

If you've followed the steps so far, you'll have created a basic Fish Eye lens that uses the default rate setting of 100%. This setting controls the percentage by which the lens magnifies and distorts the objects behind it. You can set values from -1000 to 1000. Positive numbers create a lens that magnifies objects as it distorts them.

1. Select the lens with the **Pick tool**.
2. In the Lens Roll-Up, type a new value in the Rate box.

3. Click the Apply  
button.
