

In a parallel extrusion, the extruded surfaces automatically extend all the way to the vanishing point. With perspective extrusions, however, you control how far surfaces extend toward the vanishing point. You can set values between 1 and 99, where 99 extends surfaces right to the vanishing point.

1. **Select the extrusion** with the Pick tool.

2. In the Extrude Roll-Up, click the Edit button.

3. Type a value in the Depth box, then click the Apply button.
