1.2   Introduction

What's that ?

Passy is a password-protection-system. You can use it, if you don't like others ←
    to play around
with your computer, harddisk etc.

It opens a window on your WB, where you have to enter your password. If it is the ←
    wrong one,
the screen flashes and you get the message 'WRONG PASSWORD!'. If it's the correct ←
     password,
you get back to your WB-screen.

The window is always as big as your WB-screen and it's impossible (I think) to ←
    reach the
WB-Screen behind the passy-window.

Well - a simple password-protection, that's all.

1.3 Requirements

```
Requirements
-----------
- Amiga with a modern OS (3.x) (Maybe it works on older OS-versions, too)

- GUI4CLI and GUI (You can find them in the drawer 'Passy')

- Memory

- Keyboard to type in the password

- Mouse

- Monitor

I think that's it....
```

1.4 Installation

```
Installation
---------

Just move the drawer wherever you like and double-click on the icon 'Passy'.

The default password is: Password (Case-sensitive!)

That's all.
```

1.5 Usage

```
Usage
-----

Type in the default password: Password (Case-sensitive!!) to get back to WB-screen ←
   .
If it is the wrong password, the screen flashes and you will be returned to enter  ←
   your
password again.

Preferences
----------

You want your own password?

NO PROBLEM!
```

The program PASSY is just a textfile made for GUI4CLI.
You just need to start a text-editor and search for the line ENTER YOUR PASSWORD ←
    HERE!!!
Delete the default password 'Password' there and replace it with your own and save ←
    the textfile
back as 'Passy'.
