

Thank you for your purchase of **Cherry Poppers 1**. Given the technological revolutions in the CD-ROM industry, we had to make some hard decisions about the quality of the video deliverable versus the speed of the CD-ROM drives in the installed base. We believe that we have delivered the highest possible quality video in **Cherry Poppers 1** for the majority of the drives; however, we welcome any comment you might have to help us continue to improve our products. If your monitor is capable of displaying thousands or millions of colors, you may want to set your display driver to display as many colors as possible for the best viewing result.

We provide optional installation of QuickTime for your convenience. If you are unable to view movies, please make sure that QuickTime is present on your system. If you are not sure or if you have very old versions of QuickTime (1.x), you may want to install QuickTime 2.0 onto your system. An icon for the installation is provided for you in the ZANE program group. New versions of QuickTime are not compatible with most previous releases; therefore, some of your old QuickTime-dependent applications may not work properly after you install version 2.0. If you have problems playing CD-ROMs that you had purchased from us before the release of version 2.0, we provide you with the deinstallation of QuickTime 2.0. You should be able to play those disks after you de-install the new QuickTime and reinstall the old disks.
