

Slide up

Where [1][x][y] means "smoothly decrease the period of current sample by $x*16+y$ after each tick in the division". The ticks/division are set with the 'set speed' effect (see below). If the period of the note being played is z , then the final period will be $z - (x*16 + y)*(ticks - 1)$. As the slide rate depends on the speed, changing the speed will change the slide. You cannot slide beyond the note B3 (period 113).
