

# HTML with StarWriter 3.1

---

This template defines several attributes for formatting paragraphs and characters that you will need for authoring HTML-documents. Additionally, information in this template is used as a set of preferences for HTML-import. If there are **no** set values in the HTML-document e.g. concerning the background-color, the defined settings of this document will be used. So if you want to change the standard settings for an HTML-page, you have to change the settings in this template first. To do this, select Template... from the File menu and chose the template named **HTML template (Standard)** from the group HTML templates. If you now chose the Edit button, you can modify the template and rewrite it. At the next import of a HTML-document, all settings of the template are used as defaults.

The document heading (<HEAD>) is generated automatically.

The title (<TITLE>) is retrieved from the document description.

The headlines (<H1>,<Hx>) match the paragraph styles Headline 1 to Headline x.

Preformatted text (<PRE>) matches the paragraph style PRE.

The address (<ADDRESS>) matches paragraph style Addressee.

The character style »Internet Link« is used for a link.

The character style »Visited Internet Link«, if you already visited the link.

A quotation (<BLOCKQUOTE>) matches the paragraph style BLOCKQUOTE.

For enumerations use the corresponding paragraph styles.

Indicate (<CITE>)

Code-examples (<CODE>) are marked with the character style CODE.

Emphasized (<EM>)

Keys (<KBD>) are indicated by the character style KBD.

Strong Emphasis (<STRONG>)

Placeholders and variables (<VAR>) are indicated by the character style VAR.

Typewriter font (<TT>) are indicated by the character style TT.

Attributes as bold, italic etc are used as usual.

To display a horizontal line, insert an empty paragraph with the paragraph style HR.

Definitionlists are created with help of the styles DD1-3 and DT1-3
