

Flying Tips & Tricks

The first thing to remember when flying your airplane is to always watch out for people around you. Never throw your plane at someone, even if they know your throwing it to them.

All of the planes have some sort of weight in the front to make them fly. The amount of weight in the plane makes a difference how the plane will fly. All of the planes in the program are weighted to fly short floating flights. If you want to be able to fly your plane outdoors for long flights, experiment with the weight you put in the nose. You might try gluing a small nut or bolt in the front of the plane for more weight.

Instead of actually throwing your plane try pushing it. Yes that's right, push it. Use the same motion as a throw but don't snap your wrist. Many times snapping your wrist will cause the plane to start it's flight crooked and will fly right into the ground or spin out of control.
