

– APPENDIX I –

# THE PROGRAMMABLE SOUND GENERATOR

## Controlling the PSG

Creating sound effects and music is possible with either of two system calls. **Dosound()** processes commands in a supplied buffer during interrupt processing (50 times per second). It is best suited, therefore, at playing musical passages while program flow continues. **Giaccess()** provides register-level control over the PSG resulting in a higher level of flexibility and constant updating by the application. This makes **Giaccess()** more suited for short sound effects.

The function definitions of **Dosound()** and **Giaccess()** both reference the register numbers of the PSG. It should be noted that registers 14 and 15 actually control peripherals connected to Port A and Port B of the PSG. The PSG's registers are assigned as follows:

Name	register	Meaning																											
<b>PSG_APITCHLOW</b> <b>PSG_BPITCHHIGH</b>	0 1	Set the pitch of the PSG's channel A to the value in registers 0 and 1. Register 0 contains the lower 8 bits of the frequency and the lower 4 bits of register 1 contain the upper 4 bits of the frequency's 12-bit value.																											
<b>PSG_BPITCHLOW</b> <b>PSG_BPITCHHIGH</b>	2 3	Set the pitch of the PSG's channel B to the value in registers 0 and 1. Register 0 contains the lower 8 bits of the frequency and the lower 4 bits of register 1 contain the upper 4 bits of the frequency's 12-bit value.																											
<b>PSG_CPITCHLOW</b> <b>PSG_CPITCHHIGH</b>	2 3	Set the pitch of the PSG's channel C to the value in registers 0 and 1. Register 0 contains the lower 8 bits of the frequency and the lower 4 bits of register 1 contain the upper 4 bits of the frequency's 12-bit value.																											
<b>PSG_NOISEPITCH</b>	6	The lower five bits of this register set the pitch of white noise. The lower the value, the higher the pitch.																											
<b>PSG_MODE</b>	7	This register contains an eight bit map which determines various aspects of sound generation. Setting each bit on causes the following actions: <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>Name</th> <th>Bit Mask</th> <th>Meaning</th> </tr> </thead> <tbody> <tr> <td><b>PSG_ENABLEA</b></td> <td>0x01</td> <td>Chnl A tone enable</td> </tr> <tr> <td><b>PSG_ENABLEB</b></td> <td>0x02</td> <td>Chnl B tone enable</td> </tr> <tr> <td><b>PSG_ENABLEC</b></td> <td>0x04</td> <td>Chnl C tone enable</td> </tr> <tr> <td><b>PSG_NOISEA</b></td> <td>0x08</td> <td>Chnl A white noise on</td> </tr> <tr> <td><b>PSG_NOISEB</b></td> <td>0x10</td> <td>Chnl B white noise on</td> </tr> <tr> <td><b>PSG_NOISEC</b></td> <td>0x20</td> <td>Chnl C white noise on</td> </tr> <tr> <td><b>PSG_PRTAOUT</b></td> <td>0x40</td> <td>Port A: 0 = input 1 = output</td> </tr> <tr> <td><b>PSG_PRTBOUT</b></td> <td>0x80</td> <td>Port B: 0 = input 1 = output</td> </tr> </tbody> </table>	Name	Bit Mask	Meaning	<b>PSG_ENABLEA</b>	0x01	Chnl A tone enable	<b>PSG_ENABLEB</b>	0x02	Chnl B tone enable	<b>PSG_ENABLEC</b>	0x04	Chnl C tone enable	<b>PSG_NOISEA</b>	0x08	Chnl A white noise on	<b>PSG_NOISEB</b>	0x10	Chnl B white noise on	<b>PSG_NOISEC</b>	0x20	Chnl C white noise on	<b>PSG_PRTAOUT</b>	0x40	Port A: 0 = input 1 = output	<b>PSG_PRTBOUT</b>	0x80	Port B: 0 = input 1 = output
Name	Bit Mask	Meaning																											
<b>PSG_ENABLEA</b>	0x01	Chnl A tone enable																											
<b>PSG_ENABLEB</b>	0x02	Chnl B tone enable																											
<b>PSG_ENABLEC</b>	0x04	Chnl C tone enable																											
<b>PSG_NOISEA</b>	0x08	Chnl A white noise on																											
<b>PSG_NOISEB</b>	0x10	Chnl B white noise on																											
<b>PSG_NOISEC</b>	0x20	Chnl C white noise on																											
<b>PSG_PRTAOUT</b>	0x40	Port A: 0 = input 1 = output																											
<b>PSG_PRTBOUT</b>	0x80	Port B: 0 = input 1 = output																											
<b>PSG_AVOLUME</b>	8	This register controls the volume of channel A. Values from 0-15 are absolute volumes with 0 being the softest and 15 being the loudest. Setting bit 4 causes the PSG to ignore the volume setting and to use the envelope setting in register 13.																											
<b>PSG_BVOLUME</b>	9	This register controls the volume of channel B. Values from 0-15 are absolute volumes with 0 being the softest and 15 being the loudest. Setting bit 4 causes the PSG to ignore the volume setting and to use the envelope setting in register 13.																											

## I.4 – The Programmable Sound Generator

<b>PSG_CVOLUME</b>	10	This register controls the volume of channel C. Values from 0-15 are absolute volumes with 0 being the softest and 15 being the loudest. Setting bit 4 causes the PSG to ignore the volume setting and to use the envelope setting in register 13.
<b>PSG_FREQLOW</b> <b>PSG_FREQHIGH</b>	11 12	Register 11 contains the low byte and register 12 contains the high byte of the frequency of the waveform specified in register 13. This value may range from 0 to 65535.
<b>PSG_ENVELOPE</b>	13	The lower four bits of the register contain a value which defines the envelope waveform of the PSG. The best definition of values is obtained through experimentation.
<b>PSG_PORTA</b>	14	This register accesses Port A of the Yamaha PSG. It is recommended that the functions <b>Ongibit()</b> and <b>Offgibit()</b> be used to access this register.
<b>PSG_PORTB</b>	15	This register accesses Port B of the Yamaha PSG. This register is currently assigned to the data in/out line of the Centronics Parallel port.

The following table lists the twelve-bit value required to produce the desired musical tones with the PSG's tone generators A, B, and C. The upper nibble of the value is placed into the 'coarse-tuning' register and the lower **BYTE** is placed into the 'fine-tuning' register. In addition, because the PSG must approximate musical frequencies according to an equal-tempered scale, the ideal and actual frequencies are also listed.

Note	Ideal Frequency	Actual Frequency	Value

### Sound Envelopes

An envelope may be applied to sounds generated by the PSG. Registers 11 and 12 specify the frequency of this envelope and the low four bits of register 13 specifies the envelope shape as follows (an 'x' digit means either 0 or 1):

Value	Waveform Shape
%00xx	
%01xx	
%1000	
%1001	
%1010	
%1011	
%1100	
%1101	
%1110	
%1111
