for an "!" in column 1. If your own text must start with "!", escape it using "\!". The characters \^ will be interpreted as the hot spot. If you need to use \^ literally, escape it using \\^.
!	marks the end of a cutting. Precede it with a blank line, if you want the cutting to finish with a line break.

Notes:

When you have edited a .TCL file manually, you can make the changes visible by selecting the Refresh command on the Clip Library's context menu.

Do not edit the sample clip books in the Samples folder.   Copy them to the Clip Library folder first (specified on the Folders tab of the Preferences dialog box), or your changes will get lost when you next update TextPad.

The Clip Library searches for .TCL files in the Clip Library folder first, followed by the Samples folder.   It uses the first one that it finds with a given identification number.

If you create any interesting clip books that you would like to contribute to our collection, please let us know.   We will make them available from our web site, with full credit given to each author.

Editing

How to use the Clip Library: Repositioning

32-bit Edition Only:

The Clip Library is normally positioned (docked) at the left hand side of the main window.   It can also be docked at the right hand side, or floated.   To move it, click and drag the separator between the drop-down list of books, and the list of clippings.   Double clicking that separator will cause the Clip Library to float.   When it is floating, double click its title bar to move it back to the last docked position.

You can resize the Clip Library, using the mouse, when it is floating or docked.

How to Customize: Overview

You can customize various settings to your own preferences, and these settings are preserved between sessions (except as explained below).   All user-configurable settings are accessible from theConfigure menu. You can also configure properties for the active document by choosing the Properties command from the popup menu that is displayed when you right click in its window.

Some of the configuration dialogs (eg. Font) give you the option to have the settings apply to the active document only, or to all documents.   Only settings that are applied to all documents are preserved between sessions.

Click the Contents button to see the various options that can be customized, or the next item button (**>>**) to step through them one at a time.

How to Transfer Preferences between PC's

Before transferring any preferences, first exit from TextPad, so that they are updated.

If you have customized any key bindings, these are stored in the file CUSTOM.BND, normally in the USER folder in your TextPad installation directory.   Copy that file to the same folder on the other PC.

Windows 3.1:

All preferences are stored in TEXTPAD3.INI in the WINDOWS directory.   Simply copy that file to the other PC.

Windows 95 and NT 4:

All preferences are stored in the Windows registry.   These may be transferred as follows:

1. Run REGEDIT.EXE
2. Select the key HKEY_CURRENT_USER\Software\Helios\TextPad 3
3. From the Registry menu, choose the Export command.
4. Export the selected branch to a .REG file.
5. Copy the file to the other PC and use the corresponding Import command to load the preferences from the file.   (You could also just double click the .REG file in Explorer.)

Windows NT 3.51:

All preferences are stored in the Windows registry.   These may be transferred as follows:

1. Run REGEDT32.EXE
2. Select the key HKEY_CURRENT_USER\Software\Helios\TextPad 3
3. From the Registry menu, choose the Save Key command.
4. Export the selected branch to a file.
5. Copy the file to the other PC and use the corresponding Restore command to load the preferences from the file.

How to Customize General Preferences

You can customize these general settings by choosing Preferences from the Configure menu:

Set this Option:	To Do This:
Save settings on exit	Save all settings between sessions. Note that settings are not saved if TextPad is started with the command line parameter "-s", which is supplied by Explorer and File Manager, when you double click a file.
Save the workspace	Save the state of open documents between sessions, so that you can continue from where you left off.
Allow multiple instances to run	Allow more than one instance of the program to run at a time. This is not possible for the 16-bit edition.
Use multiple selection Open File dialog box	Allow multiple files to be selected in the Open File dialog.
Allow multiple files on the command line	Allow more than one file at a time to be passed to TextPad via its command line. Check this option if you want to use Explorer's **Send To** command with more than one file, but see Frequently Asked Questions first.
Working directory follows active document	Automatically change working directory, to match that of the active document.
Display startup logo	Suppress the "splash" logo window that is displayed while TextPad starts up.
Use OLE drag and drop	Enable the drag and drop capabilities. This setting can only be changed when no document windows are open, and OLE2 has been installed. **16-bit edition only**: uses non-OLE drag and drop when not set.
Display full path names on the Document Selector	Display as much of the path as can be fitted in the Document Selector, otherwise omit the path and just display the file name.
Start with a new document	Open a new document, if no files are opened when TextPad is started.

How to Customize Binary Extensions

TextPad has a built-in list of file extensions that it associates with binary files, such as ".EXE".   If you open one of these files, it will be displayed in hexadecimal.   To modify the list:

1. Choose the Preferences command from the Configure menu.
2. Select the Binaries tab.
3. To delete an entry, select it from the list, and click Delete.
4. To add a new entry, type it in the New Extension box, and click Add.
5. To reinstate the defaults, click Set Defaults.
6. Click OK.

How to Customize Colors

The screen colors used for normal and selected text, bookmarks, and the left margin can be modified as follows:

1. Choose the Preferences command from the Configure menu.
2. Select the Colors tab on the Preferences dialog box.
3. Choose the item that you want to change the color of.
4. Select the required foreground and background colors.
5. Click OK or Apply.

Notes:

The colors are initially "automatic".   This means that they automatically change to match the colors set for your Windows desktop.

The background color of bookmarks is not used.

The foreground and background colors of the left margin are used to differentiate the active and inactive parts of a split view, and to paint line numbers.

How to Customize Compatibility Preferences

TextPad can be configured for compatibility with other applications as follows:

1. From the Configure menu, choose Preferences;
2. Select the Compatibility tab on the Preferences dialog box;
3. Choose the application from the drop-down list box;
4. Check "Show command shortcuts on menus", if you want to see them there.
5. Check "Use Microsoft's conventions for mouse click selection", if you prefer to single click in the left margin to select the line.
6. Check "Use POSIX regular expression syntax", if you prefer to use that when searching for text. See How to Use Regular Expressions for the differences between the default syntax and POSIX syntax.
7. Click OK or Apply.

Notes:

Keystroke compatibility with other applications uses the closest matching command in TextPad. It may be possible to obtain a closer match in some cases by recording a keystroke macro, and assigning a compatible shortcut to that.

The default shortcuts for TextPad are listed in the Reference section, under the heading The Keyboard.

You can view and modify the chosen shortcuts on the Keyboard tab of the Customize dialog box.

If you change the compatibility mode, any custom shortcuts that you have defined will be lost.

How to Customize Document Preferences

You can customize these document settings by choosing Preferences from the Configure menu to change all documents, or by choosing Document Properties to change them for the active document:

Set this Option:	To Do This:
Word wrap long lines	Word-wrap lines that are wider than the view, or than the column specified for hard breaks.
Constrain the cursor to the text	Restrict the position of the cursor to the existing text. Otherwise it can be placed anywhere in the document window. In word-wrap mode, the cursor is always constrained.
Maintain indentation	Automatically indent each new line by the same amount as the preceding line.
Automatically indent blocks	Indent a new line following a line ending with **{**, and unindent a **}** on a line on its own. Maintain Indentation must also be set.
Remove trailing spaces when saving	To strip trailing spaces and tabs from each line as the file is saved.
Clear undo buffer when saving.	Prevent edits from being undone, after a file has been saved. Also reduces the risk of memory overflows after a lot of edits.
Read only	Prevent the document from being edited. This cannot be set if the document has already been modified.
Automatically terminate the last line	To add line termination characters to the last line when saving the file, if it was unterminated.
Send documents as e-mail attachments	To send the document as an attachment to e-mail, instead of placing the text in-line in the message. Files larger than 32kb are always sent as attachments.
Save with no breaks in lines	Save word-wrapped documents without actually breaking the lines as wrapped.
Save with hard breaks	Insert new line characters at line breaks, when saving word-wrapped documents.
Break at column #	Wrap lines at the specified column position, otherwise fit to the current view.

How to Customize File Associations

Most applications are entirely responsible for the files that they manage (e.g. MS Word and its .DOC files), so they can register all file associations during the installation process, and guarantee that the associations are made correctly.   Text editorsdon't have that luxury.   They can be associated with all sorts of files, with scope for all sorts of problems (and support calls to us) if it's not done right.   It was easy on Windows 3.1: by adding an entry for TextPad to the registry, you could use FileManager's Associate command to correctly associate an extension with that entry.   If you do the same thing on Windows 95, you lose the correct description for the file, and any additional functionality that the original association may have had (e.g. with .BAT files, you can either edit or run them).   Hence TextPad provides its own wayto make associations.

By associating TextPad with file extensions, Explorer or File Manager will know to start TextPad when you want to edit such a file.   Change the associations as follows:

1. From the Configure menu, choose Preferences.   The Preferences dialog box is displayed.
2. Choose the Associations tab.
3. Type an extension in the New Extension box, or choose one from the drop-down list.
4. Type the description of such files in the Description box.
5. Click the Add button.
6. Repeat steps 3-5 for each new extension.
7. Click OK or Apply.

To revert an association back to its default:

1. Select the extension from the list box.
2. Click Delete.
3. Repeat steps 1-2 for each extension to delete.
4. Click OK or Apply.

Notes:

Clicking Cancel will leave your current associations intact.

If you have associated extensions with releases of TextPad earlier than 1.31, they will not show up in the list initially.   You must remake the associations to get them in the list.   The uninstall program uses this list to reinstate the default associations.

How to Customize File Backups

When you save a file, you can keep a backup copy of the original.   To customize the settings, choose Preferences from the Configure menu and select the Backup tab on the Preferences dialog box:

Set this Option:	To Do This:
Preserve original file creator when saving changes	For safety, TextPad (32-bit only) normally saves changes to a temporary file, before deleting the original. This loses the original file creator. By checking this option, the original file is overwritten, which preserves the creator, at the risk of losing the original file if the save operation fails. This setting is ignored for FAT file systems, which have no concept of a file creator.
Automatically save every xx minutes	Save all files at the specified interval. The Save As dialog box will be presented for each untitled document.
Backup files before saving changes	Copy the original file to a backup with one of the following names, before saving changes.
FILE.BAK	Backup FILE.EXT as FILE.BAK
FILE.BAK.EXT	Backup FILE.EXT as FILE.BAK.EXT
FILE.EXT.BAK	Backup FILE.EXT as FILE.EXT.BAK
FILE.EXT in folder	Backup FILE.EXT with the same name in the specified folder.

Notes:

On file systems that do not support long file names, FILE.EXT will always be backed up as FILE.BAK (unless a backup folder is given).

Only a single backup copy is kept, which is overwritten on each file save.

How to Customize File Filters

File filters are the list of wild cards in the List Files of Type box on the File Open dialog box.   You can add to the default list as follows:

1. From the Configure menu, choose Preferences.   The Preferences dialog box is displayed.
2. Select the Filters tab and Click New.   The word `New` is displayed in the Filters and Descriptions boxes.
3. Replace this word in the Description box with the text that you would like to describe the filter.   eg. `Assembler Files (*.asm, *.inc).`
4. In the Wild Cards box, type the corresponding list of wild cards, separated by semicolons.   eg. `*.asm;*.inc.`
5. Click Move Up or Move Down to change the position of this filter in the list.   The first entry in the list will normally be used as the default each time TextPad starts up.   However, if TextPad loaded a workspace when it started, the initial filter will be set to the last one used.
6. Click OK.

How to Customize File Preferences

You can customize these file settings by choosing Preferences from the Configure menu:

Set this <u>O</u>ption:	To Do This:
Number of recent files on File menu	Set the number of most recently used files on the File menu to between 1 and 16.
Default file extension	If you open or save a file using the File Open or Save As dialog boxes, and do not specify a file extension, this string will be used. It must not include spaces or dots.
Treat Ctrl+Z as end of file marker.	Prevent TextPad from reading any characters after a Ctrl+Z (hex 1A) in a file.
Work on <u>DOS</u> files in the ANSI code set.	Files that you open as DOS will be converted to ANSI when opened, and back to DOS when saved if you check this box. This option can only be changed when no documents are open.
When files are modified by another process: Prompt, Auto-Reload or Ignore	If an open file is modified by another process: **Prompt** will ask if it's OK to reload it; **Auto-Reload** will reload it automatically, unless it's been modified; **Ignore** will ignore the change.
Default code set: ANSI or DOS	Set the default code set used. Click **DOS** if you want to use most of your text files with DOS applications, otherwise click **ANSI**. This setting is used for dropped files, and files opened by double clicking, but can be overridden for individual files on the Open File dialog box.
Create new files as: PC, UNIX or MAC	Choose the option for the default end of line characters saved with new files.

How to Customize Folders

These folders, used to store various file types, can be customized using the Folders tab of the Preferences dialog box.   The default is the folder USER in the TextPad installation directory, so you will probably want to use a different folder if the installation directory is on a file server.

File Types:	Purpose:
Backup	Backup copies of files. (Can also be configured on the <u>Backup</u> tab.)
Clip library (*.TCL)	Personal books of cuttings for the Clip Library.
Custom shortcuts (CUSTOM.BND)	Personal command shortcuts.
Macros (*.TPM)	Personal keystroke macros.
Startup	The initial working directory (defaults to the desktop). This will also be the working directory when no documents are open. Note that this is overridden by the "Working directory follows active document" option on the <u>General</u> tab.
User dictionaries (U*.LEX)	Stores words added to the spelling checker.
HTTP Root	If you need to edit files in an active local web server (such as MS Personal Web Server), specify the full path to its root directory here. <u>More information</u>.
HTTP IP Address	The IP address of the local web server, in the form: http://a.b.c.d This defaults to the local host IP address: http://127.0.0.1

To Change a folder:

1. From the Configure menu, choose Preferences.   The Preferences dialog box is displayed.
2. Choose the Folders tab.
3. Click the folder in the listbox, and it will be transferred to the edit box.
4. Either type the new folder name in the edit box, or click the browse button (32-bit edition only), and select it graphically.
5. Click Apply, or OK.

How to Customize Hypertext Expressions

You can change the regular expression used in hypertext jumps from the Command Output window as follows:

1. From the Configure menu, choose Preferences.   The Preferences dialog box is displayed.
2. Choose the Jumps tab.
3. Clear the Use Defaults check box.
4. In the Regular Expression box, type the regular expression that matches the text in the Command Output window.   This must include at least two tagged expressions for the filename and line number, and optionally a third for the column number.   It must also match the start of the line.Up to 10 such expressions are saved in the drop-down list.
5. In the Register boxes, set the indexes corresponding to the tagged expressions defined in the last step.
6. Check Use Defaults, if you want to revert to the default expression.
7. Click OK.

More Information:

The Command Output window is used to capture the output from the Run command, or from tools added to theTools menu.   If the output is from a compiler, or Grep type of program, it can be used to jump directly to the corresponding source line using left double-click.   Built-in support is provided for output from Microsoft and Symantec (Zortech) compilers, inthe form:

```
filename(line): message
```

If this default is not suitable, it will be necessary to specify an alternative hypertext jump regular expression.   For example:

1. **Microsoft and Symantec (Zortech) C/C++**
   Expression = `^\([^(]+\)(\([0-9]+\))`
   File Register = 1
   Line Register = 2

2. **Borland C/C++**
   Expression = `^\(Error\|Warning\) \(.+\) \([0-9]+\):`
   File Register = 2
   Line Register = 3

3. **Java**
   Expression = `^\([A-Za-z]:[^:]+\):\([0-9]+\):`
   File Register = 1
   Line Register = 2

4. **Keil C51**
   Expression = `^.+ IN LINE \([0-9]+\) OF \([^:]+\):`
   File Register = 2
   Line Register = 1

5. **IAR Assembler**
   Expression = `"\([^"]+\)",\([0-9]+\)`
   File Register = 1
   Line Register = 2

6. **PowerBASIC**
   Expression = `^Error [0-9]+ in \([^(]+\)(\([0-9]+\):\([0-9]+\)`
   File Register = 1
   Line Register = 2
   Column Register = 3

7. **Perl for Windows 95**
   Expression = `^.+at \(.+\) line \([0-9]+\)[.,]`
   File Register = 1
   Line Register = 2

8. **GNAT ADA**
   Expression = `^\(..[^:]+\):\([0-9]+\):\([0-9]+\)`

File Register = 1
Line Register = 2
Column Register = 3

9. **Generic filename(line,column)**
Expression = `^\([^(]+\)(\([0-9]+\),\([0-9]+\))`
File Register = 1
Line Register = 2
Column Register = 3

How to Customize the Language

To choose a language for the user interface:

1. From the Configure menu, choose Preferences.   The Preferences dialog box is displayed.
2. Choose the Language tab.
3. Select a language from the list box.
4. Click OK.

Notes:

This effects the language used for menus, dialog boxes, etc, but not the on-line help.

You have to restart TextPad after changing the language, before the change takes effect.

English is always available, but other languages are stored in DLL's with names of the form "TXP32???.DLL" and "TXP16???.DLL".   For example "???" is "DEU" for German and "FRA" for French.

How to Customize the Printer

To choose a particular printer, or to set up the printed page layout and font:

1. From the File menu, choose Print Setup.   The Configure Printing dialog appears.
2. To change the printer, click the Printer button and the standard Print Setup dialog is displayed.   Click its OK button when you have made your selection.
3. To change the font, click the Font button and the standard Font dialog is displayed.   Click its OK button when you have made your selection.   Note that this selection only applies to the printer, not the <u>screen font</u>.
4. To add a header and/or footer to each printed page, type the required text in the Header and Footer boxes.   You can also use <u>header macros</u> to get the file name, date and time:
5. If you want the times in the header and footer to correspond to the creation time of the file being printed, click File Time, else click Print Time.
6. To set the page margins, fill in the Left, Right, Top and Bottom boxes.   Note that if you set these to less than the minimum that the printer allows, the settings are ignored.
7. If you want lines that are too long for the page width to be wrapped on to the next line, click the Word Wrap Long Lines box.   Otherwise lines that are too long will be truncated.
8. If you want line numbers to be printed, click the Line Numbers box.   This is independent of any setting for line numbering in the view.
9. If you have a color printer, and want to print with the colors you have selected for the screen, click the In Color box.
10. Check "Double Space", if you want all lines to be double spaced on the printout.
11. Click OK when you have completed your changes.

Tip:

To save on paper, use the Print Preview command on the File menu to check that your printer settings are satisfactory.

How to Customize the Screen Font

Only fixed width fonts are allowed on the screen, so the screen font is set independently of the <u>printer font</u>.

1. From the Configure menu, choose Screen Font.   The Font dialog box is displayed.
2. Check the DOS box, if you want to select a font for working with files in the DOS code set.
3. In the Font box, choose from the list of fixed width fonts.
4. In the Font Style box, choose from the list of styles.
5. In the Size box, choose from the list of font point sizes.
6. In the Script box (if available), choose from the list of scripts.
7. In the Scope box, select Make Default, if you want these settings to be applied to all documents, otherwise select Active Document to make a temporary change to the active document only.
8. Check Use on Printer if you want to print with this font as well.
9. Verify that the text displayed in the Sample box is satisfactory.
10. Click OK.

Notes:

Checking the DOS box makes no difference to the set of fonts that are displayed.   Its only effect is to specify that the chosen font will be used for documents that are edited in the <u>DOS</u> code set - even if you choose an ANSI font.   You can determine the code set of the active document either by double clicking the message area on the status bar, or from the Statistics tab of the Document Properties dialog box.

How to Customize Tab Stops

Tab stops and indentation can be set at regular intervals as follows:

1. To change the default settings for all documents, choose Preferences from the Configure menu, and the Preferences dialog box will be displayed.   To make changes for the active document only, choose Document Properties from theConfigure menu, and theProperties For ... dialog box will be displayed.

2. Select the Tabs tab.

3. In the Tab Size box, type the character spacing between tab stops.

4. In the Indent Size box, type the character spacing for each line indentation.   This is best set to the same value as tab stops, otherwise indentation will be made up of a mixture of spaces and tabs.

5. Check Convert New tabs to Spaces, if you want tabs converted to the equivalent number of spaces.

6. Check Convert Existing Tabs to Spaces When Saving Files, if you want existing tabs converted to the equivalent number of spaces.   This does not make any changes, until a document is saved.

7. Click OK.

How to Customize View Preferences

You can customize these view settings by choosing Preferences from the Configure menu:

Set this Option:	To Do This:
Tool Bar	Display the tool bar at the top of the main window.
with regular buttons	Display the tool with buttons on it, rather than using the flat style (32-bit edition only). The flat style requires COMCTL32.DLL 4.70 from Microsoft.
Status Bar	Display the status bar at the bottom of the main window.
Clock	Display the digital clock on the status bar.
Popup tips	Display popup help by holding the mouse pointer over a toolbar button, or a control character (shows its decimal code).
Visible alerts	Flash the window whenever the beeper is sounded.
Stay on top of other windows	Keep the main window on top of all others, even when another application is active.
Visible spaces and tabs	In visible mode, spaces are shown as (▤) , tabs as (»), and line ends as (¶).
Block cursor	Display the <u>cursor</u> as a block, instead of a vertical bar. The cursor is temporarily changed to the alternate form in overtype mode.
Vertical Splitter	Allow each view to be split vertically into two using the Split Window command on the Window menu. The default is for views to be split horizontally. This option is disabled if any windows are open.
Horizontal scroll bar	Display a horizontal scroll bar in each view. This option is checked and disabled if Vertical Splitter is checked.
Line numbers	Display line numbers in the left margin of each view.
Minimize when last document is closed	Minimize the main window when the last document is closed. You can override this option by holding the Shift key down when closing the last document.

How to Configure Document Properties

To configure properties for the active document, choose Document Properties from the Configure menu, then choose one of the following tabs from the dialog box:

Document for word-wrap and indentation settings.

View for scroll bars and visible spaces.

Tabs for tab settings.

Statistics for information about the document, such as its word count.

How to Configure View Properties

You can change these settings for the active view by choosing Document Properties from the Configure menu, and selecting the View tab:

Set this Option:	To Do This:
Horizontal scroll bar	Display a horizontal scroll bar in this view. This option is checked and disabled if Vertical Splitter is checked on the <u>View</u> tab of the Preferences dialog box.
Visible spaces and tabs	In visible mode, spaces are shown as ( ) , tabs as (»), and line ends as (¶).
Line numbers	Display line numbers in the left margin of this view.

How to View Document Statistics

You can view these properties of the active document by choosing Document Properties from the Configure menu, and selecting the Statistics tab:

Property:	Notes:
Full name	Shows the fully qualified file name. You may need to scroll to the end if the name is longer than the available display space.
Last saved at	Shows the date and time that the document was last written to its disk file.
Character count	Shows the number of characters in the document.
Line count	Shows the number of lines in the document. Note that a word-wrapped line is counted as a single line.
Word count	Shows the number of words in the document. A word is composed of letters, numbers, hyphens, underscores and apostrophes.
Code set	This can be ANSI or DOS (OEM)
File type	This can be PC, UNIX or MAC.

How to Customize the Keyboard

The shortcuts that are initially assigned to each command depend on the keystroke compatibility selected on the <u>Compatibility</u> tab of the Preferences dialog box.   Some commands are only accessible if you assign a shortcut to them, since they do not appear on any of the menus.

You can set your own shortcuts for commands as follows:

1. From the Configure menu, choose Customize.   The Customize dialog box is displayed.
2. Select the Keyboard tab.
3. Select the command category from the list, and the corresponding commands in that category will be displayed.
4. Select the command you wish to set a shortcut for.
5. Type the shortcut in the "Press new shortcut key" box.   It may consist of one or two characters.
6. Click the Assign button.

Notes:

Once you have customized the keyboard, new shortcuts that we implement in future releases will not be implemented in your custom settings.

If a shortcut clashes with any you've created on the Windows desktop, the desktop gets precedence.

Shortcuts can use any key, except Ctrl+\, or the lock keys, Tab and Print Screen, in combination with Ctrl, Shift and Alt modifiers.

No distinction is made between left and right modifier keys.

If you use a single ASCII character, such as "A", as a shortcut, you obviously won't be able to use it in normal typing!

Two character shortcuts cannot be created if the first key is unmodified, unless it's a function key.

Two character shortcuts are displayed like "Ctrl+Q, B", but the comma is not typed.

If the shortcut is currently assigned to another command, it will be displayed below it on the dialog box.   If you click Assign, the shortcut will be transferred to the new command.

More than one shortcut can be applied to each command, but the shortcut that gets displayed next to the command on its menu is chosen arbitrarily.

A shortcut can be removed from the list of current keys for a command, by clicking the Remove button.

All shortcuts can be reinstated to the defaults for the selected keystroke compatibility, by clicking the Reset All button.

All command shortcuts for the selected category can be displayed in the Command Results window, by clicking the List button.

Modified shortcuts are stored in the file CUSTOM.BND in the folder specified on the <u>Folders</u> tab of the Preferences dialog box.   This file is deleted whenever the compatibility mode is changed, or Reset All is clicked.

How to Customize the Tools Menu

To can add an executable command:

1. From the Configure menu, choose Customize.   The Customize dialog box is displayed.
2. Select the Tools tab.
3. Click New, and choose Command.   The Select File dialog is displayed.
4. Either use the Select File dialog to select an executable file and click OK, or click Cancel if you want to add a DOS internal command, such as DIR.
5. Make any necessary changes to the command in the Command box.   If you clicked Cancel in the previous step, this will have been initialized to `User Tool`, which must be changed.   Note that the command must include its full path name, unless it is on your search path.
6. Make any necessary changes to the text that will appear on the Tools menu in the Menu Text box. This box is initialized from the text in the Command box.
7. In the Parameters box, type any parameters required to run this tool.   You can include any <u>tool macros</u> here.
8. In the Initial Directory box, type the startup directory for the command.   This defaults to the directory containing the tool. You can include directory <u>tool macros</u> here.
9. Check Prompt for Parameters, if you want to supply different parameters each time you choose this tool.   The parameters you type in the Tool Parameters dialog at run time will be appended to those in the Parameters box.
10. Check Run Minimized, if you want the tool to run displayed as an icon (16-bit edition), or to minimize the Command Output window while the tool is running (32-bit edition).
11. Check Capture Output, if you want to see the output from the tool in the Command window.   This only applies to DOS or console commands.
12. Check DOS Command, if the tool is an internal DOS command, such as DIR or TYPE.
13. Check Save All Documents First, if the tool works on files that you may be editing.   Even if you don't check this option, and a tool uses any of the macros FC_File, FC_UNIXFile or FC_DOSFile, the active document will be saved prior to running the tool.
14. Click Move Up or Move Down to set the order of this tool on the Tools menu.
15. Click OK.

To can add a 3rd party Windows help file for in-context help:

1. From the Configure menu, choose Customize.   The Customize dialog box is displayed.
2. Select the Tools tab.
3. Click New, and choose Help.   The Select File dialog box is displayed.
4. Select the Windows help file that you want to use for in-context help, and click OK.
5. The menu text field will be initialized to "?", but you may change it to anything appropriate.
6. *Do not* change any of the other fields.   (The Parameters field contains an implicit "$Sel" parameter, that will cause the current selection to be passed as the help search key.)
7. Click OK.

Examples:

1. Compiling the active file with the JAVA compiler:

Menu text:	Compile JAVA
Command:	JAVAC.EXE
Parameters:	$File
Initial directory:	$FileDir
Capture Output:	(x)

2. Viewing the active HTML document with Internet Explorer:

Menu text:	View HTML
Command:	IEXPLORE.EXE
Parameters:	-nohome file:$File

3. Viewing the active HTML document with Netscape:

Menu text:	View HTML
Command:	NETSCAPE.EXE
Parameters:	file://$File

Page Header/Footer Macros

The following macros can be used in the Header and Footer boxes in the Configure Printing dialog box:

Use	To Get
&n	The normal font for subsequent text.
&b	A bold font for subsequent text.
&i	An italic font for subsequent text.
&I	A bold italic font for subsequent text.
&l	Subsequent text to be left justified.
&c	Subsequent text to be centered (this is the default).
&r	Subsequent text to be right justified.
&d	The current date in Windows short form.
&D	The current date in Windows long form.
&t	The current time in Windows format.
&f	The filename, excluding its path.
&F	The full filename, including its path.
&p	The page number.
&P	The total number of pages.

For example: to get a page header that looks like:

Left	Center	Right
readme.txt	*Page 1 of 3*	10/11/96

Set the header to "&l&f&c&iPage &p of &P&r&n&d"

Quick Open File Dialog Box

This dialog box allows you to open a file, when you do not need the browsing capabilities of the standard Open File dialog box, and you are willing to type the file name.

Use Ctrl+Shift+O to bring up this dialog box.   There is no menu or toolbar equivalent command.

It accepts single filenames, wildcards, or files specified as "@filename", where "filename" is the name of a file containing a list of files to open, one per line.   In all cases, UNIX or DOS path separators may be used.

If you don't type an extension, the default extension (if any), specified on the File tab of the Preferences dialog box, will be appended.   If you don't want an extension, either type a trailing ".", or quote the file name.

If you check "Search subfolders", TextPad will open all files matching the name in the current folder, and all its subfolders.

Click the Browse button to get the standard Open File dialog box.

Fill Selected Block Dialog Box

This dialog box appears when you choose the Fill Block command from the Edit menu.

Type in the character or characters that you want to fill the current block selection with.   You can fill with tabs by entering '\t' as the fill character.   If you actually want to fill with '\t', enter it as '\\t'.

Manage Files Dialog Box

Use the manage Files dialog to:

▢ <u>Copy</u> Files

▢ <u>Delete</u> Files

▢ <u>Rename</u> Files

▢ <u>Update</u> Timestamps of Files

The Browse button brings up the standard Open File dialog box, so that you can select the file or files you want to manage.

Shortcuts:

    Keys: F3

Copy/Rename/Move Dialog Box

This dialog box appears when you click Copy or Rename on the Manage Files dialog box.

Confirm that the files in the From box are what you want, and edit them if necessary, then type the destination file name, wild card or directory name in the To box.

The Browse button brings up the standard Open File dialog box, so that you can select the destination file name.

Delete/Touch Dialog Box

This dialog box appears when you click Delete or Touch on the Manage Files dialog box.
Confirm that the files in the edit box are what you want, and edit them if necessary.   Then click OK.

Tool Parameters Dialog Box

This dialog appears when you choose a user tool from the Tools menu and you checked the Prompt for Parameters box when you configured this tool.

Type any parameters that the program requires in the Parameters box, and click OK.

Go To dialog box

This dialog box is displayed when you choose the Go To command from the Search menu.

Type the required number in the edit box, and click Go To.   You can specify that the number represents a line, column, page or byte offset in the file.   If you make the number signed, it will be interpreted as an offset relative to the current position.

You can also use this command to go to the next bookmark.   In this case, the number in the edit control is ignored.

If you want to select everything between the current position and the specified offset, check the Extend Selection box.

The parameters that you set can be recorded in keystroke macros.

Shortcuts:

Keys: Ctrl+G

Go To Address dialog box

This dialog box is displayed when you choose the Go To Address command from the Search menu in Hex views.

Type the required hexadecimal offset in the file in the Go To Address box, and click Go To.

Shortcuts:
    Keys: Ctrl+G

Tip of the Day Dialog Box

This dialog box is displayed when the program starts up, or when you choose the Tip of the Day command from the Help menu.

Click the Next Tip button, if you want to see each tip in turn, and click Close when you've finished.   You can stop the dialog box being displayed automatically by clearing the "Show tips on startup" check box.

Word Count dialog box

This dialog box is displayed when you choose the Word Count command from the Tools menu.

The counts apply to the whole document, if no text is selected, otherwise to the selected text only.

Shortcuts:

Keys:		Shift+F9

How to Edit: Overview

TextPad loads an entire file into memory when you edit it, so the original file is not changed until you save the changes.   You can opt to keep the original file as a <u>backup</u> when saving changes.

UNIX, Mac and PC files use different end of line characters, which TextPad automatically recognizes. These will be preserved when you save the file, unless you choose to save with a different format, using the <u>Save As</u> command.

If a file has long lines, you can choose to scroll horizontally when the line extends beyond the right margin, or have words wrapped at the right margin, or at a specified column position.   If you specify a column position, hard line breaks will be inserted where words are wrapped, when you save the changes.   Otherwise, the file is saved with long lines, which you can think of as paragraphs.   You can configure these settings using the Preferences command and selecting the <u>Document</u> tab of the Preferences dialog box.

The basic functions for moving around in the text, and making simple edits follow the conventions of other Windows applications, so you can get started immediately.   The more powerful editing commands are all on the menus, with their shortcuts shown against them, so you should be able to get up to speed quickly.

Any changes you make (except converting the <u>code set</u> between DOS and ANSI) can be <u>undone</u>, and you can redo changes you undo.   You can opt to undo even after saving the changes, using the Preferences command and selecting the Document tab of the Preferences dialog box.

You can record the commands to make repetitive edits as keystroke <u>macros</u>, which you can playback on different parts of the text.

How to Move Around in Text

In the table below, you can use the Shift key in conjunction with the given keystrokes (excluding the ones that use the Alt key), to extend the selection.

To Move the Cursor:	Press This Key:
To the mouse cursor position	Left button
To the beginning of the file	Ctrl+Home
To the end of the file	Ctrl+End
To first non-space character on a line	Home (Reassign this key to "LineLeft", if you prefer it to go to the left margin.)
To the left margin	Home twice
To the end of a line	End
Forward one character	Right arrow
Back one character	Left arrow
Down one line	Down arrow
Up one line	Up arrow
Forward one word	Ctrl+W or Ctrl+Right arrow
Back one word	Ctrl+B or Ctrl+Left arrow
Forward to end of current word	Unassigned
Back to end of previous word	Ctrl+D
To the start of the next paragraph	Ctrl+Down Arrow
To the start of the previous paragraph	Ctrl+Up Arrow
To the start of the first visible line	Alt+Home
To the start of the last visible line	Alt+End
Scroll down one line	Alt+Down arrow
Scroll up one line	Alt+Up arrow
To a specified line, column or page number	Ctrl+G and fill in the number

Cursor Mode:

The cursor can be constrained to positions within the existing text only, or can be free to be placed anywhere in the document window. This setting is changed with the Constrain Cursor command on the Configure menu.

When the cursor is constrained, the left and right arrows wrap around to the previous or next line at the beginning and end of a line respectively.

In block selection mode, the Constrain Cursor command is disabled.

How to Select Text

Text can be selected in block (column) or normal mode.   Use the Block Select Mode command on the configure menu to switch between modes.

To select any text with the mouse:
1. Press and hold the left button down at the start of the text you want to select.
2. Drag the <u>cursor</u> to the end of the selection, and release the button.
   or
1. Click the left button at the start of the selection.
2. Hold the Shift key down and click the left button at the end of the selection.

To select any text using the keyboard:
1. Use any of the <u>cursor motion</u> keys to move the cursor to the start of the text you want to select.
2. Press and hold the shift key down while using the motion keys to move the <u>cursor</u> to the end of the selection.

To select a word:
Move the <u>cursor</u> over the word and double click the left button.

To select a whole line:
Double click (or single click in MS compatibility mode) the left button in the left margin, next to the line, or **non word-wrap only:** triple left click anywhere in the line.

To select a whole paragraph:
📄   Word-wrap: triple click anywhere in the paragraph.
📄   Non word-wrap: triple click (or double click in MS compatibility mode) in the left margin.

To select a block of text:
1. Make sure that word-wrapping is turned off.
2. Choose Block Select Mode from the Configure menu.
▶ Shortcut: Alt+Left click toggles block select mode on and off.
3. Use the keyboard or mouse to mark the selection as normal.

To select the whole document:
Choose Select All from the Edit menu (shortcut: Ctrl+A).
   or
Click Ctrl+Left button anywhere in the left margin.

To cancel a selection:
Press ESC.

Notes:
If you want to select a lot of text, place the cursor at the start then do one of the following:

📄   Use the <u>Go To</u> command to extend the selection.
📄   Scroll down with the scroll bar, until the end of the text you want to select is visible, and then click Shift+Left mouse button.   (Scrolling using the Page Up/Down keys normally moves the cursor, but you can use them instead of the scroll bar if the Scroll Lock key is on.)

How to Use the Clipboard

To insert text from the clipboard:

Position the <u>cursor</u> and choose the Paste (Ctrl+V) command from the Edit menu.

▶ Toolbar:

📋

To copy selected text to the clipboard:

Choose the Copy (Ctrl+C) command from the Edit menu.

▶ Toolbar:

📄

To move selected text to the clipboard:

Choose the Cut (Ctrl+X) command from the Edit menu.

📄 Toolbar:

✂️

To copy the line containing the cursor to the clipboard:

Cancel any selection (ESC) and choose the Copy Line command from the Edit menu.

To copy the word containing the cursor to the clipboard:

Cancel any selection (ESC) and choose the Copy Word command from the Edit menu.

To move the line containing the cursor to the clipboard:

Cancel any selection (ESC) and choose the Cut Line command from the Edit menu.

To move the word containing the cursor to the clipboard:

Cancel any selection (ESC) and choose the Cut Word (Ctrl+Q) command from the Edit menu.

To copy all bookmarked lines to the clipboard:

Choose the Copy Bookmarked Lines command from the Edit menu.

To move all bookmarked lines to the clipboard:

Choose the Cut Bookmarked Lines command from the Edit menu.

To append text to the existing contents of the clipboard:

Choose one of the Cut Append or Copy Append commands from the Edit menu.

How to Drag and Drop

You can use the mouse to move or copy text within a document, or to another document, as follows:

To move selected text:

1. Hold the left button down in the selection.
2. Drag the <u>cursor</u> to the new location.
3. Release the left button.

To copy selected text:

1. Hold Ctrl+Left button down in the selection.
2. Drag the cursor to the new location.
3. Release the left button.

To cancel a drag-drop:

Press ESC, or

Click the right button, or

Release the left button in the selection.

Notes:

1. The Ctrl key can be pressed or released at any time before releasing the left button, to make the drag a copy or a move.
2. If the new location is not visible, hold the mouse pointer at the edge of the window nearest to the destination, and it will scroll through the file until the pointer is moved away.

How to Insert Text

Any normal characters that you type will be inserted at the cursor position.   If any text is selected, it will be deleted before inserting the first character that you type.

To change to overtype mode, where each character that you type replaces the one at the cursor position, press the Insert key once.   This will also change the "Ins" indicator on the status bar to "Ovr", and the shape of the cursor from a vertical line to a solid block.   Press the Insert key again, to switch back to insert mode.

The Undo command will cancel the effect of consecutively typed characters, up to the end of a line.

How to Delete Text

You can delete different amounts of text as follows:

To Delete This:	Do This:
Selected text	Delete or Backspace
The next character	Delete
The previous character	Backspace
To the start of the next word	Ctrl+Delete
Back to the last start of word	Ctrl+Backspace
To the end of the line	Ctrl+Shift+Delete
The current line	Choose Delete Line from the Edit menu
The current word	Choose Delete Word from the Edit menu
The whole document	Alt+Delete
Lines with bookmarks	Choose the Delete Bookmarked Lines command from the Edit menu.

See Also:

How to Use the Clipboard for commands to save deleted text on the clipboard.

How to Change Case

Select the text to be changed, and then:

To Do This:	Use this Edit Menu Command:
Change all to lower case	Lower Case (Ctrl+L)
Change all to upper case	Upper Case (Ctrl+U)
Invert the case of each character	Invert Case (Ctrl+K)
Make the first character of each sentence upper case and the rest lower case	Sentence Case (Ctrl+Shift+K)
Make the first character of each word upper case and the rest lower case	Capitalize (Ctrl+Shift+U)

How to Indent Lines

To increase the indentation of the current line or selected lines:

1. Select the lines to be indented.
2. Choose Increase Indent (Ctrl+I) from the Edit menu.

Toolbar:

To reduce the indentation of the current line or selected lines:

1. Select the lines to be unindented.
2. Choose Reduce Indent (Ctrl+Shift+I) from the Edit menu.

Toolbar:

Notes:

When multiple lines are selected, you can also indent them using the Tab key or reduce their indentation using Shift+Tab.

The indentation level of lines changes by increments of the indent size, which can be changed on the Tab Settings property sheet.

How to Align Text

Currently selected lines, or the line containing the cursor, can be centered, or aligned to the left or right margin as follows:

1. Place the cursor anywhere on the line, or select the lines to be centered.
2. Choose the required Alignment command from the Edit menu.

Notes:

Text is centered between column 1 and the right margin, as specified on the <u>Document</u> tab of the Preferences dialog box.

How to Join Lines

You can join single or multiple lines, such that each line in turn is appended to the first, separated by a single space.

To join a single line to the current line:

1. Cancel any selection (ESC).
2. Choose Join Lines (Ctrl+J) from the Edit menu.

To join multiple lines to the current line:

1. Select all the lines to be joined.
2. Choose Join Lines (Ctrl+J) from the Edit menu.

Note:

In word-wrap mode, this command is not shown on the edit menu, but is still available using its shortcut.

How to Split Long Lines

In word-wrap mode, you can split long lines into separate lines where they are wrapped, as follows:

1. Select the lines to split.
2. Choose Split Wrapped Lines (Ctrl+Shift+J) from the Edit menu.

How to Reformat Paragraphs

You can adjust the lengths of currently selected lines to the word-wrap margin.   Words are moved between the lines as necessary, and blank lines are preserved as paragraph separators.

To reformat paragraphs:

1. Select the lines to reformat.   The current paragraph will be reformatted, if nothing is selected.
2. Choose Reformat (Ctrl+Shift+J) from the Edit menu.

How to Insert New Lines

To Create a New Line:	Press This Key:
After the current line	Ctrl+Enter
Before the current line	Ctrl+Shift+Enter
By splitting the current line	Enter

How to Insert the Date or Time

You can insert the current date and time, using the formats defined with the International applet on Control Panel, as follows:

To Insert this:	Choose this Edit Command:
The current time	Insert Time
Today's date in short format	Insert Short Date
Today's date in long format	Insert Long Date

Shortcuts:

Mouse:	Ctrl+Right click at the insertion point.
Keys:	Ctrl+F10.

How to Insert a Page Break

1. Move the <u>cursor</u> to the first line to be printed on a new page.
2. Choose Insert Page Break (Ctrl+Shift+L) from the Edit menu.

More Information:

This actually inserts the ASCII 0x0C (Ctrl+L) character in the text, but displays it on the screen as «, and draws a line at the point where the page break would occur on a printer.

The Page Break character is only recognised when it is the first character of a line.

How to Insert a File

1. Move the <u>cursor</u> to the insertion point.
2. Choose Paste File (Ctrl+Shift+V) from the Edit menu.
3. Select the file you want to insert on the Open File dialog box.
4. Click OK.

How to Insert Line Numbers

To insert consecutive line numbers at the start of each line:

1. From the Search menu, choose Replace;
2. In the Find What box type `"^"` (without the quotes);
3. In the Replace With box, type `"\i "` (without the quotes), if the line numbers start at 1, or `"\i(100) "`, if they start at 100, etc.;
4. Check the Regular Expression box;
5. Click Replace All.

More Information:

See How to Generate Sequence Numbers.

How to Transpose Text

To transpose adjacent characters:

1. Move the <u>cursor</u> between the two characters to be transposed.
2. Choose Transpose Characters (Ctrl+T) from the Edit menu.   The characters will be swapped around.

To transpose adjacent lines:

1. Move the cursor to the end of the first line, or start of the second line.
2. Choose Transpose Lines (Ctrl+T) from the Edit menu.   The lines will be swapped around.

To transpose adjacent words:

1. Move the cursor between the two words to be transposed.   This may be on a space, or intervening punctuation, or the beginning or end of a line.
2. Choose Transpose Words (Ctrl+Shift+T) from the Edit menu.   The words will be swapped around.

How to Fill Blocks

Block filling is only enabled when block select mode has been set from the Configure menu, and a block of text has been selected.

To fill with Characters:

1. Choose the Fill Block command from the Edit menu.
2. In the Fill Selected Block dialog box, enter the characters you want to fill with.
3. Choose the format of the fill characters within the selected block.   They can be aligned left or right, or repeated to fill the block.
4. Click OK.

To fill with Numbers:

1. Choose the Fill Block command from the Edit menu.
2. In the Fill Selected Block dialog box, enter the starting number, and the amount to increment it by. These must be integers, and may be positive or negative.
3. Choose the format of the numbers within the selected block.   They can be aligned left or right, or with leading zeros to fill the block.
4. Click OK.

Notes:

To fill with a tab, enter "\t" (without the quotes).   If you actually want to fill with the characters "\t", enter it as "\\t".

How to Display Spaces and Tabs

Displays spaces tabs and paragraph marks as visible characters. Spaces are shown as ( ) , tabs as (»), and line ends as (¶).

Click the button a second time to hide visible spaces.

You can also turn them on and off from the View tab of the <u>Preferences</u> and <u>Properties</u> dialog boxes.

How to Type International Characters

You can insert any character, if you know its ANSI code, by holding down the Alt key and typing zero, followed by the 3-digit code on the numeric key pad (Num Lock must be on).   Alternatively, you can type the DOS (OEM) code by omitting the leading zero.

The following table lists the shortcuts defined for common international characters, when using an English language keyboard:

To obtain:	Type:
à, è, ì, ò, ù, À, È, Ì, Ò, Ù	Ctrl+` (Grave Accent), the letter
á, é, í, ó, ú, ý, Á, É, Í, Ó, Ú, Ý	Ctrl+' (Apostrophe), the letter
â, ê, î, ô, û, Â, Ê, Î, Ô, Û	Ctrl+^, the letter
ã, ñ, õ, Ã, Ñ, Õ	Ctrl+~, the letter
ä, ë, ï, ö, ü, ÿ, Ä, Ë, Ï, Ö, Ü,Ÿ	Ctrl+:, the letter
å, Å	Ctrl+@, a or A
æ, Æ	Ctrl+&, a or A
œ, Œ	Ctrl+&, o or O
ß	Ctrl+&, s
ç, Ç	Ctrl+, (Comma), c or C
ð, Ð	Ctrl+' (Apostrophe), d or D
ø, Ø	Ctrl+/, o or O
¿, ¡	Ctrl+/, ? or !

Notes:

- Do not type the comma, except for ç and Ç.
- On the English keyboard layout, the character "^" is typed using Shift+6, so the prefix Ctrl+^ is equivalent to Ctrl+Shift+6.   This applies to any other shortcut prefixes in the shift position on your keyboard.
- These shortcuts can all be modified on the Keyboard tab of the Customize dialog box.
- The default shortcuts are only defined for TextPad and MS Applications compatibility mode.

How to Type Control Characters

You can type control characters using Ctrl+Num* (* on the numeric keypad), followed by A to Z, or the characters "[\]^_".   For example, Ctrl+Num*, A generates the same character code as if you had typed Ctrl+A in a DOS window.

You can view control characters in the 32-bit edition by holding the mouse pointer over them.   For example, the BEL character is displayed as "^G (7)" in a popup tip window.

How to Cancel the Last Action

To cancel the last edit:

Choose Undo (Ctrl+Z) from the Edit Menu

Toolbar:

To cancel the last undo:

Choose Redo (Ctrl+Y) from the Edit Menu.

Toolbar:

To cancel all edits:

Type Ctrl+Shift+Z.

To redo all edits:

Type Ctrl+Shift+Y.

Note:

The Undo command can be repeated until all changes made since the file was opened, or last saved, have been undone.

Frequently Asked Questions

Before reporting any problems, please check this list to see if there is a known solution:

- How can TextPad open files with spaces in their names, passed to its command line?
- Why can't TextPad open files with spaces in their paths, using the Open File dialog box on NT 3.51?
- How can I open more than one file at a time with Explorer's Send To command?
- When I save a file as NAME.EXT, why is it saved as NAME.EXT.TXT?

How can TextPad open files with spaces in their names passed to its command line?

TextPad can open more than one file at a time, using command lines like:

```
txtpad32.exe file1.c file2.h *.txt
```

So, if any of the names contain spaces, they must be quoted, as in:

```
txtpad32.exe "My File 1" "My File 2"
```

As a special case, a single filename, containing spaces, can be given without quotes, if the parameter -u is also used, as in:

```
txtpad32.exe -u My File
```

Solution:

If you cannot arrange for quotes around file names, you can force TextPad to accept only a single file in its command line as follows:

1. From theConfigure menu, choose Preferences;
2. Select the General tab on the Preferences dialog box;
3. Clear the checkbox against "Allow multiple files on the command line";
4. Click OK.

Additional Information:

1. This problem generally only arises if you have set up TextPad's file associations manually, using a command of the form "txtpad32.exe %1", without quoting the "%1".   If you use the <u>Associations</u> tab on the Preferences dialog box to do it, File Manager and Explorer will communicate with TextPad using DDE, rather than command line parameters, so spaces are not significant.
2. Note that there is a bug in Windows 95 Explorer which causes it to add an invisible "%1" (without the essential quotes) to the command line when you use it to edit *any* associations.   This overrides any DDE configuration, and causes problems if filenames contain spaces.   This "%1" can only be seen and removed using REGEDIT.EXE.
3. Windows 95 is very inconsistent about how it handles file names containing spaces.   For instance, if you use Explorer to select some files with spaces in their names, then use <u>Send To</u>, TextPad will open them successfully.   This is because Explorer hands over the DOS 8.3 aliases for the names, so the spaces disappear.   However, when you double click a file, Explorer hands over its long file name, unquoted, which causes the problem.   The Open File dialog box is actually part of Explorer, and it hands over long file names with quotes around them!

Why can't TextPad open files with spaces in their paths, using the Open File dialog box on NT 3.51?

TextPad uses the common Open File dialog box, which has a design fault in Windows versions prior to 95 and NT 4.   When it is enabled for multiple selection, it uses a space to separate each file name, so gets confused if a name, or its path, includes spaces.   The workaround is to clear the following option:

[   ] Use multiple selection Open File dialog box

on the <u>General</u> tab of the Preferences dialog box (or get the latest version of Windows!).

How can I open more than one file at a time with Explorer's Send To command?

By default, TextPad only allows a single filename to be passed via its command line.   This is to avoid confusion if there are any spaces in its name.   Explorer's Send To command avoids this problem by passing names using their DOS 8.3 aliases.

If you are sure that files with spaces in their names will not cause any problems with other applications that use TextPad to view files, check the following option:

[   ] Allow multiple files on the command line.

on the General tab of the Preferences dialog box.

When I save a file as NAME.EXT, why is it saved as NAME.EXT.TXT?

This is due to the way Microsoft implemented the Save As dialog box: If you supply an extension it doesn't recognize (including none), it either appends the default extension, if the filter is "*.*", or the first extension in the list for the selected filter.   This behaviour is designed to enforce the strong association between extensions and applications in Windows 95, but it does get in the way at times.   One of the most irritating aspects of this is that it can create files with names like FILE.XYZ.TXT, when you type FILE.XYZ.

Solution:

To allow a file to be saved with an arbitrary extension, delete the default extension from the File tab of the Preferences dialog box, and select "*.*" from the "Save as Type" list on the Save As dialog box. Alternatively, you can force it to accept exactly what you type by putting quotes around the name.

Why doesn't .HTML or .JAVA work as a default file extension?

If you set the default file extension to .JAVA or .HTML, and save a new file without specifying the extension, you only get a 3-character extension.   This is due to a bug in Windows 95.   The workaround is to type the extension yourself, or use NT 4 instead of Windows 95.

How do I get the correct characters for visible spaces?

In visible mode, spaces should be shown as () , tabs as (»), and line ends as (¶).   If the characters or your display don't match these, try temporarily selecting a different screen font, then reselecting the original one.

How to I get borders on my toolbar buttons?

If your computer has version 4.70, or later, of COMCTL32.DLL installed in the SYSTEM directory,.TextPad will use a flat-style of toolbar, which raises the buttons as you move the mouse over them.   You can revert to the normal style by checking "With regular buttons" on the View tab of the Preferences dialog box.

Why do I get an error message about CTL3DV2.DLL or CTL3D32.DLL?

These dynamic link libraries must be installed in your Windows system directory only. If you also have a copy in the TextPad installation directory, or anywhere on your search path, it will notify you that it has failed to load. The effect is that you will not get 3-D dialogs on Windows 3.1 or NT 3.51. (Windows 95 and NT 4 do not use the DLL's.) The solution is to delete all other copies of these DLL's.

Why did drag and drop stop working after I upgraded TextPad?

Editions of TextPad prior to 2.0 had a fallback implementation of drag and drop that didn't use OLE.   It used an anchor mouse cursor, instead of the conventional OLE one.   If you were using that when you upgraded, drag and drop will have been disabled.   To enable it again:

1) Close all documents (in TextPad).

2) From the Configure menu, choose Preferences.

3) On the General tab, check "Use OLE drag and drop".

4) Click OK.

Note that you must have the OLE 2 system installed for this to work.   It is standard with Windows 95 and NT, and you can get it for Windows 3.1 from:

http://www.microsoft.com/win32devsupport/content/faq/win32s/

and

CompuServe forum WINSHARE as WN32SOLE.ZIP.

Why doesn't TextPad preserve the original file's creator (and UNIX access modes) when it saves changes?

For safety, TextPad (32-bit only) normally saves changes to a temporary file, before deleting the original. This loses the original file's creator on file systems (such as NTFS) that maintain such information. There is an option on the Backup tab of the Preferences dialog box to change this behaviour. When selected, the original file is overwritten, which preserves the creator, at the risk of losing the original file if the save operation fails.

How can I make Notepad use TextPad instead of WordPad for big files?

In Windows 95, when you attempt to open a file with Notepad, which is too large for it, a popup window comes up asking if you want to open the file with Wordpad.   Well, if you are like me,   you deleted Wordpad long ago or didn't even install it.   So, how do you get   Windows 95 to open the file with Textpad?   Easy! There are several ways like placing a copy oftxtpad32.exe in your WINDOWS folder and renaming it to Wordpad.exe, but then you don't have access to all the functions of Textpad unless you copy several other files to WINDOWS.   Here is how to do it by changing 2 entries in the Registry.

1. Go to Start/Run, type in Regedit, then locate & open the following path:
   HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\App Paths\
   WORDPAD.EXE
2. Click on the (Default) String Value in right pane and choose Modify
3. Enter the path of your Txtpad32.exe
   e.g. C:\Program Files\TEXTPAD\TXTPAD32.EXE
4. Then, right click on WORDPAD.EXE and choose New String Value
5. Type in PATH and hit enter.
6. Then right click PATH, choose Modify, and enter the path to your Txtpad32.exe
   e.g. C:\Program Files\TEXTPAD

Now, reboot yourcomputer and the next time you click on a file to open it and the popup window comes up telling you that the file is too large   and asking if you want to open it with Wordpad, click OK and the file will open with Textpad!

This tip is brought to you by:

Alan W. Ray, Ray's Mfg. Co

Why doesn't Page Up/Down move the cursor

When the Scroll Lock key is on, the Page Up/Down keys behave the same way as when you scroll with the mouse on the scroll bar - i.e. the cursor is not moved.   You can then quickly get back to a known position in the document by pressing one of the arrow keys.

Why can't I delete a folder after I have edited a file in it?

Windows does not allow you to delete a folder, if any application is using it as its current working directory.   The working directory of most Windows applications is automatically changed by the Open and Save As dialog boxes, and TextPad optionally changes its working directory to match that of the active document.   Hence, you must open a file in another folder to make TextPad change its working directory, before deleting a folder.

Note that if you have specified a startup folder (on the Folders tab of the Preferences dialog box), and have not checked the option for the working directory to follow that of the active document (on the General tab of the Preferences dialog box), TextPad will always change its working directory back to the startup folder, when the last document is closed.

How to Create a New File

To create a new unnamed document:

From the File menu, choose New.

Toolbar:

The new document may be given a name using the Save As command on the File menu.

To create a new named file:

1. From the File menu, choose Open (Ctrl+O).   The File Open dialog appears.

Toolbar:

2. In the Directories box, double-click a directory where you want to store the source file (or move up or down a path to the appropriate directory).
3. Type the file name in the File Name box, and click OK. The default extension given to a file is .TXT, unless you specify something else.
4. Click Yes on the message box that appears, asking if you want to create the file.
5. Use the editor to type the contents of the file.

How to Open an Existing File

1. From the File menu, choose Open (Ctrl+O).   The File Open dialog appears.

Toolbar:

2. Select the drive and directory where the file is stored.   The default is the current drive and directory.
3. Set the types of files to display in the List Files of Type box.   Files with the chosen extension are displayed in the File Name box.   This box serves as a filter to display all files with a given extension. For example, Source (*.cpp,*.c,*.h) displays all files with the given extensions. The drop-down box initially listscommonly-used file extensions.   Alternatively, you can specify wildcard patterns in the File Name box to display file types.   The new wildcard pattern is retained until the dialog box is closed.   You can also use any combination of wildcard patterns, delimited by semicolons.   For example, entering "*.TXT; *.INI" displays all files withthose extensions.
4. If you want to override the automatically determined file format, choose from the drop-down list as follows:

File Type:	Definition:
Auto	A file with an extension matching the internal list of binary extensions will be viewed in hexadecimal, otherwise it will be opened as a text file.
Text	The file is read as text in the selected code set.
Binary	The file is binary and will be viewed in hexadecimal.

5. If you want to disable edits to the file, check the Read Only box.
6. In the File Name box, click a filename, then click OK.

Shortcut: Double-click a filename.

See Also: The Quick Open command.

Tips:

You can select multiple files to open at once, by using Ctrl+Left button to select each in turn, or Shift+Left button to select a range of files.

The use of spaces for multiple file opening conflicts with long file names (except on Windows 95), so to see long file names in the File Open Dialog, uncheck "Use multiple selection Open File dialog box" on the General tab of the Preferences dialog box.

The default directory for opening and saving files is the current working directory.   When TextPad is started, its working directory is the one defined on the shortcut it was started from.   This can be overridden by defining the "Startup" folder on the Folders tab of the Preferences dialog box. Subsequently, the working directory is changed whenever you select another directory with the Open or Save As dialog box.   You can also arrange that the working directory is always the same as that of the active document by checking "Working directory follows active document" on the General tab of the Preferences dialog box.

How to Open a File Named in a Document

There are two ways to open a file that is named in an open document:

1. Select the file name in the text, and use the Go To File command (Ctrl+Shift+G) to open it.   This command is not on a menu.

2. If the file is specified in an include statement with one of the syntaxes listed below, either right click it, and choose the Open command from the context menu, or place the cursor anywhere on the file name, and use the Go To File command.

```
#include "filename"
#include <filename>
!include "filename"
$include "filename"
<include file="filename">
<!--#include file="filename" -->
```

How to Open a Hex View of a File

1. From the File menu, choose Open (Ctrl+O).   The File Open dialog appears.

Toolbar:

2. Select the file to <u>open</u>.
3. Click the down arrow next to the File Format box.
4. Choose "Binary" from the drop-down list.
5. Click OK.

Tips:

You can select multiple files to open at once, by using Ctrl+Left button to select each in turn, or Shift+Left button to select a range of files.

The use of spaces for multiple file opening conflicts with long file names (except on Windows 95), so to see long file names in the File Open Dialog, uncheck "Use Multiple File Open Dialog Box" on the General tab of the Preferences dialog box.

Binary File Extensions

The following file extensions are assumed to be associated with files containing binary, or non-textual data:

COM	.EXE	.DLL	.SYS	.DRV	.386	.DOS
LIB	.OBJ	.PIF	.RES	.SYM	.BIN	.ZIP
FON	.FOT	.TTF	.MID	.WAV	.GRP	.VBX
WMF	.TIF	.PCX	.BMP	.CUR	.ICO	.TWS
HLP	.PPT	.DOT	.WRI	.MDB	.DBF	.FRX
XLS	.IMP	.WK1	.WK2	.WK3	.WK4	

You can customize this list from the Binaries tab of the Preferences dialog box.

How to Save a File

1. Switch to the source window.
2. From the File menu, choose Save (Ctrl+S).

Toolbar:

3. If your file is unnamed, the Save As dialog box is displayed.   In the File Name box, type the filename.
4. In the Drives and Directories boxes, select a drive and directory.
5. Click OK.

Note:

If the file has been modified by another process, since it was opened for editing, the Save As dialog box will be displayed so that you can opt to save it with a different name.

How to Save a File with a Different Name

1. From the File menu, choose Save As.   The Save As dialog box appears.
2. Select the drive and directory where the file is to be stored.   The default is the current drive and directory.
3. Choose the <u>File Format</u> if you want to convert from the original.
4. In the File Name box, type the filename.
5. Check the "Selection only" box, if you want to save the selected text to a new file.
6. Click OK.

How to Save the Workspace

You can arrange for TextPad to "warm start" - that is, start up exactly where you left off when you last shut it down.   To enable this feature:

1. Choose Preferences from the Configure menu.   This brings up the Preferences dialog box.
2. On the General tab, check "Save the Workspace".
3. Click OK.

Notes:

The workspace is preserved in a file called TEXTPAD0.TWS in your Windows directory.

If more than one instance of TextPad is running, only the workspace of the first one to be started will be preserved.

If TextPad is started up with the command line parameter "-s" (which is how DDE starts it), the workspace is not restored, nor saved when you exit.

On Windows 95, if this option is enabled and you shut down Windows while TextPad is still running, it will be automatically restarted when Windows starts up again.

How to Close a File

1. Switch to the file's window.
2. From the File menu, choose Close. This action closes the active window and any additional views of the window.

Tip:

When the Document Selector has the input focus, pressing the Delete key closes the highlighted file.

How to Convert a File for PC, Unix or Mac

1. From the File menu, choose Save As.   The File Save As dialog appears.
2. Select the drive and directory where the file is to be stored.   The default is the current drive and directory.
3. In the File Name box, type the filename.
4. Choose the file format from the drop-down list as follows:

File Format:	Definition:
PC	The file is saved in DOS PC format with a carriage return/line feed at the end of each line.
UNIX	The file is saved in the UNIX format with a line feed at the end of each line.
MAC	The file is saved in the Apple MAC format with a carriage return at the end of each line.

5. Click OK.

How to Work with DOS Files

Overview:

Windows applications normally use the <u>ANSI</u> code set, while DOS applications use the <u>DOS</u> code set (also known as OEM and IBM).   The numeric codes that are assigned to the English alphabet, numbers and various other common characters are the same in both sets, but characters with codes above decimal 127 (hex 7F), such as the line drawing set, use different codes, and some are unique.   Another factor is that they also depend on which code page is active.

Text on the clipboard presents an additional complication.   If it has been cut or copied from a DOS box, TextPad will convert it to the ANSI code set before pasting, unless you work in the DOS code set as described in option 3 below.

Fonts:

Some versions of Courier New can display in either the ANSI or DOS code set, but most TrueType fonts are only available in ANSI.   The standard DOS raster font is called Terminal on Windows 95 and NT, and VGAoem or 8514oem on Windows 3.1.   In some cases, MS LineDraw may be a suitable TrueType alternative to the DOS raster font.

If you decide to work on DOS files in the DOS code set (see option 3 below), you can choose which font will be used by selecting it on the <u>Font</u> dialog box, and setting the DOS check box.

Options for working with DOS files:

1. There is a Convert command on the Tools menu to convert between the code sets. After converting the text, TextPad selects the appropriate font for the current code set, so that characters are displayed correctly.
   Disadvantage: the process is not reversible for the unique characters.

2. You can choose to edit DOS files in ANSI, by setting the "Work on DOS files in the ANSI code set" check box on the <u>File</u> tab of the Preferences dialog box.   In this case, if you check the "DOS Code Set" box when you open a file (or set it as the default on the File tab of the Preferences dialog box), files are automatically converted to ANSI as they are read in, and back to DOS as they are saved.
   Disadvantage: the process is not reversible for the unique characters.

3. You can edit a DOS file without converting the characters, by clearing the " Work on DOS files in the ANSI code set " check box on the File tab of the Preferences dialog box. In this case, if you check the "DOS Code Set" box when you open a file (or set it as the default on the File tab of the Preferences dialog box), the font is automatically selected to use the DOS code set.
   Disadvantage: edit controls in dialog boxes, such as Find and Replace, continue to use the ANSI code set, so they will display some characters differently.

How to Set the Default File Folder

You can specify the default file folder using the <u>Folders</u> tab on the Preferences dialog box.

You can also change the default file folder (or working directory), by changing the way TextPad is started.   See under the appropriate heading below for how to do this with the version of Windows that you have.

From a Windows 3.1/NT 3.51 Program Manager Icon:
1. Click the Program Manager icon for TextPad.
2. Type Alt+Enter to get its properties dialog box.
3. Fill in the Default Directory field with the required directory, and click OK.

From a Windows 95/NT 4 Desktop Icon:
1. Right click the desktop icon for TextPad.
2. Choose Properties to get the properties dialog box.
3. Fill in the Start In field on the Shortcut tab with the required folder name, and click OK.

From the Windows 95/NT 4 Taskbar Start Menu:
1. Right click the Taskbar.
2. Choose Properties to get the Taskbar Properties dialog box.
3. Click the Advanced button on the Start Menu Programs tab.
4. Select "Programs" on the Explorer view.
5. Right click TextPad on the right hand pane, and choose Properties.
6. Select the Shortcut tab, and fill in the "Start In" field with the required folder name.
7. Click OK to close all the dialog boxes.

Tip:

To keep TextPad's current working directory in the chosen folder, uncheck "Directory follows Active Document" on the General tab of its Preferences dialog box.

How to Switch to a File's Window

Do one of the following:

Click anywhere in the window.

Choose the window name from the Window menu.

Double click the window name in the <u>Document Selector</u>.

Press Ctrl+F6 or Ctrl+TAB to cycle through the active source windows one at a time.

How to Create a Second View

You can split any window into 2 panes.   By default, the splitter bar is horizontal, but you can change it to vertical by closing all documents, and checking " Vertical Splitter" on the <u>View</u> tab of the Preferences dialog box.

Using the Keyboard:

1. From the Window menu, choose Split.
2. Use the arrow keys to move the horizontal bar to where you want to split the window.
3. Press Enter to create the second view, or Escape to cancel.

Using the Mouse:

Drag ▭ from the end of the scroll bar to where you want to split the window.

To Close the Second View:

Drag the splitter bar to the top or bottom of the view.

Note:

When synchronized scrolling is enabled, both views will scroll together.   This mode can be disabled with the command on the Configure menu.

How to Use the Document Selector

The Document Selector is a list box showing the each of the documents you are editing.   You can display it by choosing Use Selector (F11) from the Window menu.

The Document Selector displays the files in alphabetical order, and it can be resized to fit the file names it lists.   Its size and position are remembered between sessions.   If " Display full path names on the Document Selector" is checked on the General tab of the Preferences dialog box, the full path name is listed, otherwise just the file name.

You can use the following keys when the Document Selector is active:

Use this Key::	To Do This::
Esc	Close the Document Selector.
Left Click	Select the document window. If not already the active window, activate it.
Ctrl+Left Click	Add the clicked entry to the current selection.
Shift+Left Click	Extend the list of selected documents to the clicked entry.
Left Double Click	Select and activate the document window.
Enter	Activate the document window.
Delete	Close the selected document window.
Up Arrow	Select the previous window in the list.
Down Arrow	Select the next window in the list.
Home	Select the first window in the list.
End	Select the last window in the list.

You can also choose the following commands from a popup menu, by right clicking the selection:

Command:	Function:
Close	Close the selected documents.
Print	Print the selected documents using the current default settings.
* Tile Across	Arrange the selected documents (or all, if only one is selected) full height across the main window.
* Tile Down	Arrange the selected documents (or all, if only one is selected) full width down the main window.
Properties	Display the Properties dialog box for the active document.

* The tile commands are not available on Windows 3.1.   If more than 3 documents are selected Tile Across and Tile Down have the same effect.

How to Print a File

1. Switch to the file's window.
2. From the File Menu, choose Print.   The Print dialog box appears.
3. Click "All" for the print range.
4. Click OK.

Shortcuts:

Keys: Ctrl+P

Toolbar:

(Prints to the default printer, unless you hold Shift down at the same time)

How to Display a Page Before Printing

1. From the File Menu, choose Print Preview.
2. Click OK.   The print preview mode will be set, starting at the page containing the <u>cursor</u>.
3. Click Next Page or Prev Page to see each page in turn.
4. Click Close to return to normal viewing mode.

Notes:

When you choose this command, the main window will be replaced with a print preview window in which one or two pages will be displayed in their printed format.   The <u>print preview toolbar</u> offers you options to view either one or two pages at a time; move back and forth through the document; zoom in and out of pages; and initiate a print job.

Shortcuts:

Toolbar:

Keys: Ctrl+Shift+P

How to Keep a Log

You can keep a log in the same way as with Notepad:

1. On the first line of a document, type the following at the left margin, making sure you include the period.
   .LOG

2. On the File menu, choose Save.

Note:

Every time you open this document, TextPad will append the current time and date to the end of the document, using the formats specified for Windows.

How to Copy a File

1. From the File Menu, choose Manage Files (F3).   The Manage Files dialog appears.

Toolbar:

2. Type the name of the file that you want to copy.   This may include a path if it is not in the current working directory.   The filename may be a wildcard pattern if you want to copy multiple files.
3. Click Copy.   The Copy dialog appears.
4. Type the name that you want to give the copy.   If this is just a pathname, the file is copied to that directory, keeping its original file name.
5. Click OK.

How to Rename a File

1. From the File Menu, choose Manage Files (F3).   The Manage Files dialog appears.

Toolbar:

2. Type the name of the file that you want to rename.   This may include a path if it is not in the current working directory.   The filename may be a wildcard pattern if you want to rename multiple files.
3. Click Rename.   The Rename dialog appears.
4. Type the new name that you want to give the file.   If this is just a pathname, the file is moved to that directory, keeping its original file name.
5. Click OK.

How to Delete a File

1. From the File Menu, choose Manage Files (F3).   The Manage Files dialog appears.

Toolbar:

2. Type the name of the file that you want to delete.   This may include a path if it is not in the current working directory.   The filename may be a wildcard pattern if you want to delete multiple files.
3. Click Delete.   The Delete dialog appears.
4. Click OK to confirm that you really want to delete the file.

How to Update a File's Time Stamp

1. From the File Menu, choose Manage Files (F3).   The Manage Files dialog appears.

Toolbar:

2. Type the name of the file that you want to update its last modified date to the current time.   This may include a path if it is not in the current working directory.   The filename may be a wildcard pattern if you want to update multiple files.

3. Click Touch.   The Touch dialog appears.

4. Click OK to confirm that you really want to update the file.

How to Compare Text Files

1. From the Tools menu, choose the Compare Files command.   The Compare Files dialog box appears.
2. In the First File box, type the name of the first file to be compared.   This is initialised with the filename of the active document, if appropriate.
3. In the Second File box, type the name of the second file to be compared.   If it has the same name in another directory, just type the path name.
4. Choose if you want to ignore differences due to upper and lower case letters.
5. Choose if you want to ignore differences due to the number of spaces or tabs.   Note that tabs or spaces, where there are none in the other file, will still be flagged as a difference, unless they are leading or trailing.
6. Click OK to start the comparison.

The differences are written to the Command Results window using the following conventions:

Symbol:	Meaning:
<	Precedes each different line from the first file.
>	Precedes each different line from the second file.
a	Means that the lines following were added.
d	Means that the lines following were deleted.
c	Means that the lines following were changed.
---	Separates changed lines in the first file from the second.

For example, "14,26c122,123" means that lines 14 to 26 in the first file are changed to lines 122 to 123 in the second file.

The ANSI Code Set

This table displays the full ANSI code set, for code page 850, using the Courier font:

	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
00:	NUL	SOH	STX	ETX	EOT	ENQ	ACK	BEL	BS	HT	LF	VT	FF	CR	SO	SI
10:	DLE	DC1	DC2	DC3	DC4	NAK	SYN	ETB	CAN	EM	SUB	ESC	FS	GS	RS	US
20:		!	"	#	$	%	&	'	(	)	*	+	,	-	.	/
30:	0	1	2	3	4	5	6	7	8	9	:	;	<	=	>	?
40:	@	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
50:	P	Q	R	S	T	U	V	W	X	Y	Z	[	\	]	^	_

How to Find Text

You can find each occurrence of a combination of any characters, including uppercase and lowercase characters, whole words, or parts of words, or regular expression.

To find text:

1. From the Search menu, choose Find (F5).   This starts a modeless dialog box which remains on the screen until you close it.

Toolbar:

2. In the Find What box, type in the search string, or choose a previous string from the drop-down list.
3. Set the options you want to control the search.

Select:	To:
Text	Specify a text search string.
Hex	Specify a search string in hexadecimal.
Match Whole Word	Find occurrences of the text as a whole word.
Match Case	Find text having the given pattern of uppercase and lowercase letters.
Regular Expression	Specify that the search string is a regular expression.
Backwards	Search the document above the insertion point.
Forwards	Search the document below the insertion point.

4. Check "Extend selection", if you want to extend the selection from the cursor position to the matched text.

5. Choose Find Next. If the search string is found, the screen scrolls so you can see the text in context.
   or
   Choose Mark All to place a bookmark on each line containing the search string.

6. Either close the dialog by clicking the Cancel button, or continue editing as normal.

Tips

1. The Find What box will be initialised with the current selection, if any (as long as it is on a single line), or the last search pattern entered.
2. The Find Next command (Ctrl+F) will copy the current selection to the Find What box.
3. To do a forward search after closing the dialog box, press Ctrl+F.
4. To do a backwards search after closing the dialog box, press Ctrl+Shift+F.
5. Match Whole Word is equivalent to the regular expression \<RE\>.

Examples

How to Replace Text

You can find and replace each or every occurrence of a text pattern, in the current file, or all loaded files.

To Replace Text:

1. From the Search menu, choose Replace (F8).   This starts a modeless dialog box which remains on the screen until you close it.

Toolbar:

2. Specify the text to replace as described in <u>Finding Text</u>.
3. Type the <u>Replacement Expression</u> in the Replace With box, or choose a previous string from the drop-down list.
4. Set the scope of the search:

Select:	**To:**
Active Document	Search in current document only.
Selected Text	Search in currently selected text in current document.
All Documents	Search in all text in all open documents.

5. Choose one of the following actions:
   a) Click Find Next to select the next occurrence.
   b) Click Replace to replace the current selection.
   c) Click Replace Next to replace the current selection, and find the next occurrence.
   d) Click Replace All to replace all occurrences of the search text, in the specified scope.

Note that Find Next, Replace and Replace Next are only enabled when the scope is Active Document.

6. Either close the dialog by clicking Cancel, or continue editing as normal.

Tips:

The Replace button will replace the *current* selection, so make sure you press Find Next first.

Because edit controls do not allow tabs to be input, '\t' is used (without the quotes) to represent a tab.   If you want to replace text with literal '\' and 't' characters, specify '\\t' in the Replace With box.

Beware of replacing a pattern that is matched with a regular expression that can optionally match nothing, such as ".?" or "a*".   In these degenerate cases, TextPad can go into a loop, until the line becomes too long.

<u>Examples</u>

How to Use Regular Expressions

A regular expression (RE) is a search string that uses special characters to match patterns of text. You can use them with the Find, and Find in Files commands, and with the Replace command in conjunction with replacement expressions.   TextPad's regular expressions are based on POSIX standard P1003.2, but the syntax can be that of POSIX, or UNIX extended regular expressions (the default).   The choice can be made on the <u>Compatibility</u> tab of the Preferences dialog box.

To use a regular expression:

1. From the Search menu, choose Find, Replace, or Find in Files.
2. In the Find What box, type a regular expression.
3. Check the "Regular expression" box.

Summary of regular expressions:

Default Operator:	POSIX Operator:	Description:
.	.	Any single character. *Example:* `h.t` matches hat, hit, hot and hut.
[ ]	[ ]	Any one of the characters in the brackets, or any of an ANSI range of characters separated by a hyphen (-), or a character class operator (see below). *Examples:* `h[aeiou][a-z]` matches hat, hip, hit, hop, and hut; `[A-Za-z]` matches any single letter; `x[0-9]` matches x0, x1, …, x9.
[^]	[^]	Any characters except for those after the caret "^". *Example:* `h[^u]t` matches hat, hit, and hot, but not hut.
^	^	The start of a line (column 1).
$	$	The end of a line (*not* the line break characters). Use this for restricting matches to characters at the end of a line. *Example:* `end$` only matches "end" when it's the last word on a line, and `^end` only matches "end" when it's the first word on a line.
\<	\<	The start of a word.
\>	\>	The end of a word.
\t	\t	The tab character.
\f	\f	The page break (form feed) character.
\n	\n	A new line character, for matching expressions that span line boundaries. This cannot be followed by operators '*', '+' or {}. **Do not** use this for constraining matches to the end of a line. It's much more efficient to use "$".
\xdd	\xdd	"dd" is the two-digit hexadecimal code for any character.
\(\)	( )	Groups a tagged expression to use in replacement expressions. An RE can have up to 9 tagged expressions, numbered according to their order in the RE. The corresponding replacement expression is \x, for x in the range 1-9. *Example:* If `\([a-z]+\) \([a-z]+\)` matches "way wrong", `\2 \1` would replace it with "wrong way".
*	*	Matches zero or more of the preceding characters or expressions. *Example:* `ho*p` matches hp, hop and hoop.
?	?	Matches zero or one of the preceding characters or expressions. *Example:* `ho?p` matches hp, and hop, but not hoop.
+	+	Matches one or more of the preceding characters or expressions. *Example:* `ho+p` matches hop, and hoop, but not hp.

\{count\}	{count}	Matches the specified number of the preceding characters or expressions. *Example:* `ho\{2\}p` matches hoop, but not hop.
\{min,\}	{min,}	Matches at least the specified number of the preceding characters or expressions. *Example:* `ho\{1,\}p` matches hop and hoop, but not hp.
\{min,max\}	{min,max}	Matches between min and max of the preceding characters or expressions. *Example:* `ho\{1,2\}p` matches hop and hoop, but not hp or hooop.
|	|	Matches either the expression to its left or its right. *Example:* `hop|hoop` matches hop, or hoop.
\	\	"Escapes" the special meaning of the above expressions, so that they can be matched as literal characters. Hence, to match a literal "\", you must use "\\". *Example:* `\<` matches the start of a word, but `\\<` matches "\<".

Character Class Operators "[: ... :]"**:**

These can be used in class expressions as an alternative way of representing classes of characters. For example, [a-z0-9] is equivalent to [[:lower:][:digit:]]. The defined classes are:

Expression	Description
[:alpha:]	Any ANSI letter.
[:lower:]	Any lower case ANSI letter.
[:upper:]	Any upper case ANSI letter.
[:alnum:]	Any digit or ANSI letter.
[:digit:]	Any digit.
[:xdigit:]	Any hexadecimal digit (0-9, a-f or A-F).
[:blank:]	Space or tab.
[:space:]	Space, tab, vertical tab, return, line feed, form feed.
[:cntrl:]	Control characters (Delete and ASCII codes less than space).
[:print:]	Printable characters, including space.
[:graph:]	Printable characters, excluding space.
[:punct:]	Anything that is not a control or alphanumeric character.
[:word:]	ANSI letters, hypens and apostrophes.
[:token:]	ANSI letters, digits and underscores.

Example:

HTML tags are in matched pairs of <…>, such as <FONT SIZE=+1>. To match any tag that begins and ends on the same line, use the regular expression:

   <[^>]*>

This matches a "<", followed by zero or more characters, excluding ">", followed by a ">". Note that "*" finds the longest matching sequence on a line, so the regular expression:

   <.*>

would be incorrect, because it would not stop at the first ">", if there was more than one on the line.

For more information and examples, see <u>regular expressions</u>, and <u>replacement expressions</u> in the Reference section.

How to Generate Sequence Numbers

You can update or insert sequence numbers in a file, using <u>replacement expressions</u>.   This is achieved using the Replace dialog box, with the Regular Expression box checked.

The syntax of the replacement expression is:

Expression:	Effect:
\i	Replace with numbers starting from 1, in steps of 1.
\i(10)	Replace with numbers starting from 10, in steps of 1.
\i(0,10)	Replace with numbers starting from 0, in steps of 10.
\i(100,-10)	Replace with numbers starting from 100, reducing in steps of -10.

Examples:

1. To insert line numbers at the start of each line:

   Search for: ^

   Replace with: \i

2. To update sequence numbers of the form Axxx, Bxxx, … ,Zxxx where "xxx" is any number >= 100, independent of the letters, which are to be preserved:

   Search for: `\([A-Z]\)[1-9][0-9][0-9]+`

   Replace with: `\1\i(100)`

How to Find in Multiple Files

You can search for strings in either text (excluding Unicode) or binary files, as follows:

1. From the Search menu, choose the Find in Files command (Ctrl+F5).   This starts a modeless dialog box which remains on the screen until you close it.

Toolbar:

2. In the Find What box, either type the search string, or choose a previous string from the drop-down list.   (Check that Text or Hex is correctly set for the type of string in the Conditions box.)

3. In the In Files box, either type a list of files using wild cards, or choose a previous list from the drop-down list.   Note that by creating a file containing a list of file names, one per line, and specifying the name of that file in this box, preceded by the character '@', this command will search the specified files.

4. In the In Directory box, either type the pathname to the directory containing the files, or select a previous directory from the drop-down list, or click Defaults to set it to the current working directory.

5. In the Conditions box, specify the search criteria as follows:

Select:	To:
Text	Specify a text search string.
Hex	Specify a search string in hexadecimal.
Match Whole Word	Find occurrences of the text as a whole word.
Match Case	Find text having the given pattern of uppercase and lowercase letters.
Regular Expression	Specify that the search string is a regular expression.

6. In the File Type box, choose Text if the files contain text, or Binary if they contain any NULL characters.

7. In the Report Detail box, choose All Matching Lines if you want each matching line printed out, or File Counts Only if you simply want to know how many occurrences there are in each file.

8. Click Search Subdirectories if you want to search through all files in the subdirectories of the directory specified in step (4) as well.

9. Click Find.

Hypertext Jumps:

Matching strings are listed in the Search Results window.   You can use this to jump to a line in its file by double clicking the line.

To jump to the next occurrence, choose the Jump Next (F4) command from the Search menu.

Toolbar:

To jump to the previous occurrence, choose the Jump Previous (Ctrl+F4) command from the Search menu.

Toolbar:

Open All:

To open all listed files, right click the Search Results window (or use Shift+F10), and choose Open All from the popup menu.   This can be constrained to a subset of the files by selecting the appropriate lines

first.

How to Find a Matching Bracket

To Find a Matching Bracket:

1. Place the <u>cursor</u> to the left of the bracket to be matched: `([{< or >}])`
2. From the Search menu, choose the Match Bracket command (Ctrl+M).   If there is a matching bracket, it will be selected.

To Find the First Closing Bracket:

1. Place the <u>cursor</u> anywhere in the text.
2. From the Search menu, choose the Match Bracket command (Ctrl+M).   If there is one of the characters `>}])`, before the end of file, it will be selected.

To Select Text Between Brackets:

1. Place the cursor to the left of the bracket to be matched.
2. Type Ctrl+Shift+M.   If there is a matching bracket, all intervening text will be selected.   When matching forwards, both brackets are selected as well.   When matching backwards, neither bracket is selected.

How to Use Bookmarks

To Set a Bookmark:

Lines can have bookmarks placed on them either by choosing the Toggle Bookmark command (Ctrl+F2) from the Search menu, or by clicking Mark All on the Find dialog.

To Go to the Next Bookmark:

From the Search menu, choose the Next Bookmark command (F2).

To Go to the Previous Bookmark:

From the Search menu, choose the Previous Bookmark command (Shift+F2).

To Clear a Single Bookmark:

From the Search menu, choose the Toggle Bookmark command (Ctrl +F2).

To Clear all Bookmarks:

From the Search menu, choose the Clear All Bookmarks command (Ctrl+Shift+F2).

To Delete all Bookmarked Lines:

From the Edit menu, choose the Delete Bookmarked Lines command.

To Copy all Bookmarked Lines to the Clipboard:

From the Edit menu, choose the Copy Bookmarked Lines command.

To Cut all Bookmarked Lines to the Clipboard:

From the Edit menu, choose the Cut Bookmarked Lines command.

To Extend the Selection to the Next Bookmark:

From the Search menu, choose the Go To command.   Check the Next Bookmark and Extend Selection options on the Go To dialog box, then click OK.

Examples - Finding Text

See Also: <u>Replacing Text</u>

These examples all use UNIX extended regular expression syntax.

1. Find all trailing spaces:

    ```
    [ \t]+$
    ```
    finds one or more spaces or tabs followed by the end of line.

2. Find an empty line:

    ```
    ^$
    ```
    finds the beginning of a line immediately followed by its end.

3. Find everything on a line:

    ```
    ^.*
    ```
    finds the beginning of a line, followed by zero or more of any characters, up to the end of the line.

4. Find "$12.34":

    ```
    \$12\.34
    ```
    Note that '.' and '$' have been escaped using the backslash to hide their regular expression meanings.

5. Find any valid C language variable name:

    ```
    \<[_a-zA-Z][_a-zA-Z0-9]*
    ```
    finds a word starting with an underscore or alphabetic character, followed by zero or more underscores or alphanumeric characters.

6. Find an inner-most bracketed expression:

    ```
    ([^()]*)
    ```
    finds a left bracket, followed by zero or more characters excluding left and right brackets, followed by a right bracket.

7. Find a repeated expression:

    ```
    \([0-9]+\)-\1
    ```
    This uses a tagged expression "\(...\)" to find one or more digits, followed by a hyphen, followed by the string matched by the tagged expression.   So this regular expression will find 12-12, but not 12-34.

Examples: Replacing Text

These examples all use UNIX extended regular expression syntax.

1. Find any alphabetic word starting with an upper case letter:

   ```
   [A-Z][a-z]+
   ```
   and replace with the same word all in upper case:

   ```
   \U&
   ```

2. Find a C language variable name starting with a lower case letter:

   ```
   \<[a-z][_a-zA-Z0-9]*
   ```
   and make the first letter upper case:

   ```
   \u&
   ```

3. Find two numeric strings separated by one or more spaces:

   ```
   \([0-9]+\) +\([0-9]+\)
   ```
   and swap them around, using a tab to separate them:

   ```
   \2\t\1
   ```

4. Find "paste":

   ```
   paste
   ```
   and replace with the contents of the clipboard:

   ```
   \p
   ```

5. To change:

X100000	to	X100.000
Y100123		Y100.123
Z600		Z.600

   Find: `\([XYZ]\)\([0-9]*\)\([0-9][0-9][0-9]\)`

   Replace: `\1\2.\3`

Regular Expressions

A regular expression (RE) is a mechanism for describing patterns in text when executing the Find, the Replace, and the Find in Files commands.   An RE is made up of ordinary characters from the ANSI character set, some of which take on the special meanings described below.

See How to Use Regular Expressions for the differences between the default syntax and POSIX syntax.

Ordinary Characters

An ordinary character is an RE that matches itself.   It can be any character in the ANSI character set except <newline> and the special characters listed below.   An ordinary character preceded by a backslash is treated as the ordinary character itself, except when the character is **(**, **)**, **<**, **>**, or the letters **f**, **n, t** and **x**, or the digits **1** through **9**.

Hex Characters

Any character can be represented by its hex value.   This is specified with the pattern \x*dd*, where *dd* is any 2-digit hexadecimal number, excluding zero.

Tabs

A tab character is represented by the pattern \t.

Page Breaks

A page break (form feed) character is represented by the pattern \f.

Line Breaks

A line break is represented by the pattern \n.   This matches carriage return and line feed characters. Note that these cannot be combined with repetition operators (see below), so you can only match an exact number of them (e.g. \n\n will match a single blank line.) **Do not** use this for constraining matches to the end of a line, as it's much more efficient to use "$" (see Expression Anchoring below). This pattern should only be used to match text that spans line boundaries.

Special Characters

These special characters, can be rendered ordinary by preceding them with a backslash (\), if they are single special characters, or removing the preceding backslash if they are compound special characters.

Character	Context
. [\	The period, left square bracket, and backslash are special except when used in a Class Expression.
* ? +	Asterisk, question mark and plus are special except when used in a class expression, as the first character of an RE, or as the first character of a Tagged Expression.
-	The hyphen is special in a Class Expression, except as the first or last character of that expression.
^	The circumflex is special when used as the first character of an entire RE (see Expression Anchoring), or as the first character of a Class Expression.
$	The dollar sign is special when used as the last character of an entire RE (see Expression Anchoring).

Wildcard Character

The period (**.**), when used outside of a class expression, matches any character except newline.

Repetition Operators

The asterisk (*****) matches zero or more occurrences of the smallest possible preceding regular expression, while the question mark (**?**) matches zero or one, and the plus sign (**+**) matches at least one occurrence.   For example, A*b+ matches zero or more A's followed by one or more b's.

Interval Operator

Repeats the smallest possible preceding regular expression the given number of times.   The options are:

\{count\}	Matches exactly count times.
\{min,\}	Matches at least min times.
\{min,max\}	Matches between min and max times.

Alternation Operator

The alternation operator (\|) matches either the expression to its left or the one to its right. It has a lower precedence of any other regular expression operator, so the surrounding RE's must be bracketed with \ (...\) if only a part of them is to be matched.

Class Expressions

A class expression is a RE, enclosed in square brackets (**[…]**), that matches any one of the elements contained in the brackets.   The permitted elements of a class expression are:

Simple Characters:

These are single characters that match themselves.   To match a right square bracket (**]**), it must be the first character of the class expression, after any initial circumflex (see Negated Class Expressions).   To match a hyphen, it must be either the first or the last character of the class expression.   For example [AaBb] matches upper or lower case A or B.

Negated Class Expressions:

If the first character of a class expression is the circumflex (**^**), the expression matches any character not in the class.   For example [^AB^] matches any character except A, B and the circumflex itself.

Range Expressions:

A range expression is two characters separated by a hyphen (**-**).   It matches any of the characters in the ANSI collating sequence, between the two characters.   For example, [A-Za-z0-9-] matches any upper or lower case letter or digit, or the hyphen itself.

Character Class Operators:

These can be used as an alternative way of representing classes of characters.   For example, [a-z0-9] is equivalent to [[:lower:][:digit:]].   The defined classes are:

Expression	Description
[:alpha:]	Any ANSI letter.
[:lower:]	Any lower case ANSI letter.
[:upper:]	Any upper case ANSI letter.
[:alnum:]	Any digit or ANSI letter.
[:digit:]	Any digit.
[:xdigit:]	Any hexadecimal digit (0-9, a-f or A-F).
[:blank:]	Space or tab.
[:space:]	Space, tab, vertical tab, return, line feed, form feed.
[:cntrl:]	Control characters (Delete and ASCII codes less than space).
[:print:]	Printable characters, including space.
[:graph:]	Printable characters, excluding space.
[:punct:]	Anything that is not a control or alphanumeric character.
[:word:]	ANSI letters, hypens and apostrophes.
[:token:]	ANSI letters, digits and underscores.

Expression Anchoring

An RE can be restricted to matching strings that begin or end a line or word, as follows:

^	A circumflex as the first character of an RE anchors the expression to the beginning of the line.
$	A dollar sign as the last character of an RE anchors the expression to the end of the line.

\<	The character pair **\<** anchors the next RE to the start of a word.
\>	The character pair **\>** anchors the previous RE to the end of a word.

Tagged Expressions

A tagged expression is an RE that starts with the pair **\(** and ends with the pair **\)**.   There can be up to nine such expressions in a complete RE.   Such an expression matches the same as the expression without the surrounding **\(** and **\)**.   The first expression defined in this way can be referenced as **\1** later in the RE, and so on up to **\9** for the ninth tagged expression.   Each such reference matches the same string as its original tagged expression.   For example \(tu\) \1 matches the string "tu tu".

References to tagged expressions can also be used in <u>Replacement Expressions</u>.

Replacement Expressions

Replacement expressions are used to substitute text in conjunction with Tagged Regular Expressions, when using the Replace command.

Expression	Definition
&	Substitute the text matching the entire search pattern.
\0 to \9	Substitute the text matching tagged expression 0 through 9. \0 is equivalent to &.
\f	Substitute a page break (form feed).
\i<*expression*>	Substitute a sequence number.
\n	Substitute a newline.
\p	Substitute the contents of the clipboard.
\t	Substitute a tab.
\x*dd*	Substitute the character with hex code *dd* (must be 2 hex digits, excluding 00).
\u	Force the next substituted character to be in upper case.
\l	Force the next substituted character to be in lower case.
\U	Force all subsequent substituted characters to be in upper case.
\L	Force all subsequent substituted characters to be in lower case.
\E or \e	Turns off previous \U or \L.

To substitute a literal **** or **&**, use **** and **\&**.

Warning:

Beware of replacing a pattern that is matched with a regular expression that can optionally match nothing, such as ".?" or "a*".   In these degenerate cases, TextPad can go into a loop, until the line becomes too long.

The Status Bar

| | | 1 | 2 | Read | Ovr | Block | Sync | Rec | Caps | 3:50 pm |
The status bar is displayed at the bottom of the main window.   To display or hide the status bar, use the Preferences command in the Configure menu.

Theleft pane of the status bar describes the actions of menu items as you use the arrow keys to navigate through menus.   This area similarly shows messages that describe the actions of toolbar buttons as you depress them, before releasing them.   (If after viewing the description of the toolbar button command you wish not to execute the command, then release the mouse button while the pointer is off the toolbar button.)

The right hand panes of the status bar indicate the following information:

Indicator	Description
1	The line number of the <u>cursor</u>.
2	The column number of the cursor.
Read	The file is read-only, otherwise **Edit** is shown.
Ovr	The Insert key is latched down, otherwise **Ins** is shown.
Block	Block or **Norm**al selection mode, or **Wrap** for word wrap mode.
Sync	Synchronized scrolling of all views is enabled.
Rec	A keystroke macro is being recorded.
Caps	The Caps Lock key is latched down.
3.50pm	The current time.

The status bar is *active*.   This means that you can double left click any of its panes (except for Time) to change the indicated state.

The Toolbar

The toolbar is displayed across the top of the main window, below the menu bar.   The toolbar provides quick mouse access to many commands.

To display or hide the toolbar, use the Preferences command in the Configure menu.

The effect of some buttons can be modified by holding the Shift or Ctrl Key down when they are clicked, as shown in this table:

Click	Normal Operation	With Shift	With Ctrl
	Opens a new document.		
	Opens an existing document using the Open File dialog box, in which you can locate and open the desired file.	Displays the Quick File Open dialog box.

	Temporarily pauses the keystroke macro recorder.		

Playback Button (Toolbar)

	Normal Operation	**With Shift**	**With Ctrl**
	Plays back the scratch keystroke macro.	Displays the Playback Macro dialog box.	

The Keyboard

These tables list the default command shortcuts for TextPad. If you have chosen to work in compatibility mode with another application, you can view the shortcuts on the <u>Keyboard</u> tab of the Customize dialog box.

Single Key Shortcuts:

Key	Modifier	Command
A	Ctrl	Select All
B	Ctrl	Move the <u>cursor</u> back to start of word
B	Ctrl+Shift	Select back to start of word
C	Ctrl	Copy selection to clipboard
C	Ctrl+Shift	Append selection to clipboard
D	Ctrl	Move cursor back to end of word
D	Ctrl+Shift	Select back to end of word
E	Ctrl	Center text
E	Ctrl+Shift	Right align text
F	Ctrl	Find next instance of search pattern
F	Ctrl+Shift	Find previous instance of search pattern
G	Ctrl	Go to line
I	Ctrl	Increase indentation
I	Ctrl+Shift	Reduce indentation
J	Ctrl	Join selected lines
J	Ctrl+Shift	Split word-wrapped lines
K	Ctrl	Invert case of selection
L	Ctrl	Convert selection to lower case
L	Ctrl+Shift	Insert a page break
M	Ctrl	Find matching { [(< or >)] }
M	Ctrl+Shift	Select to matching { [(< or >)] }
N	Ctrl	Create a new document
O	Ctrl	Open a document using the common Open File dialog box
O	Ctrl+Shift	Open a document by typing its name
P	Ctrl	Print active document
P	Ctrl+Shift	Preview the active document as it will print.
Q	Ctrl	Prefix key for two key commands (see below)
R	Ctrl	Playback the scratch macro.
R	Ctrl+Shift	Record a new macro.
S	Ctrl	Save the active document
S	Ctrl+Shift	Save all documents
T	Ctrl	Transpose the lines or characters either side of the cursor
T	Ctrl+Shift	Transpose the words either side of the cursor
U	Ctrl	Convert selection to upper case
U	Ctrl+Shift	Convert first character of selection to uppercase and the rest to lower case
V	Ctrl	Paste text from the clipboard
V	Ctrl+Shift	Insert the contents of a file at the <u>cursor</u> position.
W	Ctrl	Move cursor forward to start of word
W	Ctrl+Shift	Select forward to start of word
X	Ctrl	Cut the selection to the clipboard

X	Ctrl+Shift	Cut and append the selection to the clipboard
Y	Ctrl	Redo last Undo
Y	Ctrl+Shift	Redo all Undos
Z	Ctrl	Undo last edit
Z	Ctrl+Shift	Undo all edits
0	Alt	Activate the Clip Library
Break	Ctrl	Stop the tool running in the command window (only under 32-bit versions of Windows)
Backspace		Delete selection, or character before the cursor, (replace it with a space in overtype mode).
Backspace	Ctrl	Delete back to the last start of word.
Delete		Delete selection, or character after the cursor.
Delete	Ctrl	Delete forward to the next start of word.
Delete	Ctrl+Shift	Delete to the end of the line.
Delete	Alt	Delete all lines in the document.
End		Cursor to end of line.
End	Shift	Select to end of line.
End	Ctrl	Cursor to end of document.
End	Ctrl+Shift	Select to end of document.
End	Alt	Cursor to start of last visible line.
Enter		Start a new line in an edit document, or do a hypertext jump in a command or search results window.
Enter	Ctrl	Insert new line after current line
Enter	Ctrl+Shift	Insert new line before current line
Enter	Alt	Display in-context properties dialog box
Escape		Cancel any existing selection
Home		Cursor to start of line. Press twice to go to the left margin. Reassign this shortcut to "LineLeft" if you always want it to go to the left margin.
Home	Shift	Select to start of line. Press twice to select to the left margin. Reassign this shortcut to "LineLeftSel" if you always want it to select to the left margin.
Home	Ctrl	Cursor to start of document.
Home	Ctrl+Shift	Select to start of document.
Home	Alt	Cursor to start of first visible line.
Insert		Switch between insert and overtype mode..
Scroll Lock		Locks cursor position when scrolling with page up/down keys.
Tab		Indent selected lines, or move cursor to next tab stop.
Tab	Ctrl	Next window (same as Ctrl+F6).
Tab	Ctrl+Shift	Previous window (same as Ctrl+Shift+F6).
Tab	Shift	Reduce indentation of selected lines, or move cursor to previous tab stop.
Left Arrow		Cursor left one character.
Left Arrow	Shift	Select left one character.
Left Arrow	Ctrl	Cursor left one word
Left Arrow	Ctrl+Shift	Select left one word
Right Arrow		Cursor right one character.
Right Arrow	Shift	Select right one character.
Right Arrow	Ctrl	Cursor right one word.

Right Arrow	Ctrl+Shift	Select right one word.
Down Arrow		Cursor down one line.
Down Arrow	Shift	Select down one line.
Down Arrow	Alt	Cursor down to the start of the next paragraph.
Down Arrow	Alt +Shift	Select to to the start of the next paragraph.
Down Arrow	Ctrl	Scroll the view up one line, without moving the cursor.
Up Arrow		Cursor up one line.
Up Arrow	Shift	Select up one line.
Up Arrow	Alt	Cursor up to the start of the previous paragraph.
Up Arrow	Alt+Shift	Select to to the start of the previous paragraph.
Up Arrow	Ctrl	Scroll the view down one line, without moving the cursor.
F1		In-context help
F1	Ctrl	Display document statistics on status bar
F1	Shift	Invoke in-context help cursor
F2		Go to next bookmark
F2	Ctrl	Set or clear a bookmark on the current line
F2	Shift	Go to previous bookmark
F2	Ctrl+Shift	Clear all bookmarks
F3		Invoke the Manage Files dialog box
F3	Ctrl	Show or hide the Clip Library
F3	Alt	Invoke Windows File Manager or Explorer
F4		Hypertext jump to next item in Search or Command Output window
F4	Shift	Hypertext jump to previous item in Search or Command Output window
F4	Ctrl	Close the active window.
F5		Invoke the Find dialog box
F5	Ctrl	Invoke Find in Files dialog box
F6		Activate next view
F6	Ctrl	Activate next window
F6	Ctrl+Shift	Activate previous window
F7		Check the spelling of the active document.
F7	Ctrl	Invoke the Playback Macro dialog box.
F8		Invoke Replace dialog
F8	Ctrl	Replace next instance of search pattern
F9		Sort
F9	Ctrl	Compare
F9	Shift	Word count
F10		Activate the main menu
F10	Shift	Popup the in-context document menu
F10	Ctrl	Popup the insert date/time menu
F11		Invoke the Document Selector
F11	Ctrl	Activate the Command Results window
F11	Shift	Activate the Search Results window

Two-key Shortcuts:

Keys	Command
Ctrl+Q, B	Switch in and out of block select mode
Ctrl+Q, C	Display the Customize dialog box
Ctrl+Q, E	Switch between read-only and edit modes
Ctrl+Q, F	Display the Font Selection dialog box
Ctrl+Q, H	Display/hide the horizontal scroll bar
Ctrl+Q, L	Display/hide line numbers
Ctrl+Q, P	Display the Preferences dialog box
Ctrl+Q, R	Set the right margin at the cursor position
Ctrl+Q, S	Switch in and out of selection mode
Ctrl+Q, Y	Switch in and out of synchronized scrolling mode
Ctrl+Q, V	Display/hide visible spaces, tabs and paragraphs.
Ctrl+Q, W	Switch in and out of word-wrap mode

Typing Control Characters

The Mouse

Cursor Positioning:

To set the insertion position with the mouse, click the left mouse button when the mouse <u>cursor</u> is at the required character position.   You can set it to the start of a line by clicking in the left margin next to the line.

Text Selection:

To do this:	In TextPad Mode:	In MS Compatibility Mode:
Select any text	Click on the first character and drag to the last.	Click on the first character and drag to the last.
Select a single word	Double click on the word.	Double click on the word.
Select an entire line	Double click in the left margin next to the line, or **non-word-wrap only:** triple click anywhere in the line.	SIngle click in the left margin next to the line, or **non-word-wrap only:** triple click anywhere in the line.
Select an entire paragraph	**Word-wrap:** Triple click anywhere in the paragraph.	**Word-wrap:** Triple click anywhere in the paragraph.
	Non word-wrap: Triple click in the left margin.	**Non word-wrap:** Double click in the left margin.
Select the entire document	Press Ctrl and click in the left margin.	Press Ctrl and click in the left margin.
Extend the current selection	Press Shift and click or drag to the new last character position.	Press Shift and click or drag to the new last character position.

In-context Menus:

- Right click a document to pop up the in-context menu.
- Ctrl+Right click an edit document to pop up the insert date/time menu.

The **cursor** is the blinking vertical line or block, which indicates the insertion position for text.   Contrast this with the **cursor**, which tracks the mouse position.

The **mouse cursor** is a pointer on the screen which tracks the mouse position. Contrast this with the **cursor**, which is the blinking vertical line or block cursor indicating the insertion position for text.

Introducing TextPad

Winner - 1995 and 1997 Ziff-Davis Shareware Awards.

Winner - 1996 Shareware Industry Awards.

When just getting the job done is work enough, the last thing you need is to waste time having to learn yet another computer application. Your experience with other tools should be relevant to each new application, making it possible to sit down and use that new application right away.

That's why TextPad is so popular. Whether you simply need a powerful replacement for Notepad, a tool for editing your web pages, or a programming IDE, TextPad does what you want, the way you would expect.

TextPad is designed to provide the power and functionality to satisfy the most demanding text editing requirements.   It is Windows™ hosted, and comes in 16 and 32-bit editions.   Huge files can be edited by either - just choose the edition that works best with your PC.   The 32-bit edition can edit files up to the limits of virtual memory, and it will work with Windows 95, Windows NT and Windows 3.1 with Win32s extensions.

TextPad has been implemented according to the Windows 95 user interface guidelines, so great attention has been paid to making it easy for both beginners and experienced users. Command shortcuts can be modified to taste, with emulations provided for WordStar, BRIEF, and Microsoft applications.   In-context help is available for all commands, and in-context menus pop-up with the right mouse button.   The Windows multiple document interface allows many files to be edited simultaneously, with up to 2 views on each file.   Text can be dragged and dropped between files.

In addition to the usual cut and paste capabilities, you can correct the most common typing errors with commands to change case, and transpose words, characters and lines.   Other commands let you indent blocks of text, reformat paragraphs, and insert whole files.   Any change can be undone or redone, right back to the first one made.   Visible bookmarks can be put on lines, and edit commands can be applied to lines with bookmarks.
Frequently used combinations of commands can be saved as keystroke macros, and the spelling checker has dictionaries for 10 languages.

It also has a customizable tools menu, and integral file compare and search commands, with hypertext jumps from the matched text to the corresponding line in the source file (ideal for integrating compilers).

Sumary of Features

Year 2000 Compliance

Summary of Features

📄   Huge files can be edited (up to the limits of virtual memory for the 32-bit edition).   See Specifications for the actual limits.

📄   Supports Universal Naming Convention (UNC) style names, and long file names with spaces.

📄   CUA compliant keyboard commands, which can be fully customized.

📄   Multiple personalities: compatibility with Microsoft applications, WordStar, BRIEF and TextPad 2.

📄   The user interface is available in French, German, Italian, Polish, Portuguese and Spanish.

📄   Multiple files can be simultaneously edited, with up to 2 views per file.

📄   Warm Start feature lets you restart exactly where you left off.

📄   In addition to the usual cut, copy and paste capabilities, selected text can be centered, case shifted and block indented, and characters, words and lines can be transposed.   Cut and copied text can be appended to the clipboard, as well as replacing its contents.

📄   Text can be automatically word-wrapped at the margin, or at a specified column, if it does not fit on a line.   In this mode, text can be split into separate lines where wrapping occurs, or lines can be intelligently joined, preserving paragraphs.

📄   OLE2 drag and drop editing for copying and moving text between documents.

📄   Unlimited undo/redo capability.   The undo buffer can be optionally cleared when a file is saved, or by using the Mark Clean command.

📄   Block (column) selection mode, and visible display of tabs and spaces.

📄   A spelling checker with dictionaries in 10 languages.

📄   A keystroke macro recorder, with up to 64 active macros.

📄   A Clip Library for organizing frequently used text, such as program templates, or HTML tags.

📄   Sorting, using up to 3 keys.

📄   Text can be automatically aligned and indented, relative to the previous line, to aid block indentation.

📄   The right mouse button pops up an in-context menu.

📄   The cursor can be constrained to the text, or can be positioned freely in the document view.

📄   Toolbar with fly-by usage hints, and an *active* status bar.

📄   A powerful search/replace engine using POSIX-style regular expressions.   Sets of files in a directory tree can be searched, and text can be replaced in all open documents at once.

📄   Visible bookmarks can be placed on individual lines, and on all occurrences of a search pattern. Bookmarked lines can be cut, copied or deleted.

📄   A built in file manager for fast file copying, renaming, deleting etc.

📄   Print previewing, and printing with customizable headers/footers and page breaks.

📄   Viewer for binary files using a hexadecimal display format.

📄   Command to view HTML documents in a web browser.

📄   Built in file comparison utility, and up to 32 user-defined tools with parameter macros.

📄   Hypertext links from file search and user tool output to the relevant source line.

📄   DDE interface to other tools, such as VC++.   The editor detects when an open file has been modified by another tool, and prompts you to reopen it.

Specifications

- Conforms to MS Windows User Interface Design Guide 4 recommendations.
- The editor can handle files with up to 32,500 lines in the 16-bit edition, and up to the limits of virtual memory in the 32-bit edition, except that in word-wrapped mode it is also limited to 32,500 lines.
- The maximum line length is 4095 characters.
- The number of concurrent edits is limited by available memory.   In the 16-bit edition, the 64KB local heap restricts this to a maximum of 28.
- Supports Universal Naming Convention (UNC) style, and long file names with spaces.
- 8-bit text files with DOS, UNIX and Macintosh end of line characters are supported.
- Text can be in either the ANSI (Windows) or OEM (DOS) character sets.
- Each document has a single MDI window with up to 2 views.
- Fonts and tab stops are user selectable (fixed width font for editing).
- Up to 16 (user settable) most recently used files are listed on the File menu.
- Up to 32 (16 in 16-bit edition) user-defined commands can be added to the Tools menu.
- Up to 64 (16 in 16-bit edition) keystroke macros can be added to the Macros menu. This is restricted to 2 macros in unregistered copies.

Limitations:

- The 16-bit edition cannot cut or paste more than 64KB at a time.
- Non-OLE drag and drop does not support scrolling.
- The 16-bit edition, and the 32-bit edition under Win32s, can only display the output of a user tool command in a window after the command has completed.
- The 32-bit edition cannot mail files under 16-bit Windows.

Registration Benefits

This product makes use of the most advanced software technology available today.   As the technology improves, so does our software.   Your registration fee enables us to keep it at the forefront of technology, so that you continue to benefit from the productivity gains it gives you.

As a registered user, you will receive:

A copy of the latest release of **both** 16 and 32-bit editions on 3.5" diskette, unless you opt for the download only price, which includes a license for both editions.

A license file entitling you to use all future *maintenance releases (which will be made available for downloading from our Internet web site, CompuServe, AOL and MSN).   This license file will be e-mailed to you, if you quote your e-mail address with your order.

The display of your name, company and registration number on the About dialog box.

Technical support by e-mail, FAX, or through the mail, at no charge, for at least 101 days.

* We reserve the right to introduce an upgrade charge for major new releases.

How to Order

Registration Instructions:

The registration fee can be paid in UK pounds, or US dollars using a check or credit card.   CompuServe members can also use their shareware registration service to pay in US dollars.

Value added tax (<u>VAT</u>) is payable by European Community member countries, so payment is required in UK pounds.   VAT need not be paid, except in the UK, if you quote your VAT registration number with the order..

We always send an invoice if you specify a company name.   Private users can request one by stating "invoice required" in the place of the company name.

If you have already downloaded the latest release, there is no point in paying extra to have the software on diskettes.   Just order it at the <u>no disk</u> price, but make sure you clearly state the e-mail address you want your license to be sent to.

<u>Online Ordering</u>

<u>Paying Direct in UK Pounds</u>

<u>Paying Direct in US Dollars by Check</u>

<u>Paying through PsL in US Dollars by Credit Card</u>

<u>CompuServe Registration</u>

<u>Purchase Orders</u>

Online Ordering

If you have Internet access, you can place your order online, using a secure order form, if your browser suppports them.

For more information, follow the link to online ordering from the home page on our web site.   You may reach it by clicking the following link, if you are running Windows 95, NT 4 or later:

http://www.textpad.com/

Paying in UK Pounds

We accept payment by cheque, or with the following credit cards:

Visa - MasterCard - American Express - Delta - EuroCard - JCB

Cheques must be in UK pound denominated drafts drawn on a UK bank, or by EuroCheque, or by Pound Sterling International Money Order. Sorry, but banking fees for payments in other denominations are prohibitively expensive. (Please note that EuroCheques are not valid for payment in US dollars.)

See the <u>Price List</u> for current pricing, and return the completed <u>Order Form</u>.

Paying in US Dollars by Check

For non-European users, we accept direct payment with a check made out in US dollars. European users **must** pay in UK Pounds, to keep our VAT records in order.

See the Price List for current pricing, and return the completed Order Form.

Paying in US Dollars by Credit Card

MasterCard, Visa, American Express, and Discover orders can be placed through PsL, *a credit card order taking service*.   You can reach PsL 24 hours a day 7 days a week by fax at 1-713-524-6398 or by e-mail to 11709@pslweb.com.   You can also call PsL at 1-800-242-4PsL(4775) or 1-713-524-6394 between the hours of 7:00 am and 6:00 pm CST Monday-Thursday and 7:00 am and 12:30 pm CST on Fridays, except holidays.   You can also mail orders to PsL at P.O. Box 35705, Houston, TX 77235, USA.

THESE NUMBERS ARE FOR ORDERING ONLY.   Any other queries, including the status of the shipment of the order, must be addressed to Helios Software Solutions.   PsL will charge us $2.50 for any queries you make, then pass them on for us to answer anyway, so *please ask us directly*!

PsL requires the following information:

Product Name: TextPad

Users: 1__ 5__ 10__ 20__ 50__ Unlimited__

Diskettes required: Yes__ No__

E-mail Address: _____

Credit Card [   ] MasterCard [   ] VISA [   ] AMEX [   ] Discover

Credit Card Number: _____

Expiry Date: _____

Name On Card: _____

Company: _____

Billing Address: _____

                            _____

                            _____

You **must** specify an e-mail address, unless you order diskettes.

We will automatically send an invoice if you specify your company name.   Private users who want one should state "Invoice Required" in place of the company name.

PsL will notify us within one working day of you placing your order, and we will e-mail a license file to you if you specify your e-mail address.   If you opt for having the software sent on diskettes, we will mail them directly to you.

Note: e-mail addresses can be quite complicated, and occasionally get written down incorrectly by the telephone operators.   If you have not received your license file within a couple of days, please send an e-mail message to: orders@textpad.com

CompuServe Shareware Registration Service

Note: This option for payment is only available for **single** user licenses.   Payment for site licenses **must** be made directly to us in UK Pounds or by a check in US Dollars.

If you have a CompuServe account you can have the registration fee charged to your account.   Simply GO SWREG and follow the online instructions.

The registration ID numbers are:

ID Number	Includes Disks	Price
3938	No	$27
794	Yes	$35

We will automatically send an invoice if you specify your company name.   Private users who want one should state "Invoice Required" in place of the company name.

VAT at 17.5% will be added to these prices for European residents.

CompuServe will notify us on the day of your order and we will e-mail a license file to you.   If you opt for having the software sent on diskettes, we will mail them directly to you.

Purchase Orders

Purchase orders (net 30 days) are accepted only from government and accredited educational institutions and major corporations, provided that they are submitted on purchase order forms with a purchase order number.   Please be sure to include the European or World wide order form with a purchase order.

See the Price List for current pricing.

Price List

<u>Valid for 4 months from 27th May, 1998</u> *(please check our web site for current pricing)*

Single User Prices:

Currency	Without Diskettes	With Diskettes
US Dollars	$27.00	$35.00
UK Pounds (ex. VAT)	£17.00	£20.00
UK Pounds (inc. VAT*)	£19.97	£23.50

Site License Prices:

Users	US Dollars	UK Pounds (ex. VAT)	UK Pounds (inc. <u>VAT</u>*)
5	$120.00	£80.00	£94.00
10	$210.00	£140.00	£164.50
15	$300.00	£200.00	£235.00
20	$360.00	£240.00	£282.00
50	$750.00	£500.00	£587.50
Unlimited	$1000.00	£680.00	£799.00

Notes:

📄   If you have already downloaded the latest release, there is no point in paying extra to have the software on diskettes.   Order it without diskettes.

📄   When purchasing without diskettes, you must download the software yourself, and *must provide an e-mail address* for us to send your license file to.

📄   * <u>VAT</u> at 17.5% is payable by UK residents, and European residents who are not VAT registered. You **must** pay in <u>UK Pounds</u> if VAT is applicable.

📄   TextPad can be purchased in <u>US Dollars</u> or UK pounds only.   The prices are as shown in the tables above, and are not subject to exchange rate fluctuations.   They are inclusive of shipping and handling.

📄   A site license is for a single physical site.

📄   Site licenses always include one set of diskettes.

📄   Additional educational discounts for site licenses are available on request.

VAT - Value Added Tax

Value Added Tax (VAT) is known by the following (polite) names, in other member countries of the European Community:

- **Austria**: Mehrwertsteuer (Mwst)
- **Belgium**: Taxe sur la Valeur Ajoutée (TVA)
- **Denmark**: Mervaerdiafgift (Moms)
- **Finland**: Arvonlisävero (ALV)
- **France**: Taxe sur la Valeur Ajoutée (TVA)
- **Germany**: Mehrwertsteuer (Mwst)
- **Greece**: ØIIA (FPA)
- **Italy**: Imposta sul Valore Aggiunto (IVA)
- **Luxembourg**: Taxe sur la Valeur Ajoutée (TVA)
- **Netherlands**: Belasting over de Toegevoegde Waarde (BTW)
- **Portugal**: Imposto sobre el Valor Acrescentado (IVA)
- **Spain**: Impuesto sobre el Valor Anadido (IVA)
- **Sweden**: Mervärdesskatt (Moms)

VAT at 17.5% must be paid by:

- All UK residents.
- Residents of all other European Community countries who are not registered for VAT.

Thank you for your interest in this product.

Registered User License Agreement

This is a legal agreement between you (either an individual or an entity) and Helios Software Solutions. By opening the sealed software packages and/or by using the SOFTWARE, you agree to be bound by the terms of this Agreement.   If you do not agree to the terms of this Agreement, promptly return the disk package and accompanying items for a full refund.

SOFTWARE LICENSE

1. GRANT OF LICENSE.   This License Agreement ("License") permits you to use one copy of the software product identified above, which may include user documentation provided in "on-line" or electronic form ("SOFTWARE").   The SOFTWARE is licensed as a single product.   Its component parts may not be separated for use on more than one computer or by more than one user at any time.   The SOFTWARE is "in use" on a computer when it is loaded into the temporary memory (i.e. RAM) or installed into the permanent memory (e.g. hard disk) of that computer.   If the SOFTWARE is permanently installed on the hard disk or other storage device of a computer and one person uses that computer more than 80% of the time, then that person may also use the SOFTWARE on a portable or home computer.

2. COPYRIGHT.   The SOFTWARE is owned by Helios Software Solutions and is protected by United Kingdom copyright laws and international treaty provisions.   Therefore you must treat the SOFTWARE like any other copyrighted material (e.g. a book or musical recording) except that you may either (a) make one copy of the SOFTWARE solely for backup or archival purposes, or (b) transfer the SOFTWARE to a single hard disk provided you keep the original solely for backup or archival purposes.   You may not copy the printed materials accompanying the SOFTWARE, nor print copies of any user documentation provided in "on-line" or electronic form.   You must not redistribute the file TEXTPAD.LIC, which licenses your copy of the software.

3. OTHER RESTRICTIONS.   This License is your proof of license to exercise the rights granted herein and must be retained by you.   You may not rent or lease the SOFTWARE, but you may transfer your rights under this License on a permanent basis, provided you transfer this License, the SOFTWARE and all accompanying printed materials, retain no copies, and the recipient agrees to the terms of this License.   You may not reverse engineer, decompile, or disassemble the SOFTWARE, except to the extent applicable law expressly prohibits the foregoing restriction.

LIMITED WARRANTY

LIMITED WARRANTY.   Helios Software Solutions warrants that the SOFTWARE will perform substantially in accordance with the accompanying printed material and on-line documentation for a period of 101 days from the date of receipt.

CUSTOMER REMEDIES.   Helios Software Solutions' entire liability and your exclusive remedy shall be, at Helios Software Solutions' option, either (a) return of the price paid or (b) repair or replacement of the SOFTWARE that does not meet this Limited Warranty and that is returned to Helios Software Solutions with a copy of your receipt.   This Limited Warranty is void if failure of the SOFTWARE has resulted from accident, abuse, or misapplication.   Any replacement SOFTWARE will be warranted for the remainder of the original warranty period or thirty (30) days, whichever is longer.

NO OTHER WARRANTIES.   To the maximum extent permitted by applicable law, Helios Software Solutions disclaims all other warranties, either express or implied, including but not limited to implied warranties of merchantability and fitness for a particular purpose, with respect to the SOFTWARE and any accompanying written materials.

NO LIABILITY FOR CONSEQUENTIAL DAMAGES. To the maximum extent permitted by applicable law, in no event shall Helios Software Solutions be liable for any damages whatsoever (including, without limitation, damages for loss of business profits, business interruption, loss of business information, or other pecuniary loss) arising out of the use or inability to use the SOFTWARE, even if Helios Software Solutions has been advised of the possibility of such damages.

Unregistered User License Agreement

LIMITED WARRANTY AND REMEDIES

THE PROGRAM IS PROVIDED "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.   IN NO EVENT WILL THE AUTHOR BE LIABLE TO YOU FOR ANY DAMAGES, INCLUDING INCIDENTAL OR CONSEQUENTIAL DAMAGES, ARISING OUT OF THE USE OF THE PROGRAM, EVEN IF ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

YOU ACKNOWLEDGE THAT YOU HAVE READ THIS LICENSE, UNDERSTAND IT AND AGREE TO BE BOUND BY ITS TERMS AS THE COMPLETE AND EXCLUSIVE STATEMENT OF THE AGREEMENT BETWEEN US, SUPERSEDING ANY PROPOSAL OR PRIOR AGREEMENT, ORAL OR WRITTEN, AND ANY OTHER COMMUNICATIONS BETWEEN US RELATING TO THE SUBJECT MATTER OF THIS LICENSE.

TextPad is a shareware program and is provided at no charge to the user for evaluation.   Feel free to share unlicensed copies with your friends, but please do not give it away altered or as part of another system.   The essence of shareware software is to provide personal computer users with quality software without high prices, and yet to provide incentive for programmers to continue to develop new products.

If you find this program useful and find that you continue to use it after a reasonable trial period, you must make a registration payment (see the registration instructions for details).   This registration fee will license one copy for use on any one computer at any one time.   All users will receive a copy of the latest release when they register, and free technical support for a limited period.

Commercial users must register and pay for their copies within 30 days of first use or their license is withdrawn.   Site License arrangements may be made by contacting Helios Software Solutions.

Anyone distributing this product for any kind of remuneration must first contact Helios Software Solutions for authorization.

You must treat this software just like a book.   For example, this software may be used by any number of people and may be freely moved from one computer location to another, as long as there is no possibility of it being used at more than one location ata time.   Just as a book cannot be read by two people at the same time.

You are encouraged to pass a copy of this software along to your friends for evaluation, but you must include all files in the original distribution.   Please encourage them to register their copy if they find that they make use of it.

Distributor License Agreement

Anyone wishing to charge people a fee for giving them a copy of this software must have the written authorization of the author, without which, the distributor is guilty of copyright violation.   To receive such authorization, send this completed application, along with a copy of your software library's order form to Helios Software Solutions.   Include £5.00 to cover the cost of processing the application and of sending you the latest version of the software.   For distributors already recognized by the Association of Shareware Professionals, this application is not necessary.

```
Name of Organization: _____

Your Name: _____

Address:    _____
            _____
            _____
```

Terms of Distribution of TextPad:

1.   The fee charged may not exceed $10, including postage, mailer and any other charges.

2.   Your library's catalog or listing must state that this program is not free, but is copyrighted software that is provided to allow the user to evaluate it before paying.

3.   The offering and sale of the software will be stopped at any time the author so requests.

4.   Copies must be made from the copy of the software sent to you with this agreement. This is required for control purposes.

5.   Problems or complaints about the program will be reported to the author for investigation.   In return for a license to charge a fee for the distribution of TextPad, I agree to comply with the above terms of distribution.

```

            your signature                          date

_____  _____  _____
    Keith MacDonald         control #         date
```

Definition of Shareware

Shareware distribution gives users a chance to try software before buying it.   If you try a shareware program and continue using it, you are expected to register.   Individual programs differ on details -- some request registration while others require it, some specify a maximum trial period.   With registration, you get anything from the simple right to continue using the software to an updated program with printed manual.

Copyright laws apply to both shareware and commercial software, and the copyright holder retains all rights, with a few specific exceptions as stated below.   Shareware authors are accomplished programmers, just like commercial authors, and the programs are of comparable quality.   (In both cases, there are good programs and bad ones!)   The main difference is in the method of distribution.   The author specifically grants the right to copy and distribute the software, either to all and sundry or to a specific group.   For example, some authors require written permission before a commercial disk vendor may copy their shareware.

Shareware is a distribution method, not a type of software.   You should find software that suits your needs and pocketbook, whether it's commercial or shareware.   The shareware system makes fitting your needs easier, because you can try before you buy.   And because the overhead is low, prices are low also.   Shareware has the ultimate money-back guarantee -- if you don't use the product, you don't pay for it.

Association of Shareware Professionals

Helios Software Solutions is an approved vendor and associate member of the Association of Shareware Professionals (ASP).

The primary goals of the ASP include:

- **o** To inform users about shareware programs and about shareware as a method of distributing and marketing software.
- **o** To foster a high degree of professionalism among shareware authors by setting programming, marketing, and support standards for ASP members to follow.
- **o** To encourage broader distribution of shareware through user groups and disk dealers who agree to identify and explain the nature of shareware.
- **o** To assist members in marketing their software.
- **o** To provide a forum through which ASP members may communicate, share ideas, and learn from each other.

The Association of Shareware Professionals have drafted a code of ethics for all present and future members.   This code of ethics includes the following requirements:

- **o** A member's program (evaluation version) must not be limited (crippled) in any way.   In the true spirit of Try-Before-You-Buy, users must be able to evaluate all the features in a program before paying the registration fee.
- **o** Members must respond to every registration.   At the very least they must send a receipt for the payment.
- **o** Members must provide technical support for their products for at least 90 days from the date of registration.

The ASP has put in place a system to help ensure that users are treated fairly and professionally.   If a user is unable to resolve a problem with a member author then the user can contact the ASP Ombudsman with their complaint.   The Ombudsman will then try to help resolve the dispute.

ASP Ombudsman Statement:

Helios Software Solutions is a member of the Association of Shareware Professionals (ASP).   ASP wants to make sure that the shareware principle works for you.   If you are unable to resolve a shareware-related problem with an ASP member by contacting the member directly, ASP may be able to help.   The ASP Ombudsman can help you resolve a dispute or problem with an ASP member, but does not provide technical support for members' products.

Please write to the ASP Ombudsman at:

ASP Ombudsman
157-F Love Avenue
Greenwood, IN 46142
U.S.A.

How to Use Keystroke Macros: Overview

Keystroke macros are useful whenever you have the same sequence of editing commands to repeat, or a block of text to insert.   You can record one unnamed (scratch) macro, and up to 64 named ones (16 in the 16-bit edition), which are added to the Macro menu.   Each macro has a default play mode (once only, repeat through selected text, or repeat to the end of the document), which can be overridden when you play it back.

Recordable Commands:

📄 Normal typing.

📄 Selection and cursor positioning using keystrokes.

📄 All commands on the Edit menu, except for Undo and Redo.

📄 All commands on the Search menu, except for Find in Files.

📄 The Convert to DOS/ANSI command on the Tools menu.

📄 All commands on the File and Windows menus.

📄 Next Window and Previous Window commands.

📄 Previously recorded, named macros.

📄 Mouse double and triple clicks.   *Not* mouse motion or drag and drop.

Points to Bear in Mind:

📄 You should normally position the <u>cursor</u> before starting the recorder, since the macro will play back from the current position.   The Find/replace commands are exceptions to this rule.

📄 All of the parameters that you set on the Find or Replace dialog box are recorded.

📄 If you record a Find Next or Previous command, the current search string will be used.   i.e. the search string will not be recorded, so when you play it back, it will try and find a pattern matching the last search string used.

📄 Playback is terminated when the Find command fails to find matching text.

📄 The file name for the Insert File command is recorded.

📄 You can pause the recorder, if you don't want to record some commands in the middle of a recording.

📄 If you want to be able to play back a macro to the end of the document, it is important that you record at least one command to move the cursor down a line.

📄 You can cancel a macro, while it is being played back by, releasing the playback button on the <u>toolbar</u>, or with the Stop Playing command on the Macro menu.

📄 After a macro has finished playing, the Undo command will cancel any changes it made.

📄 The unnamed (scratch) macro is only saved if the option to save the workspace is enabled on the <u>General</u> tab of the Preferences dialog box.

See also: <u>Recording</u>, <u>Playing</u>, <u>Saving</u>, <u>Example</u>.

How to Record Keystroke Macros

To record a keystroke macro:

1. If the <u>cursor</u> position is significant, move it to where you want first.
2. Start the macro recorder with the Record command on the Macro menu.
3. If you have previously recorded a macro, and not yet saved it, you will be asked if you want to erase it.
4. Type as usual, or invoke any of the <u>recordable</u> commands.
5. When you have finished, select the Stop Recording command on the Macros menu, or click the record button again on the toolbar.
6. The first time, you will be prompted to <u>save</u> the macro.   You can choose to just use it as an unsaved (scratch) macro, or to save it with a name, and whether you want to be prompted in future.

Notes:

Macros that are supplied with TextPad are stored in the Samples folder.   Any that you create are stored in the folder specified on the <u>Folders</u> tab of the Preferences dialog box.

If you create any interesting macros that you would like to contribute to our collection, please let us know.   We will make them available from our web site, with full credit given to each author.

Shortcuts:

Toolbar:

Keys: Ctrl+Shift+R

See also: <u>Overview</u>, <u>Playing</u>, <u>Saving</u>, <u>Example</u>.

How to Save a Keystroke Macro

To save the unnamed (scratch) keystroke macro:

1. Choose the Save command from the Macros menu.   The Save Macro dialog box will be displayed.

2. Choose a file name.   The default will be MACROxx.TPM, where xx is a number.   The file will be stored in the folder configured on the <u>Folders</u> tab of the Customize dialog box.

3. In the Display Name box, type text that you want to appear on the Macros menu.   If you insert an '&' before any character, it will be underlined on the menu, and can be used as the menu accelerator.

4. Optionally fill in the Author and Comment fields.   These can be modified later by clicking the <u>Properties</u> button on the Macros tab of the Customize dialog box.

5. Choose the default play mode.   This can later be overridden when <u>playing</u> the macro, or modified as for the Author and Comment fields.

6. Click OK.

See also: <u>Overview</u>, <u>Recording</u>, <u>Playing</u>, <u>Example</u>.

How to Playback a Keystroke Macro

To play back the unnamed (scratch) keystroke macro:

Choose the Playback command from the Macros menu.

Shortcuts:

Toolbar:

Keys: Ctrl+R

To play back a named macro:

Select it by name from the Macros menu.

To play back a macro differently from its default mode:

1. Choose the Multi-play command from the Macros menu.   The Playback Macro dialog box will be displayed.

   Shortcut:

   Toolbar: Shift+

2. Select a named macro, or the scratch macro to play.

3. Choose to play it a specified number of times, or through the current selection, or to the end of file.

4. Click OK.

See also: <u>Overview</u>, <u>Recording</u>, <u>Saving</u>, <u>Example</u>.

Macro Examples

Selecting HTML Tags:

HTML tags are in matched pairs of <…>'s, which may extend over several lines.   You can create a macro to select a whole tag as follows:

1. Open the Find dialog box;
2. Type "<" (without the quotes) in the Find What box;
3. Start the recorder, using Ctrl+Shift+R, or the toolbar button;
4. Click the Find Next button;
5. Select up to the matching ">", using the Match Bracket command on the Search menu (Ctrl+Shift+M);
6. Stop the recorder, using Ctrl+Shift+R, or the toolbar button;
7. Save the macro with a suitable name.

If you want to delete the tag, hit the Delete key before stopping the recorder.   Then you can play it to the end of the file to strip all tags.

Tagging Selected Text with HTML <B> … </B> Tags:

1. Select some text *on a single line*;
2. Open the Replace dialog box;
3. Type "\&" (without the quotes) in the Find What box;
4. Type "<B>&</B>" in the Replace With box;
5. Check the Regular Expression box;
6. Start the recorder, using Ctrl+Shift+R, or the toolbar button;
7. Click the Find Next button;
8. Click the Replace button;
9. Stop the recorder, using Ctrl+Shift+R, or the toolbar button;
10. Save the macro with a suitable name.

To use this macro, select the text that you want displayed in a bold font, then playback the macro.

How to Change Macro Properties

You can change the properties of a macro by choosing Customize from the Configure menu, and selecting the Macros tab.   If you select a macro, and click the Properties button, you can view or modify the following properties:

Property:	Description:
File Name	The name of the disk file containing this macro.
Display Name	A name of up to 40 characters that will appear on the Macros menu. You can insert an '&' to indicate the character to use as the menu accelerator.
Author	This is automatically set to the name of the registered user. It can be up to 40 characters long.
Description	Up to 128 characters to remind you what the macro does.
Default Play Mode	Choose from "Play Once", "Repeat through Selection", and "Repeat to End of File".

How to Customize Macro Preferences

You can customize these macro settings by choosing Customize from the Configure menu, and selecting the Macros tab:

Macros Available: lists the macros available in the specified folder, which have not already been selected.   Macros are searched for first in the folder specified on the <u>Folders</u> tab of the Preferences dialog box, then in the Samples folder.

Macros on menu: lists the macros which have been selected.

Click this button:	To do this:
Add	Add the selected macro from the Available list to the menu.
Remove	Removes the selected macro from the menu, and puts it on the Available list.
Delete	Permanently deletes the macro file.
Move Up	Moves the selected macro up the menu list.
Move Down	Moves the selected macro down the menu list.
Properties	View or change the macro <u>properties</u>.

New command (File menu)

Use this command to create a new, unnamed document.

You can open a new document, and give it a name at the same time, with the <u>Open</u> command.

Shortcuts:

Toolbar:

Keys: Ctrl+N

<u>More information</u>

Open command (File menu)

Use this command to open an existing document.

Select the file (or multiple files) from the Open File dialog box which appears.

Shortcuts:

Toolbar:

Keys: Ctrl+O

More information

Close command (File menu)

Use this command to close all views containing the active document.

You get prompted to save changes to your document before you close it.   If you close a document without saving, you lose all changes made since the last time you saved it.   Before closing an untitled document, the Save As dialog box appears to suggest that you name and save the document.

Shortcuts:

Keys: Ctrl+F4

More information

Close All command (File menu)

Use this command to close all your documents.   If any document has been modified, you will be prompted to save it before its window is closed.

Revert command (File menu)

Use this command to revert to the last saved state of the active document.   You will be asked if it is OK to lose any changes, before the file is reloaded.

Save command (File menu)

Use this command to save an open document.

When you save an unnamed document for the first time, the <u>Save As</u> dialog box appears, so that you can give it a name.

Shortcuts:

Toolbar:

Keys: Ctrl+S

<u>More information</u>

Save As command (File menu)

Use this command to save the active document with another name.
The <u>Save As</u> dialog box appears, so that you can supply the new name.

<u>More information</u>

Save All command (File menu)

Use this command to save all modified documents.

When you save an unnamed document for the first time, the <u>Save As</u> dialog box appears, so that you can give it a name.

Shortcuts:

   Keys: Ctrl+Shift+S

Manage Files command (File menu)

Use this command to open copy, rename, delete or update the timestamps of files.

Shortcuts:

Toolbar:

Keys: F5

More information

Properties command (File menu)

Use this command to display statistics about the active document's file.   The same information can be obtained by choosing Properties from the Configure menu, and selecting the Statistics tab on the Properties dialog box.

Print command (File menu)

Use this command to print the active document.

This command presents a Print dialog box, where you may specify the range of pages to be printed, the number of copies, the destination printer, and other printer setup options.

Shortcuts:

Toolbar:

Keys: Ctrl+P

More information

Print Preview command (File menu)

Use this command to display the active document as it would appear when printed.

When you choose this command, the main window will be replaced with a print preview window in which one or two pages will be displayed in their printed format.   The print preview toolbar offers you options to view either one or two pages at a time; move back and forth through the document; zoom in and out of pages; and initiate a print job.

Shortcuts:

Toolbar:

Keys: Ctrl+Shift+P

Print Setup command (File menu)

Use this command to select the printer and setup the appearance of the printed page.

You can set margins and headers and footers on the <u>Printer Preferences</u> dialog box which appears.

Send command (File menu)

Use this command to send the active document to another person via electronic mail.   You must have a MAPI compatible e-mail system installed to enable this command.

File Statistics command (File menu)

Use this command to display the size and number of lines in the active document, on the status bar.

Shortcuts:

Keys: Ctrl+F1

1, 2, 3, 4 ... command (File menu)

Use the numbers and filenames listed at the bottom of the File menu to open the last several documents you closed.   Choose the number that corresponds with the document you want to open.

Exit command (File menu)

Use this command to end your session.   You can also use the Close command on the application Control menu.   You are prompted to save any documents with unsaved changes.

Shortcuts:

Mouse: Double-click the application's Control menu button.

Keys: Alt+F4

Undo command (Edit menu)

Use this command to undo the last edit command, including Redo.   It is unavailable when there is nothing to undo.

You can undo each edit you made since the file was last saved by repeated use of this command, or you can undo all edits at once using Ctrl+Shift+Z.

Shortcuts:

Toolbar:

Keys: Ctrl+Z   or   Alt+Backspace

More information

Redo command (Edit menu)

Use this command to cancel the last Undo command.   It is unavailable when there is nothing to redo.

You can redo each undo you cancelled by repeated use of this command, or you can redo all undos at once using Ctrl+Shift+Y.

Shortcuts:

Toolbar:

Keys: Ctrl+Y

More information

Cut command (Edit menu)

Use this command to remove the currently selected text from the document and put it on the clipboard. It is unavailable if no text is currently selected.

Cutting text to the clipboard replaces the contents previously stored there.

Shortcuts:

Toolbar:

Keys: Ctrl+X   or   Shift+Delete

More information

Copy command (Edit menu)

Use this command to copy the selected text from the document to the clipboard.   It is unavailable if no text is currently selected.

Copying text to the clipboard replaces the contents previously stored there.

Shortcuts:

Toolbar:

Keys: Ctrl+C   or   Ctrl+Insert

More information

Paste command (Edit menu)

Use this command to insert the contents of the clipboard at the <u>cursor</u> position, or to replace the current selection.   It is unavailable if there is no text on the clipboard.

Shortcuts:

　　Toolbar:　　📄

Keys:　Ctrl+V　or　Shift+Insert

　<u>More information</u>

Copy Selection Append command (Edit menu)

Use this command to copy the currently selected text from the document and append it to any text already on the clipboard.   It is unavailable if no text is currently selected.

Shortcuts:

    Keys: Ctrl+Shift+C

More information

Copy Line command (Edit menu)

Use this command to copy the line containing the <u>cursor</u> to the clipboard. It is unavailable if the current selection extends over a line boundary.

<u>More information</u>

Copy Line Append command (Edit menu)

Use this command to append the line containing the cursor to any text already on the clipboard.   It is unavailable if the current selection extends over a line boundary.

More information

Copy Word command (Edit menu)

Use this command to copy the word containing the <u>cursor</u> to the clipboard.   It is unavailable if any text is selected.

<u>More information</u>

Copy Word Append command (Edit menu)

Use this command to append the word containing the <u>cursor</u> to any text already on the clipboard.   It is unavailable if any text is selected.

<u>More information</u>

Cut Selection Append command (Edit menu)

Use this command to remove the currently selected text from the document and append it to any text already on the clipboard.   It is unavailable if no text is currently selected.

Shortcuts:

Keys: Ctrl+Shift+X

More information

Cut Line command (Edit menu)

Use this command to remove the line containing the <u>cursor</u> from the document and put it on the clipboard.   It is unavailable if the current selection extends over a line boundary.

<u>More information</u>

Cut Line Append command (Edit menu)

Use this command to remove the line containing the <u>cursor</u> from the document and append it to any text already on the clipboard.   It is unavailable if the current selection extends over a line boundary.

<u>More information</u>

Cut Word command (Edit menu)

Use this command to remove the word containing the <u>cursor</u> from the document and put it on the clipboard.   It is unavailable if any text is selected.

Shortcuts:

    Keys: Ctrl+Q

<u>More information</u>

Cut Word Append command (Edit menu)

Use this command to remove the word containing the <u>cursor</u> from the document and append it to any text already on the clipboard.   It is unavailable if anytext is selected.

Shortcuts:

    Keys: Ctrl+Shift+Q

<u>More information</u>

Delete command (Edit menu)

Use this command to delete the currently selected text, or the character after the <u>cursor</u> if nothing is selected.

Shortcuts:

    Keys: Delete

Delete Line command (Edit menu)

Use this command to delete the line containing the <u>cursor</u> from the document.   It is unavailable if the current selection extends over a line boundary.

Delete Word command (Edit menu)

Use this command to delete the word containing the <u>cursor</u> from the document.   It is unavailable if any text is selected.

Delete Bookmarked Lines command (Edit menu)

Use this command to delete all lines that have bookmarks on them.

Cut Bookmarked Lines command (Edit menu)

Use this command to delete all lines that have bookmarks on them, and place them on the clipboard.

Copy Bookmarked Lines command (Edit menu)

Use this command to copy all lines that have bookmarks on them to the clipboard.

Invert Case command (Edit menu)

Use this command to change selected characters from upper to lower case, and vice versa.

If no text is currently selected, the case of the character after the <u>cursor</u> is changed, and the cursor is moved one position to the right.

Shortcuts:

    Keys: Ctrl+K

<u>More information</u>

Upper Case command (Edit menu)

Use this command to change selected characters from lower to upper case.

If no text is currently selected, the case of the character after the cursor is changed, and the cursor is moved one position to the right.

Shortcuts:

Keys: Ctrl+U

More information

Lower Case command (Edit menu)

Use this command to change selected characters from upper to lower case.

If no text is currently selected, the case of the character after the <u>cursor</u> is changed, and the cursor is moved one position to the right.

Shortcuts:

    Keys: Ctrl+L

<u>More information</u>

Sentence Case command (Edit menu)

Use this command to make the first character of the start of each sentence in the current selection upper case, and the rest lower case.

This command is unavailable if no text is currently selected.

Shortcuts:

Keys: Ctrl+Shift+K

More information

Capitalize command (Edit menu)

Use this command to make the first character of each word in the current selection upper case, and the rest lower case.

This command is unavailable if no text is currently selected.

Shortcuts:

    Keys: Ctrl+Shift+U

More information

Transpose command (Edit menu)

Use this command to transpose lines or characters.   If the <u>cursor</u> is at the beginning or end of a line, the adjacent lines are swapped, otherwise the adjacent characters are swapped.

This command is unavailable if any text is selected.

Shortcuts:

    Keys: Ctrl+T

Transpose Words command (Edit menu)

Use this command to transpose the words either side of the <u>cursor</u>. Any punctuation between the words is left in place.   If the cursor is in the middle of a word, its two halves are transposed.

This command is unavailable if any text is selected.

Shortcuts:

Keys: Ctrl+Shift+T

Reduce Indent command (Edit menu)

Use this command to reduce the indentation of currently selected lines.   Note that if more than one line is selected, Shift+Tab has the same effect.

Shortcuts:

   Toolbar:

Keys: Ctrl+Shift+I

More information

Increase Indent command (Edit menu)

Use this command to increase the indentation of currently selected lines. Note that if more than one line is selected, the Tab key has the same effect.

Shortcuts:

Toolbar:

Keys: Ctrl+I

More information

Align Center command (Edit menu)

Use this command to center currently selected lines between the left and right word-wrap margins.

Shortcuts:

    Keys: Ctrl+E

More information

Align Left command (Edit menu)

Use this command to align currently selected lines to the left margin.

<u>More information</u>

Align Right command (Edit menu)

Use this command to align currently selected lines to the right margin.

Shortcuts:

    Keys: Ctrl+Shift+E

More information

Join Lines command (Edit menu)

Use this command to join currently selected lines.   Each line in turn is appended to the first, separated by a single space.

Shortcuts:

Keys: Ctrl+J

More information

Split Wrapped Lines command (Edit menu)

Use this command when in word-wrapping mode to split currently selected lines at the point where they are wrapped, by inserting new line characters.

Reformat command (Edit menu)

Reformat:

Use this command to adjust the lengths of currently selected lines to the word-wrap margin.   Words are moved between the lines as necessary, and blank lines are preserved as paragraph separators.

Shortcuts:

Keys: Ctrl+Shift+J

Insert Line After command (Edit menu)

Use this command to open up a new line after the line containing the <u>cursor</u>.   It is unavailable if the current selection extends over a line boundary.

Shortcuts:

    Keys: Ctrl+Enter

<u>More information</u>

Insert Line Before command (Edit menu)

Use this command to open up a new line before the line containing the <u>cursor</u>.   It is unavailable if the current selection extends over a line boundary.

Shortcuts:

Keys: Ctrl+Shift+Enter

<u>More information</u>

Insert Page Break command (Edit menu)

Use this command to insert a page break at the start of the line containing the <u>cursor</u>.   It is unavailable if any text is currently selected.

Shortcuts:

Keys: Ctrl+Shift+L

<u>More information</u>

Insert File Name command (Edit menu)

Use this command to insert the full file name of the active document at the <u>cursor</u> position, or to replace the current selection.   This command is disabled for documents that have never been saved to a file.

Shortcuts:

Keys: None

Insert File command (Edit menu)

Use this command to insert the contents of a file at the <u>cursor</u> position, or to replace the current selection.   The File Open dialog box appears to allow you to select the file to insert.

Shortcuts:

   Keys: Ctrl+Shift+V

<u>More information</u>

Insert Time command (Edit menu)

Use this command to insert the current time at the <u>cursor</u> position.   The format used is as specified with Control Panel's International applet.

Shortcuts:

    Keys: Ctrl+F10

Insert Short Date command (Edit menu)

Use this command to insert the current date at the <u>cursor</u> position.   The format used is as specified for short dates with Control Panel's International applet.

Shortcuts:

Keys: Ctrl+F10

Insert Long Date command (Edit menu)

Use this command to insert the current date at the <u>cursor</u> position.   The format used is as specified for long dates with Control Panel's International applet.

Shortcuts:

Keys: Ctrl+F10

Mark Clean command (Edit menu)

Use this command to cancel, without undoing, any changes that have been made to the active document.   The changes remain, but you will not be prompted to save the document when you close it.

This command also clears the undo buffer for the document.

Fill Block command (Edit menu)

Use this command to fill the selected block of text with a specified character or characters.   A dialog box is displayed for you to enter the characters to fill with.   These are repeated if the block to be filled is wider than the fill characters.

You can fill with tabs by entering '\t' as the fill character.   If you actually want to fill with '\t', enter it as '\\t'.

This option is disabled until a selection has been made in block mode.

Clear All command (Edit menu)

Use this command to delete the whole contents of the Command Results window.

Shortcuts:

Keys: Alt+Del

Select All command (Edit menu)
Use this command to select the whole document.

Shortcuts:

    Mouse: Crl+Left click in the left margin.

    Keys: Ctrl+A

More information

Find command (Search menu)

Use this command to specify a search string and the search criteria, such as whether or not to match case.   It brings up the Find dialog box, which can remain permanently on screen.

Shortcuts:

Toolbar:

Keys: F5

<u>More information</u>

Find Next command (Search menu)

Use this command to find the next occurrence of the selected text.   If nothing is selected, or the selection extends over one line, the last search string, if any, is used.

If one of the Find, Replace, or Find in Files dialog boxes is on the screen, the new search string is copied to its Find What box.

Shortcuts:

Keys: Ctrl+F

More information

Find Previous command (Search menu)

Use this command to find the previous occurrence of the selected text.   If nothing is selected, or the selection extends over one line, the last search string, if any, is used.

If one of the Find, Replace, or Find in Files dialog boxes is on the screen, the new search string is copied to its Find What box.

Shortcuts:

Keys: Ctrl+Shift+F

More information

Find in Files command (Search menu)

Use this command to specify a search string, the search criteria, such as whether or not to match case, and the list of files to search.   It brings up the Find in Files dialog box, which can remain permanently on screen.

Shortcuts:

Toolbar:

Keys: Ctrl+F5

More information

Replace command (Search menu)

Use this command to specify search and replace strings and the search criteria, such as whether or not to match case.   It brings up the Replace dialog box, which can remain permanently on screen.

Shortcuts:

Toolbar:

Keys: F8

More information

Replace Next command (Search menu)

Use this command to replace the current selection with the last defined replacement string.

Shortcuts:

Keys: Ctrl+F8

More information

Go To command (Search menu)

For text files, this command moves the <u>cursor</u> to the beginning of a specified line, page, column,or byte offset.   It brings up the <u>Go To</u> dialog box, in which you can type the number.   If the number is signed, it is interpreted as an offset relative to the current position.

For binary files, this command moves the cursor to a specified offset in the file.   It   brings up the <u>Go To Address</u> dialog box, in which you type the address in hexadecimal.

Shortcuts:

    Keys: Ctrl+G

Jump Next command (Search menu)

Use this command to do a hypertext jump to the next item in the Search or Command Results windows.

Which of the Search or Command Results windows is used by this command is set according to the last one accessed.   This is shown with a bullet ( ) against it on the Window menu.

Shortcuts:

Toolbar:

Keys: F4

Jump Previous command (Search menu)

Use this command to do a hypertext jump to the previous item in the Search or Command Results windows.

Which of the Search or Command Results windows is used by this command is set according to the last one accessed.   This is shown with a bullet (▤) against it on the Window menu.

Shortcuts:

   Toolbar: ▤

Keys: Shift+F4

Toggle Bookmark command (Search menu)
Use this command to set or clear a bookmark on the current line.

Shortcuts:

Keys:　　　Ctrl+F2

More information

Next Bookmark command (Search menu)

Use this command to go to the next line containing a bookmark.

Shortcuts:

Keys: F2

More information

Previous Bookmark command (Search menu)

Use this command to go to the previous line containing a bookmark.

Shortcuts:

Keys: Shift+F2

More information

Clear All Bookmarks command (Search menu)

Use this command to remove all the bookmarks from the active document.

Shortcuts:

    Keys: Ctrl+Shift+F2

More information

Match Bracket command (Search menu)

Use this command to go to the closing bracket matching the opening bracket after the <u>cursor</u> (or vice versa).

Shortcuts:

    Keys: Ctrl+M

<u>More information</u>

Toolbar command (View menu)

Displays or hides the toolbar.   This setting is also available on the <u>View</u> tab of the Preferences dialog box.

Status Bar command (View menu)

Displays or hides the status bar.   This setting is also available on the <u>View</u> tab of the Preferences dialog box.

Clip Library command (View menu)

Displays or hides the Clip Library.

Shortcuts:

    Keys: Ctrl+F3

More information

Horizontal Scroll Bar command (View menu)

Displays or hides the horizontal scroll bar in the active view.   This setting is also available on the View tab of the <u>Properties</u> dialog box.   Note that you can set the default for all views on the View tab of the <u>Preferences</u> dialog box.

Shortcuts:

Keys: Ctrl+Q, H

Line Numbers command (View menu)

Displays or hides line numbers in the active view. This setting is also available on the View tab of the Properties dialog box.   Note that you can set the default for all views on the View tab of the Preferences dialog box.

Shortcuts:

    Keys: Ctrl+Q, L

Visible Spaces command (View menu)

Displays spaces tabs and paragraph marks as visible characters in the active view. Spaces are shown as (▤) , tabs as (»), and line ends as ().

This setting is also available on the View tab of the Properties dialog box.   Note that you can set the default for all views on the View tab of the Preferences dialog box.

Shortcuts:

Toolbar: ▤

Keys: Ctrl+Q, V

In Web Browser command (View menu)

Displays the active document in the default web browser.   This command is only available for HTML documents.   It is also displayed on the context menu for HTML documents.

For this to work, the browser must have associated itself with the extension of the document's file name.

Shortcuts:

   Keys: None

More information

Compare Files command (Tools menu)

Use this command to look for differences between two text files.   It brings up the Compare Text Files dialog box, in which you can specify the file names.

Shortcuts:

    Keys: Ctrl+F9

More information

Spelling command (Tools menu)

Use this command to check the spelling of the active document.

Shortcuts:

Toolbar:

Keys: F7

More information

Sort command (Tools menu)

Use this command to sort selected lines.

Shortcuts:

Keys: F9

More information

Word Count command (Tools menu)

Use this command to get word, line and character counts for the active document.

Shortcuts:

Keys: Shift+F9

More information

Convert command (Tools menu)

Use this command to convert the character set in the active document between ANSI and DOS (also known as OEM or IBM).

Note that the conversion is not reversible for characters that are unique to the current character set (such as line drawing characters), and the command cannot be undone.

TextPad selects the MS LineDraw font, after converting to DOS, and the default font after converting to ANSI.

More information

HTML Validator command (Tools menu)

Use this command to check the syntax of the active HTML document with CSE 3310 HTML Validator.

Shortcuts:

    Keys: None

More information

Block Select Mode command (Configure menu)

Use this command to alternate between block (column) and normal selection modes.   A check mark is shown against this menu item when block selection mode is enabled.   The current state is also displayed on the status bar.

This command is not available in word-wrapping mode.

Shortcuts:

Mouse: Alt+Left button

More information

Word Wrap command (Configure menu)

Use this command to switch in and out of word-wrapping mode.

Shortcuts:

Toolbar:

Keys: Ctrl+Q, W

More information

Synchronize Scrolling command (Configure menu)

Use this command to switch in and out of synchronized scrolling mode.   When enabled, "Sync" is shown on the status bar, and scrolling one view causes all views of all other documents to scroll by the same amount.

Preferences command (Configure menu)

Use this command to bring up the Preferences dialog box.   This lets you configure various settings.

More information

Customize command (Configure menu)

Use this command to bring up the Customize dialog box.   This lets you customize TextPad's command shortcuts, tools and macros.

<u>More information</u>

Screen Font command (Configure menu)

Use this command to bring up the standard Font dialog box.   This lets you select the font to be used on the screen.

More information

Document Properties command (Configure menu)

Use this command to bring up the Document Properties dialog box.   This lets you change various properties of the active document, and view its statistics.

<u>More information</u>

Split Window command (Window menu)

Use this command to split the active window into 2 panes.   You may then use the mouse or the keyboard arrows to move the splitter bar.   When you are finished, press the left button, or Enter to leave the splitter bar in its new location.

Pressing escape cancels this command.

More information

Tile Across command (Window menu)

Use this command to arrange your windows side by side across the screen.

Tile Down command (Window menu)

Use this command to arrange your windows one above another, in a non-overlapped fashion, down the screen.

Cascade command (Window menu)

Use this command to arrange your windows in an overlapped fashion, from top left to bottom right of the screen.

Arrange Icons command (Window menu)

Use this command to arrange neatly the icons for minimized windows at the bottom of the main window. If there is an open document window at the bottom of the main window, then some or all of the icons may not be visible because they will be underneath this document window.

Clip Library command (Window menu)

Use this command to display or hide the Clip Library.

Shortcuts:

Keys: Ctrl+F3 or Alt+0

More information

Selector command (Window menu)

Use this command to bring up the Document Selector.   This is a list of your open documents that remains permanently on the screen.   You can move and resize this to your requirements, and use it to switch between document windows.

Shortcuts:

   Keys: F11

More information

Search Results command (Window menu)

Use this command to switch to the window showing the results of the last Find in Files command.   This command is unavailable if you close the window, until you do another Find in Files.

After you have used this command, a bullet mark () is shown against it on the Window menu, to show that the Jump Next/Previous commands on the Search menu apply to this window.

Shortcuts:

   Keys: Shift+F11

More information

Command Results command (Window menu)

Use this command to switch to the window showing the output of the last tool from the tools menu.   This command is unavailable if you close the window, until you run another tool.

After you have used this command, a bullet mark ( ) is shown against it on the Window menu, to show that the Jump Next/Previous commands on the Search menu apply to this window.

Shortcuts:

    Keys: Ctrl+F11

More information

1,2,... command (Window menu)

A list of currently open document windows is displayed at the bottom of the Window menu.   A check mark appears in front of the document name of the active window.   Choose a document from this list to make its window active.

Contents command (Help menu)

Use this command to display the opening screen of Help.   From the opening screen, you can jump to step-by-step instructions, and various types of reference information.

Once you open Help, you can click its Contents button whenever you want to return to the opening screen.

Search for Help command (Help menu)

Use this command to display the Search dialog box.   This displays the index of help topics for you to select from.   It is equivalent to clicking the Search button when you are already running the help system.

Tip of the Day command (Help menu)

Use this command to display the Tip of the Day dialog box.

TextPad on the Web command (Help menu)

Use this command to connect to TextPad's home page with your default browser.   The URL is http://www.textpad.com/, in case this command is unable to connect automatically.

About TextPad command (Help menu)

Use this command to display the About dialog box.   This displays various license details, and system resource information.

Context Help command

Use the Context Help command to obtain help on some portion of the graphical interface.   When you choose the Toolbar's Context Help button, the mouse pointer will change to an arrow and question mark.   Then click somewhere in the application window, such as another Toolbar button.   The Help topic will be shown for the item youclicked.

Pressing escape cancels this command.

Shortcuts:
   Keys: Shift+F1

Open Include File (Context menu)

Clicking with the right button on a line beginning `#include ...`, adds a command to open the included file to the popup menu.   If you choose that command, the file will be opened in a new window.

Open All command (Context menu)

This command is on the context (right click) menu for the Search Results window.   It will open all the files listed, or only those in the current selection, and place bookmarks on each matched line.

More information

Installing TextPad

Minimum Requirements:

16-bit Edition:	**32-bit Edition:**
386SX CPU with 4MB RAM	486SX CPU with 4MB RAM (12MB for NT)
1.5 MB free disk space	2.5 MB free disk space
Windows 3.1 in 386 enhanced mode	Windows NT 3.51, NT 4.0, Windows 95 or Windows 3.1 with the Win32s 1.30.172 subsystem.

Installation:

TextPad has a setup program which configures it for the version of Windows that you are using.   Some things will not work if you do not install it correctly.   You have been warned!

The setup program will preserve your existing preferences when updating from an earlier release.

Installing from a ZIP File:
  1. Unzip into an empty temporary folder, with PKUNZIP 2.04g.
  2. Run SETUP.EXE, and follow the on-screen instructions.
  3. Be sure to install TextPad into a different folder from the one used in step 1 above.
  4. Delete the files unzipped in step 1 above.

Installing from Diskettes:

To install TextPad run SETUP.EXE from the disk labelled "Setup Disk 1", and follow the on-screen instructions.

Notes:

📄   Do not attempt to install the 32-bit edition on Windows 3.1 or 3.11 without first installing Microsoft's Win32s 1.30.172, 32-bit extensions to Windows. Win32s is available from CompuServe forum MSWIN as PW1118.EXE, and from URL:
http://support.microsoft.com/support/win32dev/faq/all.asp

📄   If you have previously used an unregistered copy of TextPad, its OLE drag-drop capability may have been disabled.   To enable it, run TextPad (without opening any files) and choose the Preferences command from the Configure menu.   Make sure that the "Use OLE Drag and Drop" box is checked on the General settings tab.   If you get an error message, you will need to obtain OLE 2.   This is standard on Windows 95 and NT, is supplied with many Microsoft products, and the relevant files are included with Win32s.

📄   If you have associated file extensions with TextPad using Explorer or File Manager, remake them using the Associations tabs on the Preferences dialog box.   This will ensure that TextPad is started correctly when you double-click a file.

What Goes Where:

The setup program creates a two-level directory structure.   The top level contains the main program and README files.   The sub-directories contain the following files:

SYSTEM	Online help, dynamic link libraries, tips of the day and command shortcut files.
SPELLING	DLL's and standard dictionaries for the spelling checker.
SAMPLES	Sample macros and clip library files.
USER	Default folder for storing customized command shortcuts, user dictionaries, macros, and clip library files.

TextPad will not work correctly if its files are not where it expects to find them, so please do not move them around.   The USER folder is under your own control, and the files that are stored in it can be specified on the Folders tab of the Preferences dialog box.

Personal Preferences:

The 32-bit edition saves your personal preferences in the Windows registry under the key:
    HKEY_CURRENT_USER\Software\Helios\TextPad 3

The 16-bit edition saves them in TEXTPAD3.INI, in your WINDOWS directory.

All preferences can be configured from within TextPad, so if you edit them directly, it is at your own risk.

Obtaining Updates

How to Sort by Selected Column

To sort lines in your document, using the text in the selected column as a key:

1. Uncheck word-wrapping and check block select mode on the Configure menu.
2. Click the mouse at the top left of the column, and drag it to the bottom right to select the lines to sort.
3. From the Tools menu, choose the Sort command to display the Sort Selected Column dialog box.
4. Choose to sort in ascending or descending order.
5. Set the comparison to be by character, with capital letters being significant or not, or by numeric value.
6. Check the "In character code order" box, if you want characters ordered by their numeric codes, rather than locale specific conventions.
7. If you want to delete all duplicate lines, check the "Delete duplicate lines" box.
8. Click OK.

Notes:

Character comparisons use the collating sequence conventions for the regional settings selected with Windows Control Panel.

Numeric comparisons use signed integral values.   Floating point values are not supported.   If the key field does not contain a number, the value used for comparison is the ANSI code of the first character.

See also: Sorting by Keys

How to Sort by Specified Key Positions

To sort selected lines in your document, using up to 3 keys:

1. Uncheck block select mode on the Configure menu.
2. Click the mouse on the first line, and drag it to the last line to sort.
3. From the Tools menu, choose the Sort command to display the Sort Selected Lines dialog box.
4. For each of up to 3 keys:

   Specify the start display column position and length.   Omit the length if the key extends to the end of the line.

   Choose to sort in ascending or descending order.

   Set the comparison to be by character, with capital letters being significant or not, or by numeric value.
5. Check the " In character code order " box, if you want characters ordered by their numeric codes, rather than locale specific conventions.
6. If you want to delete all duplicate lines, check the "Delete duplicate lines" box.
7. Click OK.

Notes:

📄   Lines are sorted first by key 1, then key 2, then key 3.

📄   Keys may overlap.

📄   Character comparisons use the collating sequence conventions for the locale selected using Windows Control Panel.

📄   Numeric comparisons use signed integral values.   Floating point values are not supported.   If the key field does not contain a number, the value used for comparison is the ANSI code of the first character.

See also: Sorting by Column

How to Check Spelling: Overview

TextPad has licensed spelling checking technology from LexSaurus Software, Inc.   This gives you the ability to verify words, correct spelling errors, check capitalization, create your own dictionaries, and extend the standard ones.   Dictionaries are available in the following languages:

dansk	Nederlands
Deutsch	Norsk
español	svenska
français	UK English
italiano	US English

See Obtaining Standard Dictionaries if you don't already have the dictionary you require.

Standard dictionaries must all be installed in the SPELLING sub-folder of your TextPad folder, but you can specify an alternative folder for custom dictionaries, and personal extensions to standard dictionaries.   (You will want these folders to be different if TextPad is installed on a file server.)   Personal extensions are added to a user dictionary corresponding to the currently selected language or custom dictionary, so the standard dictionaries can be write protected.

By default, if the corresponding dictionary is available, TextPad will use the one corresponding to the language you have set for Windows (using Control Panel).   You can choose a particular language using the Preferences command, and selecting the Spelling tab on the Preferences dialog box.

Spelling is checked for the entire document, unless you select the text to be checked first.   Parts of HTML and LaTex documents are ignored by the spelling checker, as described below.

When a word is not recognized, you can add it to the dictionary.   If you know in advance of words you use that are unlikely to be in the dictionary, you can add them all at once from a simple text file.   Normally, such additions are used in conjunction with the corresponding standard dictionary, but you can have up to two stand-alone custom dictionaries.

Notes regarding HTML documents:

Text in HTML tags will be ignored for documents with standard HTML file extensions.   In addition, the spelling checker will automatically convert to and from HTML syntax for high ANSI characters.   For instance "Ü" will be interpreted as "Ü".

Notes regarding LaTex documents:

Documents with the file extension ".TEX", are considered to contain LaTex type setting information.   Any word starting with "\" will treated as a command, and be ignored, as will any words in "{ … }" immediately following the command.   Text between "$ … $" is treated as mathematical symbols and also ignored.

Any character from the set "OoUuAas", which is preceded by a double quote is interpreted as the corresponding character from the set "ÖöÜüÄäß", and vice versa.

_____

How to Check Spelling

To check the spelling of a whole document, first clear any selection, otherwise select the text to check, then choose the Spelling command from the Tools menu.   You will be presented with the following dialog box for each word that is not recognized:
The spelling checker will list suggestions for the correction, if it has any, and place the most likely of them in the **Change To** box.   If you want to edit the original word, you can copy it to the Change To box by clicking it.

The actions available are:

- **Ignore** this occurrence of the word, and continue checking.
- **Ignore All** occurrences of the word, and continue checking.
- **Change** the original to the word in the Change To box, and continue checking.
- **Auto-correct** all occurrences of the word to the word in the Change To box, and continue checking.
- **Add** the original to the dictionary, and continue checking.   Note that Shift+Add will add all unique words in the document to the dictionary.
- **Suggest** other words similar to the one in the Change To box.   This button is disabled until you modify the Change To word.
- **Undo Last** change, and continue checking.
- **Close** the spelling checker.

The Options button allows you to select the language and configure various other settings.   You can also do this using the Preferences command and selecting the Spelling tab on the Preferences dialog box.

How to Edit User Dictionaries

There is one user dictionary corresponding to each of the available languages.   When you edit a dictionary, no changes are made to the base dictionary.

To edit a user dictionary:

1. Choose the Preferences command on the Configure menu.   The Preferences dialog box will be displayed.
2. Select the Spelling tab.
3. Choose the language to edit.
4. Click the Edit button to display the following dialog box.
The words currently in the dictionary will be listed.   Choose from the following actions (none of which can be undone):

📄   **Add** the word in the Entries box.   If you want an automatic replacement for all occurrences of this word (e.g. one you frequently mistype, or an abbreviation you want to expand), type it in the Automatic Replacement box before clicking Add.

📄   **Delete** the selected word.

📄   **Change** the selected word to the one in the Entries box.   You can change the Automatic Replacement at the same time.

📄   **Add File** of words.   Prepare the file with one word per line, optionally separated by a space or tab from its automatic replacement.   The automatic replacement may contain spaces, but neither the word nor its replacement may contain more than 50 characters.

📄   **Delete All** words in the dictionary.

📄   **Close** the editor.

How to Obtain Standard Dictionaries

Standard dictionaries for the spelling checker are available for downloading from our web site at http://www.textpad.com/, and from CompuServe forum WINUTIL, amongst other sources.   The following table shows the name of the file to download for each language.

To install a language file, simply unzip it into the SPELLING sub-folder of your TextPad folder, then select it on the Spelling tab of the Preferences dialog box.

Language:	File Name:
dansk	txpaddan.zip
Deutsch	txpaddeu.zip
español	txpadesp.zip
français	txpadfra.zip
italiano	txpadita.zip
Nederlands	txpadned.zip
Norsk	txpadbok.zip
svenska	txpadsve.zip
UK English	txpaduk.zip
US English	txpadus.zip

How to Configure the Spelling Checker

To configure the spelling checker:

1. Choose the Preferences command on the Configure menu.   The Preferences dialog box will be displayed.
2. Select the Spelling tab.

This tab can also be displayed by clicking the Options button on the <u>Spelling</u> dialog box.

The parameters you can configure are:

Language: choose from the drop-down list of available languages.   *Automatic* selects the language configured by Control Panel.

Ignore words containing. These settings are on a per language basis:
All CAPITALS - prevent acronyms (e.g. HTML) being checked;
Numbers   - prevent sequence numbers, such as "A10", being checked
Underscores   - prevent words such as "x_offset" being checked
Single letters   - prevent one letter words being checked.

Remember which words to correct automatically. When checked, words corrected using the Auto-Correct button on the Spelling dialog box are permanently saved in the user dictionary.   Otherwise, they are discarded when you close TextPad.

Prompt for proper nouns and abbreviations. When *not checked*, unrecognized words that start with a capital letter, or end with a period are added to the user dictionary exactly as typed.   This means that if they are later encountered without an initial capital letter or trailing period, they will not be recognized, and will have to be added as separate words.   When this option *is checked*, you will be asked if a word starting with a capital letter is a proper noun.   If not, it will be added with the first letter in lower case.   Similarly, if a word ends in a period, you will be asked if it is an abbreviation.   If not, it will be added without the trailing period.

Substitute HTML syntax for high-ANSI characters. When checked, characters with diacritical marks, such as Ü and é, are automatically converted to their equivalent HTML syntax (e.g. Ü), as you type, and when spelling errors are corrected.   This setting applies to the currently selected language, and for HTML documents only.

<u>Edit</u> the selected user dictionary.

Getting Assistance While You Work

You can use the on-line help system in various ways to help you as you work:

📄   Press F1 in any context to display help information.　For example, highlight a menu command and press F1 to find out what it does.

📄   Click

📄 on the toolbar, then click

▶? where you want help.

📄   Hold the mouse pointer over a toolbar button to find out what it does.

📄   Use the Contents command on the Help menu to display all help topics.

Technical Support

Important: Please read <u>How to Report Problems</u> before submitting any problem reports.

Technical support can also be obtained by sending electronic mail to:

<u>support@textpad.com</u>

You can also fax queries to +44 (1772) 786375, or post them to:

Helios Software Solutions
PO Box 619
LONGRIDGE
PR3 2GW
England

How to Report Problems

Have you checked the <u>frequently asked questions</u> and <u>known problems</u> first?

Please provide at least the following information with any problem report:

1. The version number and edition (16/32-bit) of TextPad.
2. The version of Windows (and Win32s if appropriate) that you're using.
3. Driver manufacturer and version numbers for printer problems.
4. Display driver and screen resolution for GPF's, along with any error messages.
5. Which compatibility mode you have selected in TextPad.
6. How to reproduce the problem.

Please do not send large attachments unless we ask you to.   A screen dump can create a 2MB bitmap file, whereas the important information may be represented in only 100 characters.

E-mail your completed report to:

<u>support@textpad.com</u>

or FAX it to:

+44 (1772) 786375

or post it to:

Helios Software Solutions
PO Box 619
LONGRIDGE
PR3 2GW
England

Obtaining Updates

New releases of TextPad will be made available for downloading from various sites, including:

Our Internet Web site at URL: http://www.textpad.com/

Our FTP server at: ftp.textpad.com
   Log in as "anonymous", use your e-mail address as the password, and change directory to /pub.
CompuServe forum WINUTIL, as:
      TPAD16.ZIP   (16-bit edition)
      TPAD32.ZIP   (32-bit edition)

Note: To maintain full TextPad access rights, registered users must keep their original license file with each new release.

Here are some tips you may find useful:

- Remember to make use of the right mouse button.
- Double left click in the left margin selects the line.
- Ctrl+left click in the left margin selects all lines.
- Alt+left click toggles block (column) selection mode.
- The indicators on the status bar can be changed by double clicking them.
- To save a file with a new name, while keeping it open with the original name, select all lines (Ctrl+A) before using the Save As command, and check "Selection only" on the Save As dialog box, before clicking the Save button.
- "@-files" are normal text files containing a list of file names one per line.   They can be used on the command line and in the Quick Open dialog box, to make TextPad open all the specified files, and in the "In Files" box on the Find in Files dialog box, to specify the list of files to search.   Simply precede the name of this file with an "@" to make TextPad look inside it, rather than open it as a normal file.   (Note that the "@" character must not be part of the name of the file.)
- When you right click a "#include" line in a C/C++ source file, a command to open the included file is added to the pop up menu.
- You can use Explorer's Send To command to open selected files with TextPad.   Right click the selection, choose Send To, and pick TextPad from the cascading menu.
- When using the Save As dialog box, Windows 95 will not let you specify a name without an extension, or an arbitrary extension that it does not recognize, unless you select "All Files (*.*)" as the Save as type, or enclose the name in quotes.
- When the File Open dialog box is enabled for multiple file opening, it does not show long file names (except on Windows 95 & NT 4).   This setting can be changed on the General tab of the Preferences dialog box.
- On Windows 95 and NT 4, you can create directories, and rename and delete files using the Open File dialog box, just like in Explorer.
- You can change the default Open File filter by moving it to the top of the list on the Filters tab of the Preferences dialog box.   Note that if you set the option to save the workspace, on the General tab, the default is the last filter that you used.
- Ctrl+Shift+O brings up a simple dialog box for file opening, in which you can type wild cards, such as "*.html".
- In the Replace dialog box, you can use '\t' as a tab and '\f' as a form feed in the search and replace strings, if you check the Regular Expression check box.
- After you have saved the Search or Command output results as an ordinary file, it loses its hypertext jump property, but you can always load an ordinary file into the Command output window by capturing the output from the DOS *TYPE* command.

Known Problems

The following problems have been identified with this release:

1. Various printer drivers do not work with Win32s (e.g. HP DeskJet and Citizen Swift).   The symptoms are that TextPad 32 goes through the motions of printing a file, but it never gets printed.   Try using a compatible driver from the standard list of Windows printer drivers, instead of the one that comes with the printer, or contact your supplier for an updated driver.   You can get PCL driver 6.1d, to fix the problem with HP DeskJets, from CompuServe forum HPPERIPHERALS.

2. If you use TextPad 16 and you have an HP LaserJet 4M with the Adobe printer driver, you must use version 3.01 or later.   This can also be downloaded from CompuServe forum HPPERIPHERALS.

3. WinFax Pro 4 does not work with 32-bit applications that use Win32s to run on 16-bit Windows. Therefore you must use the 16-bit edition of TextPad if you want to use it to send faxes on Windows 3.1x.

4. Print preview does not work with generic text printers.

5. The 32-bit edition will not save files from NT 4 to a UNIX server, if connected using Samba, unless the direct overwrite option is set on the Backup tab of the Preferences dialog box.

6. The edit commands to change case don't work in the 32-bit edition, when running on the Hebrew edition of Windows 3.1 with Win32s.   This is due to a bug in Win32s.

7. On NT 4.0 (up to SP #3, at least) the Open File dialog box cannot be used to open many files at once, due to a 256 character limitation.   TextPad uses a 2Kb buffer, so this is due to a bug in NT 4.0.

8. On NT 4.0 (up to SP #3, at least) TextPad takes a long time to open a file with an associated extension, if you double click the file on the desktop.   This is due to a known problem in NT 4, which is fixed in the first beta release of NT 5.   A workaround is to right click the file, and use the Send To command.

9. The freeware program, ExpNotes, from PC Magazine, will cause TextPad (and IE 3) to crash when you move the mouse over the flat-style toolbar.   The workaround is to select "with regular buttons" on the View tab of the Preferences dialog box.

10. Netscape Navigator and Communicator cannot send the text of a TextPad document in-line in an e-mail message.   If you configure them to process e-mail from MAPI-based applications, they replace the standard MAPI32.DLL with a cut down version that does not have the required functionality.   The workaround is to check "Send documents as e-mail attachments" on the Document tab of the Preferences dialog box.

11. If you save a file to a server from a client PC running NT 4 and IBM Antivirus 3.0 for Windows NT, it will end up full of binary null characters.   This problem is not specific to TextPad, so make sure "Prevent common viruses" and "Check files when accessed" are turned off, to prevent it happening.

How to Uninstall TextPad

From Windows 95:

1. Click the Start menu and select Settings/Control Panel.
2. Double click Add/Remove Programs.
3. Select TextPad from the list and click Add/Remove.
4. Confirm that you want to uninstall TextPad.
5. When Uninstall has finished, use Explorer to manually delete the TextPad installation directory, and the uninstall program.

From Other Versions of Windows:

1. Run UNINSTAL.EXE (or UNINST16.EXE) from your TextPad installation directory.
2. Confirm that you want to uninstall TextPad.
3. When Uninstall has finished, use File Manager to manually delete the TextPad installation directory, and the uninstall program.
4. Manually delete any Program Manager icons and groups for TextPad.

A Note about File Associations:

Any file associations that you have made with TextPad 1.31 or later will revert back to their defaults when you uninstall TextPad.   If you have previously associated any file extensions with TextPad, and you want to set them back to their default associations at any time:

1. Run File Manager (WINFILE.EXE)
2. Select any file with the given extension.
3. From the File menu, choose the Associate command.
4. Make the corresponding association from the following table:

.BAT	MS-DOS Batch File
.INF	Setup Information
.INI	Configuration Settings
.REG	Registration Entries
.TXT	Text Document

The Command Results Window

The Command Results Window is used to capture the output from the Run command, or from tools added to the Tools menu.   If the output is from a compiler, or Grep type program, it can be used to hypertext jump directly to the corresponding source line usingleft double-click.   Built-in support is provided for output from Microsoft and Symantec compilers, in the form:

```
filename(line): message
```

If this default is not suitable, it will be necessary to specify an alternative hypertext jump regular expression,.   This is set from the Hypertext Expression command on the Configure menu for the Commmand Output window.

Loading a File into the Command Results Window:

If the Command Results to be used for hypertext jumps is written to a file, rather than stdout, it cannot be captured automatically.   However, any file can subsequently be loaded into the Command Results window by adding the following command to the Tools menu:

Command:	TYPE
Menu Text:	Load Command Results
Parameters:	
Initial Directory:	*(something suitable)*
Prompt for Parameters	[**X**]
Run Minimised:	[**X**]
Capture Output:	[**X**]
DOS Command:	[**X**]
Save files before starting:	[ ]

If the file needs post-processing in any way, use your own filter program, instead of the DOS TYPE command, to write the processed data to stdout.

Tool Parameter Macros

Programs that you add to the Tools Menu can be started with context dependent information using parameter macros.   These can be specified in the "Command",   "Parameters" and "Initial Directory" fields of the Tools dialog box, and in the Run and Tool Parameters dialog boxes.   The following macros are defined:

Macro Name	Expanded String
$File	The fully qualified filename of the current document.
$DOSFile	Same as $File, except that DOS aliases are substituted for any long names in the path, and characters are converted to the DOS (OEM) code set.
$UNIXFile	Same as $File, except any '\' characters are changed to '/'.
$FileName	The simple filename of the current document.
$BaseName	$FileName, stripped of any extension.
$FileDir	The drive and directory of the current document.
$FilePath	The directory of the current document, stripped of the drive.
$UNIXPath	Same as $FilePath, except any '\' characters are changed to '/'.
$Dir	The current working drive and directory.
$UNIXDir	Same as $Dir, except any '\' characters are changed to '/'.
$Line	The cursor line within the current document
$Col	The cursor column within the current document
$Prompt	Prompt for a parameter to substitute for "$Prompt". If it is followed by a string in brackets, that string will be displayed in the prompt dialog box. E.g. $Prompt(Enter user name:).
$Password	Prompt for a parameter to substitute for "$Password ". The parameter will not be echoed as it is typed If it is followed by a string in brackets, that string will be displayed in the prompt dialog box. E.g. $Password(Enter password:).
$Sel	Selected text in the active document. This is limited to the first line in a multiple-line selection.
$SelLine	The text of the current line in the active document. This will be selected, if necessary.
$SelWord	The current word in the active document. This will be selected, if necessary.
$Clip	Selected text in the active document, or the whole document if nothing is selected, is copied to the clipboard before running the tool. (This is not a

real parameter, in that nothing is
substituted in the command line.)

Notes:

📄   An empty string replaces any macro that is inappropriate in the current context.

📄   Macros can be in any case (eg. $File = = $file = = $FILE).

📄   The macro name can be bracketed to delimit it from subsequent text.　(eg. $(Sel)ection), except for $Prompt and $Password.

📄   If a filename macro contains spaces when expanded, it will automatically be quoted.

📄   *Fully qualified* is defined to mean drive + path from the root of that drive (e.g. C:\WINDOWS\ WIN.INI).

📄   In any expression using macros, a non-alphabetic character, or the end of line must terminate each macro.

📄   If a tool uses any of the macros FC_File, FC_UNIXFile or FC_DOSFile, the active document will be saved prior to running the tool.

Command Line Parameters

The command line parameters listed below can be used to start TextPad.   They are not case sensitive, but must appear before any file names.   Surround any parameters containing spaces with quotation marks (").   Because some of the parameters are mutually exclusive, conflicts are resolved by using the last option specified.   Any other parameters are silently ignored.   The switch character can be '/' or '-' as shown:

Parameter	Description
-av	Arrange windows vertically tiled.
-ah	Arrange windows horizontally tiled.
-ac	Arrange windows cascaded.
-am	Arrange windows maximized.
-i	Start minimized (iconized).
-l#	User interface language, where # is: 7=German, 9=English, 10=Spanish, 12=French, 16=Italian.
-m	Start another instance, regardless of the setting for "Allow multiple instances". (Only available in the 32-bit edition.)
-ol	Set landscape orientation for printing.
-op	Set portrait orientation for printing.
-p "file"	Print the specified file using default printer.
-q	Don't display startup "splash" message.
-r	Open any files in the command line as read only.
-s	Started by a DDE shell command.
-t "title"	Append "title" to the main window title bar.
-u file	Open the file, whose name can contain spaces, but does not need to be quoted.
@file	Open all the files that are listed, one per line, in the specified file. This overrides the option to load the workspace, specified on the General tab of the Preferences dialog box.

Notes:

📄   Except when using the **-p** option, multiple filenames and/or wildcards can follow these command parameters, but they must be quoted to allow for filenames containing spaces.

📄   An empty, quoted filename (i.e. "") causes a new document to be created.

📄   If the filename to be edited (**not** printed) is followed by "(<line>[,<col>])", with no intervening spaces, the file will be opened with the <u>cursor</u> at that position.   If <line> is a hex number (eg. 0x1a22), a hex view of the file will be created, with the cursor at that address.

   eg.   TXTPAD32.EXE -ac "Read me.txt(51,20)"

In this example TextPad will start up and open "Read me.txt" at line 51, column 20 and display it in a cascaded window.

How to Run Other Programs

1. From the Tools menu, choose the Run command.   The Run dialog box appears.

2. In the Command box, either type the name of the program or command, or choose a previous entry from the drop-down list.   If the program cannot be found in your search path, you will need to supply its full path name.

3. In the Parameters box, type any parameters required by the program.   You can use any tool <u>macros</u> such as $File here, to specify the active file.

4. In the Initial Directory box, type the initial working directory for the program.   If this box is blank, it defaults to the directory containing the particular program.   You can use directory tool <u>macros</u> here.

5. If the command is a DOS internal, such as DIR or TYPE, check the DOS Command box.

6. If you want the program to run in a minimized window, check the Run Minimized box.

7. If you want to redirect the output from the program to the Command window, check the Capture Output box.   This has no effect for Windows applications.

8. Click OK.

Note:

If you capture the output of another program in 32-bit versions of Windows, the output is displayed in the Command window immediately.   In 16-bit versions of Windows, the output is displayed when the program finishes.

How to Use with Compilers

You can configure TextPad to compile the file in the active window, and output any compiler error messages to the Command Results window.   By double clicking an error message, you can go straight to the corresponding source line.

The first step is to add the command line for your compiler to the Tools menu using the <u>Tools</u> tab on the Customize dialog box.

Then you may have to define a regular expression that matches compiler error messages, using the hypertext <u>Jumps</u> tab on the Preferences dialog box.   TextPad uses that to extract the file name, and line and column numbers to open the file at the right spot, when you double click the error message.

For example, to configure TextPad to use Java, add it to the Tools menu as follows:

Menu text:	Compile JAVA
Command:	JAVAC.EXE
Parameters:	$File
Initial directory:	$FileDir
Capture Output:	[x]
Save files:	[x]

Then set its hypertext jump as follows:

Expression:	^\([A-Za-z]:[^:]+\):\([0-9]+\):
File Register:	1
Line Register:	2

How to Use as the Editor for Other Applications

TextPad can easily be used as the editor for other applications.   By using its dynamic data exchange (DDE) capabilities, each file to be edited can beopened in a new window, rather than starting another copy of TextPad.

The TextPad installation directory contains programs called DDEOPN16.EXE and DDEOPN32.EXE in the SYSTEM folder.   These translate command line requests to open files into the appropriate DDE commands for the 16 and 32-bit editions of TextPad respectively.   The first parameter must be the registered server name `TextPad`, and the second parameter is the file to open, with an optional line and column position immediately following in brackets.

Example 1:

To use TextPad as the editor for **WinCIM 2**, add the following line to the [General Preferences] section of WINCIM.INI:

```
Text-Editor=C:\TEXTPAD\SYSTEM\DDEOPN16.EXE TextPad
```

Example 2:

To use TextPad as the editor for **WinGrep**, add the following line as the editor command on its Configure dialog box:

```
C:\TEXTPAD\SYSTEM\DDEOPN16.EXE TextPad $f($l)
```

Example 3:

To use TextPad with **Visual C++ 1.52**, so that it edits the same active file as MSVC, customize the Tools menu of MSVC.EXE with the following command:

```
Command Line:   C:\TEXTPAD\SYSTEM\DDEOPN16.EXE
Menu Text:      &TextPad
Parameters:     TextPad $File($Line,$Col)
```

Example 4:

To use TextPad with **Visual C++ 5**, so that it edits the same active file as MSVC, customize the Tools menu of MSVC.EXE with the following command:

```
Command Line:   C:\TEXTPAD\SYSTEM\DDEOPN32.EXE
Menu Text:      &TextPad
Parameters:     TextPad $(FilePath)($(CurLine),$(CurCol))
```

Notes:

📄   For best performance, you should use DDEOPN32.EXE with 32-bit versions of Windows, and DDEOPN16.EXE with 16-bit versions.

📄   Whenever TextPad is reactivated, it checks the last modified date of each file that you are editing, and asks if it should reload any that have been changed by another application.

How to Use with Web Browsers

TextPad can display the active HTML document in a web browser, using the View HTML command on its View or context (right click) menu.   Files with the following extensions are recognized as containing HTML tags:

HTM, HTML

STM, STML

SHT, SHTML

SGM, SGML

CFM

PTX, PTI, PTE, PT

The file name is passed to the browser using the normal file extension association information, which was written to the Windows registry when the browser was installed.   This means that if the browser has registered that it can use DDE messages, it will be able to use a single instance to view each file, otherwise a new instance will be started for each one.

If you edit files directly in a local web server, such as MS Personal Web Server, you should specify its root path and IP address on the Folders tab of the Preferences dialog box.   Then TextPad will tell the browser to access those files using HTTP, rather than as ordinary files, allowing any macro substitution to take place.

How to Use with HTML Validator

CSE 3310 HTML Validator is a 3rd party application for validating the syntax of HTML documents, which is available on the Internet from http://www.htmlvalidator.com/.   We do not support it in any way (except for the interface with TextPad, described below), so please check that web page for support information.

HTML Validator helps you find and correct the following problems in your HTML documents:

- Misspelled or invalid tag names, tag attributes, and tag attribute values.
- Misspelled or invalid character entities.
- Missing quotation marks.
- Missing closing tags.
- Incorrect placing and nesting of tag names.
- Incorrect or incompatible HTML based on a specific browser or HTML version (i.e. Netscape extensions, HTML 2.0)
- Use of high ASCII characters in HTML documents.

If you choose to install it, either by purchasing it, or by downloading an evaluation copy, the 32-bit edition of TextPad will automatically add a command to run it to its Tools menu, which will be enabled for the active HTML document.   Run this command to output any error messages to the Command Results window.   Double click an error to edit the source document at the corresponding line, or use the Jump Next and Jump Previous buttons on the toolbar to step through the errors.

You can also add commands to configure HTML Validator to the Tools menu as follows:

1. From the Configure menu, choose Customize.
2. Select the Tools tab on the Customize dialog box.
3. Click New.
4. Select "HTML Validator setup" from the drop down menu.
5. Click OK.

You can assign shortcuts to any of these commands using the Tools tab on the Customize dialog box.

How to Use with the Java Development Kit

The Java Development Kit (JDK) is a product from Sun Microsystems for developing Java applications. It can be downloaded from http://www.sun.com/java/.   We do not support it in any way (except for the interface with TextPad, described below), so please check that web page for support information.

After you have installed the JDK, you can add commands to compile and run Java applications to TextPad's Tools menu as follows:

1. From the Configure menu, choose Customize.
2. Select the Tools tab on the Customize dialog box.
3. Click New.
4. Select "JDK Commands" from the drop down menu.
5. Click OK.

You can assign shortcuts to either of these commands using the Tools tab on the Customize dialog box.

Notes:

1. If the JDK is already installed when you install TextPad, its Setup program will give you the option to add these commands at installation time.
2. The option to add JDK commands only appears on that menu if JAVAC.EXE is not run by any existing tools, and if your PATH variable in AUTOEXEC.BAT includes the path to JAVAC.EXE.

Acknowledgement:

Thanks to Cay Horstman (http://www.horstmann.com/), the co-author of *Cora Java* (published by Prentice-Hall), for contributing RUNJAVA.BAT.   This figures out whether to run your Java program as an applet in a web browser, or using the Java interpreter.

DDE Commands

The following DDE commands are recognized.   They are all part of the "system" topic.

Command:	Function:
[open("*filename*")]	Opens the specified file using the default code set.
[opendos("*filename*")]	Opens the specified file using the DOS (OEM) code set.
[command(Append,"*string*")]	Appends the string to the active document.
[command(SaveAs,"*filename*")]	Saves the active document with the given name.
[command(Save)]	Saves the active document.

These commands must be passed exactly as shown, with no embedded spaces, except in the quotes.

Note that the topic is not used to specify the document, so Append, Save and SaveAs all apply to the active document.

How to Restrict User Capabilities

TextPad can be configured to restrict the ability of a user to make and save changes, manage files, and work with external tools.   The settings must be configured manually with REGEDIT.EXE, so it is important to restrict access to that program.

To set the same capabilities for *all users* of a PC, except those with Administrator rights, create the following key in the registry:

    HKEY_LOCAL_MACHINE\Software\Helios\TextPad\Security

Then create a DWORD value under that key, with the name "Capabilities".

To restrict the capabilities of an *individual user,* except those with Administrator rights, log on as that user, then create a DWORD value called "Capabilities" under the key:

    HKEY_CURRENT_USER\Software\Helios\TextPad 3\Options

This can also be set by the Administrator, by accessing the same key for each user under HKEY_USERS.

Each bit of "Capabilities" restricts a different capability, as shown in the following table:

Value:	Capability:
1	Disallows creation and use of user tools on the Tools menu.
2	Disallows editing existing files.
4	Disallows use of the Save As command.
8	Disallows use of the Manage Files and Explorer commands.

Set "Capabilities" to the sum of the values for each capability you want to disallow.

Windows 3.1 Users

The "Capabilities" setting is stored in TEXTPAD3.INI in your WINDOWS directory, under the section [Options].   Obviously, access to this file must be restricted, but do not make it read-only, because TextPad saves all its user preferences there.

What's New

In TextPad 3:

<u>Enhancements</u>

<u>Bug Fixes</u>

In TextPad 2:

<u>Enhancements</u>

<u>Bug Fixes</u>

In Earlier Releases:

<u>Enhancements</u>

<u>Bug Fixes</u>

What's New: Enhancements

Release 3.2.3

📄　　The IntelliMouse wheel now scrolls the window under the cursor.

📄　　Added ".SHTM" to the list of HTML extensions.

📄　　Increased the number of file extension filters to 16.

📄　　New tool parameter macros $SelLine and $SelWord, for selecting and substituting the line or word under the cursor.
Release 3.2.2

📄　　New tool parameter macros, $Prompt and $Password for specifying parameters at run time.

📄　　In MS Mouse compatibility mode, mouse activation no longer changes the cursor position.

📄　　The Quick Open command now changes the current working directory to match the file path.

Release 3.2.1

📄　　Printing odd and even pages, for double sided printouts.

📄　　New option on the Compatibility tab of the Preferences dialog box dialog box to choose POSIX syntax for regular expressions.

📄　　Automatic substitution of HTML syntax for high-ANSI characters can now be controlled with an option on the Spelling tab of the Preferences dialog box.

📄　　ASP and WRL are now recognized as extensions for HTML documents.

📄　　Repainting has been optimized when running macros.

📄　　The Stay on Top command now precedes Close on the System menu.

Release 3.2

📄　　Polish user interface.

📄　　POSIX standard P1003.2 regular expression compatibility, including operators for matching zero or one ("?"), a specified range of matches ("\{min,max\}"), character classes (e.g. "[:alpha:]"), and alternation ("this\|that").

📄　　View in Web Browser command on the View menu.

📄　　The setup program detects if the Java Development Kit (JDK) has been installed, and gives the option to add compile and run commands to the Tools menu.

📄　　The popup menu for the New button on the Tools tab of the Customize dialog box also displays a command to install the JDK commands, if appropriate. (32-bit edition only.)

📄　　A command to run HTML Validator is automatically added to the Tools menu, if that application has been installed.   The popup menu for the New button on the Tools tab of the Customize dialog box also displays a command to add configuration tools for the validator.   (32-bit edition only.)

📄　　The Document Selector now supports multiple selection for the Close and Print commands on its context menu, and the 32-bit edition has new commands to tile the selected windows.

📄　　New option on the Document tab of the Preferences dialog box to terminate the last line automatically.

📄　　New command on the Edit menu to insert the file name of the active document.

📄　　New option on the Print Setup dialog box to specify double spaced printing.

📄　　New option on the Compatibility tab of the Preferences dialog box dialog box to choose Microsoft's conventions for mouse click selection.

📄　　New option on the Quick Open (Ctrl+Shift+O) dialog box to search for the specified file or wild card in all subfolders.

📄　　The Clip Library for HTML characters has been extended to include all those defined for the ISO-8859-1 (Latin-1) character set in HTML 4.0.

📄　　The spelling checker now handles word containing embedded HTML characters, such as "é".

High ANSI characters typed in HTML documents are automatically substituted with the equivalent HTML syntax.

In LaTex documents, the spelling checker now interprets double quotes before one of "OoUuAas" as the corresponding "ÖöÜüÄäß".   It also skips text between "$ ... $", and in contexts such as "\cite{ ... }".

Files larger than 32kb are now e-mailed as attachments, and there is a new option on the Document tab of the Preferences dialog box to force all e-mail to be sent that way.

The View.ActivateClipLib command (Alt+0) now toggles the focus between the Clip Library and the active document.

The destination line of a go to or bookmark command is now briefly highlighted.

The positions of the Command and Search Results windows are now persistent.

If the cursor is at the end of the document when its file is reloaded, as a result of changes made by another process, it will be moved to the new end of document, thus tracking the end of file.

The option to minimize the main window when the last document is closed can now be overridden by holding the shift key down.

It is now possible to restrict the ability of a user to make and save changes, manage files, and work with external tools.

If a startup folder has been specified on the Folders tab of the Preferences dialog box, and the current working directory has not been configured to follow that of the active document, the working directory will be reset to the startup folder, when the last document is closed.

After a print preview, the cursor is now moved to the top of the last page viewed, unless it is the initial page.

Release 3.1

Portuguese (Brazilian) user interface.

New option on the Backup tab of the Preferences dialog box to save files automatically, at a specified interval.

Revert command on the File menu, to revert to the last saved copy of the active document.

The Match Bracket command searches forward for the first closing bracket, if the cursor is not on a bracket.

Shortcuts are now resolved before opening .LNK files.

When no documents are open, the Paste command now creates a new document to paste into.

The Save command now checks if a file has been modified by another process, and does a Save As if it has.

New command on the Help menu to connect to our web site.

A DDE "opendos" command for opening files in the DOS code set.

Release 3.0

Multiple personalities: compatibility with Microsoft applications, WordStar, BRIEF, IBM Personal Editor and TextPad 2 (see later for changes to shortcuts in this release).   The chosen personality can be selected from the new Compatibility tab on the Preferences dialog.

Customizable keystroke shortcuts: new Customize dialog box for customizing the keyboard, user tools and macros (which were previously on the Preferences dialog box).

Clip Library for inserting frequently used text, such as HTML tags.

International characters, such as è and ü, can now be typed using shortcuts compatible with MS Word, on English keyboards.
Control characters characters can be typed using Ctrl+Num* (* on the numeric keypad), followed by a letter.

The decimal code for control characters is displayed in a popup tip window, if the mouse pointer is held over the character. (32-bit edition only.)

New commands on the Edit menu to center and left and right align text.

New View menu, for faster access to some options that are on the Preferences and Properties

dialog boxes.

- Word Count command on the Tools menu.
- Go to File command (Ctrl+Shift+G) opens a file based on the name in the current selection.   This command is not on a menu.
- "@file" processing: opens all the files listed in another file on the command line.
- Wild cards and @files on Quick File Open dialog box.   It also now appends the default file extension, unless the name contains a "." or is quoted.
- The 32-bit edition now allows up to 64 user macros, and 32 user tools.
- New option on the Find dialog box for extending the selection to the matched text.
- New options on the Go To dialog box for going to a byte offset in the file, and to the next bookmark.   If the offset is signed, it is treated as a relative offset from the current position.   The parameters of the Go To command are now recorded in keystroke macros.
- Support for in-context help using 3rd party Windows help files.   These may be configured using the Tools tab of the Customize dialog box.
- Folders for file locations can now all be configured on the new Folders tab on the Preferences dialog box, including a new one for specifying the startup folder.
- The context menu command to View the active HTML file in a web browser now checks if it is in an active web server, so that any macro content can be expanded by the server.
- New option on the General tab of the Preferences dialog box for allowing multiple files in the command line.
- The option, on the Document tab of the Preferences dialog box, for saving word-wrapped files with hard line breaks is now independent of the word-wrap margin.
- The font selection dialog box now has an option to choose the script for international languages.
- Locale specific rules are now taken into account when sorting text (32-bit edition only).
- The Send command now places the text in-line in the e-mail message, rather than as an attachment.
- Now preserves the preference for paper orientation in the printer.
- Macro descriptions are displayed on the status bar, when highlighted on the menu.
- Ctrl+Tab now alternates between two windows, if the Ctrl key is released between each use. Otherwise it cycles through all the windows (like with Ctrl+F6).
- The state of the search engine is preserved when running macros.
- The "Match whole words" checkbox on find/replace dialog boxes is disabled when the search string is not a word.
- Shift+Find Next button on Find dialog box reverses direction of next find.
- The scope on the Replace dialog box is changed to match the selection state.
- New regular expression "\&" matches the current selection (i.e. it does not actually search, but allows you to make replacements based on selected text).
- Saving all files before running user tools is now optional.
- New tool parameter macros $UNIXPath, and $Clip.   Parameter macros are now evaluated for the actual command, so you can use commands like "$FileDir\$BaseName.exe".
- New command line parameters to set default printout orientation, and to force another instance to start.
- The color for drawing page breaks can now be selected.
- Sort parameters are now persistent.
- The Document Selector now has a context (right click) menu.
- In overtype mode, backspace now replaces characters, other than spaces and tabs, with spaces, rather than deleting them.
- It's now possible to specify separate fonts for editing in the ANSI and DOS cose sets.
- Notepad style logging is now available, using .LOG as the first line of a file.

New option on the <u>View</u> tab of the Preferences dialog box to minimize the main window when the last document is closed.

Other new commands:

File/Properties

Edit/Copy Line

Edit/Copy Line Append

Edit/Copy Word

Edit/Copy Word Append

Edit/Delete Line

Edit/Delete Word

Edit/Sentence Case

PrintAll (not on menu)

SetRightMargin (not on a menu)

WindowToggleIcon (not on a menu)

WindowToggleZoom (not on a menu)

SelectBegin (not on a menu)

SelectEnd (not on a menu).

Cursor/LineLeft (not on a menu).

Tools/ToolRerun(not on a menu).

The following shortcuts have changed from TextPad 2:

Select All	Ctrl+A
Center Text	Ctrl+E
Right Align Text	Ctrl+Shift+E
Redo	Ctrl+Y
Redo All	Ctrl+Shift+Y
Insert Line After	Ctrl+Enter
Insert Line Before	Ctrl+Shift+Enter
Increase Indent	Ctrl+I
Reduce Indent	Ctrl+Shift+I
Scroll up/down	Ctrl+Up/Down
Paragraph up/down	Alt+Up/Down
Sort	F9
Compare	Ctrl+F9
Word Count	Shift+F9
Word Wrap	Ctrl+Q, W
Preferences	Ctrl+Q, P

In addition, some new shortcuts have been defined, and the default shortcuts for user tools and macros and the cut word commands have been deleted.   Backward compatibility can be obtained by selecting TextPad 2 on the Compatibility tab of the Preferencesdialog box.

What's New: Bug Fixes

Release 3.2.3

- The spelling checker stopped on a word that was too long.
- The spelling checker did not trap words beginning with numbers.
- The spelling checker prompt for proper nouns is no longer made for German words.
- In LaTex documents, words such as F\"ommer were wrongly spell checked as ömmer.
- The RE "\n" did not match the first end of line, if the cursor was already there, or for empty lines.
- Registers were not allocated correctly for multiline regular expressions.
- The active document is no longer saved when running a tool with the parameters FC_FileName or FC_BaseName.
- GPF running macros between two documents.
- The cursor column is now maintained when deleting lines.
- When a file was already open, clicking its shortcut should not have rewound it.
- Could not select all in a document consisting of entirely blank lines.
- File change notifications could be missed when TextPad was minimized.
- The 16-bit edition added 100 to short form dates > 1999.
- Reverse searches for multiple new lines crashed after wrapping around at the start of the document.

Release 3.2.2

- Multiple instances are now detected by a mechanism that is more reliable when the system is busy.
- The Save button is now disabled when the last document is closed.
- Relative paths in the Command Results window did not work with hypertext jumps.
- Extending selection with Shift+Left click in the left margin did not work in MS mode.
- Reverse find failed to match patterns at the start of a line.
- The number of selected lines was not updated on the status bar when scroll selecting with the mouse.
- The selection was not updated to show different length spelling corrections.
- The "Regular Expression" setting did not operate correctly in the 16-bit edition.
- The full pathname was not shown for binary views.
- Replace All in a selected column could leave the wrong text selected.
Release 3.2.1

- Spell checking crashed when the last line was unterminated, and the last word should have been ignored, because it was all capitals, or contained a number.
- Redundant "MDI" entries could appear on the Window menu.
- The keyboard layout was not correctly identified on NT 3.51
- Only the first file matching a wild card was opened when started from command line, and only one instance was allowed to run.
- Under certain circumstances, the prompt to reload externally modified files stopped being given.
- Sorting and deleting duplicates, when everything was selected, and word wrap was on could result in a crash.
- Could not split an unterminated wrapped line.
- Replace All did not stop at the end of the current selection, if it was in the middle of a line.
- Inserted text could be indented to align with the previous line in the wrong circumstances.
- Down arrow ended up in the wrong column after splitting a line with Enter.
- Block selection behaved strangely when a new document was opened, and the cursor was

normally constrained to the text.

- Go to column should not have flashed the line.
- Couldn't escape the regular expression "\n" with "\\n".
- If Replace All deleted the line containing the cursor, the selection was incorrect.
- Ctrl+Shift+Tab did not cycle through documents in exactly the reverse order of Ctrl+Tab.
- Could not right click the context menus for the Selector, macros and Clip Library.
- The Selector and Find/Replace dialog boxes could not be used on virtual displays.

Release 3.2

- Block mode should have been cleared when re-enabling word wrapping, after closing all documents.
- File extension dependent behaviour was not implemented correctly for newly created files.
- Focus was lost when replying to multiple "Reload" dialog boxes.
- The Window Selector lost focus after selecting an iconized document.
- Dropping a file, when in print preview mode, messed up the menu bar.
- An INCLUDE environment variable could not have spaces between paths, and included files were not explicitly searched for in the directory of the parent document.
- The number of copies to print was not reset to 1 after each printout.
- The limit of 4 macros in unregistered copies has been removed.
- Could not record File.New (Ctrl+N) in a macro.
- Substituting the new file name in $File, when saving an untitled document before running a user tool.
- The reformat margin was too small by 1 column when word wrapping was on.
- On NT, if a window's title bar was clipped, it became invisible when the workspace was restored.
- The 16-bit edition did not free printer device contexts.
- The French spelling checker could cause lock ups.
- Only the first 255 characters of each line were printed by the Compare command.
- The Close All command would close the Command Results window, without prompting, while a user tool was running.
- Commands on submenus of the Edit menu ignored shortcuts, after being popped up on a read only document..
- The 16-bit edition wrongly used the language set for Windows, to determine the keyboard language.
- Ctrl+Tab did not always cycle through the documents in the correct order.
- The Reformat command could corrupt up the last line, if it was unterminated and word wrap mode was not enabled.
- Clip Library inserts did not get indented correctly.

Release 3.1

- Incorrect status bar message for Mark All.
- Selection of blank line could not be cleared by up/down arrows.
- Paragraph selection in word wrap mode should not search forward for a blank line.
- No visible paragraph mark at end of new lines.
- Undo All after first save did not clear "is modified" condition, when undo stack was emptied at each save.
- Jump Next missed first instance in Command Results.
- Active untitled documents should have been saved before running a tool with $FileName.
- The Reformat command worked on the current paragraph, when a line was selected.
- @-files on the command line, which did not have a full path name, were given an incorrect full

path, such as c:\@file.

- Open All did not work when File Counts Only was selected.
- Reformat in macro did not work in files with unterminated last line.
- Crash due to bad time stamps on files.
- Blank page after duplex printing an even number of pages.
- Page fault searching for RE \("\)*\1
- Match bracket did not take account of the current selection.
- Selection not repainted after void Reformat command.
- ANSI & control characters could be inserted in read-only documents using shortcuts.
- Goto column did not set preferred cursor column.
- Opening a file when in Print Preview mode messed up the user interface.
- Find in Files only counted the first instance on each line.
- Indent less set the modified flag when no changes were made.
- Ctrl+Tab was not recorded in macros.
- IE 4 URL's could not be dropped.
- An unsuccessful Replace All in Selected text could select an extra line.
- Comparisons of files with less than 3 lines always reported differences.
- Cursor down on the last row of word wrapped text did not go to the end of the line.
- More than one user tool could be run simultaneously, using shortcuts.
- Down arrow on the last line, in block mode, incorrectly moved the cursor to column 1.
- Dots in path names could confuse the process for generating backup file names.

Release 3.0

- The 16-bit edition now checks CTL3DV2.DLL version is >= 2.31, to prevent GPF at startup.
- GPF at 0008:ED08 in 16-bit edition, when moving the mouse over the toolbar, before the program has obtained focus.
- Missing line numbers on printout, when first line is continued from previous page.
- Missing word wrap printing for lines that are all spaces up to the right margin.
- GPF doing Find in Files for patterns containing "%s" or "%c".
- Macros that play to the end of the file, and involve a Find command, could be repeated once too often.
- Insert mode wasn't restored after running a macro.
- Ctrl+Left click in the left margin didn't select all in block mode.
- Deleting or cutting a selected block of text should have left the cursor at the start, rather than the end of the selection.   Similarly, after pasting a block, the cursor should have been repositioned to the end of the first line of the block.
- "Use on Printer" option on the font dialog box was not persistent.
- GPF using Alt+End when word-wrap is enabled, and the document has fewer lines than can be displayed in its view.
- The command to Replace in All Documents was not recorded.
- Sorting when no lines were selected, and the last line was unterminated, did not include the last line in the sort.
- Custom dictionaries now start completely empty.
- GPF after indenting a single line file, then turning on word-wrap.
- The right margin was sometimes not repainted correctly after selecting in block mode.
- When invoked by Explorer's Print command, a new instance of TextPad is always started, to avoid reentrancy problems.
- Ignoring case, when searching for high ANSI characters, had no effect.
- Shift+Down arrow on the last line of a file did not select the line, if it was unterminated.
- Flat toolbar buttons were not centered vertically.
- The keys used for making the choice of colors persistent should have been only in English.   This means that you may have to reconfigure your color scheme, if you were working in one of the other interface languages.
- The Insert File command failed if the file was being accessed.
- The selection was not correctly updated after a replacement that spanned line boundaries.
- The "-r" command line parameter was not forwarded to an already running instance of the program.
- The initial directory for user tools is now validated before trying to run them.
- Until a screen font was explicitly selected, visible spaces were displayed in the wrong characters.
- Up and down cursor movement in word-wrapped documents could go to the wrong column.
- Deleting the selection by typing a character is now treated as an atomic operation for undo purposes.
- More than one radio button could be selected on the Go To dialog box.
- A visible ¶ should not have been displayed on the last line of a document.
- Incorrect line count when the last line is unterminated.
- The right margin was not adjusted when line numbers were turned on in an open document.
- Consecutive '*' or '+' characters should not have been allowed in regular expressions.
- The Delete Line command only deleted the contents of a line in Block Selection mode.
- The Find Previous command did not work in a macro.
- It was not possible to print selected text starting after line 32767.
- The second copy started on the wrong page when doing duplex printing of an odd number of pages.
- Progress indicator not always deleted when saving to a full disk.

What's New: Enhancements
Release 2.3

📄   Tips of the day introduce you to some of the things you never knew TextPad could do.

📄   The MS IntelliMouse wheel can now be used for scrolling.

📄   The Save As dialog box now has an option to save selected text only.

Release 2.21

📄   New option in <u>View</u> preferences to select the button bar style toolbar (32-bit edition only).

📄   The 32-bit edition now uses the <u>minimize</u> setting for user tools to minimize the Command Output window.   This can be used to speed up tools that generate a lot of output.

Release 2.2

📄   French user interface (not on-line help) is now available.   This can be selected on the <u>Language</u> tab of the Preferences dialog box.

📄   Option to enable line numbering on the <u>View</u> tab of the Preferences dialog box.

📄   File open/save progress indicator on the status bar.

📄   A command has been added to the context (right click) menu for HTML documents, to view them in the default browser.

📄   Internet Explorer style toolbar for 32-bit edition.

📄   Ctrl+Down Arrow moves to the start of the next paragraph, and Ctrl+Up Arrow to the start of the previous paragraph.   Holding Shift down at the same time extends the selection.   Note that to provide compatibility with Microsoft applications, the previous use of these keystrokes to scroll up and down one line has been replaced with Alt+Down Arrow and Alt+Up Arrow respectively.   Sorry if this inconveniences you.

📄   Triple left click now selects the whole line (or paragraph in wrap mode).

📄   Bold and italic fonts for printing <u>headers and footers</u>, and a new macro (&P) to print the total number of pages.

📄   Support for color printers, using the selected color scheme.   This can be enabled using the Print Setup command on the File menu.

📄   The dialog box to configure printing has been added as a tab on the Preferences dialog box.

📄   The command line, or drag and drop file is always brought to the top of any workspace files.

📄   New <u>tool parameter macros</u>: $UNIXFile returns the full file name, and $UNIXDir the full directory of the active document, substituting a '/' for each '\'.

📄   There is now an option on the <u>Sort</u> dialog boxes to delete duplicate lines.

📄   There is now an option in <u>Spelling</u> preferences to ignore words containing underscores.

📄   The 16-bit edition has been built using the "large" compiler model, so it can open more windows, and handle bigger macros.

Release 2.1

📄   German user interface (not on-line help) is now available.   This can be selected on the <u>Language</u> tab of the Preferences dialog box.

📄   Faster memory management in 32-bit edition.

📄   The destination of the Go To command can now be a column or page, as well as a line.

📄   Views can now be split vertically instead of horizontally.   This is configured on the <u>View</u> tab of the Preferences dialog box.

📄   Synchronized scrolling can be temporarily disabled by holding the Ctrl key while using the scroll bar.

📄   All lines will be sorted if none are selected.

📄   When text is selected, cursor left goes to the start of the selection and cursor right to the end.

📄   The spelling checker ignores LaTex commands in documents with the .TEX extension.

📄　　　New tool parameter macros: $FilePath returns the directory of the active document, stripped of the drive letter; and $DOSFile returns the full file name substituting DOS aliases for long name components of the path.

📄　　　The configuration setting for externally modified files has been moved from the General to the File tab of the Preferences dialog box.   It has a new option to disable checks for modified files.

📄　　　Command line parameter -r opens any files in the command line as read only.

📄　　　There is now an option to create a new document on startup, on the General tab of the Preferences dialog box.

Release 2.0

📄　　　Up to 16 keystroke macros can be created and assigned to a menu.

📄　　　A spelling checker with dictionaries in 10 languages.

📄　　　Sorting by the selected column, or up to 3 specified keys.

📄　　　Configurable color scheme.

📄　　　Cut, Copy and Paste are back on the top level of the Edit menu.   Some menu mnemonics have had to be changed in consequence.

📄　　　Visible spaces in word-wrap mode, and a visible end of line character.

📄　　　A Load All command on the context menu for the Search Results window.

📄　　　Ansi/Dos conversion of the active document, and editing in the DOS code set.

📄　　　Ctrl+Shift+Del deletes to the end of the current line.

📄　　　Move by word follows programmer's editor semantics for program source files.

📄　　　The Explorer *Send To* command now works for multiple files, but this has changed the requirement for quoting file names in command line parameters.

📄　　　Toolbar buttons for spell checking, keystroke macros, and displaying visible spaces.

📄　　　Extra shortcuts using toolbar buttons in conjunction with the Shift and Ctrl keys.

📄　　　Modified files are indicated with an asterisk.

📄　　　The status bar shows the number of characters or lines selected.

📄　　　Synchronized scrolling of all views.

📄　　　Configurable list of extensions recognized as binary files.

📄　　　The settings for hard line breaks can be set on a per document basis.

📄　　　New options to:
Strip trailing spaces.
Not treat Ctrl+Z as marking the end of file.
Automatically reload externally modified files.
Disable drag and drop editing in the 32-bit edition.
Store backup files in a specified directory, or with alternative extensions.
Suppress the startup splash message.
Set the default format for new files to PC, UNIX or MAC.
Convert new tabs to spaces, while leaving existing ones alone.
Not clear the undo buffer when files are saved.

📄　　　Conventional file reads and writes can now optionally be used by the 32-bit edition for accessing remote files.   This should provide better compatibility with Lantastic, PC-NFS and other network systems that don't fully support memory mapping.

📄　　　Files that are opened for writing by another process can now be loaded into the editor.

📄　　　The 32-bit edition now detects changes to file modification dates and read-only status, without needing to lose and regain active status.

📄　　　A Replace Next button on the Replace dialog box to replace then find the next occurrence.

📄　　　Numeric variable in replacement expressions for generating or updating sequence numbers.

📄　　　Hex character codes (\xdd), newlines (\n), and page breaks (\f) in find/replace regular expressions.

📄   If current selection extends over one line, the scope is initialised to Selection on the Replace dialog box.

📄   The current selection can be substituted as a parameter to a user tool using <u>tool macro</u> "$Sel".

📄   The <u>Statistics</u> tab now shows a file's format and character set.

📄   Goto Line can now extend the selection in block mode.

📄   Alt+Home/End moves the cursor to the start of the first/last visible line.

📄   The page break character is now recognized at the end of lines, as well as at the start.

📄   Paste and drop now replace characters in overtype mode, unless the paste or drop is onto selected text.

📄   After a column of text has been inserted, the insert position is moved to the end of the first, rather than last line.

📄   Switching to the Search or Command Output window does not change the working directory.

📄   New <u>DDE</u> commands to write to documents and save them.

What's New: Bug Fixes

Release 2.3

📄   The progress indicator wasn't removed from the status bar if the open file command was cancelled.

📄   The move forward by word command bypassed the end of a line.

📄   Recently used files on the File menu were being marked read-only according to the attributes of the file, rather than the setting on the Open File dialog box.

📄   If relative paths were used in the command line, the second and subsequent files could not be found.

📄   Splitting word wrapped lines, which were indented off the right side of the view, could cause an endless loop.

📄   A filename without an extension could be opened as binary, if a directory component in its path cantained a binary extension.

📄   Scratch macros containing ordinary typing, and created prior to release 2.2, resulted in an "Invalid Workspace" error when the workspace was reloaded.

📄   The screen area before indented, word-wrapped text was not always repainted correctly.

📄   The cursor was incorrectly positioned after saving word-wrapped text with hard line breaks.

📄   Backspacing on a new, auto-indented line should have moved the cursor left by the indent size, rather than the tab size.

📄   On NT 3.51, any attempt to configure user tools with spaces in their path names failed, because the path was being corrupted.

Release 2.21

📄   The flat-style toolbar background retained ghost images at the old position when it was moved.

📄   Spelling checker now recognizes multiple word replacements.

📄   GPF using Crl+(Numeric Pad Digit), for non-existent macros.

Release 2.2

📄   "Out of memory" error when saving files from the final build of NT 4.0 to disks on Windows 95 systems.

📄   The foreground and background colors were the wrong way around for the left margin.   If you have customized these settings, please reverse them.

📄   Licensing on the Hebrew edition of Windows 3.1x with Win32s.

📄   Incorrect selection placement after changing the case of a single character.

📄   The File Close commands should have been disabled when a macro is being recorded.

📄   In single instance mode, the 32-bit edition was not activated when an attempt was made to start another instance..

📄   File auto-save should not have been done for the Explorer tool.

📄   Missing vertical scroll bar in binary views with vertical splitter.

📄   The selector should have been hidden during Print Preview.

📄   Ctrl+Tab and Ctrl+Shift+tab were not recorded in macros.

📄   High ANSI characters could not be recorded in macros.

📄   Cancelling a macro that was played from the menu stopped other macros being played.

📄   The 16-bit edition issued an error message when loading macros.

📄   The DOS (OEM) code set was not used when copying bookmarked lines.

📄   The 16-bit German user interface did not have a print preview mouse pointer.

📄   The Split Wrapped Lines command should not have cleared the selection when it finished.

📄   The regular expression '$' did not match UNIX end of lines in the Find in Files command.

📄   The spelling checker no longer treats double hyphens as part of a hyphenated word.

📄 Errant user tools, or closing the Command Output window while a tool was running, could leave instances of PLUMB.EXE running (32-bit only).

📄 A horizontal scroll bar was not displayed in hex views, unless it was turned on on the Properties dialog box.

📄 The default play mode for macros did not work.

📄 The Find Previous command did not work if the cursor was at the start of the document.

📄 The 32-bit edition did not become the foreground window when a file was dropped on it.

Release 2.1

📄 The ordering of files in the Search Results window now matches those in the Document Selector.

📄 16-bit edition could crash doing Find in Files on files containing Ctrl+Z.

📄 File filters > 255 bytes stopped registry saves.

📄 Filename was not quoted when setting up Associations for printing.

📄 When loading from a file, the spell checker should not have prompted for proper nouns and abbreviations.

📄 The status bar message was not cleared when all documents were closed.

📄 Modified indicator (*) on Document Selector was only updated when a document was active.

📄 Running some DOS tools with invalid file headers could cause the 32-bit edition to crash.

📄 Insert Line Before an indented line, followed by backspace, deleted too much text.

📄 Incorrect cursor position after splitting word wrapped lines.

📄 The cursor seemed to disappear after indenting a selected block.

📄 If the Search or Command Output windows were saved using the Save button on the toolbar, they continued to be used as output windows.

📄 Files containing bracketed numbers in their paths, such as c:\data(1)\file.ext, could not be opened by double clicking them in Explorer.

📄 Pasting lines longer than 4K resulted in the split lines being inserted in reverse order.

📄 Cancelling a "play once" macro with Ctrl+R disabled the Playback command on the Macro menu.

📄 Failure to find a search pattern didn't cancel macro playback.

📄 A macro that deleted, but didn't move the cursor, wasn't allowed to run to end of file.

📄 Move cursor by word didn't change the preferred cursor position.

📄 The range of the selection was not updated on the status bar, if it was extended with Shift+Left click.

📄 File filter customizations could be lost by using the command line to pass a filename to an already running instance, rather than using DDE, when double clicking an associated file.

📄 Multi-file open only honoured the OEM codeset setting for the first file.

📄 User dictionaries for the spelling checker didn't work on NT 3.51.

What's New: Enhancements in Earlier Releases
Release 1.32a:
📄 Multiple files can now be supplied as command line parameters, provided each name is quoted (e.g. txtpad32.exe "File1" "File2"). This isto avoid confusion with file names containingspaces. If any of the files don't exist, TextPad asks if you want to create them.

📄 The commands to insert the date and time now have their own popup menu. This can be popped up using Ctrl+F10, or Ctrl+Right click.

📄 The Block Fill command can now fill with a sequence of numbers.

📄 File comparison can now optionally ignore differences due to case of letters, and numbers of spaces and tabs.

📄 The match brackets command now matches < with >.

📄 If the current selection extends over one line, the scope is initialised to Selection on the Print dialog box.

📄 When a window is iconised, any file path is stripped from its title.

📄 The combobox has been changed to a listbox on the Filters tabs of the Preferences dialog box.

Release 1.31:

📄 User settable default for the ANSI or DOS character set.

📄 "Options" on the Configure menu has been renamed "Preferences".

📄 Changes to configuration settings are saved immediately.

📄 Associating file extensions with TextPad must now be done from the Associations tab of the Preferences dialog box. The setup program no longer has that as an option.

📄 Dates and times are displayed according to the Windows regional setting (32-bit only).

📄 Uninstallation now follows the Windows 95 guidelines.

📄 Paths can be omitted from the file names displayed in the Document Selector. This is set from the General tab of the Preferences dialog box.

📄 The startup "splash" message can be disabled using the command line parameter "-q".

📄 A different cursor is used in overtype mode.

📄 When auto-indent mode is enabled, a "}" is always unindented on an empty line, regardless of whether or not the cursor is constrained to the text.

📄 The Find Next button on the Replace dialog box stops searching at the end of file, rather than wrapping around to the beginning, as happens with the Find dialog box.

📄 When run on NT with the 2nd new shell preview, TextPad now uses the new File Open dialog box.

📄 The environment variable COMSPEC is now used to determine which command interpreter to run for user tools.

Release 1.30:

📄 The state of the workspace can be saved between editing sessions, includingopen documents, window positions, bookmarks & fonts.

📄 The Command and Search windows can now be edited, by turning off the read-only property. (Double-click **Read** on the status bar.)

📄 Lines with bookmarks can be cut, copied or deleted. The Edit menu has been slightly rearranged to accomodate the new commands.

📄 A selected block can be filled with a character or string.

📄 The left margin of word-wrapped paragraphs is now aligned with the first line of the paragraph, when the Maintain Indentation property is set on the Document tab of the Properties dialog box.

📄 Paragraphs can be reformatted when not in word-wrap mode.

📄 The Close All command has been moved from the Window to the File menu.

📄 The Stay on Top command has been added to the System menu.

A word-wrap button has been added to the toolbar.

A file can be printed without bringing up the Print dialog box, by clicking the print button on the toolbar. The Print command on the File menu still displays the dialog box.

Dragging and dropping files on to a printer icon is now supported on Windows 95.

Text can be converted between the ANSI and DOS (OEM) character sets when opening and saving files.

The cursor can be set to a flashing block, or a vertical bar from the View tab of the Preferences dialog box.

If a document is opened read-only because its file has the read-only attribute set, it is automatically made editable when the state of the file changes. (Useful for source control systems.)

To avoid problems with file names containing spaces, TextPad now only allows a single file name as a command line parameter.

The pre-release version of the new shell for NT is supported.

Release 1.29:

On Windows 95 and NT, the 32-bit edition uses the Windows Registry, instead of TEXTPAD.INI to save its settings.

New commands to insert the current date and time were added to the Edit menu.

The installation program automatically registers TextPad's DDE commands.

What's New: Bug Fixes in Earlier Releases

Release 1.32a:

🗎   Crash when saving word-wrapped files with hard line breaks.

🗎   Command names could not have spaces in user tools.

🗎   Parameters to user tools could not be quoted.

Release 1.32:

🗎   When the 32-bit edition is restricted to running as a single instance, file names in command line parameters are now made absolute before passing them over to the previous instance.

🗎   Warnings due to unterminated last line are no longer given.

🗎   The default tab setting on the Preferences dialog box was wrongly initialised to that of the active document.

🗎   The document width was not recalculated when the tab size was changed.

Release 1.31:

🗎   On Windows 95, file extensions are now always displayed, regardless of the setting in Explorer.

🗎   Scroll bars now operate correctly on NT 3.5.

🗎   When switching from word-wrap mode, horizontal scroll bars are now displayed if set on in View Preferences.

🗎   Double clicking in the margin in word-wrap mode now selects the line as displayed, instead of the paragraph.

🗎   Splitting lines longer than 4095 characters sometimes inserted garbage into a file.

🗎   The 32-bit edition could not open some files with particular accented characters in their names.

🗎   Starting with parameter "-s" cleared the "Save Workspace" flag on exit.

🗎   Command line parameters are no longer case sensitive.

🗎   CreateProcess error -1 in Run command on NT with the new shell preview.

Year 2000 Compliance

TextPad allows users to insert dates in text files, and in the headers and footers of printouts, but it does not manipulate them in any way, nor store them in a binary form.   Dates are displayed using the long and short formats that are configured with the Regional Settings applet on Control Panel.

On **Windows 95, 98 and NT**, the date and time are obtained by calling one or more of the following standard Win32 routines:

- GetSystemTime
- GetFileTime
- FileTimeToLocalFileTime
- FileTimeToSystemTime
- GetTimeFormat

On **Windows 3.1**, the date and time are obtained by calling one or more of the following standard C runtime library routines:

- time
- localtime
- _dos_getftime

Hence, as long as the version of MS Windows that TextPad is running on can cope with dates beyond the end of the century, TextPad will not cause any problems.

File Open dialog box

The following options allow you to specify which file to open:

File Name

Type or select the filename you want to open.   This box lists files with the extension you select in the List Files of Type box.

List Files of Type

Select the type of file you want to open:

Drives

Select the drive containing the file that you want to open.

Directories

Select the directory containing the file that you want to open.

Network...

Choose this button to connect to a network location, assigning it a new drive letter.

File Save As dialog box

The following options allow you to specify the name and location of the file you're about to save:

File Name

Type a new filename to save a document with a different name.   A filename can contain up to eight characters and an extension of up to three characters.

Drives

Select the drive in which you want to store the document.

Directories

Select the directory in which you want to store the document.

Network...

Choose this button to connect to a network location, assigning it a new drive letter.

Title Bar

The title bar is located along the top of a window.   It contains the name of the application and document.

To move the window, drag the title bar.   Note: You can also move dialog boxes by dragging their title bars.

A title bar may contain the following elements:

- Application Control-menu button
- Document Control-menu button
- Maximize button
- Minimize button
- Name of the application
- Name of the document
- Restore button

Scroll bars

Displayed at the right and bottom edges of the document window.   The scroll boxes inside the scroll bars indicate your vertical and horizontal location in the document.   You can use the mouse to scroll to other parts of the document.

Size command (System menu)

Use this command to display a four-headed arrow so you can size the active window with the arrow keys.

After the pointer changes to the four-headed arrow:

1. Press one of the DIRECTION keys (left, right, up, or down arrow key) to move the pointer to the border you want to move.

2. Press a DIRECTION key to move the border.

3. Press ENTER when the window is the size you want.

Note: This command is unavailable if you maximize the window.

Shortcut
Mouse: Drag the size bars at the corners or edges of the window.

Move command (Control menu)

Use this command to display a four-headed arrow so you can move the active window or dialog box with the arrow keys.

Note: This command is unavailable if you maximize the window.

Shortcut
    Keys: Ctrl+F7

Minimize command (application Control menu)

Use this command to reduce the window to an icon.

Shortcut
Mouse: Click the minimize icon on the title bar.
Keys: ALT+F9

Maximize command (System menu)

Use this command to enlarge the active window to fill the available space.

Shortcut
    Mouse: Click the maximize icon on the title bar; or double-click the title bar.
Keys: Ctrl+F10 enlarges a document window.

Next Window command (document Control menu)

Use this command to switch to the next open document window.   This corresponds to the order in which you opened the windows.

Shortcut
   Keys: Ctrl+F6

Previous Window command (document Control menu)

Use this command to switch to the previous open document window. This corresponds to the order in which you opened the windows.

Shortcut
Keys: SHIFT+Ctrl+F6

Close command (Control menus)

Use this command to close the active window or dialog box.
Double-clicking a Control-menu box is the same as choosing the Close command.

Shortcuts
Keys: Ctrl+F4 closes a document window
            ALT+F4 closes the main window or a dialog box

Restore command (Control menu)

Use this command to return the active window to its size and position before you chose the Maximize or Minimize command.

Switch to command (application Control menu)

Use this command to display a list of all open applications.   Use this "Task List" to switch to or close an application on the list.

Shortcut
   Keys: Ctrl+ESC

Dialog Box Options
When you choose the Switch To command, you will be presented with a dialog box with the following options:

Task List
   Select the application you want to switch to or close.

Switch To
   Makes the selected application active.

End Task
   Closes the selected application.

Cancel
   Closes the Task List box.

Cascade
   Arranges open applications so they overlap and you can see each title bar.   This option does not affect applications reduced to icons.

Tile
   Arranges open applications into windows that do not overlap.   This option does not affect applications reduced to icons.

Arrange Icons
   Arranges the icons of all minimized applications across the bottom of the screen.

No Help Available

No help is available for this area of the window.

No Help Available

No help is available for this message box.

Print dialog box

The following options allow you to specify how the document should be printed:

Printer
This is the active printer and printer connection.   Choose the Setup option to change the printer and printer connection.

Setup
Displays a Print Setup dialog box, so   you can select a printer and printer connection.

Print Range
Specify the pages you want to print:

  All   Prints the entire document.
  Selection   Prints the currently selected text.
  Pages   Prints the range of pages you specify in the From and To boxes.

The default action is to print all pages in the specified range, but you can choose to print just the odd or even pages, if you want to print on both sides of the paper.

Copies
Specify the number of copies you want to print for the above page range.

Collate Copies
Prints copies in page number order, instead of separated multiple copies of each page.

Print Quality
Select the quality of the printing.   Generally, lower quality printing takes less time to produce.

Print Progress Dialog

The Printing dialog box is shown during the time that <<YourApp>> is sending output to the printer.   The page number indicates the progress of the printing.

To abort printing, choose Cancel.

Print Preview toolbar

The print preview toolbar offers you the following options:

Print
>   Bring up the print dialog box, to start a print job.

Next Page
>   Preview the next printed page.

Prev Page
>   Preview the previous printed page.

One Page / Two Page
>   Preview one or two printed pages at a time.

Zoom In
>   Take a closer look at the printed page.

Zoom Out
>   Take a larger look at the printed page.

Close
>   Return from print preview to the editing window.

Print Setup dialog box

The following options allow you to select the destination printer and its connection.

Printer
Select the printer you want to use.   Choose the Default Printer; or choose the Specific Printer option and select one of the current installed printers shown in the box.   You install printers and configure ports using the Windows Control Panel.

Orientation
Choose Portrait or Landscape.

Paper Size
Select the size of paper that the document is to be printed on.

Paper Source
Some printers offer multiple trays for different paper sources.   Specify the tray here.

Options
Displays a dialog box where you can make additional choices about printing, specific to the type of printer you have selected.

Network...
Choose this button to connect to a network location, assigning it a new drive letter.
