One-point perspective is created when you change the length of one side or two parallel sides of the grid box. To do this, you drag one of the box's handles, holding down CTRL to constrain the handle to horizontal or vertical movement

only.

1. Hold down CTRL and drag the top-left handle downward. When you release, one-point perspective is created.

2. Repeat step 1, but drag another handle. If you drag

vertically, you maintain one-point perspective.
