How does the system password get into the Windows registry?

To install the Wildcat! System Password in the registry of a machine on your network:

1. Log onto the machine directly. This does not mean connecting to it over the network, it means going to the keyboard attached to the machine in question, and logging on as a user with "administrator" privileges.

2. Run the program *wcSyspw*:

    From a command line in your *Wildcat!* home directory, type

    ```
    wcsyspw [ENTER]
    ```

3. Type the System Password when prompted. The System Password must match the password you typed in *wcConfig*.

{button ,JumpContents(`wcConfig.hlp')}   wcConfig Help

Type the system password that you entered in *wcConfig.*

Accept your selection and save your entry.

Close the program without saving your entry.
