ADDED
6/25/99

In addition to general maintenance modifications, this update addresses the following issues: The game will now support force-feedback joysticks, 16-button joysticks, simultaneously connected joysticks, multiple hat-switch joysticks, and other additional joystick capabilities. The update also modifies the flight model and air-speed information to provide more realistic aircraft performance -- the most noticeable differences will be the ability to fly at higher speeds at higher altitudes. The update also provides public and private NovaWorld hosting capabilities, allowing users to join other user-hosted games through NovaWorld. Side passwords have been included for some multiplayer games as well.

The update provides additional 3-D support for some video cards. Cheat code capabilities during multiplayer have been addressed. Additionally, final modifications have been made to permit integration with the F-22 Raptor product.

3dfx Voodoo Banshee owners, download the updated Banshee DLL to allow F-16 MRF to use hardware acceleration. Unzip and replace your current HW_3DFX.DLL to install.
