Open <u>Job settings</u> dialog in **Add New Job** mode

All Jobs in parallel

If checked: multiple Jobs can run simultaneously.

If unchecked: only one of the active Jobs runs at any given time. When this Job completes or aborts, the next Job is selected randomly according to Job Priorities.

Clear log

Clear the selected Job log.

Default Job settinds

To open this dialog, select <u>Options/Job defaults...</u> menu item.

You can specify here default values for most of the Job settings. These values will be used when a new Job is created or a URL is dropped on the Job list.
For detailed description of Job options see <u>Job settings</u> dialog section.

General page
- **Local directory:** this field value is concatenated with file name extracted from <u>Job settings</u>/**URL** field to form the initial value for <u>Job settings</u>/**Save as** field
- **Start Job:** depending on the selection in this radiogroup, the initial value for <u>Job settings</u>/**Start on+at** will be set to either current time, current time + 10 min or current time + 24 hours
- **Priority, Authentication/User, Authentication/Password:** same as in <u>Job settings</u> dialog.

Error handling page
- **Fail/after** NNN **connection errors, Fail/after** NNN **protocol errors, Connection timeout/Control, Connection timeout/Data:** same as in <u>Job settings</u> dialog.

Proxies page
- **Access WEB sites, Access FTP sites:** these selections will be used to set the <u>Job settings</u>/**Use Proxy** selection when the resource scheme (determined from <u>Job settings</u>/**URL** field) has changed.
- **HTTP proxy Name and Port, FTP proxy Name and Port, Force proxy to reload cache:** same as in <u>Job settings</u> dialog.

Delete...
Delete selected Jobs

Detailed log

If checked: all client commands and server replies will be logged in addition to system events.
If unchecked: only system events will be logged.

Edit...

Open ~~Job settings~~ dialog in **Edit Job settings** mode

Menu:Exit

Close Net Vampire.

Features

Net Vampire allows you to:

- Download files:
    - from FTP servers - directly, via FTP proxy or via HTTP proxy
        - from HTTP servers - directly or via HTTP proxy
        - from GOPHER servers - via HTTP proxy
- Resume download at current position for both FTP and HTTP protocols, if the origin server supports restart
- Specify several files to download. Job list will be saved on program exit
- Set numerous <u>download options</u> individually for each Job
- Run several Jobs in parallel or one-by-one
- Specify Job priorities to give more chances to some Jobs in one-by-one mode
- Start each Job at specified time
- View <u>histogram-like data flow representation</u> - great for TCP/IP fine-tuning
- View and save detailed or brief log
- Create new Jobs by dragging and dropping to the Job List window or floating Drop Basket:
    - URLs from Netscape Navigator or Internet Explorer;
        - *.URL shortcut files from the desktop or folders;
        - selected text from word processors.
- Receive a WinPopup message on Job completion or failure
- Be notified automatically when a new version of Net Vampire is released
- Enjoy Windows 95 look and feel

Help topics

Show Help contents.

Hints

- Doubleclick the Histogram window to bring up the <u>Histogram options</u> dialog.
- Doubleclick a Job in the Job list window to edit Job settings.
- Press <DEL> key in the Job list window to delete the selected Jobs.
- Right-click the Drop Basket window to access.the popup menu.
- Some HTTP proxies keep downloading the requested file even after the client-to-proxy link has failed. Uncheck <u>Job settings</u>/**Force HTTP proxy to reload cache** option to get the file from the cache the next time you request it.
- Move the mouse cursor over the Time and BPS fields in the info panel when the current Job is transferring data, to view hints with extra info.
- Automatic http redirection is not supported in this version. If a web server has replied that the requested resource has been moved to a different location (reply code 3XX), you have to doubleclick the Job in the JobList and put the URL returned by server ('Location:' header field in the log window) into the URL field.

Histogram options

This dialog opens when you select <u>Options/Histogram options...</u> menu item.

- **Scale: 100% =** NNN **bytes -** depending on the bandwidth of your connection to the Internet, you may have to change this value to make the histogram fit into the window

- **Sampling: every** NNN **s -** you can increase this value to cover a longer period of time.

- **Color -** changing this value doesn't affect program performance, but in some cases can improve your own performance.

Job settings

This dialog appears when you select one of the following menu items:

Job/Add... to create a new Job;

Job/Edit... to change settings for the selected Job;

The dialog title changes accordingly.

🔥 Specify the URL for the file you want to download in the **URL** field, for example:

```
http://www.kulichki.com/~vampire/index.html
```

Http:, ftp: and gopher: schemes are currently allowed. If no scheme is specified, but the server name starts with 'www.' or 'ftp.', 'http://' or 'ftp://' respectively will be added to the URL when you close the dialog.

🔥.In the **Save as:** field you specify the fully qualified file name for the local file to store received data. Press 🗑 button to select an existing file or directory.
Note: This field is updated as you edit URL field contents to mach remote and local file names, but you can also edit **Save as** field manually.

🔥.The **Start on/at** fields contain the Job start date and time. To change the date quickly, press the date dialog button 🗓 or use the incremental spinbutton
🔽 . Press
🕓 button to use the current date and time.

🔥.The **Cancel Job** group of controls allows you to specify when to stop download attempts. If all checkboxes in this group are unchecked, the Job will keep trying until stopped manually or a fatal error (such as a local file write error) occurs. However, it's a good idea to limit the number of attempts in one or more ways. Check **after NNN connection errors**, **after NNN protocol errors** and/or **if restart is not supported by server** checkboxes to stop the Job when the specified condition is encountered. You can specify independently the maximum number of errors of each type.
Note: the **maximum error number** spinedit controls are disabled if the corresponding checkboxes are unchecked.

🔥.**Connection timeout** can be set separately for **Control** and **Data** connections. To disable time-out, set it's value to 0.
Note1: It is not recommended to disable time-out unless you have a good reason for it.
Note2: Data connection is established only if the FTP protocol is used, otherwise the **Connection_timeout/Data** spinedit control is disabled.

🔥.Information in the **User** and **Password** fields is used to login to an FTP server. For anonymous login, it should contain the name 'anonymous' and your e-mail address as a password. The values in these fields are also used for user authentication with an HTTP server if **HTTP Authorization** option is checked.

🔥.The **Use proxy** radiogroup can be used to select the way the origin server will be contacted.
None option means direct connection to the server. If you select **HTTP** or **FTP** option, the corresponding proxy server will be involved.
Note: some selections may be disabled if incompatible with the resource scheme determined from the **URL** field.

🔥.Fill the **Proxy** edit box for the selected proxy type with full domain name or IP address of the proxy, and set **Port** value to the port number the proxy is listening at.

🔥.Some HTTP proxies keep partially received files in the cache and return these parts when you request the file. If this is the case, check **Force HTTP proxy to reload cache** option to make sure the file doesn't come from the proxie's cache.

Latest version...

Every 10 days Net Vampire contacts its site and checks if a new version of the program is available.To see the results, select Help/Latest_version... in the Main menu.

Special thanks to...

🩸 Current Version: **2.4**
🩸 Released: **August, 1997**
🩸 Distribution status: **FREEWARE**

🩸 This program is distributed **'as is'**. The author shall not be held liable for any direct or indirect damage or claims caused by this software.

🩸 Post your comments to   **al@toko.dnepr.net**
🩸 Visit the Net Vampire web page: **http://www.kulichki.com/~vampire/**

Quick start

1. Run Net Vampire
2. Rightclick in the Job list window and select **Add...** in the popup menu.to bring up the **Job options** dialog with "Add new Job" caption.
3. Type `"www.kulichki.com/~vampire/index.html"` in the **URL** field.
4. Make sure the **Save as** field value points to an existing directory
5. Press ⊞ button.
6. Set **Use proxy** selection to **None**.
7. Press <OK> button. A new Job will appear in the Job list and start immediately.
Note: if you are connected to Internet via a proxy server, ask your network administrator how to set the proxy options.

Save log...

Save the log of the selected Job to a file.

Show drop basket

When this option is checked, a small window appeares on top of all other windows to make drag-and-drop easier.

Special thanks to...

- **Larisa**, my wife. Without her love, I would   never write Net Vampire (BTW, she gave a name to the program);

- the genius **guys from Borland**, for Delphi 2.0, the greatest programming tool;

- the **MasterBank programmers** for their outstanding RX component library;

- **Christopher E. Proud**, for his fix to the IDropTarget declaration bug in Delphi;

- **Robert Skwirsk** and **Gary J. Shapiro**, for numerous bug reports and many useful ideas;

- all **users** for their feedback - I would quit working on the project a long time ago without their messages.

Start

Start selected Jobs now, ignore Start Time specified in the <u>Job options</u> dialog.

Start on schedule
Wait for the Start Time, then start selected Jobs.

Stop

Stop selected Jobs and disable start at Start Time.

System options

To open this dialog, select the Options/<u>System options...</u> menu item.

- **New Jobs will be... :** press the button corresponding to the mode you want new Jobs to enter on creation.
- **Restore Job state on program startup:** if this option is checked, every Job in the list will restore its state (i.e., Completed, Starting, etc.) upon Net Vampire start.
- **Send WinPopup message on Job completion:** check this option to receive a WinPopup message on Job completion or failure. Leave **'.'** in the **to** field to direct messages to your local computer or type-in any valid computer name. On Windows 95 machines, winpopup.exe must be running for the Send Popup Message to work properly.

System options...
Open <u>System options</u> dialog.

System requirements

The program was tested with:

CPU: 486DX2-66 ... Pentium-180
RAM: 8M ... 96M
OS: Windows 95, Windows NT 4.0
TCP/IP stack: standard Microsoft 32-bit ONLY

What is it for?

This program is a fully automatic FTP and HTTP file downloader. It will start at the time you specified and make as many attempts to download the file as you tell it. Vampire resumes broken connections and restarts download at current position for both FTP and Web servers. To start file retrieval,   just drag-and-drop a URL from your browser!

However, this is not just another download scheduler. Specially designed to deal successfully with noisy servers and unreliable links, full of low-level code, Net Vampire provides high stability and does the job when other programs fail. Full status info, including a unique histogram display, detailed log and many configurable options allow to fine-tune the program and retrieve virtually every file on the Net.

What's new

Net Vampire 2.4 has the following new features compared to v.2.0:

- *<UserID>:<Pass>@* URL syntax support for FTP and HTTP;
- *#<anchor>* URL syntax is recognized;
- Job state (i.e., Stopped, Scheduled etc.) is restored on program startup;
- Multiple selection in the JobList is allowed;
- JobList selection follows the active Job;
- Delete dialog removed;
- WinPopup message is sent on Job completion or failure;
- New Job can be either Starting, Scheduled, or Stopped;
- The *vampire.lst* file lists all successfully retrieved URLs;
- 'Active Jobs' warning appeares on program exit;
- A floating Drop Basket 'StayOnTop' window allows easy drag-and-drop.
- JobList columns are autoresized;
- Date/Time is displayed in the format set in the Windows Control Panel;
- Latest version autochecking;
- Hints over the Time and BPS fields in the info panel display extra statistics when the current Job is transferring data;
- The taskbar button now has a hint wich shows the selected job status;
- Grand Total statistics

The following bugs have been fixed since v.2.0:

- RichEdit error;
- GPF on program exit;
- Jobs are started/queued correctly on the 'All Jobs in Parallel' option change;
- The correct local IP address is used for multihomed hosts;
- Dynamic local IP change is now detected;
- 'Can not load Jobs' message doesn't appear anymore;
- Histogram width is not affected by the Display settings in the Windows control panel;
- Connection Timeout values set to 0 now force infinite timeout;
- The Run/Minimized option in the Windows shortcut is treated properly;
- 'Cancel Job if restart is not supported' now works with http too.
