Name

pr - spool file to Print Manager

Description

Pr provides a method of calling More for printing rather than displaying a file.   It is only available from the WinXs menu in File Manager.

Pr uses the printer font and print margin defaults set up for More.   Each file is printed in the form defined for the UNIX pr(1) comand;   that is, with a page header consisting of the following:

      <date and time> <filename> <page number>

On invocation, the user is presented with the standard Windows print dialog box, which allows either printing of an entire file or of a specified range of pages.
