                    Author

1.2 Introduction

MM2 (MemoMaster V2.1) is one of those programs which can be used
to avoid forgetting events such as your wedding anniversary.
Install it on the disk you generally boot with, record all those
birthdays and any other events you feel you might need reminding
of and you will be warned about them when they approach.

1.3 System Requirements

MM2 requires Kickstart 2.04 or higher.

1.4   installation

Simply copy MM2 across to where-ever you want to put it.

To make MM2 check for any current memos each time you turn the
computer on, you must run MM2 in your User-Startup.
For example, if you put MM2 in your Utilities drawer on DH1: then
you must add the following line to you User-Startup file:

    DH1:Utilities/MM2 check

1.5   usage

Memo fields.

    Date.
        Date in format dd-mmm-yy eg 23-feb-92. You can leave
        the year part blank or put in other characters if you
        like. You might do this if the memo refers to an event
        which occurs annually and you do not want the year
        recorded for some reason. For example, you might want
        to record a birthday but not know (or want to
        publicise) the year.

    Notice.
        The number of days notice you require for this
        particular event. You might need 10 days to organise
        a birthday present but only need a couple of days
        notice of an agreed date to make a phone call. You can
        put values up to 99 here. Please remember that you
        will only get the reminder if you use your computer
        and only then if MM2 gets run.

    Type.
        At present the program only recognises two types of
        memo. Annual ones (type = 'a' or 'A') and others. The
        only difference is that annual ones will pop up
        irrespective of the year part of the date field whereas
        you will only get reminded about others in the period
        specified by the full date and the notice required.

    Text.
        60 characters of free text.

MM2 specific gadgets.

    There are 18 custom gadgets on the MM2 window. A group of
    6 checkbox gadgets, one for each memo, and 12 'action'
    gadgets in two rows.

    The memo checkbox gadgets can be clicked on to highlight
    memos to be acted on using some of the 'action' gadgets.

    The upper row of action gadgets are concerned with movement

around your list of memos and (left to right) have the
following effects
        Move to beginning of list.
        Move back towards the beginning by 6 memos.
        Move back 1 memo.
        Move forward 1 memo.
        Move forward 6 memos.
        Move to end of list.

    The lower row functions are as follows.
        - ADD displays a requester allowing you to add a new
        memo.
        - EDIT displays a requester allowing you to edit an
        existing memo. This will appear for each memo
        highlighted when the gadget is clicked on.
        - DELETE displays a requester asking you to confirm
        that you really wish to remove a memo from the list.
        This will appear once for each memo highlighted when
        the gadgets is clicked on.
        - CHECK looks through the list of memos and displays
        a requester to show any which are due. These are the
        ones which would be displayed if the program had been
        run using the command line "MM2 check". You will need
        to use this gadget particularly if you have started
        MM2 from workbench.
        - SHRINK removes the main MM2 window from the display
        and replaces it with an AppIcon. If this isn't possible
        then the main MM2 window will shrink down to a bar
        until you click on the zoom gadget. Double clicking on
        the AppIcon will restore the main MM2 window.
        - HELP puts MM2 into HELP mode. (The gadget stays
        highlighted to indicate this). If you now click on any
        of the custom gadgets or on the close gadget the
        program will display some help on the use of that
        gadget.

1.6 MemoMaster Program History

MemoMaster V2.1 (12 September 1994) 29320 bytes
==
 * Rewrote GUI to use GadTools
 * Fixed a few small bugs which could occur if you try to look past
   the last memo.
 * Source code now requires DICE 3.0 to compile without alterations.
 * Rewrote documentation in AmigaGuide format.

MemoMaster V2.0a (6 September 1994) 28980 bytes
==
 * Altered source code slightly to allow it to compile under DICE 3.0
 * Altered strcmp to stricmp in CLI parameter checking, which means
   that the "check" parameter doesn't have to be in lowercase.
 * Fixed a minor visual bug, not enough spaces were being printed to
   clear a bit of text.

MemoMaster upto and including V2.0

```
=================================
   Original versions by Jeff Flynn.
```

1.7   future

```
Possible future additions to MemoMaster
========================================
```
 * If MemoChk() finds non-type-A memo with date=today, give option to
   delete.
 * Menu options:
     - Select all 'out of date'
     - Select all of specified type.
 * Anything you suggest (within reason naturally).

1.8   Copyright Information

MemoMaster has been released into the public domain by Jeff Flynn.
Anybody is free to copy this program to anyone interested so long as you
keep all the files together. Files included should be :-
