Chapter 1

AutoCLI

1.1 Introduction

Long, long ago, when the Directory Opus was only of version of 4.12, and I was barely went on Amiga, I was very lazy to tyme in the archive name, when creating it, and that's why I invented the new method, which allows to create archives with the only one mouseclick. Time passed, DOpus changed on my eyes, and became of the 5-th version, and here my already calmed lazyness was seriously shocked. The point is that the creators of this masterpiece, probably haven't thought about the guys like me. Though all my attempts of converting configs of AutoLHA(LZX) failed. The cause was very simple -somehow the mask {Ou} became not working at all. (It is not working now too). After the long "fight" with my lazyness this program was created, which, I think, will help you to pack anything easier. However this is not the only thing it can do.

1.2 Installation

Simply copy the program the executable AutoCLI to your favourite path and then copy the file AutoCLI.config to the same directory, or to the s:.

1.3 System requirements

Computer Amiga
CPU 68000
Some memory
OS 2.0

The program was written on A1200/A1230/16Mb
It was also tested on:
A1200/A1240/16M
CD32/SX1/8M

1.4 Autor

If you have any new ideas, or you found some bugs (little, of course :-)), or you simply want to write me a letter you can find me here:

394016, Tulsкая street 16, Voronezh, Russia
to Nasonov Roman

or by FidoNet:
2:5025/400.10
To: Roman Nasonov

It's a pity, but I don't have any internet E-Mail address :-)

I hope that you'd like my first programm, and you'll use it.

(c) Zetter'00

All Rights Reserved

1.5 Distribution

This programm is freely istributed if no changes are made into the packets integrity. You must not modify or somehow else change the contents of this package without written permission of the author.

This program is provided 'as-is'. Author is not carrying any responsibility for any damages caused by this programm. You are using this programm at your own risk. Author doesn't give any guarantees of working of this programm on your machine.

AutoCLI is mailware. That means that if you like this programm you should simply write me a letter. I understand that any money demands in our country is absurd, so you can at least support the beginner programmer (I.e. me) by your letters. It is very good to know that my work is not useless for somebody.

The complete set of contents

AutoCLI	- executable file
AutoCLI.doc	- documentation
autocli.config	- configuration file
Examples/packers.buttons	- the example of using with DOpus 5
Examples/gfxcon.buttons	- the example of using with DOpus 5
Examples/Dopus4exm.CFG	- the example of using with DOpus 4

1.6 Features

100% Asembler coded in Devpac
Fully multitasking support
Used simply fully configurable text configuration file
Support different options
Small size (about 3K)
Installation contain samples for Dopus 4 and Magellan2

1.7 Description

This program is intended for comfortable frequent execution of AmigaOS commands. In particular it can be used for automated packing/unpacking of archives with the possibility to pack different files into different archives and for executing programs which could understand only one file as parameter multiple times.

Let's examine usage of this program, for instance, to pack the LHA archives. For example, we have the directory dir1 with the file1, file2, file3 files in it. Let's also set the string 'LHApk' in the 'Command' requester (look Preferences chapter) and enable the switch Autaname (it is obligatory for packing). Let's enter the directory dir1, mark files file1-file3, then execute AutoCLI. The result will be a file dir1.lha located in the directory dir1 and containing marked files in it. Now let's set the switch 'Single' and execute AutoCLI for another time. In this case the result will be three files: file1.lha, file2.lha and file3.lha. I.e. every of three marked files is placed into different archive. Now let's mark only the directory name (dir1). Now the result will be the file dir1.lha but in the same subdirectory our directory located. Let's now move our files to any root directory. For example RAM: and remove the 'Single' switch. We will have an archive ram.lha as a result in this case. This is only the brief description of possibilities of this program. The other switches and options are very simple to understand while using. But you must be very attentive with the 'Autaname' option. It is usually not used with conjunction with not archiving.

1.8 Some Details

AutoCLI tested with next external programs :

```
-LHA 1.48, 1.42 (2.1 does not work)
-LZX 1.21 (for use 1.20 need some changes in configuration file)
-ZIP 2.3
-HA 0.999
-BZIP 0.1p12
-GfxCon020 v1.8b, v1.8c
-arec 1.0
```

On another versions normal work not guarantee. If you use another programs or version of archivers, please send to

autor

their names and versions with

bugreports to insert in this list.

1.10 Usage

This programm is working only from CLI. There is no any filerequesters in it.

1.11 Options

- C=Command/K Name of the command to launch. Look in the settings chapter for more information.
- S=Single/S Switch, making AutoCLI using mode 'one file to one archive'. If the file has any icons, they will be placed into the same archive. (See option IconsOFF). In other words the chosen programm will be launched for so many times, the amount of marked files is. If it is not entered AutoCLI enters mode 'all files into one archive', i.e. 'Command' will be launched once with all filenames as argumets.
- A=Autoname/S The switch enabling the automated name choosing. Understands the switch 'Single/Normal' changing the algorithm of choosing the names. Must be entered before the list of filenames.
- D=Delete/S The switch enabling the automated delete source files. Deleting not warranty on files/dirs which protected by lock.
- K=Ask/S The switch enabling requester on delete source files.
- R=Reverse/S The commandline for the most of the programm is: <command> <arguments> <file1> ... <fileN>, but some of them require the list of files to be typed before the arguments: <command> <file1> ... <fileN> <arguments>. Such a mode is enabled with the hel of this switch.
- I=IconsOFF If this switch is present AutiCLI ignores all .info files. You should not use this option while archiving, because no icon files will be included into archive in this case.
- F=FullName If this switch is present, AutoCLI runs in special mode: Single plus `_FULL_NAME_` Autoname. For example: <command> <arguments> <FULL_NAME> <FULL_NAME>. This switch is useful for 'arec'.
- PRI/N The priority for the task to be run. [-127...5]
- Stack/N Stack for the task to be run. [0...99998]
- Files/M List of filenames transferred to the programm to be run.

The switches Autoname, Single, Reverse, IconsOFF, Delete, FullName and Ask

could also be placed in the configuration file, hardly setting the working mode for any variation of the launching command. In that case the options selector works like the logical 'OR', i.e. option is marked set if it presents in commandline, config file or both.

Setting the stack might be done also by the two ways: first - typing in the commandline the option 'Stack/N' with parameter, second - setting the stack amount in the config file (see preferences). Besides the first method has a priority over the second, i.e. if the stack amount is typed in the commandline, then only this value will be used.

Some remarks of using the programmes like Directory Opus with AutoCLI

Most programmes, archivers in particular, makes their output into the current directory. Thus when launching the archiver you should set the flag 'CD source', otherwise the result of packing/depacking might be unknown.

There is another peculiarity of launching the program from DOpus 5. The point is that DOpus limits the length of the launching command by the parameter Max CLL in preferences/CLI launching. So, if this parameter is set to a very big number, then there are problems with starting archiving the big amount of files. The problem is that appear icon names, usually hidden in dopus listers, therefore length of command line become bigger then the maximum allowed. I reduced it to the amount of 384, and everything became OK.

1.12 Examples

```
;AutoCli Congiguration File Version 1.5
;this is comment
\\LHA c:lha ;command name, path
\pk:a -r a ;variation, AutoCLI option, command options
\un: x ;variation, command options
\gfxcon:25000 work:gfx/converters/gfxcon/gfxcon ;command name, stack, path
\8g:sir gif 256;variation, AutoCLI options, command options
\4g:sir gif 16 ;variation, AutoCLI options, command options
;etc
```

1.13 Preferences

The program AutoCLI works with the config file located in the s ←
: catalogue,
or in the same directory the main program is. If you master the format of this file, you will be able to create your own types of automated file processing.

Common format:

```
; - comment
\\<command without mode>[:<stack>]<space><path to command>
<variation(2 symbols)>:[a][s][i][r][d][k]<space><options for command>
```

Common format of configuration file is ierarchical with 2 levels of iteration. There are the symbolic names of launching commands (without variations) and full paths to the executables launching by this command on the first level. There are variations, options for current variation of executing

command (including working modes of AutoCLI) on the second one. Comments could be placed at the end of any line and must be started with ';' (semicolon)

Name of the command (WITHOUT VARIATION) must be started from double backslash ('\\'), after it goes non-obligatory parameter Stack, in decimal form, separated from the commandname with colon. then goes the space and the full path to the executable file.

Two symbols of variation, started from backslash ('\'), are placed on the new line. After it must go the colon and AutoCLI options for this variation. Options must stay without any spaces between them. Then must stay the space and options for launching command for this variation after it. They will be typed in as the arguments for the launched program. Full commandline AutoCLI option 'C=Command/K' must look like LHApk, where LHA is commandname and pk is its variation. Same names of variations for different commands are allowed.

Example

1.14 Future plans

If you have any ideas you should write to me. All your suggestions will be examined.

1.15 Known bugs

Program traces the existence of the icons of files of the list, but in the case when file name or directory name ends on .info. this file could be removed from the list. If you don't want this, then do not use this program on such a files.

If there is no main file in the list, then the corresponding .info file would be deleted from the list. This bug will be removed in next version.

AutoCLI, or to be more exact. most of archivers doesn't support filenames with the symbols '*', '#', '(', '[' etc. in them. It's a pity, but nothing is doing to change this. If it will annoy me hardly, I'll do the in-program renaming of such files.

1.16 Thanks

I want to thank next peoples for help:

- Vladimir Berezenko for english translation documentation files.
 - Vitaliy Chepeleff for fine beta testing and converting this documentation to guide format.
 - Denis Sotchenko for help Amiga OS programming.
 - AmIS for miscellaneous help and advices.
 - Levitator for give e-mail service.
-
