

WinDialer

Version 4.0

**Created By
Andrew G. Novotak Jr.**

WinDialer is a database program and dialer for windows that is designed to hold addresses and phone numbers. The program will dial the phone number(s) that you specify in the database on command as long as you have a modem and a phone attached to your modem. I wrote the program because I had a need for a program like this. I thought it might be useful to others as well.

This program is Shareware, and a contribution of \$5.00 would be appreciated.
