

Bob "Swabola" Curtiss

Bob witnessed the entire evolution of this project from its embryonic HyperCard™ stack stage (February 1992), to its amazing gymnastic bombs on his Mac SE FDHD with System 6.0.5 (May 1992), and finally, (to his utter amazement) the golden version with a plethora of features that will not bomb (November 1992.)

Bob operated the clutch 68000 microprocessor test machine. His poor restart finger has paid the price, as it is permanently tatoored with a squiggly line. All those still running the older machines for hours on end without a mishap, thank Bob Curtiss, the man who can't say the same.
