How to boot with no WB-Startup ?

1.2 introduction

Once upon a time

AutoExec.bat is The best way to boot on 2 different startup-sequence only by pressing LMB or not.

Easy to install and so very very easy to use, it's the ultimate solution for a 2 differents boot system !

AutoExec.bat was first made only for me. As it's very cool, easily configurable, and very

safe
 , i decide to put it on Aminet for every Amiga users in the World
 and for free ...

1.3 disaventage

When installing new things, "Installer" is looking in your s:startup-sequence to see if the call for s:user-startup is here ... As it isn't here, but in your new s:startup-big, it want to put the folowing lines in s:startup-sequence :

```
if exist s:user-startup
  execute s:user-startup
endif
```

example of installer window:

```
+-----+
|Installation (75%done)                                     |
|               Modify startup-sequence file              |
| +-----+                                              |
| |   Makedir Ram:env RAM:env/sys ram:t                   | |
| |   assign t: ram:t                                     |
| |   assign env: ram:env                                 |
| |   >-----<INSERT HERE|                               |
| |                                                       |
| |   Path >NIL: RAM: C: SYS:Rexxc ....and so on         |
| |                                                       |
| +-----+                                              |
|               File being modified:                      |
|               sys:s/startup-sequence                    |
|   Proceed with change                                Skip this part |
|   Select another file                                Abort install  |
|                                                       |
|               Help                                       |
+-----+
```

Go to help to see what he really want to do and press "Skip ths part"

1.4 requirement

Windows 98/NT4 Christmass edition rev 2
PIII 800Ghz liquid cooled
DirectX v19+
voodoo IV turbo
SoundBlaster 512bit 42Hz 4wd
Bill Gates Backdrop on your screen
...get fuck !

you only need an Amiga ...

Developped(!) on A1200/030/50 os3.1

Tested on A500+ os2.0 and don't work ... guru :-(
So i don't know if it work with 2.04 ...

Tested on A4000 desktop OS3.1 and it worked

1.5 installation

If you want to test it, go
here
Firs, take a look to this files:

Startup-sequence
Startup-Big
Startup-small

As those files are for my system, you MUST edit them for your's.

Now, you can install it:

Copy "c/AutoExec.bat" in your C: dir.

Make a Backup of your old startup-sequence. (eg "Startup-Sequence.old")

Copy all 3 "s/Startup.#?" to your S: dir.

Open your favirite text editor (CygnumEd, GoldEd, Emacs, Ed, vi, WordPad ...) and edit them:

Your old Startup-sequence will be dispatch in 2 files, startup-sequence & startup- ↵
big

The new startup-sequence contain the most important thing:

- setpatch
- Makedir RAM:env RAM:ENV/Sys ram:t and its assigns
- path for some dir
- autoexec.bat
- Endcli !

The startup-Big contain the rest of your old startup-sequence:

- from "path ..." to "LoadWB"

1.9 thanks

Thanks to Wouter for the great AmigaE.

Big Thanks to my only friend who's got an Amiga,
-> Stephanie Roussel (sTeFi or StEfi)

1.10 history

V1.0: No bug!

If you find any bug (?!), see node "author" or send an e-mail to the
Uploader of this archive, telling that's for me (bLa\$TeR_oNe) ...

1.11 2do

Well ... maybe a Visual Basic version :-)

A 3 different boot versions (nothing, LMB, RMB) but as I don't need this,
I will never do it.

1.12 test

Format a blank floppy disk (bootable) and copy "src/test/#?" to this one.

Then reboot and press or not LMB to see if it works with your system.

type Autoexec.bat at cli for further test...

1.13 safe

Yes! it's very safe ...

After a big BrainStorming, I must admit that there is only one bad thing that
could happen :

you don't install it correctly (Lamer!)

1.14 nowbstartup

To boot with no WB-Startup, you must rename this drawer to a temp. name during the LoadWB commande, and use the DELAY option.

Look here for details

Warning:

- Power faillure/reset when rename WBstartup !

If it happend, (very very bad luck) your sys: partition wont be validated ...
So wait for auto-validation or use DiskSalv to repair it !
