To bend the segment you just changed, do the following:

◆ Click and drag the top segment up and to the right (not on a node).

As you drag, the segment changes shape. Notice that the control points extending from the nodes at each end of the segment also move when you drag. You can use these control points to shape the segment more

precisely.

Click and drag a control point. Notice that you can change

its angle and its distance from the

node.
