

None of the example shapes are **curve objects**, but you can convert any of these shapes to curves. Once a shape has been converted to curves, you can change it's shape in different ways.

To convert the rectangle to curves, do the following:

1. Select the rectangle with the Shape tool or the **Pick tool**.
2. Click the **Convert To Curves** button on the Property Bar.

Notice, even if you selected the rectangle with the Shape tool, the Pick tool is now active.
