There is at least one completed unit here in Ithaca, and two more under construction (including mine :-). The finished unit has brewed some mighty fine beers, including the Festbier that Steve Russell and Tom Strasser took a national second place with in the AHA "Fest is Best" club-only competition.

Good Luck and Happy brewing.

Subject: Lager fermentation temp?

I've got a bock going in the basement at the moment, and I've been trying to keep the temperature for fermentation around 45F. Now I see this message about Kaiserslauten fermenting around 0C. So what's the scoop? Am I right, or are they (or did our reporter misread their sign)? It'll be easy enough for me to cool my ferment, I just have to close the "root cellar" door tighter. And while I've got your attention, what is the recommendation for lagering temperature?

Thanks.

Subject: basil beer

In response to Bryan Gros's question about basil beer:

Your question got through the first time. I didn't answer right away; I figured someone else would. Sorry.

Anyway, I've never tried basil in beer. I have, however, used garlic and ginger (not in the same batch), both of which are aromatic; basil probably falls in the same category. Papazian discusses addition of such ingredients in his book, but here's what I understand: It's best not to boil these for the full duration, because all the things that will give the beer its flavor and smell will evaporate. Boil them with the wort for about the last ten minutes. This is essentially what is done with finishing hops; one boils them only for a few minutes, to give the beer a kind of flowery aroma.

I'll be interested to hear how your basil beer comes out. If it's good, I might try some myself. Good luck.

Subject: NA Beer - The Schmidling method might work

Upon reading Jack's original post of the NA beer process (basically a single stage flash distillation at 170 F) I had doubts too, but a little back-of-the-envelope calculation reassured me that it might work as claimed.

The trouble with the comments posted to date is that they all proceed from a bad assumption, that is, that the ratio of ethanol vapor to water vapor will be equal to the ratio of the vapor pressures of the two components. In fact, the ratio also depends on the mole fractions of the two components in the liquid and on molecular interactions between the components in the liquid phase. (Also vapor phase interactions, but these are negligible at atmospheric pressure). A quick trip through McCabe and Smith's book, Unit Operations of Chemical Engineering, shows that a dilute solution of ethanol in water (1 to 3 mole%) gives about a 10:1 concentration factor for ethanol in the vapor - that is, 1 mole% ethanol in the liquid will produce a vapor that is about 10 mole% ethanol. Hence Jack's procedure is far more efficient than would be predicted solely on the basis of vapor pressure ratio.

I'll post more on this subject after I have a chance to check out the DECHEMA vapor-liquid equilibrium data tables and do a few more calculations.

Meanwhile, if Jack will kindly send me a bottle each of the before and after beers, I will be happy to analyze them on my HPLC and report precisely how much alcohol was removed.

Until then, can we bank the fires, please?
Cheers, Jean.

PS: Clever aphorisms & fancy signature bars waste bandwidth.

Subject: UPS shipping

I don't want to beat a dead horse, but UPS has a rather large book with packaging and other requirements for shipping various substances. If you get flak about shipping brew, ask to see what the book says about alcohol (or beer, which may not be listed but would fall under alcohol).

Back when I was into making sailboards I was shipped (via UPS) the wrong type of polyester resin. I asked UPS what I needed to do in order to ship it back. They handed me the book and told me to do what it said. It clearly specified everything. 5 gallons was enough to require those triangular "Flamable" signs on any truck transporting it, as I recall). The book is quite interesting - you'd be surprised at the scope of what is listed (corrosives, explosives, etc). You can ship some really nasty stuff by UPS - alcohol is mild by comparison.

Subject: Bleach Sanitizing comments

Following are a few of my comments on questions raised about my post of bleach concentration calculations:

Darren-Evans Young asks if using a higher concentration shortens the contact time? Darren I would guess that killing bacteria is like killing people, if

one bullet does the job in 1 minute then 100 bullets in 1 sec doesn't kill'em

more effectively, One of the reasons for increasing the time is to lower the

concentration, thereby lowering residuals that pass on to you and me.

Richard Childers says he rinses until no smell of chlorine after using a strong solution of bleach. Rich you really should not be rinsing after you

use the bleach solution to sanitize. There are critters in your tap water you really don't want in your beer! That is the reason for using low concentrations of bleach so we don't have to rinse! As for your concern about your septic tank, do the same calculation I did to arrive at a dilution

factor for your septic tank. I would expect 5 gals of 200ppm bleach dilluted

in hundreds of gallons of water & poop will not be a problem for the poop patrol in your septic tank.

On another similar related subject I see some you HBDers using the words sanitize and sterilize interchangeably. You can't sterilize with bleach. You can only sanitize! To sterilize you need an autoclave.

From: eisen@kopf.HQ.Ileaf.COM (Carl West)
Subject: *Old* style homebrewing (2nd half)

This is the second half of a piece that seemed longer when I was cleaning up after the scanner :)

The following is from the Scotsman [about which I know nothing more, 100 Years... has no bibliography. "Victorian Scholarship" is an oxymoron. -CW] as quoted in One Hundred Years of Brewing, originally published in 1903 as a supplement to The Western Brewer. Re-published in 1974 by the Arno Press which claims no copyright.

The vat was then made ready for brewing. It was a thick oaken cask, with a bunghole near the bottom. A handful of evenly cut straw was taken and one end of it firmly tied up. The loose ends of straw were neatly spread out, fanwise, and it was placed inside the bunghole, to act as a strainer when the wort was run off. The spread ends were bent so as to lie against the bottom of the vat. The whole was held in position by a flat, triangular stone, set aslant, its base resting on the bent straw ends, and its apex holding the tied ends against the side of the vat, above the bunghole. (This strainer must have been originated amid great poverty of material.) When it was adjusted the vat was ready for use.

Some of the malt was then put through a sieve. The part that sifted out was called " smeddum "--which word Burns takes occasion to use metaphorically. It was kneaded up into tiny bannocks, baked on a griddle and eaten. If when baked the smeddum inside the crust was in taste and appearance like a thick dark syrup, the malt was good and strong. If not syrupy, the malt was poor. These smeddum bannocks were rather tasty, and the entire household judged it necessary to pronounce on the malt.

The coarse malt from which the smeddum had been sifted was put into the bottom of the vat next to the strainer, to prevent it getting choked. The rest of the malt, together with hot water, was then gradually added. The water had to be just at the boiling point--called " preening," when full of bubbles like pin points shooting to the surface.

The malt and water while being added were stirred with a stick, care being taken to avoid disturbing the strainer. When the malt was all in, the thickness of the mixture had to be such as to hold the stick upright of itself for a moment. The vat was then covered up and left undisturbed for four and a half hours.

The bunghole was then uncorked, the liquid wort drawn off and boiled and skimmed in an iron pot till it had shrunk an inch from its first mark round the pot, when it was poured into a wooden or earthenware vessel to cool. If boiled too " sore," its effect on the digestion of ale drinkers was deplorable.

When tepid, a small quantity of the wort was put into the kirn, the " barm " added, the kirn covered and left to " work."

This went on for some days, more wort being added as the fermentation gathered force.

The foam on the ale had a raised peak or " coolie " in the center. When this " coolie " began to sink, the yeast on the top of the ale was removed and the home brewed--which its admirers declared comparable only with champagne--was ready for use.

The malt left in the vat was again mixed with water, which was put through the same process, and was almost equal to the first ale, though sharper in flavor. A third water was put on, which made a fine mild drink for the everyday use of children and maid servants. The exhausted home brewer seldom had patience to take pains with this brew, which, through the third water, was called " second ale," and it was often like sour whey.

The time devoted to each stage of the process varied according to the quantity of malt made, as well as to the temperature. There was some particular danger, each irretrievably spoiling the brew, to be avoided at every step. When, in addition to all the worry naturally attendant on brewing, a tax was laid on malt, it was no wonder that home brewing gradually ceased, and is now unheard of in the land. It says a great deal for rural perseverance that the contest with gaugers was so long and closely waged.

From: David Christian Homan <dh10+@andrew.cmu.edu>
Subject: Re: no-alcohol yeast

Yeast produces ATP (Adenosine triphosphate - I think), which is the basic energy source for a cell by a process called "fermentation" (shocking, isn't it?). Fermentation occurs under anaerobic conditions, and, in yeast the waste product is ethanol. (Fermentation also occurs in the human body under anaerobic conditions. Say you do a 500 yard sprint - your muscles can't utilize the glycolysis and oxidative phosphorylation pathways effectively - so it uses fermentation instead. Here the waste product is Lactic Acid which causes those horrible cramps.)

It would seem to me that a no-alcohol yeast would have to produce some other waste product, and what you would be left with would probably not taste very good.

Anyone else know?

> smells clean, IE, until I can no longer detect bleach. This is pretty
easy,
> and doesn't involve wasting much water.
>
> I would guess that one's nose - and tongue - are more sensitive to
extreme
> dilutions of bleach than any other instrument at hand.

The one exception to this rule that I'd be concerned about, is this: if
you've been working with bleach solutions for some period of time (an
hour or more, perhaps), your nasal passages will have become somewhat
saturated with chlorine vapors, and they'll "numb out" somewhat. You'll
find it difficult to distinguish between the amount of chlorine remaining
in your rinse-water, and the amount of chlorine still drifting around the
air in the room, and the amount which is sitting in your sinuses. You
may mistakenly deduce that there's no chlorine left in the rinse water,
because your nose can't detect any difference between the rinse water
and non-chlorinated water.

In order to be sure that there's no significant amount of chlorine left,
you'd probably need to vent out the room (to remove any airborne
chlorine)
and then have someone who has not been working with bleach solutions
come and verify that the rinse-water is pure.

There's an unfortunate tradeoff here, though: ventilating the room will
suck in outside air (naturally) which may be full of bacteria and
wild-yeast spores. If you've just gone to a lot of trouble to sanitize
your carboy, other equipment, and brewing surfaces, this is just what
you don't want to do.

My hunch is that it'd be better to stick with a somewhat weaker dilution
of bleach (in the 2T/5gal range) and use a longer contact time. This
should sterilize the equipment just as well as a higher concentration,
and would leave less chlorine to be rinsed away.

From: NCDSTEST@NSSDCA.GSFC.NASA.GOV
Subject: Yeast culturing,new supplier

My friend, Dr. Martin Shiller, has formally started his yeast culturing company. This provides brewers with a brewer and Phd combination who can supply technical information, cheap supplies and refills to kits without the problems that come with dealing with the chemical supply house

and I for one am quite happy to no longer have to pay over four bucks per brew when an all grain batch is only eight bucks to begin with.

Also, when you culture your own, its clean and you can be assured of getting enough cells to actually get a quick ferment (unlike that 50 ml pack of wyeast :-):-)

Martin currently can supply a complete kit including an alcohol burner, culture loop, petri dishes, sterile 1 and 50 ml vials of wort (UV cooked for sure sterility), and solid growth media for slants. All for about \$25. He can also supply individual parts/refills if you are already an expert at this.

Of course, I have no financial interest in this company, I just thought other people might have had a hard time finding affordable supplies.

You can reach Martin at :
The Yeast Culture Kit Co.

Date: Fri, 31 Jan 92 13:43 MTS
From: Chuck Coronella <CORONELLRJDS@CHE.UTAH.EDU>
Subject: NA beer, inappropriate tone

I took offense to Chip Hitchcock's submission in HBD # 813. I hope other people responded quicker than I, but if not, here is my 2c.

> I included your entire message, even the signature line. If you don't
>remember what you've been saying, maybe you've had too much of your "NA"
>homebrew.

Damn it, I'm really getting tired of people saying _shit_ in the digest regarding J.S. If you've got a problem with his brewing procedures, say so- there's no need for this type of response. KEEP IT TO YOURSELF!!! The entire post was insulting and childish. (and unscientific, but more on that later.) J.S. is showing to be creative and a good learner. He also has learned much better manners than Chip.

Now, regarding the question of non-alcoholic beer: To establish my credentials, let me just say that I am currently finishing my Ph.D. in Chemical Engineering (and looking for a job, but that's another story entirely). I feel qualified to respond to the topic in a general manner.

Regarding the formula for vapor pressure- I think there is a units problem in the formula presented by Chip. Here is a summary from Perry's Handbook of emprirical data:

	alcohol	T('C)	P(mm Hg)	T('C)	water
	-2.3	10	12		
8.0	20	22			
	19.0	40	33		
	48.4	200	66		
	(boiling point)	78.4	760	100	(boiling point)
	97.51520		121		

The numbers put forth earlier are wrong. The vapor pressure of EtOH is higher than the vapor pressure of H2O at all temperatures, but not much. For example, at 78'C, p(vap) of EtOH is 760 mm Hg, and for H2O, it's 312 mm Hg.

(I interpolated P(vap) of H2O over a small distance in order to compare at equal vapor pressures.)

Therefore, Jack had the right idea. Raising the temperature of the beer will tend to drive off the alcohol. Unfortunately, not much. If any Chem.E.'s out there have some time to kill, you could do an isothermal flash calculation to find the exact vapor concentration, and the residual liquid concentration.

In Perry's handbook, J.D. Seader (my advisor, who is most definitely NOT a brewer) recommends about 60 trays for the binary separation of ethanol and water. What Jack has suggested is essentially a single-stage distillation. Therefore, it's safe to say that the concept of heating the beer will effect the alcohol concentration only slightly. This is because the vapor

pressures of the two compounds are fairly close, i.e., the vapor concentration of the beer is pretty close to the liquid concentrations.

I hope this sets the record straight.

Anyone know how Coors makes alcohol-free beer?

Chuck Coronella, soon-to-be-unemployed Ph.D.

From: oopwk@terra.oscs.montana.edu (Warren Kiefer)
Subject: Blow-off, siphoning, keggig

Just thought I'd toss my opinions into the ring. The blow-off method is one of 2 things that vastly improved the quality of my beer. The other thing being liquid yeasts. The blow-off method seemed to reduce the harshness

of my homebrew. This opinion was derived after a side by side comparison of the same recipe. I use a one inch tube, stuff it straight into the mouth of my glass carboy and run it down into a bucket containing water mixed with sodium metabisulphite. Of course you do lose a bit of beer, but when your brewing a batch every 2 weeks, you won't even miss it :*). IMHO, there is nothing better then watching the foam build up and run out of the tube into the bucket...

Onto siphoning, I know this has been mentioned before, but I haven't seen it for a while but here goes. I boil a quart or two of water before I get ready to siphon and let it cool. So when I'm ready to siphon all I do is fill my siphon hose with the cooled water, attach to siphon wand and drop the siphon hose into the carboy. Works great no infections to worry about.

Question on keggig, I found myself low on CO2 the other night, so what I did was prime the keg with 1/2 cup sugar, shot 5lbs. CO2 into keg, and put the keg in the closet. I usually force carbonate, but since I was low on CO2, I figured I should try something different :'). Now does anyone have any idea how long I need to let this sit before it's ready to tap ???

One more question, a buddy of mine just came home from Alaska, we want to brew more then 5 gallons at a time, so we need some kind of plans for a bigger brewery. I know I've (whoops) seen suggestions and ideas on this before in this forum, but I didn't save any of them (duh!). So let me know. I'm glad to see the flame wars on the digest have burned out. Happy brewing and lets all just take a moment to give thanks to the barley growers of America !!!!!!!!!!!

From: bradley@adelphi.edu (Robert Bradley)
Subject: Bell's Prter, CAMRA Canada, no-mouth siphoning

Howdy Homebrewers,

Anybody out there had beer from a Michigan Micro named Bell's? It's readily available in the Chicago area. There's a sediment in the bottle; I assume there's yeast in the sediment. My question: has anybody had any experience culturing the yeast from their bottles? Porter in particular.

The reason I ask instead of just trying is that there's something a little funny - a little sour - in the flavour of the beer. It's a black, bittersweet style of porter and it feels quite creamy in the mouth. If it's chilled, you don't notice the sourness, and even when warmish, it's not entirely unpleasant. Does anybody know (or even be willing to speculate) what would cause the sourness; particularly, does it have anything to do with the yeast?

CAMRA Canada: I was on the executive of the Toronto chapter about 5 years ago. Even then we had trouble rousing the National by phone or mail. I'm not sure they ever published more than a couple of What's Brewing magazines in any 12 month period. Worse still, there was apparently great hatred of CABA among the national executive (this being, admittedly, hearsay coming from the older members of the local exec). We had trouble getting up-to-date members' lists from Ottawa.

New members probably often missed our local mailings and activities because of slackness at the top.

Finally, Lee Slezak describes in #814 a "no-mouth" siphon starter. The following works well for me, with no gadgets needed. I fill the siphon hose with bleach solution using the mouth method - I assume the bleach will kill any mouth-beasts - and then never lose the pressure. I leave the bleach solution in the hose until it's sanitized, then rinse through with clear water. I leave the hose full of clear water until I begin siphoning. If you want, you can even drain the water into a glass as the tube fills with beer so that you don't dilute your 5 gal. of beer with 3 ounces of water.

Happy Imbolg!

Rob

?

>inhibiting later stages of the ferment ?)

I've included all of option c, because I tend to think that diacetyl is what you're looking for. It's been quite a while since I tasted draught bitter so I don't recall the flavors very accurately. Try racking the beer off the trub, once early in the ferment and then once again, late in the ferment, two days after adding finings such as gelatin or isinglass to precipitate out the yeast. Separating the beer from the yeast will increase the amount of diacetyl in the finished beer because the yeast breaks down the diacetyl it made earlier into a flavorless compound whose name escapes me. Good luck and please report on your results -- I would tend to trust your judgement of the accuracy of your bitter then I trust my judgement.

From: korz@ihlpl.att.com
Subject: LIFE'S GOAL

I live in the southern suburbs of Chicago. Here, and in most of the rest of the Chicago metro area, the three most popular beers are Budweiser, Miller Lite and Heileman's Old Style. On summer weekends, I travel through Indiana to southwestern Michigan where I lay on the beach and sailboard. Except for a tiny portion of Chicago called Lincoln Park and one or two exceptions, every corner tavern in my normal daily travels carries the BIG THREE and none carry Sam Smith's, Young's, Boulder, Anchor, Sierra Nevada,... well, you get the picture.

One of the primary reasons for my starting in homebrewing is because of this reason. I've even taken to drinking water or club soda in local bars rather than support the BIG THREE. This brings me to my LIFE'S GOAL:

TO HAVE FLAVORFUL BEER BE AS COMMON AS THE BIG THREE ARE IN 1992 IN MY LITTLE CORNER OF THE WORLD.

My thinking may be a little twisted on this, and you are all welcome to comment, but it won't change my mind: if I can turn a significant percentage of people in my area on to homebrewing, it will change the beer-purchasing profile of my area, and subsequently flavorful beer will be as common as the American Pilsener style is today. I've still got a significant portion of my life in which to accomplish this task and I think it is a truly noble goal. Recently, some of you have reported having the laws changed in your states regarding homebrewing. Well to this I raise a glass of homebrew and say, "who says you can't fight City Hall?"

Cheers!
Al "a man with a mission" Korzonas.

From: hpfcmr.fc.hp.com!hplabs!uunet!bnr-vpa!bnr-rsc!crick (Bill Crick)
Subject: LEAD _> HOT WATER HEATER

Recently I saw articles from people using water from the hot water tap in their brewing process. I think this is a VERY BAD IDEA! I have seen several references (books on tea, coffee, water quality, articles on lead in water....) that say very distinctly not to drink water that comes from the hot water tap. The reason is that if your plumbing system has copper pipes soldered with lead/tin solder, then the hot water can have a much higher lead concentration than the cold water. The reason for this is the hot water dissolves more lead than the cold water. A secondary factor, is the low volume of a cold water pipe allows flushing the water that has been sitting in the pipes without running a very large amount of water. This isn't true of the hot water system, as you need to run more than the volume of the water tank to flush the system

(like >40gallons).

This was all recently confirmed when a friend installed a water filter in his house. Several of the info packages he got on filter candidates mentioned the lead from hot water tap issue!!!

SO DON'T USE HOT WATER FROM THE TAP! LEAD CAUSES ARTIFICIAL STUPIDITY!

As an aside, I don't have a hot water heater in my house. I have a cold water heater. I find that the water coming out of the cold water heater, or hot water tank to be plenty hot enough, and don't see a need for a hot water heater;-)

A recent article presented residue from different concentrations of bleach, I agree that the lower concentrations are sufficient. However, the residue calculations don't account for repeated rinsing. If you assume that rinsing the carboy out with a quart of water, removes 80-90% of whatever is in the last teaspoon he can't get out, then 3 rinsings would reduce the concentration by $0.2 \times 0.2 \times 0.2 =$ a factor of .008

The 80-90% figure is from high school chemistry lesson on how to most efficiently use solvents to clean glassware. Note I usually do five rinsings.

Do you mind if people are given your e-mail address for referral?

If the answer to both of these questions is 'yes', read on.

I think it would be useful for there to be a listing of the e-mail addresses of people in various homebrew clubs, in order to promote club membership, inter-club activities, and the like.

Now and then people on the net ask "is there a homebrew club in _____?" or "any homebrewers from _____ on the digest?" or "what about having a get-together with homebrewers from _____?"

I have always been curious as to the club affiliations of those of you in HBD-land, but have refrained from submitting a posting like this because such a request might deluge my mail beyond belief.

Well, in a burst of stupidity and motivation, I decided to bite the bullet.

If you are in a homebrew club, nationally or internationally affiliated or not, and wouldn't mind being the subject of a referral, be it to someone potentially interested in joining your club or someone looking to inform your club about an upcoming contest or what-have-you, please send me your e-mail address and club membership as follows:

On the subject header put your state or province and club name first, such as:
CA/San Andreas Malts or WA/Brews Brothers. Keep the body of your message to your name and e-mail address (no .sig 's, please).

For example:

Subject: NY/Ithaca Brewers' Union

Body of message:

Steve Russell srussell@msc2.msc.cornell.edu srussell@crnlmsc2

I'll have it available for anyone who wants it, just to provide information on homebrewing clubs to people who might be interested. If you do *not* wish for random people to send you e-mail, please ignore this posting.

If you are not a club member but are interested in knowing who are members of a club in a given area that are on the HBD, wait at least a couple weeks and then I'll post instructions as to what format would be easiest for me to deal with. Probably something like..."Subject: Clubs/NY/all" or "Subject: Clubs/NY/NYC".

Thanks,

STEVE

Subject: creamy porter problem

I'm appending my recent HBD post:

>I recently tasted my all-grain porter (first one) against Anchor's
>Porter.
>
>The big thing I noticed was Anchor Porter is thick, creamy. Mine
>is low carbonated, but it does not have that creamy feel. Any
>idea how this is achieved?
>

Several people have asked for the recipe. Let me stress that I don't
feel that this beer is bad, just that I guess it could be better.
(Assuming Anchor is my yardstick) It was my first all grain brew (and
my first porter).

Alcatraz Porter (3 gal batch)

4.5 lbs barley
4 oz wheat malt
8 oz Munich malt
9 oz Crystal/Chocolate mixture
4 oz Black Patent
1/4 cp molasses
1.6 oz Cascade Hops (5.8AAU) /
0.5 oz Mt. Hood Hops (3.8AAU??) / Bittering
0.4 oz Cascade (finish)
Wyyeast English Ale

1. Add all grains, crushed, to 6qts water at 55C. Wait 30 min
2. Raise temp to 62C (Added 2qts boiling water) Wait 75 min
3. Raise temp to 75C. Wait 5 min
4. Sparge with 75C water
5. Bring to boil, add molasses, cascade, and mt. hood hops
6. Boil one hour
7. Add finishing hops. Boil 5 min.
8. Cool down in sink. Add yeast from starter.

OG : 54
FG : 10 (after ten days) all in primary fermenter (5gal carboy)
Primed with 3/4 cup dried malt extract.

It has a good malt flavor. Next time I would cut back on the
hops some.

But how do I get the creamy feel? more malt?

Thanks. - Bryan

Subject: EUREKA, Carbonation

To: Homebrew Digest
Fm: Jack Schmidling

EUREKA

One of the first things I did when I got my 10 gal SS kettle was to carefully calibrate it inside and out at one gal levels. I etched the marks in with a Dremmel and then emboldened them with an indellible marker. This was to allow me to boil until the wort reached the planned volume and take all the guesswork out of it.

Well, I am not sure what happens in a kitchen but I boil my beer outside and in this cold weather, there is so much steam rising from the surface that the marks are just about totally useless. The visibility is "zero zero" and no change expected till spring.

I also like to hang a thermometer in the wort so I can turn the heat down before it reaches the boilover stage but the same problem forces me to remove the thermometer to read it. It is likewise difficult to even see the boiling surface to know what is going on.

Well, my experience as a pilot reminded me that in the worst of conditions, one can always see the runway if one is standing on it. If I could get my head into the kettle, I should be able to see the markings, IF I could get close enough.

However, a far more practical idea occurred to me and I rushed to the "shipping room" and found a two foot cardboard mailing tube. I held it to my eye and poked it into the cloud bank and EUREKA, "VFR" (that's Visual Flight Rules). The markings looked like a runway on a sunny day.

Moral: Little things mean a lot.

Subject: PSI/Temp chart for force carbonation

>I have the above mentioned chart in my hot little hands right now.....

> My guess is no, but I'm a programmer, not a cellar-master. So, what am I missing ?

Well, I'm not a programmer and all the geek talk about this chart is leaving me out in the cold. Why doesn't someone just post it instead of talking about it?

For what it is worth, I took someone's suggestion and shook the blazes out of the last batch I carbonated and it was fully carbonated in 24 hrs at 30 psi at around 60F. I was dumbfounded to see the pressure drop 10 to 20 lbs just giving it a good shake. I just kept doing this till the pressure stopped dropping and let it sit overnight.

The head is thick and creamy and I doubt that I will ever prime beer again. This one happened to be NA and so it eliminates re-inoculating and priming.

.....

The above is sort of pre-empted by most of the other responses and I just carbonated a batch of stout, needed for a party next week, in less than 30 min but another question occurred to me that no one seems to have addressed.

Just how much CO2 does it take to carbonate a 5 gal batch?

How many batches can one carbonate with a \$15 refill? The tank seems to last forever when used just for dispensing but I have no feel for how much is used to carbonate and if it is an economic consideration.

Subject: cold water "momily"

(Oooh. There's that word again!-)

Recent conversation with a British friend perhaps sheds some light on the hot versus cold water issue. (I first ran into this in brewing tea, where the proper method starts with cold tap water.) Apparently, standard plumbing practice in Britain is to run the water main to a cistern in the attic, and to supply (almost) all the water taps in the house from the cistern. The only exception is a single cold water tap in the kitchen. Now, you may not want to drink water that has been sitting in a tank for some unknown period of time before you get it, so you typically will drink water only from the kitchen cold tap, and not from any of the hot taps.

Why the cistern? Well, apparently in many places, the ancient water mains just aren't large enough to handle everybody turning on their showers at the same time.... (Or so he said.) The cisterns provide a measure of buffering.

From: A MESSAGE FROM STIV <STROUD%GAIA@leia.polaroid.com>
Subject: azeotropes, NA beer

I can only chuckle at some of the recent postings regarding whether Jack's NA beer procedure will work or won't and why, lots of handwaving, vapor pressures, equilibrium mixtures, blah, blah, blah.....

My advice to Chip H. and Chuck C. is that if wish to apply Raoult's Law to a system, make sure that the system you're looking at obeys the law before you start making generalizations.

In the case of ethanol/water, it is not an ideal system and all of the calculations you performed are meaningless. Due to molecular interactions, ethanol and water form a minimum boiling mixture called an azeotrope which, at atmospheric pressure, boils at 78.2 degrees Centigrade (lower than either EtOH or water) with a composition of 95.6% ethanol and 4.4% water. (At lower pressures the percent of alcohol in this azeotrope actually increases).

In practice this means that if you boil a water/ethanol mixture, what will boil off initially is this azeotrope (4.4 : 95.6) until one of the two components is totally distilled, then the remaining component will distill.

In Jack's system this ratio may be slightly different since there are small amounts of other components in the beer and since Jack doesn't quite hit the boiling point (172.8 deg. F) of the azeotrope. However, as Jean Hunter pointed out, the ratio is at least 10:1 EtOH:water and is probably even higher.

If Jack is getting >1 cup evaporation from 1 gallon of beer (assumed 5% alc./vol) by his procedure, he is more than likely making NA (<0.5% alc.) beer. I'll leave it to you to do the math. I'd be very interested in seeing any results that Jean might get from an HPLC analysis of Jack's NA beer.

I didn't post it because it's bad netiquette to drop large files
(esp. postscript) into mailing lists. There are a lot of weak mailers
out
there and MTA's that truncate long files. It's now available from the
homebrewer's archive via FTP and E-mail service (thanks aem!) Drop me
E-mail if you want a copy (and which version, text or postscript).

> Just how much CO2 does it take to carbonate a 5 gal batch?

I, too, am curious what mileage other folks are getting. I've been a
wastrel
with my CO2, so I think my back-of-envelope numbers should be a good
outside guess. I've keggered, carbonated, and dispensed two (2) 5-gal soda
kegs. I also used the CO2 to force sanitizing and rinse water through
the
pickup-tubes on 12 keg-cleanings. Toss in as many pressurizations of the
empty tanks for storage. I also put a blanket of CO2 down before
siphoning
into the keg. My 5lb tank has gone from 800PSI_g to 760PSI_g. It is
grossly
unfair to say that each keg cost 20PSI but using that as another outside
approximation shows the tank's good for 35-40 kegs (cleaning, keggering,
and
dispensing), my guess is closer to 60. My refills are \$7, so \$.20 a keg
is
chicken feed to me. But my sample is admittedly too small and is
statisticly
inconclusive. I've heard you're not supposed to empty the CO2 tank, how
far
down have folks taken it?

Bryan Gros at bgros@sensitivity.berkeley.edu writes:

> But how do I get the creamy feel? more malt?

I noticed you were using Wyeast English Ale yeast. Is this 1028 or 1084? I would suspect 1028. Try using 1084. I have made porters/brown ale with 1084 and the creamyness is there.

Wyeast has told me that 1084 is great for porters and fruit beers since it adds a touch of creamyness. You will get a slight amount of diacetyl from the 1084, but not that woody/bold/mineral taste which 1028 leaves.

Hopes this help....

Subject: Re: Force Carbonation

I have a 5lb bottle of CO2 and it lasted for around 18 kegs o
beer (firestone). I forced carbonated most of them (around 12).

I got the bottle refilled at a local welding supply for \$8.
Actually I traded in my bottle for an refilled one - that way my
gas supply was "down" for only 15 minutes.

Question:when you carbonate, do you have problems with beer being
forced back into the gas line? Does carbonating through the "out"
tube prevent this from happening? The reason beer is forced back
out the gas line is due to inertia (hammering) from the sloshing
beer.

- Larry Barello

P.S. Great idea, Jack, on using a cardboard tube to see the marking
inside the kettle. I had been using my spoon to "feel" the dents...

From: ALTENBACH@CHERRY.llnl.gov
Subject: EXPLODING KEG

The following is excerpted from an article in the Stockton Record, a reputable daily rag from Stockton, CA, dated 2/2/92, byline Sarah Williams.

The title is: STOCKTON NATIVE'S BEER-KEG DEATH STUMPS FAMILY

"The family of a Stockton native killed by a ruptured beer keg is trying to sort through the freak accident.

Clinton Richard Doan, ... died Wednesday at his Ketchum, Idaho, home after he opened a refrigerator in his garage.

"When he went to put his lunch in the refrigerator, the beer keg exploded in his face and killed him," said Doan's mother, Dorothea Doan Evans of Washington.

Evans said her son's wife, Donna, had tried to put his lunch in the refrigerator but was unable to because the keg had expanded. When he tried, he was killed.

The family has not determined whether it will sue, Evans said.

According to sheriff's reports, a faulty regulator could be to blame for the extreme pressure inside the keg.

The keg shot upward and hit Doan in the head after its bottom cracked..
."

What a way to go! The article did not say whether the keg held industrial Milbudiken or, (perish the thought) homebrew. And we thought bottles and carboys were dangerous! Does anyone in Idaho netland know more of this tragedy?

>>said...)

It is possible that it is under 0 Celsius since the alcohol will lower
the
freezing temperature a little (how much depends on strength, but it's
probably
not too much).

This isn't however a ferment it is an aging (aka lagering), by the time
it hits
these cold cellars it should have done most if not all of it's
fermenting.

>Try racking the

>beer off the trub, once early in the ferment and then once again, late
in

>the ferment, two days after adding finings such as gelatin or isinglass

>to precipitate out the yeast.

What I meant was to use finings two days before the second racking and not the first. I don't have any data saying that you shouldn't fine your yeast out of suspension early in the ferment, but intuitively, it doesn't sound like a good idea to me. I think that, to get more diacetyl to remain in your beer, the yeast should be precipitated out and the beer racked off it basically when the beer is almost done fermenting. Comments?

From: Greg.Winters@EBay.Sun.COM (Greg Winters)
Subject: Barleywine Questions

After trying a wonderfully delightful barleywine at a local brewpub (Seabright in Santa Cruz) I got the bug to make one yesterday. Unfortunately, all I had to work from was the basic outline from the table in TCJOHB and no recipe. I've always been one to improvise but had a few questions I was hoping to get answered by this knowledgeable (and relaxed) group.

Recipe:

11 lbs pale malt extract (generic)
4 oz. Fuggles (4.2%) Boiling
3/4 oz. Fuggles Finishing

I plan to pitch Wyeast Belgian Ale for primary fermentation and then rack to secondary and pitch a champagne to finish it off.

Questions:

What is the traditional time of finishing hops? I had no clue so compromised at 5 minutes...

How long to age in secondary before bottling?

Expected time needed to condition in bottles?

Thanks, Greg

I've tried many of Larry Bell's different brews (Kalamazoo Brewing Co.)
and they all have a little hint of sourness in the background. In
general,
I do like his beers though.

I believe it does have something to do with the yeast. I've cultured
yeast from one of his ales, but the starter had that same sour taste,
so I chickened out and didn't pitch it.

If you do try it, I'd like to know how your beer turns out.

Subject: NA Beer - The Schmidling method might work

>Meanwhile, if Jack will kindly send me a bottle each of the before and after beers, I will be happy to analyze them on my HPLC and report precisely how much alcohol was removed.

That is a most generous offer and if you had posted your mailing address it would be on the way. However, upon further consideration, it seems not only a waste of energy but hardly in the true "scientific tradition". After all, what is to prevent me from re-bottling a can each, of Old Style and Kingsbury?

There have been several highly technical responses that address my method from theoretical viewpoints. There was one "sure-fire" alternative that boils the blazes out of the beer and several hunches that maybe, it would work.

The scientific tradition demands that other experimenters attempt to reproduce my experiment, then evaluate and publish THEIR results. Remember "cold fusion"? We would still be arguing about it if critics only theorized.

Admittedly, the weakness of my "paper" is that the analysis of the results are subjective because I have no way of measuring the alcohol other than how it makes me feel. Not very precise but a measure, nevertheless.

I suggest that anyone who has the capability of measuring alcohol in beer take a bottle of their own and pour half of it into a beaker. Heat this to 170F (uncovered) and let it cool (uncovered) and make the tests on this and the other half of the bottle.

Then, tell us it DOESN'T work. "Can't" work, simply is not good enough.

The only caution I inject is that a Bunsen burner, full blast on a 100 ml beaker may not simulate the heating rate of gas stove on a gallon. I think the total time is irrelevant because it is proportional to volume but heating

rate might affect the results.

Subject: SLIMEMOLDS

> My daughter (9), wants some more "pets". She has access to slime mold spores via the program at the local science museum and has been badgering me to help get her started.

WOW! Encouraging a daughter interested in slimemold is not even on the same plane as a few batches of beer. If you have never seen slime mold grow, I suggest it is worth the risk. I spent months doing this and filming them for my video on fungus. Unfortunately, no one told me how "easy" it was.

But I suspect that only a routine amount of care should allow both pursuits in the same house. Unless you are a both real slob, the number of spores getting from her area to yours would not be measurably greater than what is endemic.

GO FOR IT!

Subject: re: coffee in beer...

Guy McConnell mentions a "Monte Sano" blend of coffee that he used to brew a "mocha-java stout". He sez he chose it cuz its a light blend.

Why not use the real thing. Mocha-Java as in Mocha Mattari (from Yemen) and Java Estate (from, uh, Java). This is one of the finest and smoothest coffee blends ever. It can be brewed VERY strong and stay smooth, yet is very tasty and delicate when brewed medium light. A note to the uninitiated (into coffee snobbery, that is ;-), many "Moka" blends are made with either no or next to no Mocha (the commonest substitute is Ethiopian Harrar + Java, the worst is 10-20% real Mocha/Java blended with Columbian/Mexican generic coffee beans). (I know, coffee belongs in rec.food.drink, but it came up here... ;->) Another side note, dark roasts seem to have a higher oil content in the brewed coffee than light roasts. As I understand, you absolutely do NOT want to introduce any kinda oils in brewing as they oxidise easily (read "rancid!" |~<)

Subject: various bottling methods

I recently tried several bottling methods that worked or didn't work for me.

I used a TSP soak on two cases of bottles. The TSP didn't quite remove all the stains from inside the bottles. The labels came off easily for all bottles except for one particular brand(I think it was Bud or Bud Light). A subsequent soak in bleach removed all stains from inside the bottles.

Lately I've been using my dishwasher to clean bottles. It has a "Sanitary Wash" cycle that consists of a long wash in 170F water followed by a heat drying cycle. I've not had any problems yet, as long as the bottles don't have any stains.

Unwilling to cap 96 bottles for a party I was planning, I bottled two batches in regular 2-liter soda bottles. I just rinsed out the soda, used a bleach soak, filled with beer, and used the original cap. This worked much better than I expected, and I saw no difference between the beer in the 2-liter bottles and the beer in the 12oz bottles, except perhaps that the 2-liter bottles had developed a bit more carbonation.

Of course champagne bottles work well. Sparkling cider bottles also make great containers.

Subject: fennel spice beer

Just recently I brewed a batch of spiced stong lager.
The spice used was fennel(sp?), which I think is also called
anise(sp?). The recipe is as follows:

"Bengal Butt Kicker"
15 lbs Klages OG: 1.070
2.75 lbs Munich IBU: ~35-40
1 lb Amber crystal Color: dark orange
.25 lb Chocolate
1 oz Northern Brewers 10%AA (60min)
1 oz N. Brewers (15 min)
0.5 oz Cascades 5.9%AA (15min)
2 oz fresh fennel (15 min)
6 oz fresh orange peel (15 min)
0.5 tsp Irish Moss(15 min)
1 cp American Lager yeast slurry
10 Bengal Spice tea bags, "dry hopped"
0.75 cp Corn sugar to prime

Upwards infusion mash, low-temp conversion.
Used water with high carbonate hardness.

So far, the young beer tastes great with an unusual
taste that is difficult to describe. I hadn't seen
mention of using fennel before, so I thought I'd
mention it.

From: chad@mpl.UCSD.EDU (Chad Epifanio)
Subject: REQUEST: Millet Beer (sic)

A friend of mine spent some time abroad(I can't quite remember where), and he used to party with a local liquer made from fermented Millet grain. Aparently the stuff is abysmal, but he wants to make some for a friend who is coming to the US.

As far as I can fathom, the grain is steeped until the seed just begins to germinate. Then it is dried in the sun, turning often to ensure even drying. It is then added to enough water to make everything damp again, and exposed to wild yeast. It ferments for a week or so in a vat. When it is time to drink it, boiling water is added to the fermenting grain, stirred for five min, then drank with a straw.

Somehow this doesn't seem quite kosher, but this is the best I could do with info extracted from him combined with brief info from an old Zymurgy article entitled "Beer and the Origins of Cereal Grains"

If by any chance somebody knows the real scoop on this, please let me know. Otherwise, I'll let you know how my version tastes in a week or two.

End of HOMEBREW Digest #816, 02/04/92

Date: Tue, 4 Feb 92 10:35:14 GMT
From: Sgt John "iceberg" Bergmann <iceberg@sctc.af.mil>
Subject: BBK tour responses

Hello All,

In HOMEBREW Digest #816...

Volker Stewart <radavfs@ube.ub.umd.edu> writes:

>Fritz Keinert <keinert@iastate.edu> writes:

>>Kaiserslautern is pretty far from Bavaria. Are you sure it is not
>>"Badische Brauerei"? Baden (another region in Germany) is a lot
>>closer.

>Well, my guess is that the brewery is trying to imply some
>sort of quality - Bavaria is known around the world for its
>beer...

That's not quite it. Back some 170 years plus when the brewery was founded, this part of Germany belonged to the Kingdom of Bavaria. They tried to change the name to something more regional in the early 1980's, but the locals were aghast that their beer heritage was being tampered with (that and sales dropped dramatically :-).

and then:

Jay Hersh <hersh@expo.lcs.mit.edu> writes:

>This isn't however a ferment it is an aging (aka lagering), by the time it hits
>these cold cellars it should have done most if not all of it's fermenting.

Yeah, you're right Jay. They do the ferment in big inverted conical steel thingies, then lager in (I think) wooden casks. Not all the beer goes thru this process. Got typing faster than I was thinking....

Also, they said they made Clausthaler, the Non-alcohol beer there. This would mandate additional equipment that wasn't shown to us on the tour, so I'm sure I missed out on a lot. I think the language barrier played a big part.

Happy Brewing, 'Pay your Taxes,
Johnny B. I need the money...'

Subject: Priming sugar

The other day I was going to bottle some Pale Ale I had brewed and went looking for my priming sugar. These days, I have been using pure cane sugar - Confectioners - for the priming (I haven't had any problems with this).

Thing is that someone else in the house had used the sugar recently for baking (imagine that) and after rolling the dough in the sugar had put the excess back in the box. Of course, I learned this only once I saw the flaky gingerbread dough rolling in the boil.

Needing sugar FAST I went over to the sugar box and pulled out some granulated cane sugar and used that instead. Now I know that both are cane sugar, but does it matter whether I'm using the extra-fine confectioners powder or the granulated stuff?

Cheers.

Subject: To Rinse or Not

Volker Stewart (radavfs@ube.ub.umd.edu) asked in #816 about why one should or should not rinse with city water. Fair question, since most of us drink and cook and even brew with it.

I don't rinse, because my city water has a small amount of bacteria in it. If I rinse, I run the risk of infecting my beer with E. Coli or a nitrifying bacteria that might harm the taste of the beer over time.

Call your water company, and ask for a water analysis. Along with the mineral balance of the water, which you may find useful, look for bacterial counts.

Subject: Coffee in beer (again)

John R. Pierce writes:

> Guy McConnell mentions a "Monte Sano" blend of coffee that he used to
brew a
> "mocha-java stout". He sez he chose it cuz its a light blend.

Well, actually I said that I used it because it was a mild blend. It
also
happened to be what I had in the house at the time. While it certainly
isn't
Peet's "roasted to within an inch of its life", it isn't a light roast
either.
I would characterize it as a medium roast. I did find out the blend; it
is
1/3 Peru, 1/3 Uganda, and 1/3 Santo Domingo (according to the lady I
called).

> Why not use the real thing. Mocha-Java as in Mocha Mattari (from
Yemen)
> and Java Estate (from, uh, Java). This is one of the finest and
smoothest
> coffee blends ever. It can be brewed VERY strong and stay smooth, yet
is
> very tasty and delicate when brewed medium light.

Absolutely. Why not indeed? My recipe was intended to be a starting
point
for anyone wanting to try this. I named it Mocha-Java Stout because the
word
"mocha" is often (and quite correctly) used to describe flavoring with
chocolate and "java" is a rather widespread (if not universal) reference
to
coffee in general. It was a chocolate-coffee stout. If there is one
thing I
would change, it would be to add more Monte Sano or a more assertive
coffee to
bring out that flavor a bit more. I can barely detect the coffee aroma
and
taste myself but a friend who doesn't drink coffee said that he could
detect it
quite plainly. I would probably use Mocha-Java or Sumatra Mandheling if
I
brewed this again. High quality Java Estate coffee has been rather
scarce of
late though, making it hard to get a good Mocha-Java blend.

> Another side note, dark roasts seem to have a higher oil
> content in the brewed coffee than light roasts. As I understand, you
> absolutely do NOT want to introduce any kinda oils in brewing as they
> oxidise easily (read "rancid!" |~<)

This was one thing that I wanted to test in brewing this beer. I was
a
little concerned that the oils in the coffee and the chocolate would kill
the
head but it has a beautiful, creamy head that lasts. As for oxidation,
it

hasn't a trace of it. I am quite careful in handling my wort to minimize the risk of this anyway. Again, I recommend a brew like this to anyone who enjoys the three flavors as much as I do.

"Drinking homebrew from a wooden cup"

Date: 04 Feb 92 12:36:22 EST
From: Bill Crisafulli <73750.2427@compuserve.com>
Subject: Beer Across America

In HBD 814 Bill Dyer described Beer Across America. I posted a message back in December announcing the creation of this little club, so I thought I'd also put in my two cents.

BAA is currently trying to work out a national distribution scheme. UPS will deliver within the state of Illinois but refuses to ship out of state. They are using an air service currently to get deliveries to most of the midwest states, but want to cover the whole of "America" ASAP. I'll post when things get settled and let all know.

BAA is run by some friends of mine. It is legit, they are handling the beer well and using quality shipping materials. The beer is ordered and delivered directly to their location in IL. They ship it out within a week of their receipt. The last shipment Bill described was their first, and out of 500 shipments only one had any breakage.

I agree that it would be great if they could handle additional orders when someone finds a beer they like, but the old freshness problem rears its head. Because the beers they are shipping are not generally available in normal channels, they get a limited supply and thus they do not want to hold any extra. Further on down the road I expect them to offer some limited offerings in this vein, but not right now.

I have no direct interest in this operation, other than writing an article in the newsletter about beer. Of course, I am getting compensated for that in liquid form, but other than that this is all their baby!

Subject: Hot & Cold Break Galore
Full-Name: "John Cotterill"

If anyone doubts the formation of large quantities of break material in their brew, believe it, the stuff is really there! Generally, I brew and ferment in stainless containers so there is no way of seeing whats at the bottom, unless I rack my brew. And with pellet hops and busy yeast, its hard to say what else is at the bottom of any particular vessel.

I have just started culturing yeast. As part of this experiment, I needed to make up several batches of sterile starter wort. I did this by first adding some malt extract to some boiling water, adding some hops, and boiling the mixture for about 10 minutes. I then filled some Mason jars with the wort and pressure cooked it for 15 minutes. When I pulled the jars out, there was a good 1/4 to 1/2 inch of break (hot and cold) at the bottom of the jar. I was really surprised at how much stuff there really was!

From: Fred Condo <CONDOP@CGSVAX.CLAREMONT.EDU>
Subject: NA Beer by Boiling; CO2 & EtOH

I have tasted beer made non-alcoholic by boiling. The maker of the stuff is highly sensitive to alcohol, and couldn't drink the stuff if her method didn't work. Steve Stroud's comments on the 95:5 alcohol:water distillation product exactly gibes with my faint recollections from college chemistry. It is also why you can't buy liquor higher than 190 proof. Pure ethanol has to be made by means other than distillation.

pierce@pyramid.pyramid.com (John R. Pierce) asks about Co2 and ethanol. You seem to be a little unclear here... There isn't a CO2-producing versus an alcohol-producing version of fermentation. Under anaerobic conditions, yeast split each glucose molecule into equal proportions of carbon dioxide and ethanol.

Thus, you blow off the CO2 in fermentation, but TRAP the CO2 from your priming sugar by sealing the bottle or keg. For each molecule of CO2 produced in carbonation, you get one of alcohol, so priming does marginally increase the alcohol content of the beer. MARGINALLY.

Summary:

yeast
glucose ----> 2 carbon dioxide + 2 ethanol

From: Conn Copas <C.V.Copas%lut.ac.uk@hplb.hpl.hp.com>
Subject: Encouraging diacetyl

Al advised that fining and racking towards the end of the primary is one means of encouraging diacetyl, but then asks whether fining earlier in the primary would do any harm. I don't have the answer myself, but have seen wine recipes which advocate adding bentonite whilst pitching the yeast. It always seemed to me that this might inhibit the ferment by preventing yeast circulation, but possibly not. Presumably, bottom fermenters would get 'buried' easier than top fermenters ?

"Drinking Homebrew from a wooden cup"

Date: Tue, 4 Feb 92 17:27 EST
From: CONNOLLY%RISVAX@CCNMR.MIT.EDU
Subject: NA brew

HBDers:

I've run a bit behind the journal but I'd like to comment on the NA thread and thank Steve S. (HBD #816) for hopefully ending this ridiculous discussion. For those of you who claim to be experts on the subject and don't believe that Jack S.'s technique works I'd suggest you check your P. Chem. texts. Mine (Atkins, 1978) gives H₂O and ethanol as an example of a binary azeotrope, complete with a phase diagram, saving lots of calculations that can't really be done anyway. The key is to realize that the deviation from Raoult's Law is due to hydrogen bonding between H₂O and EtOH. (Atkins, 1978, p. 230)

Also, if you check the CRC Handbook of Chemistry and Physics you will look under binary azeotropes and see that the vapor will contain ca. 95% EtOH and ca. 5% H₂O. It only makes sense that at this rate you will eventually reach the point where the amount of EtOH in the pot is less than 0.5% and you've got real NA homebrew on your hands!

I wouldn't worry about the scientific method and cold fusion in this case Jack...these are experimentally verified facts that have been known for well over a hundred years.

Sorry to flame...I've got some useful info out of the Digest but sometimes the misinformation given out by those flaunting their education (I'll refrain) is really irritating.

From: Bob Jones <BJONES@NOVA.llnl.gov>
Subject: B.A.B.O. & NA Beer from Micah Millsapw

I would like to mention that the Bay area brewoff on January 25th went nicely. There were over 150 entries. There were also some great prizes, ribbons, cash, hops etc. The judges (myself included) were provided with some great food and beer after the event. In all it was a lot of fun.

N/A beer? Can you really do it at home? Early in '91 I wrote an article for the California Celebrator Brewspaper about making N/A at home. When I find the disk that it's on I'll post it. It is not too difficult a process, alcohol removal. The efficiency of stove top evaporation is less than 100 percent but it is something that you can probably live with. It is possible to determine if you have in fact removed some of the alcohol from the beer by checking the specific gravity before and then after heating the beer. The gravity should increase. The process is, after all removing the lightest component of the beer. It is also possible to allow the vapor from the heated beer to condense on a cool surface so that it may be collected. Sensory analysis should verify the presence of ethyl alcohol. A bit of caution, higher temperatures than 180F can boil off the higher alcohols which when concentrated can be toxic. Collecting the distillate is also illegal in the USA. Some commercial N/A is produced by drawing off the alcohol in a vacuum, this works the best but is next to impossible to do at home. Another method is to use specially designed yeast strains and mashing techniques to retard or reduce attenuation levels.

If there is some interest in the homemaking of non alcohol beers, then I would be willing to post the information and techniques that I've gathered. This may save Jack S. from having to reinvent the wheel. Also my N/As do taste good and tend to be hoppy.

Note: low alcohol beers are easier to homebrew than N/As.

From: Brian Capouch <brianc@zeta.saintjoe.EDU>
Subject: Re: Millet Beer (sic)

In the past few weeks, I've been lucky enough to pick up a couple of books that have changed my life as a brewer. Last Friday, I found a copy of "100 Years of Brewing" in a used bookstore in Chicago. That same day, I believe, there was a wonderful excerpt from that book here on the digest, followed by another post this week. . . . There's a very interesting piece in there about the 1902 technique for brewing "Steam" beer, and if anyone's interested I'll be glad to copy it.

The other book is Keith Steinkraus' "Handbook of Indigenous Fermented Foods." It contains chapters on fermentations of many sorts, and the portion of the book that deals with yeast-fermented alcoholic beverages is the longest in the book.

Do you know the name of the drink in question? The book contains very explicit directions for the preparation of the various beverages, and I'll look it up and post it if you'd like.

I've lined up sources of millet, sorghum, and maize, and will be trying to learn to malt them sometime in the next few weeks. One of my goals is to make some authentic Peruvian-style chicha, about which I've been reading more and more lately. I'm almost certain that's where Charlie P. has gone in search of the "oldest brewers in America." The Winter issue of American Brewer outlines a trip that was taken in search of chicha by a freelance person who was hired by the Schoenling-Hudepohl folks to go down there and see what was shaking. The article contains a lot of interesting things about the beverage, but is so permeated with cultural arrogance and snide remarks about the "filthy" Indians it was depressing to read. The same fellow had an interview last weekend in the Cincinatti paper that I haven't read, but from what I've heard is equally filled with pinhead humor attempted at the native's expense.

Subject: How to Read HBD on your Macintosh, read on!

Hi folks,

I fellow I met through the 'net has created a HyperCard stack for those who read the HBD and would like to read it on their Mac instead on on their mainframe. A few detailsd as to how this works:

- 1) You download as many HBD's as you want to your Mac.
- 2) You run the "Homebrew Browser" and import as many HBD's into the stack
- 3) You then will be presented with 2 screens, a left one with message headers, and a right one with the messages.
- 4) You can scroll on either side, but the cool part is that if you scroll through the message headers and click on one in the left window, the right window will pull up the associated message.
- 5) If you hold down the option key while selecting a message header--you will move to the message, and copy the message to a black card (for replying).
- 6) If you prefer to look throught a month's worth of HBD's, this will save a ton of time.
- 7) It's only \$5.

OK. I'm just the point man on this, I didn't write it, nor am I getting anything out of it--it will be ready within the week, and as soon as I can figure it out, I'll put it into the HBD archives. For now, if you want a copy, send me a message with the message header "I want a brew browser", with your e-mail address included. Ill set up a distribution file, and Ill send you one. Ill also re-post to HBD when I send out.

Any questions, e-mail me.

Subject: Coffee

About adding coffee to stout:

For Xmas my wife got me a "Coffee Toddy" - it makes coffee with cold water and claims no boiling means no oil/acid released from the coffee. Basically it's a bucket with a hole in the bottom that you put a cork in from the outside. A filter fits over the hole inside - the filter is a half inch thick fibrous thing. You add about a pound of ground coffee to a gallon of cold water and let it sit for a day. Pull the cork out over a container and voila! Liquid instant coffee. This stuff is VERY strong - you add water like 4:1 to make drinkable coffee. I don't know the chemistry behind it but I believe there is less acid in this than regular coffee it doesn't upset my stomach at all. And it tastes smoother - not always what I want in coffee but I would like it in beer.

Seems like this would be perfect for adding to a stout.
I haven't tried it yet but I'm going to.

Subject: shipping via UPS

from John Freeman:

Well, I hate to do bring this up again, but how does one ship beer?

I just came from my unfriendly local UPS Center where I was told "We don't ship alcohol of any kind". The manager gave me the same story. First, they tried to tell me it was a law. When I pointed out that it wasn't a law, and asked him to show me a written policy, then he said he could refuse my package for any reason. After more BS, he said he was sorry he couldn't help me. I doubt his sincerity.

sorry if this has been addressed and finished already, but i'm kinda behind in my reading. i hate it when i don't have time for my fun stuff at work! anyway, i was going to bring this up during the last thread of this, but everyone seemed to answer the questions, but this time i'm really curious. john, could you tell me where it was you were told this, such as which store? my best friend and another really good friend both work in upper level UPS. i asked them what UPS's policy was on shipping beer/alcohol/homebrew. they both assured me UPS would ship it. it is NOT illegal. they said the only thing to worry about would be wrapping it properly to make sure it doesn't break and you might want to send it as a perishable item to prevent spoilage. they were a little concerned that UPS people were refusing to send it. interesting.

Subject: YASSS (Yet Another Siphon Starting Suggestion)

(Mea culpa! I first sent this to homebrew-request@hpfcmi.fc.hp.com - hope it doesn't appear twice...)

Recently, there have been many interesting and creative :-) as well as practical suggestions for starting siphons, but nobody has mentioned the technique I now use. Now that I have the 1.5(?)" blowoff tube, I no longer need my 3/8" blowoff tube as a blowoff tube. I sanitize the blowoff tube (and tip that used to go into the stopper) the same time I sanitize the rest of the siphon tubing. When I need to start my siphon, I stick the blowoff tube tip inside the end of the siphon hose - also conveniently 3/8" - and suck on the end of the blowoff tube. Once the siphon is started, I clamp off the tube above the blowoff tube coupling and disconnect the two pieces of tubing.

Since the "first flow" through the siphon clears the residual chlorine bleach, I would have discarded it anyway. I can use this sample for gravity readings and taste-check.

With this method, my mouth never touches the "real" siphon hose. If, perchance, the siphon doesn't start the first time - no big deal. Suck on the end again. I never disconnect the two hoses until I'm sure the siphon is going. It works for me. Your mileage may vary.

>John B writes:

That's not quite it. Back some 170 years plus when the brewery was founded, this part of Germany belonged to the Kingdom of Bavaria. They tried to change the name to something more regional in the early 1980's, but the locals were aghast that their beer heritage was being tampered with (that and sales dropped dramatically :-).

>I would suggest to any student of German history that they take a look at a map of Germany in the 18th century to illustrate the strange sprawl of the hundreds of German states - it really is a mosaic! Thanks for the info, John! :)

Then, Fritz Keinert <keinert@iastate.edu> writes:

>A friend of mine of Lithuanian descent told me about a drink they make there for special occasions, based on fermented rye bread. Some time later, I checked out a Russian cookbook from the library, and they also mentioned a drink called "kvass" based on fermented bread. I assume they were talking about the same thing. The cookbook did not give any details.

>Does anybody know more about this?
Only that this drink is immensely popular in the summertime in Russia! I visited Moscow in the summer of 1984, and was surprised to see people lined up at (sometimes horse-drawn) tank-cars, similar to those used to transport water on farms. The cars said KBAC (i.e. Kvass in Cyrillic) and I didn't find out until later what it was - it is indeed some sort of fermented bread drink. One person tried it and was underwhelmed. I'll have to wait until I get back there...:) Best, Volker Stewart

From: Bob Jones <BJONES@NOVA.llnl.gov>
Subject: Bleach sanitizing revisited

After a private email conversation with George Fix concerning my bleach sanitizing concentrations I made another call to my contact at Clorox. The microbiologist there reconfirmed that 50-200ppm of chlorine was the best concentration for sanitizing. The key word here is "CHLORINE". She said contact time on the order of a few minutes was adequate for a good kill if the vessel was cleaned first with a good detergent. My original post on bleach concentrations was based on using the stock bleach solution and then diluting to the working concentrations. No one ever said if the recommended concentrations were stock bleach or the free available chlorine in the bleach. When one takes the standard stock bleach solution which is 25000ppm chlorine and then dilutes it in 5 gals of water to obtain the proper concentration for sanitizing, the quantities are quite different from my original post. The new values look like this...

BleachChlorine inResidue in final
added 5 gal of waterbeer

2T	40ppm	.01ppm
1/2C	160ppm	.04ppm
5 oz	200ppm	.05ppm
1C	320ppm	.08ppm

The above residues were calculated based on 1t of sanitizing solution being diluted with 5 gals of beer. The dilution factor is 3855. The figures look even better now.

So 1/2C or 5 oz. of stock bleach solution seems about right to me for sanitizing in 5 gals. of water. 2T or 1 oz. of bleach in 1 gal of water will give 200ppm chlorine.

I also ask about dumping these concentrations into septic tanks and she didn't seem to think it would be a problem.

Subject: CO2 milage

I use a 20# CO2 tank and 5gallon Cornelius Kegs (soda). The last two tanks of CO2 lasted me about 8 batches each -- but I may have had a leak. I use a LOT of CO2 for non-dispensing and about half those batches were primed and naturally carbonated, half force carbonated. When I say a LOT of CO2 for non-dispensing, I mean: forcing sanitizing solution out of the keg, forcing out rinse water and/or rinse industrial beer (several of the batches), purging kegs of air before siphoning into them, etc. I suspected a leak and tightened everything down again (I have a 4-product setup -- LOTS of fittings, hoses, clamps, etc.). After that, I checked all the possible leak locations with a little dishwashing liquid in water -- no leaks. Too bad I did not check before tightening.

I think Ken's approximation of 60 kegs for a 5 lb tank may be high, though. It depends on how much of a leak I had -- I hope Ken's right.

There are two Lithuanian drinks that I know of, but I'm not sure about whether they are both fermented or not. I've been meaning to ask my grandmother about this, but keep putting it off. One is called "gira," which I know is made from rye bread, but I don't know if it is fermented -- my grandmother used to give us kids some, but if it sat around longer it... hmmm? Another is called "pieninis," which is (I believe) made from milk (pienas == milk)! I know pieninis is fermented. I've got to get these recipes -- if they are truly brews, how could a homebrewer of 100% Lithuanian descent let their family recipes be lost?!

From: Mike Fertsch <FERTSCH@adc1.adc.ray.com>
Subject: Pressure in CO2 Tanks

Key Key makes some calculations about keg pressure, and extrapolates to amount of gas in the tank:

>My 5lb tank has gone from 800PSI_g to 760PSI_g. It is grossly
>unfair to say that each keg cost 20PSI but using that as another outside
>approximation shows the tank's good for 35-40 kegs

The problem with these calculations is that CO2 tanks are filled with liquid CO2, not gas. The gauge simply measures the pressure of the gas above the liquid, not the quantity of CO2 in the tank.

As gas is compressed, it reaches a point where the the gas starts condensing into a liquid. As more an more gas is put in the tank, the pressure stays the same, but more liquid 'gas' collects. The gauge measures the pressure where the gas condenses, which is a function of temperature. The gauge is a good measure of tank temperature, rather than the quantity of gas. As a tank is emptied, the pressure stays the same until all the liquid CO2 evaporates, then the pressure drops quickly.

From: anelliga@hamlet.Prime.COM (A Nelligan)
Subject: Barlywine Questions

In answer to Greg's Barlywine issue:

We also made concocted a barleywine out of TCJOHB.
Our recipe looked something like this:

2 cans Munton & Fison Light Malt Extract
2 lbs Munton a& Fison light dried malt extract
1/4 lb domino light brown sugar
3 1/2 oz fuggles hops
another 1/2 oz fuggles for finishing
2 pkg Munton & Fison ale yeast.

We did a single stage fermentation, so I can't answer your
question about how long to age in secondary.

We gave the finishing hops 10 minutes.

As far as conditioning in bottles--
well, it's been 14 months now and it keeps getting better.
At 2 months it was OK, but cloudy enough that we thought
we should have used gypsum. It was also VERY sweet, but
also very hoppy and quite smooth.
By 9 months it was clear, but quite heavy and we thought
maybe less sugar.
Last week it had gotten considerably drier and VERY clear.
It's really good now, so I don't know if it'll last long
enough for me to give you an update later.

Good luck,
Ann

Subject: sanitazation

Hi Volker--

I'm new to the digest too, so if this has been disucssed I missed it just as you did. So I'll dive right in.

I use B-Brite to sanitize my bottles. I mix it up by the gallon and use and re-use and re-use it. All that siphoning back into the storage bottles is a handy way to sanitize hoses. So far I haven't had any problems.

I also use tap water to rinse. I live in greater Boston and have Quabbin Reservoir water-I have no idea of the bacterial content of the water but I've had no problems with that either.

Subject: NA Beer - the Schmidling Method

Jack and I have been corresponding off-net about NA beer; he now has my mailing address but has suggested that I repeat his experiment with a 1-gal batch and analyze my own samples rather than analyzing his samples. On the digest, on the subject of my lab analyzing his samples, he writes:
> However, upon further consideration, it seems not only a waste of energy
> but hardly in the true "scientific tradition". After all, what is to
> prevent me from re-bottling a can each, of Old Style and Kingsbury?
Nothing, Jack, except that in a scientific collaboration like the one I proposed, one of the traditions is that I trust you and you trust me. As a professional researcher and research mentor, I take scientific integrity very seriously, and I can't <g> or RDW when the joke is about the possibility of anybody's research fraud taking place in my lab.
Now if Jack doesn't trust the HPLC, that is perfectly understandable, and we should definitely run the Old Style and Kingsbury's as experimental controls along with some Schmidling Method NA Beer.
Thanks also to other HBD'ers for helpful comments via e-mail. Cheers -
Jean

Subject: Re: Kvas a recipe

Kvas

I got this recipe from a book called 'dinerparty a la perestrojka'. I tried it once, it tasted terrible, but that was probably due to the fact that the rye-bread was almost burned.

Ingredients:

500 gr. Rye-bread
8 l water
25 gr yeast (the book mentions yeast to make bread)
225 gr sugar
4 spoons of luke warm water
1 lemon
2 spoons of raisins
2 branches of peppermint

1. Put the slices of rye-bread in the oven (200 degrees Celsius) for about 45 mins, until they're dried.
2. Boil the 8 liters of water. Crumble the dried rye-bread, put it in the boiling water for about 5 mins.
3. Let it the water, and rye-bread rest for 4 hours, covered with a tea-cloth.
4. Crumble the yeast, 15 mins before the 4 hours are over. Mix the crumbled yeast with some sugar and the luke warm water. Let it rest for 15 mins.
5. Filter the water-rye-bread mix in a kitchensieve. Carefully extract all water from the rye-bread.
6. Wash, and peel the lemon. Add the lemon-peel, the sugar, the yeast and the peppermint. Stirr the solution, and let it rest (covered) for 8 hours.
7. Sieve the solution (tea-cloth).
8. Bottle it.
9. Put some raisins, a bit of lemon-peel, and a fresh leaf of peppermint in every bottle, close the bottles, and keep them in a cool place.
10. Ready when the raisins start floating.
11. Sieve the stuff one more time in a tea-cloth.
12. Put the Kvas in the fridge 4 hours before drinking.

This is more or less the description the book gives. Remember this is a recipe for non-brewers. It is a cookbook after all.

Happy brewing!

Subject: re: kvass

There was an article in Zymurgy a few years back on kvass (88 or 87 perhaps? sigh, all my back issues are in storage). It claimed that kvass was mildly alcoholic, in the 2% range. But I spoke with a Russian emmigrant not too long after that issue came out and he claimed that it was non-alcoholic. Further, he told me that one could buy kvass extract in some of the Russian shops along Fairfax in the LA area (Jewish enclave, although that is changing). Sadly, I never had the opportunity to follow up on it.

It sounds to me, however, that kvass is a generic name for a drink made from dark rye, and that when it gets a bit old, it gets hard -- not unlike cider. Charlie P. has described a number of indiginous drinks that are good for only a short while, and European beer certainly used to belong to that list. I think that kvass may also.

Subject: How much chlorine?

Bob Jones gave some calculations for chlorox bleach solutions and recommends 50-200 ppm levels of the bleach solution for sanitation. I come up with different numbers and use much lower amounts.

As I understand it, Chlorox bleach is 5.25% Sodium Hypochlorite (NaOCl) in solution. I know that inorganic chlorine compounds are inherently unstable, and the age of the bottle will effect its strength, as it forms Hypochlorous Acid and otherwise outgases, etc. But, for these calculations, lets assume the 5.25% NaOCl is the starting point.

NaOCl is dissolved in the water as Na(+) and ClO(-) ions, and it is the ClO which I know from swimming pool maintenance as "Free Available Chlorine."

This ion is a strong oxidizer: by shoving the oxygen molecule where it otherwise wouldn't go, and then either outgassing as CL₂ or combining with free molecules from what it just oxidized to form chloramines, chlorphenols, chloroform, etc. This is my understanding of how chlorine work.

If I grab my trusty dictionary that includes atomic weights, and look up the weights for Na, O, and Cl, I get:

Cl	35.453
O	15.9994
Na	22.9898

Using these weights, I calculate that the ClO ion is 69.12% of the NaOCl, so that in a 5.25% NaOCl solution I have 3.63% "Free Available Chlorine" when fresh from the factory. This means that chlorox bleach is approximately 36,300 ppm F.A.C.

With 128 oz per gallon, 2 Tbls per oz, 3 tsp per Tbls, I get about 3.5 Tablespoons of bleach to 5 gallons of water to make 100 ppm FAC solution.

Given all that, and given that I keep my swimming pool in the 1-3 ppm range, I use 1 teaspoon of bleach to 5 gallons of water, and I don't rinse. This 1 teaspoon gives me around 8-10 ppm, which is about the level I use in the swimming pool to "superchlorinate" it. Superchlorination breaks down chloramine compounds and also breaks up oils (sun tan, skin oil) in the pool. I find this level of sanitation just fine for soaking, running through hoses, whatever, and I never fear damaging my yeast or producing chlorphenols

from grain materials. This 10 ppm level in 5 gallons gets my chlorine way
down
into the low ppb just by draining carboys and shaking off hoses, wine
theifs,
stoppers, funnels, and stuff. I sanitize bottles in a dishwasher.

Subject: Re: Jack's NA beer

At 170f, jack is not only driving off alcohol, but pasturizing his beer. One issue that has not been discussed is the flavor changes that might occur. It is a Homebrew/beer aficionado's assertion (momily?) that pasturized beer has a cooked flavor to it. The "fresh flavor" of draft beer being the preferred commodity.

Another issue is oxidation. There is going to be some amount of it for not other reason than all the extra handling. In addition, the hot wort is going to absorb some O₂ and react while cooling down.

So, Jack, what is (IYHO) the effects on the flavor of your beers? None? Not objectionable? Have you gotten feedback from your beer judge buddies in Chicago? Is the beer a light beer or a robust IPA? The latter might mask minor oxidation type defects. Naturally if the defects can't be detected, then they are not a problem!

I look forward to giving this a try with a future spring wheaten ale.

Subject: UPS and Homebrew

Why don't we try to actually settle the whole UPS debate instead of just swapping stories about it?

What I'm saying is this: We homebrewers need access to some official UPS documentation that says, flat out, "UPS will ship alcohol provided _____."

If we can get a copy of such a document, we can take it with us when we go to ship homebrew, and show it to any UPS flunky who tries to object. Heck, maybe even paste a photocopy of the relevant passage to the outside of the box . . .

Jeanne Sova talks about a couple of friends high up in UPS. Can you get their policy in writing? Someone else mentioned UPS' Big Book of Regs; sounds like that would be perfect. If I had a UPS center anywhere close, I'd try to track it down myself, but since I'm a couple of hours away from the closest, this really isn't practical. That's why I'm appealing to the HBD for someone, anyone, to get the straight \$#!+ from UPS and put this thing to rest once and for all.

newsletter of information on the month's selections and "...discounted
prices
on previous selections."

No obligation, quit whenever you want.

Costs: In the flyer: "You'll be billed aproximately \$13.95 plus tax,
shipping
and handling." (per month) On the registration form: "My total monthly
average
cost will be aproximately \$13.95 plus tax, shipping and handling." And
further
on: "Deliver to my: __Office (\$3.25) __Home (\$3.75) (The above price
includes
shipping and handling, Illinois residents only. Outside Illinois
shipping and
handling will be \$1.00 to \$4.00 higher.)"

There are no restrictions mentioned as far as where they will ship to.

Worst case is \$7.75 S&H plus the aprox. \$13.95 for the beer = \$21.70 a
month,
or \$10.85 per 6 pack. I have done a lot of shipping of commercial beers
to
people and this is about the cost I incur. And I don't make anything off
of my
shipments! Sounds pretty reasonable to me. As long as the beer is well
cared
for (which Bill Crisafullisays is the case) I think this will be worth
the \$\$.

Let's hear from those of you who belong as to the condition of the brews.

RW...

You definitely have a leak! I used to use a 5 lb bottle (15 lb now for convenience). I too use my CO2 for dispensing, transferring, purging air, carbonation, etc. My last 5 lb bottle lasted about 30 batches! The difference in our set-up (I suspect) is that I do not leave my CO2 connected to the kegs of beer. I simply set the keg to 15 psi, then disconnect the CO2. When I want to drink the beer, I drop the pressure to 5 psi, hook up the CO2 and dispense at 5 psi. When I'm done drinking, I jack up the CO2 to 15 psi again and disconnect it from the keg. Occasionally, a small leak will develop in a keg, and I'll lose carbonation. No problem, I just re-carbonate it. This is generally not a problem, however.

I performed an experiment once where I left my CO2 connected. I used a leak detector solution to see if there were any leaks. I could not find any. The CO2 tank was about half full. After a week it was empty. I was fairly surprised! No leaks, and it leaked! I then added some CO2 from another bottle, to the same keg, and then disconnected the CO2 hose. The keg was still at pressure a week later.

I am pretty sure that some of the CO2 leaked from the flare fittings on the soda connector/CO2 line interface. I have been told by people in the soda industry that this type of connection is notorious for leaking. A few days ago, I was looking in the Foxx catalog and noticed these little nylon washers that sit between the male and female flare. I have ordered some and will see if they help prevent leaks while the system is all connected.

From: arf@ddswl.mcs.com (Jack Schmidling)
Subject: NA Beer

To: Homebrew Digest
Fm: Jack Schmidling

From: Jean Hunter <MS3Y@CORNELLA.cit.cornell.edu>
Subject: NA Beer - the Schmidling Method

>Jack and I have been corresponding off-net about NA beer; he now has my mailing address but has suggested that I repeat his experiment with a 1-gal batch and analyze my own samples rather than analyzing his samples.

I believe I suggested using one bottle of beer for the test. My exact words were...

I suggest that anyone who has the capability of measuring alcohol in beer take a bottle of their own and pour half of it into a beaker. Heat this to 170F (uncovered) and let it cool (uncovered) and make the tests on this and the other half of the bottle.

Then, tell us it DOESN'T work. "Can't" work, simply is not good enough.

The only caution I inject is that a Bunsen burner, full blast on a 100 ml beaker may not simulate the heating rate of gas stove on a gallon. I think the total time is irrelevant because it is proportional to volume but heating rate might affect the results.

.....

Clearly, you do not need a gallon of beer and the effort it takes to process one bottle just doesn't justify the trouble and expense of sending mine to you unless you get results significantly different from what I published. I also explained (in email) that I do not, at the moment, have any available to ship, that was made in precisely the prescribed manner.

< On the digest, on the subject of my lab analyzing his samples, he writes:

> However, upon further consideration, it seems not only a waste of energy
> but hardly in the true "scientific tradition". After all, what is to
> prevent me from re-bottling a can each, of Old Style and Kingsbury?

<Nothing, Jack, except that in a scientific collaboration like the one I proposed, one of the traditions is that I trust you and you trust me. As
a

professional researcher and research mentor, I take scientific integrity very seriously, and I can't <g> or RDW when the joke is about the possibility of anybody's research fraud taking place in my lab.

As a scientist you MUST trust NOBODY.

<Now if Jack doesn't trust the HPLC, that is perfectly understandable, and we should definitely run the Old Style and Kingsbury's as experimental controls along with some Schmidling Method NA Beer.

You missed the point entirely.

Egos are terrible things. I have been raked over the coals in this forum and accused of everything from being a fraud to a Nazi. Some people with tender feelings, just might resort to dishonesty to redeem themselves.

That is why I suggested you (all) conduct the experiment independantly and whether you believe it or not, that is the way science works. Otherwise, I could also include a battery I charged using my cold fusion process. If it is fully charged when you get it, that would prove my cold fusion prosess, by your standards.

From: grumpy!cr@uunet.UU.NET (C.R. Saikley)
Subject: BABO, modesty and infamy

Micah Millspaw writes:

>> I would like to mention that the Bay area brewoff on January
>>25th went nicely. There were over 150 entries.

And Richard Stueven responds:

>Micah is too modest. He neglects to mention that he won one of those
>great prizes himself, as did another (in)famous HBD contributor,
>CR Saikley.

>From Webster's :

famous - adj 1. a : widely known b : honored for achievement
2. EXCELLENT, FIRST RATE

infamous - adj 1. having a reputation of the worst kind
2. DISGRACEFUL

Hmmmm. I guess there's a fine line.....:-) :-)

All seriousness aside, this year's BABO was a smashing success. HBDer's Bob Jones, Russ Wigglesworth, Tom Altenbach, Micah Millspaw and myself were in attendance. This is a really fun event, and I'd recommend it to anyone near the Bay Area.

The event took place at Lyon's Brewery of Dublin, which is a pub - not a brewery. Not only was lunch provided, but Judy, publican at Lyon's, supplied two rounds of beers for all of the judges (and stewards??). The Brewer's Brass, an all brass band of very talented musicians and homebrewers, performed during lunch and during the truly infamous Brew Dude Fashion Show. Then the Rolling Boil Blues Band (sometimes known as the Flocculating TRUBadours) dazzled the audience with their musical ineptitude ;-). All in all it was a good time.

I have a good reason for being modest about the awards I garnered that day.

I didn't get any! In fact, I had no entries. However, I was fortunate enough to judge the holiday ale category, and there were some tasty brews indeed.

It was a very difficult category to judge as few objective criteria exist.

We decided to use commercial examples (such as Anchor and Sierra) as rough guidelines, although it is necessarily a loosely defined style. It turned out to be a very popular category, with 36 or so entries. Fortunately, there was a preliminary judging that winnowed the number of entries down to a manageable 13.

Has anyone else out there judged holiday beers or specialty brews?? I'd be interested in hearing of your experiences in judging these tough styles.

Yours in Infamy,

CR

From: stevie@spss.com
Subject: Call for Midwest Judges

This year, the AHA National Homebrew Competition has expanded to include another regional first-round judging site -- Chicago (finals will be at the AHA National Conference in June in Milwaukee). The deadline for entries is April 1, with judging scheduled for the weekend of April 10-12 at Goose Island Brewing Co.

While the Chicago-area beer geeks are a hearty bunch, the expected number of entries will likely exhaust the palates (and bladders) of our BJCP-certified judges. So, the call goes out! If you are a BJCP beer judge interested in working the first round, please let me (stevie@spss.com) know. You don't even have to be from the Midwest to join us. Wherever you're from, if you expect to be in Chicago over April 10-12, we want you.

Planning is now underway for a solid weekend of beer events, including a tour of Chicago Brewing Company (home of Legacy Lager and others) and visits to other local brewpubs and beer bars. Housing will also be available to those who need it. More detailed info to follow.

From: whg@tellab5.tellabs.com (Walter H. Gude)
Subject: Pre-crushed Grain M**ily?

There's that work again :-).

Seriously, I've asked this question and I've seen it asked by others at least twice with no reply.

1) How long can one keep crushed grains?

Everyone says you can't keep them "very long". Would someone care to quantify "very long". Is it a month? a week? a day?

2) What are the effects?

Decreased effectiveness? Stale taste? Mold?

3) Can you quantitatively tell the grain has gone bad? How?

While I don't like to keep crushed grain around myself, I'm beginning to wonder how much folk lore is involved here.

Somebody (anybody) have comments?

Walter Gude

From: gummitch@techbook.com (Jeff Frane)
Subject: WYeast Book

Brian Smithey (hey! looks like your address changed; didn't you used to have a .gov attached to your name?)

I note in the most recent Homebrew Digest your question about WYeast's book on yeast. And, yes, it's supposed to be out now . . . but it isn't. Dave has been too busy, apparently, to write much on it or to bug me for my share. When we had our last conference on the book he had arrived at a much more ambitious outline than we'd originally developed. When completed, the book will have a great deal of useful information on general usage and specifically on the strains WYeast is carrying.

The truth is, I've been ducking Dave -- or anyway, not calling him -- because I've got to get cracking on my pages. I'm sure Dave is, as usual, swamped out at the Yeast Farm, and I know he's been working hard trying to resolve packaging problems with the manufacturer back east.

Incidentally, I peeked in to the CompuServe beer forum today for the first time in a long time and noticed a thread about WYeast's monopoly of the homebrewer's yeast biz. !! Someone there has a confused idea of capitalism; I know for a fact that Dave and his wife, Jenny, have busted their asses to make WYeast a successful business. They provided a breakthrough package and exquisitely high quality control (they come by it honestly; both of them were Food Science students under my pa!) and created an economic niche that didn't exist previously. A brief look at the recipes of winning beers in the last few years' AHA competitions is enough, I think, to convince anyone of the quality of their product. What isn't obvious is the number of microbreweries and brewpubs who rely on WYeast to maintain their yeast bank or supply.

Ooog, what a diatribe!

Subject: Wire top bottles (Scott Welker)

Here's a question for my fellow homebrewers: I am considering brewing a fine dark ale as a gift for various occasions. But bottles are my worry; I was hoping to use 1 liter glass wire top bottles, which can be bought at food specialty and gourmet shops. They look far less sturdy than the standard homebrewing wiretop, Grolsch empties. Has anyone out there ever successfully brewed in the department store variety? Looking forward to your direct (or on the HBD) replies.

From: srussell@msc2.msc.cornell.edu (Stephen Russell)
Subject: Brew Club E-Mail Database

Homebrew club members (and potential members) on the digest:

I am compiling a database of the e-mail addresses of members of homebrew clubs that are willing to have them available to both other clubs and potential members.

This is a reposting. Sorry to take up the bandwidth BUT I really do think that having a database of e-mail addresses of members of Canadian, U.S. and other homebrew clubs would be of great value.

For one, it would provide easy reference for persons interested in joining your club. This would help boost membership, enthusiasm, etc.

For another, it would enable you to publicize interclub events such as homebrewing competitions and the like directly.

So far, I have received responses from 55 brewers representing 36 clubs in 24 states and provinces. Which is not a bad start, but I hope to do better, considering that in the U.S. alone there are more than 170 clubs.

With that in mind, I'll call for responses one more time:

IF you are a member of a homebrew club *AND* are willing to be listed in such a database, please send me e-mail with your state/province and club name in the subject header (as in NY/Ithaca Brewers' Union) and your name and e-mail address(es) on one line in the body of your message text. Please, no .sigs.

Send information to me at <srussell@msc2.msc.cornell.edu> on internet or at <srussell@crnlmsc2> on bitnet.

Administrative/questions/advice/grief should be sent to my 'regular' address, <srussell@snoopy.msc.cornell.edu> or <srussell@crnlmsc3>. Yes, I do plan to send this on to the archives and hope to update it somewhat regularly.

If you know of fellow homebrewers who have access to e-mail but do *not* subscribe to this digest, please ask them if they would be interested in this database and explain how they can respond.

By the way, I have no commercial connections whatsoever. I am just a member of a homebrew club that has utilized intraclub e-mail communication extremely effectively (some 40 of our 85-90 members are on e-mail), and I think that the concept could be extended to the interclub level without much difficulty.

I look forward to hearing from you. And 'thank you' to the 55 respondents.

Cheers and beers, skol, mud in your eye, prosit, sante, slainte,

STEVE

From: sterling@gandalf.umcs.maine.edu (Sterling Udell)
Subject: Yeast Re-use

I'm planning to try the Father Barleywine yeast cake re-use trick this weekend, and I have a quick question for those of you who have successfully done this technique before.

Do you need to oxygenate the wort with this method? Kinda seems like the yeast won't really need to go through much of a reproductive phase (since they're all there from the last batch), so oxygenation will be unnecessary.

Please e-mail responses to me directly, and I'll hopefully get them before I start the brew. Thanks!

[low-priority message, body not included]

End of HOMEBREW Digest #819, 02/07/92

Date: Fri, 7 Feb 92 08:42:13 -0500
From: hartman@varian.varian.com (John Hartman)
Subject: re: Pre-crushed Grain

In HBD #819 Walter Gude asks for feedback on long term storage of crushed grain. I asked the same question around Christmas time and got no response--not even private e-mail. My conclusion is that no one has experienced any problems with crushed grain going bad. My supplier, Brewmaster in San Leandro, CA, told me it would be fine for six months. I suspect that if kept clean, cool and dry it will last closer to a year.

fyi,
John Hartman

From: Bob Jones <BJONES@NOVA.llnl.gov>
Subject: Stout Recipe from Micah Millspaw

There has been a lot of discussion about making a coffee flavoured beer. Last year myself and Bill Coffee (appropriate name) who is head brewer at St. Stans came up with Kahlua stout. There are several versions a stout, a cream stout and a imperial stout. So here is a 5 gallon recipe for the standard version. This is one of St. Stans special at the pub only beers.

5# 2-row barley
2# 120L caramel malt
2# 20L caramel malt
2# british crystal
1# wheat malt
1# dextrin
1# roast barley

2oz Northern brewer hops 75min.
1/2oz styrian goldings 75min.
1 bottle kahlua liquor extract

whitbread ale yeast

mash @ 160F
and the kahlua extract to the primary before pitching the yeast.

enjoy
Micah Millspaw 2/6/92

Subject: Re: BABO, modesty and infamy

In HBD #819, C.R. Saikley calls my attention to a book written by one Mr.Webster, which I've never bothered to read. Too many words, and besides, I think the section on infusion mashing leaves out too many details.

>All seriousness aside, this year's BABO was a smashing success. HBDer's
>Bob Jones, Russ Wigglesworth, Tom Altenbach, Micah Millspaw and myself
>were in attendance. This is a really fun event, and I'd recommend it
>to anyone near the Bay Area.

There were a few low-profile HBDer's there as well (myself, Laura Lawson, Greg Schmitz). Maybe next time there's a Bay Area event, we can get coordinated. (And then go get *un*coordinated!)

>The event took place at Lyon's Brewery of Dublin, which is a pub - not
>a brewery. Not only was lunch provided, but Judy, publican at Lyon's,
>supplied two rounds of beers for all of the judges (and stewards??).

...and some of the customers!

>The Brewer's Brass, an all brass band of very talented musicians and
>homebrewers, performed during lunch and during the truly infamous Brew
>Dude Fashion Show. Then the Rolling Boil Blues Band (sometimes known as
>the Flocculating TRUBadours) dazzled the audience with their musical
>ineptitude ;-) All in all it was a good time.

I missed the TRUBadours...had to go to the Sharks game and drink Meister Brau. Which by the way doesn't taste very good on top of a few pints of Lind's IPA.

>I have a good reason for being modest about the awards I garnered that day.
>I didn't get any! In fact, I had no entries.

My mistake! I remember hearing your name and Micah's being called from the judges' stand while the awards were being handed out, and I (erroneously) assumed you were among the winners.

Great fun all around!

>Yours in Infamy,
>CR

Yours in Illiteracy,

Subject: UPS Shipping of Alcohol

I called up the San Francisco office of UPS, and asked them. The official answer is that for UPS to ship alcohol (knowingly), the sender must have a shipping permit from the Alcohol, Tobacco and Firearms office of the U.S. Government. This would explain why commercial businesses that deal in alcoholic beverages don't have a problem with UPS. UPS themselves do not issue permits, they just look at them. So everyone will probably have to continue to be evasive or lie.

From: Chuck Coronella <CORONELLRJDS@CHE.UTAH.EDU>
Subject: Beer distillation: the real story

I took offense to two messages that sarcastically criticized my post regarding distillation of alcohol from beer, 1 posted in Digest #816 by <STROUD%GAIA@leia.polaroid.com> (Steve Stroud) and another in Digest # 817 by CONNOLLY%RISVAX@CCNMR.MIT.EDU

Both correctly pointed out the existense of an azeotrope in the Ethyl Alcohol-water system:

>In the case of ethanol/water, it is not an ideal system and all of the
>calculations you performed are meaningless. Due to molecular
interactions,
>ethanol and water form a minimum boiling mixture called an azeotrope
which, at
>atmospheric pressure, boils at 78.2 degrees Centigrade (lower than
either EtOH
>or water) with a composition of 95.6% ethanol and 4.4% water. (At lower
>pressures the percent of alcohol in this azeotrope actually increases).

And then incorrectly interpreted the significance of an azeotrope:

>In practice this means that if you boil a water/ethanol mixture, what
will boil
>off initially is this azeotrope (4.4 : 95.6) until one of the two
components is
>totally distilled, then the remaining component will distill.

The existence of an azeotrope in this system means that if you boiled a liquid AT THE AZEOTROPIC COMPOSITION (89.43 mole% EtOH) the vapor would have an identical molar composition, 89.43%. At all other compositions, the vapor coming off a boiling liquid will be different than the liquid composition, and DIFFERENT from the AZEOTROPIC composition. The equilibrium vapor composition coming off a boiling liquid is described by an equilibrium curve. An x-y graph of the EtOH-H2O system is available in several references, I used "Phase Equilibria in Chemical Engineering" by S.M. Walas, Butterworth, 1985, p264, and data in Perry's Chemical Engineering Handbook, Section 13. Beer is roughly 4% alcohol (1.6 mole %); the azeotrope is at the other end of the equilibrium curve. Therefore, the azeotrope is not a consideration in this situation. Q.E.D.

Assume beer is composed of, for arguement's sake, only 4% w/w EtOH and 96% w/w H2O. Then, in mole fractions, $x(\text{EtOH}) = 1.6\%$. Examine an x-y graph of the EtOH-H2O system. At $x = 1.6\%$, I find $y(\text{EtOH}) = 14.3\%$. So, initially, the vapor is 29.9% w/w EtOH. Not bad. But the thing to remember is that this is a BATCH distillation, so that the vapor is 30% EtOH for the 1st moment only. After then, the beer is < 4% w/w EtOH, and so the vapor is less than 30%. (This wouldn't necessarily be true if the azeotrope was near this concentration range.) The equilibrium curve is rather steep in this range, indicating that $y(\text{EtOH})$ will drop quickly with liquid-phase concentration.

So the vapor becomes closer to pure water with time, and very quickly.
One
could solve a differential equation to find the exact solution.

Conclusion: Boiling (or heating) is effective in removing most of the alcohol only if the amount of "beer vapor" removed is a pretty large multiple of the volume of EtOH initially present, maybe 20 times.

Of course, I'm assuming that the other components in beer don't significantly affect the calculations, not an insignificant assumption. I discussed this briefly with Chip Hitchcock, and his chemistry is better than mine, so I defer to him: (don't hold him to it; these were initial guesses)

From: IN%"cjh@vallance.HQ.Ileaf.COM"

>I suspect that the low concentrations of sugars, hop oils, etc. wouldn't
>have a strong effect. The hop oils aren't polar enough to entangle much
>with the liquids (//guess//). The molal concentration of sugars is
around
>.166 (start with 1#/gallon = (454/180) moles / 3.8 liters = .664,
figure
>(average) 3/4 of sugar converted); my recollection is that the molal
>boiling point elevation of polar liquids runs around a small number (~
2?) 'C.
>Guesses, but indicative.

So to those who claim to have great knowledge about azeotropes, I say, go back and read your textbook. It's easy to identify the azeotrope; not so easy to understand it.

Sorry for the technical discussion. I know this is Greek to many (most) who aren't chem e's or chemists. But I was p.o.d by those who tell me I don't know what I'm talking about when they don't know what they're talking about. At the outset of this discussion, I certainly didn't intend to get into this so deeply; I prefer my beer WITH alcohol.

From: whg@tellab5.tellabs.com (Walter H. Gude)
Subject: Pre-crushed Grain M**ily?"

"There's that work again :-)."

Would someone please explain what a "momily" is ?

"1) How long can one keep crushed grains?"

I haven't seen a definitive answer yet, either, but I plan to experiment, anyway. Ten minutes of experimentation showed me how to peel labels off my labels, I don't think it will take any longer to keep grains fresh, or at least prevent them from going stale quickly.

Some sort of plastic container, such as one might use to keep grains safe from rodents and condensation, seems appropriate. Some sort of absorption material for loose H2O would be useful, provided it was isolated so that it didn't flavor the grains with a plastic taste. I'd guess that kitty litter might work very nicely, as a hygroscopic material. Then, once the moisture has been concentrated into the absorbent material, put the whole container in the freezer. (I suggest clean kitty litter, if you don't want your beer to have a strange taste ... :-)

Think of them as coffee beans and you'll have no problem, I'd guess. The nature of the problem is not as different as it might seem.

Subject: BABO results

OK here are the catagories and the winners for the Bay Area Brewoff held Jan 25, 1992 at Lyon's Brewery Depot. Dublin, Ca.

Pale Ale - 45 entries total

1st - Hans & Inga Sundet, Gold Country Brewers
2nd - Wayne Greenwaye, San Andreas Malts
3rd - Bob & Zach & Warren, U.B.A.

Porter - 23 entries total

1st - John Arends, Sonoma County Beerocrats
2nd - Bruce Brazil, Draught Board
3rd - Rick Guthrie, Draught Board

Dry Stout - 26 entries total

1st - John Arends, Sonoma County Beerocrats
2nd - Kelly Dunham, Brew Birds of Hoppiness
3rd - Eric Henschal, BURP

Barley Wine - 10 entries total

1st - Bob Hufford, Santa Clara Valley Brewers
2nd - Micah Millspaw, SAAZ
3rd - Kirk Ware, no club affiliation

Amber Lager (steam style) - 11 entries total

1st - Kevin Johnson, San Andreas Malts
2nd - Brad Brumit, F.O.B.
3rd - Bill Kirk, Santa Clara Valley Brewers

Holiday Beer - 32 entries total

1st - Peter Gotts, No club affiliation
2nd - Bob Jones, Draught Board
3rd - Bill Jamaca, Tandem Malt Processors

Mead - 9 entries total

1st - Rod Houck, SAAZ
2nd - Gerald Burke, Draught Board
3rd - Tom Altenbach, Draught Board

Total entries = 155.

1st place awards - \$20, ribbon, Lyon's Brewery Connoisseur beer mug
2nd place awards - \$10, ribbon, 8oz hops
3rd place awards - \$5, ribbon

Bob Jones, Competition coordinator.

From: Frank Tutzauer <COMFRANK@ubvmsb.cc.buffalo.edu>
Subject: Steam beer recipe

A while back, someone (sorry, forgot who) was complaining because it seemed like the only recipes that were posted were those in which the author said something like, "Haven't tasted it yet, but I'll let you know." Anyway, this person, whoever he or she was, implored HBDers to post their best (tried) recipe, under the condition that the poster had at least 10 batches worth of experience. I've finally reached that plateau (thunderous applause). Batch 11 and 12 are fermenting, but Batch 10 has been bottled and tasted. Of my first 10, only Batch #1 was a disaster. The rest ranged from drinkable to damn good. Batch #8 was the best. Here is the recipe:

Frahnkenschteam (Steam Beer)

(My wife, Carol, a fan of the movie Young Frankenstein, insists on the name.)

1 c English 2-row pale malt
1 c Crystal Malt, 60L
1 c Crystal Malt, 120L
6 lb light M&F dried malt extract
1 and 1/2 oz. Northern Brewer hop pellets (alpha = 6.5; 50 min.)
1/2 t Irish Moss (15 min.)
1 oz. Northern Brewer hop pellets (1 min.)
Wyeast 2035 American Lager yeast (cultured from a previous batch)
3/4 c corn sugar for priming

Brewer's specifics: Toasted pale malt in a 375 degree oven for 20 minutes.
Cracked it along with the crystal and steeped in 2 quarts of 150-175 degree water for 20 minutes. Sparged with approx. 1 gallon of water. Dissolved DME in sparge water plus cold water to make 3 and 1/2 gallons. Boiled for 60 min., adding hops and Irish Moss for indicated times. Chilled with a 2-gallon ice block and 20 degree outdoor temps. Racked off hot/cold break, topped up to 5 gallons, pitching a 2-3 cup starter at about 90 degrees. Visible fermentation in 12 hours, active in 18. Fermentation temps 68 to 71 degrees.
O.G. = 1.049, IBUs approximately 37. Single-stage fermentation for 14 days; bottled with 3/4 cup priming sugar. F.G. = 1.022, a little high, but fermentation was definitely done.

Comments: I did a side-by-side comparison of this brew to a bottle of Anchor Steam, and here are the similarities/differences: This beer is exactly the same color as Anchor Steam, but it's a bit cloudier due to a little chill haze. The head is neither as big nor as long lasting as Anchor Steam's, but it clings to the side of the glass better. This beer has more body than Anchor Steam, and it is a bit maltier and sweeter; Anchor Steam is crisper

with more hop bitterness. It is not as carbonated as Anchor Steam,
although
it would not be considered undercarbonated. All in all a very good beer.

Subject: Beamish Stout

As a Stout lover, I was encouraged to read the following in this week's "Irish Emigrant":

"Beamish and Crawford has won a court battle to sell Beamish Stout in the US. The company which sells Jim Beam whiskey had objected."

Of course, there is little chance that we will be able to buy it here in Alabama.

Subject: NA Beer

To: Homebrew Digest
Fm: Jack Schmidling

From: larryba@microsoft.com
Subject: Re: Jack's NA beer

>At 170f, jack is not only driving off alcohol, but pasturizing his beer. One issue that has not been discussed is the flavor changes that might occur. It is a Homebrew/beer aficionado's assertion (momily?) that pasturized beer has a cooked flavor to it. The "fresh flavor" of draft beer being the preferred commodity.

I would also like to point out that to alcoholics, the preferred commodity is alcohol. Having been there, my current preference is a compromise on the flavor to avoid the problems created by alcohol

>So, Jack, what is (IYHO) the effects on the flavor of your beers? None?

I think your word "cooked" best describes the alteration. However, it seems to mellow with time. After a week or so, I can only notice it when I make a direct comparison.

> Not objectionable?

Only to the extent that it would be better without it. However, in the sense that it ruins the beer, definitely not.

The procedures that call for boiling the beer obviously would have the problem to a greater extent and that is why I am working at the lowest temperature that seems to accomplish the task.

>Have you gotten feedback from your beer judge buddies in Chicago?

I havn't taken any in since the initial time with the clovey stuff. I will take some in... OOPS... missed last night's meeting... to the next.

> Is the beer a light beer or a robust IPA?

It is Schmidling Generic Ale

8 lbs Klages
1.5 oz hops
EDME yeast

> The latter might mask minor oxidation type defects. Naturally if the defects can't be detected, then they are not a problem!

One might look for a combination to intentionally mask the defect.

I would suggest roasted barley. This also happens to be what I put in my most recent batch but it is already in a keg, alcohol and all. I do note a similar sort of taste and it could serve the same purpose as calling my clovy batch "Spiced Holiday Ale".

>I look forward to giving this a try with a future spring wheaten ale.

Why don't you try it NOW. Why wait till Spring?

I have the current batch in a keg and it is a real pleasure to be able to go over there and take a nip without feeling guilty about violating my glass-a-day vow.

Maybe it's all in the head but I can not pour a partial glass of real beer.

It has to be full or I feel cheated and I usually am sad when it is empty.

With the NA, an inch on the bottom, usually satisfies the urge.

From: whg@tellab5.tellabs.com (Walter H. Gude)
Subject: Pre-crushed Grain M**ily?

>1) How long can one keep crushed grains?

As the manufacturer of an up-scale malt mill, it would give me pleasure to tell you the time is measured in nanoseconds. However, the truth is probably months.

It depends as always, on how you store it. My guess is that if you freeze it, it would be good for a year or more. If you store it at room temperature in sealed plastic bags, it would probably be good for 3 months or more. Moisture is the killer. If left out in a humid environment, it would deteriorate rapidly (days).

>2) What are the effects?

>Decreased effectiveness? Stale taste? Mold?

Unless it is very damp, malt will still be malt and the "effectiveness" is not likely to change in dry storage. It can of course get moldy, taste stale and the effect would be to impart that taste to your beer.

>3) Can you quantitatively tell the grain has gone bad? How?

Taste it. As long as it tastes good, it will make good beer.

>While I don't like to keep crushed grain around myself, I'm beginning to wonder how much folk lore is involved here.

I am afraid you are on the right track.

>Somebody (anybody) have comments?

I would have remained silent till I saw that "anybody".

But it is FUN to do it yourself. And BTW, lots of people who sell milled grain, do it in the back room with a Corona. I would be more concerned with the kind of mill used than how long you store it. If they use a roller mill, it will not only make better beer but it will keep longer. The more flour produced, the faster it will deteriorate.

If I could have found a source for the malt I wanted, at .55 lb, that would crush it properly, I never would have built my own mill.

Necessity is the mother of invention.

Subject: Wyeast starter?

Just bought my first packages of liquid yeast this morning and am anxious to try them out (london ale, and american ale). The package mentions making a starter only if the yeast is old, or if brewing more than five gallons of beer. I remember reading several times on the digest that a starter is necessary. However, I also remember reading that others say it is not. Should I make starter, and if I should, what is the best way to make one? Thanks.

Caitrin

Date: Sun, 9 Feb 92 19:36:36 -0700
From: Jon Binkley <binkley@beagle.Colorado.EDU>
Subject: Wyeast Belgian Ale Yeast

I tried the Wyeast Belgian Ale strain for the first time last week. Today I racked to secondary. It seems to have fermented very quickly- 1.055 to 1.010 already. The fermentables I used were (partial 2 step mash, 5 gallons):

3 lb. 6-row pale malt
1 lb. flaked wheat
1/2 lb. rolled oats
3 lb. 65% wheat dry malt extract
1 lb. clover honey

The most comment worthy feature was a pronounced banana smell. It reminded me a lot of the smell of wheat beers I've made using Wyeast's Bavarian Wheat strain. This leads me to wonder if some of the character I'd been attributing solely to the S. delbrukei was really coming from the wheat malt. Any comments?

I've read (here?) that to avoid the overproduction of esters by cultured Chimay yeast (allegedly the forebears of Wyeast's strain) one should ferment relatively cold. For my batch, we kept it around 70 deg. the first night to get things rolling, then moved it to a room that stays pretty consistantly 55-60 deg. Today, after racking, we moved it to the "lager room," which stays at 45-50 deg. Could this temperature profile be responsible for the banana esters?

I'm not worried, mind you- the taste of the sample I took for the gravity measurement was pleasant, in spite of and to some degree because of the esters. They're not overbearing, and the taste was dry and tart. The orange and corriander I threw in for finishing didn't come through as much as I'd hoped, and I'm planning to throw more in at priming time. I was trying for the taste of Hoegaarden White. I know, I know: too much malted wheat, not enough unmalted wheat. That's what I get for brewing by the seat of my pants, reading just enough to get into trouble and not enough to duplicate a style. Oh well, it's fun and the beer is tasty, even if it doesn't fit perfectly into a classic category.

From: Jon Binkley <binkley@beagle.Colorado.EDU>
Subject: More Wyeast Woes

Add two more data points to the chart of burst Wyeast packages. The victims this time were a package of the #1056 Chico ale yeast, and an emergency backup package of the new "Steam" lager yeast. These were the first duds in about 30 packages we've bought in the past year. Luckily my friend is on good terms with the guys at the brew supply shop, so he'll probably get his money back. Unluckily, we were both itching to brew today, and instead spent the day racking and tinkering with equipment.

Grrr... When are they going to fix these damned things?!?

Subject: A Guide to Micro's

I am interested in starting a guide of Micro's and BrewPubs around the world.
I'd appreciate it if you would send me information on the breweries in your area - including such information as Name (of course :), Address, and comments (what are they good at - how do you like it - etc). If anything else - please send me a list of good pubs in the SF (Treasure Isl.) area. The Navy is sending me on vacation to that area in April for a couple of days and I'd really like to sample the good breweries in that area.

Thanks Much!

BTW - If there is interest, I'll post the information I gather to the archive site or to HBD.

From: afd@hera.cc.bellcore.com (adietz)
Subject: homebrew club responsibility question

A question for the homebrew club officers out there.

How do you handle, ummm, "release of responsibility" in your club?
Namely, if someone gets into trouble after a meeting, you don't want
the club to be held responsible.

I'm part of a group organizing a new club in NJ. Right now, this
responsibility is "understood," that is, we're small
enough that the charter members tend to know this implicitly, and handle
themselves accordingly. I'm somewhat concerned that down the road, when
the
club is larger, when we are more active, that something will happen and
the officers will get their asses burned.

We won't always be meeting in a bar. So we won't always have the
legal cover that such a place like that provides.

I'd appreciate knowing how people handle this.

Subject: ENOUGH FLAMING ALREADY!

This post is not about beer. It's about the level of FLAMING and HOSTILITY that's been going on in this journal.

ENOUGH IS F**KING ENOUGH!!!

I used to enjoy reading this journal, but the level of hostility between posters has been pumped up so high, that quite frankly, reading the journal just plain sucks sometimes!

Is it possible for people to disagree here while still remaining civil and courteous? Would you talk to this other person face-to-face with the same disgust and anger that you do on the network? You'd probably go home with a broken nose if you did! I don't read this journal to pick up tension and anger; I think we all have enough to deal with in our jobs and lives elsewhere. THIS IS SUPPOSED TO BE A HOBBY, REMEMBER???

So let's cool it, huh? And discuss the brewing we enjoy with a little lighter heart? Thanks.

> in the SF (Treasure Isl.) area.

Tom,

A couple of years ago, I transcribed a list of brew establishments that I found in the California Celebrator. The list contained brew pubs, micro-breweries and supply houses. At the time, the list was probably quite complete, but by now it's likely out of date. I'll append a copy anyway, as there are hopefully more additions to the list than there are deletions. (I'll not append the list to HBD as it's already in the archives (file 8910.shar.Z). However, if an HBD reader would like the list, I will happily entertain mail requests.)

I doubt you'll find much in the way of quality brew *on* Treasure Island, as it's mostly (if not entirely) a naval reservation. It is, however, but a short drive from there to Oakland, Berkeley and San Francisco, where a number of pubs/breweries are located. Since the list is so old, I suggest you call first to see if an establishment is still in business before visiting.

There is also a "tour" in the Bay Area called BART'n'brew. BART is Bay Area Rapid Transit, a train/subway system we have here in the Bay. I have not yet done this, but there are supposed to be a number of brew pubs (6?) within a few blocks walking distance from BART stations throughout the bay. I'll try to get details from a friend who has done it.

Subject: Re: UPS Shipping of Alcohol

> The official answer is that for UPS to ship alcohol (knowingly), the sender
> must have a shipping permit from the Alcohol, Tobacco and Firearms
> office of the U.S. Government.

How could I resist? I called the San Jose office of the Treasury Department Bureau of Alcohol, Tobacco, and Firearms, and had a pleasant conversation with Jerome Stayer and Inspector Amy Ulszewski. It turns out that BATF does not issue any such document as a "shipping permit." They do issue *operating* permits to breweries, wineries, and distilleries, and it's possible that this permit is what UPS wants to see. However, Amy said that BATF has no Federal policy or regulation concerning the shipment of alcohol by individuals, save that alcoholic beverages may not be shipped by the US Postal Service. So far as Federal law is concerned, any private carrier can ship beer anywhere.

Now for the bad news: although there is no Federal policy, there is a patchwork of state regulations which carriers must obey, and the Inspector speculates that the difficulty in complying with these regulations is what keeps shippers out of the shipping business. (My wife belongs to the Alexander Valley Vineyards wine club, and we get two bottles every couple of months or so, shipped through UPS! The box does have a stamp on the front saying "Contains alcoholic beverages; adult signature required.") Amy suggested contacting every private carrier in the book until you find one that will accept the shipment.

So I thanked them very much and called the local Federal Express office. Big surprise: they won't accept alcoholic beverages from individuals. A very pleasant and sympathetic fellow read to me from the policy book, which said (somewhat abridged), "Alcoholic Beverages: Due to various state regulations alcoholic beverages can only be accepted if processed by [some automatic FedEx computer device whose name I didn't catch], or if they are shipped from one licensed distributor or manufacturer to another licensed distributor or manufacturer." Large Fed Ex customers (>= 10 packages/day) can get a hand-held thingy from Fed Ex for processing the packages, and it apparently already knows the state laws or something. The whatchamacallit is free, but you have to have volume to get one.

That's as far as I went today. Anyone else care to run with this?

There's a business opportunity in here somewhere, but I just can't figure out where it is. Speculation: could a liquor store or distributor be conned into providing this service, for a hopefully modest fee? Perhaps the AHA should negotiate with shipping companies, so that at least sanctioned events could get policy approval? (Let's ship a case or two of real IPA to UPS' chairman and CEO.)

From: gjfix@utamat.uta.edu (George J Fix)
Subject: Re: UPS Shipping of Alcohol
Subject: Chlorine (George Fix)

I am somewhat uneasy about the dilute chlorine solutions recommended in recent posts. These will control health threatening bacteria relevant to swimming pools, but I am concerned about the effectiveness of say a 10-20 mg/l (ppm) free available chlorine (FAC) solution on bacteria that are relevant to beer. Remarkably, the latter, like our yeast, are health positive, and the last things one would want to remove from a swimming pool. On the other hand, they are capable of turning our beers into pickle juice, and tend to be more resistant to chlorine than pathogens.

It is my belief based on personal experience as well as data published in the literature that 100 mg/l FAC is needed to properly sanitize brewing equipment. In the context of bleach one sometimes sees a 200mg/l figure quoted, but I believe this refers to the sodium hypochlorite (NaOCl) content. As noted in an earlier post, the molecular wts. of Na, O, and Cl are 22.99, 15.999, and 35.453, so the concentration of NaOCl is roughly double the FAC. Bleach is theoretically 5.25% NaOCl, but this can decrease both with age and temperature. I recall measuring some where the NaOCl content had dropped to 2.5%. Thus, Bob Jones' recommendation of 1oz. (2T) per gallon sounds like a good figure to work with. Experience has shown that with 100mg/l of FAC only 15 mins. of contact time is needed (and generally usually less).

This subject is somewhat complicated by the fact that if we were 100% efficient at cleaning, then chemical sanitation could be eliminated entirely. From 1975-1985 I was on the faculty of CMU at Pittsburg, and had during this period the good fortune to work on several projects at the tiny Straub Brewery in St. Marys, Pa. Gibby Straub, who was the brewmaster at that time, told me that they went from 1933 to 1954 without ever using any chemical cleaners or sanitizers. Never once during this period did they dump a brew. In fact, they operated at full capacity during the entire period, and were only one of three small breweries (say 30,000 bbl/yr. or less) to survive the 1950's and 1960's. Anchor and Frankenmuth were the other two. When they cleaned in the old days they really cleaned. Gibby told me that their rule was 2 hrs. cleaning for each hr. brewing. In the 1950's came modern union work rules, and in particular a 8hr. work day. At that point chemically based sanitation systems became a necessity.

As mentioned in earlier posts I now prefer iodophor to chlorine. Something I forgot to mention was that dilute solutions of iodophor (1oz. per 5 gallons) is entirely satisfactory. Moreover, a 5-10 min. contact time is adequate. There is another product called peracetic acid which has become very popular in German breweries. It is a modern version of vinegar sanitation (widely used in traditional German brewing)

and consists of acetic acid and some hydrogen peroxide. The latter seem more natural to beer than iodine. If anyone has had any experience with it, or knows where to get some, I would be grateful for the info.

From: Nick Cuccia <cuccia@eris.berkeley.edu>
Subject: Re: Homebrew Digest #820 (February 10, 1992)

Here is my list of Bay Area brewpubs, broken down by mass transit transfer point. Most of the directional information is pretty general (I don't have street addresses), but should get you there. I make no claims of completeness; this is off the top of my head, and the top of my head is pretty weak when it comes to the San Jose area (I know that there is a Gordon Biersch and a Tied House there, as well as a third brewpub downtown; I just don't know where they are located).

BART:

Berkeley

Triple Rock Brewery (Shattuck Avenue, about three blocks north of BART station).

Bison Brewery (Telegraph Avenue, seven blocks south of UC-Berkeley. Walk or take AC Transit 40 southbound).

Oakland Civic Center

Pacific Coast Brewing Company (On Washington near Eighth Street, about four blocks south and one block west of BART station).

Tied House Alameda (Take AC Transit 51 southbound to first Alameda stop; walk north to the estuary, and continue west).

Hayward

Buffalo Bill's Brewpub (On B street, two blocks west of BART).

San Francisco Embarcadero

Gordon Biersch (The old Hills Brothers plant, about three or four blocks south of Embarcadero station on Spear Street. (not open yet)).

San Francisco Powell/Montgomery

San Francisco Brewing Company (Columbus Street, between Broadway and Montgomery; walk north on Stockton (long!) or take MUNI 30 Stockton).

San Francisco Civic Center

Twenty Tank Brewery (11th Street between Folsom and Harrison, about four blocks south of Civic Center station).

CalTrain:

Palo Alto

Gordon Biersch (On Emerson, 1-2 blocks east of University, 2 blocks north of CalTrain station).

Mountain View

Tied House Mountain View (corner of Villa and Bryant, 1 block south and one block west of CalTrain station).

Golden Gate Ferry:

Larkspur

Marin Brewing Company (Larkspur Landing Shopping Center, across Sir Francis Drake from Larkspur ferry terminal).

Note that this is just a list of brewpubs; I've left off microbreweries (only two--Anchor in SF and Lind in San Leandro--are accessible via transit these days; Pete's is contract brewed by August Schell, and Devil Mountain has moved their works from the old Walnut Creek train depot to Benicia) and beer bars. Hopefully some kind soul will correct my errors and fill in my omissions.

Cheers,
- --Nick

Subject: new staling-inhibiting bottle caps

The AHA has distributed some anti-oxidation bottlecaps to homebrew clubs and encouraged their trial use. Recently, I witnessed a comparison taste test. Steve Kemp, of Brewers of the South Suburbs (of Chicago), brewed and bottled a hoppy spiced beer in December and randomly capped his bottles with either regular bottle caps or the anti-oxidation caps. Last Friday, this split batch was distributed at the B.O.S.S. meeting for side-by-side tasting. The anti-oxidant-capped beer was in no uncertain terms more hop- and spice-aromatic and hop-flavored than the regular capped beer. Note that the tasting was not done blindly, but instead side-by-side, but there was no doubt regarding differences between the beers.

I have no other information on the bottle caps. I am a member of AHA, but have no affiliation with the manufacturer of the caps.

Subject: Yeast culturing, cheaper

In the HBD of 2/7/92, Jeff Frane notes the fine work that Wyeast has provided the brewing community.

<Incidentally, I peeked in to the CompuServe beer forum today for the <first time in a long time and noticed a thread about WYeast's monopoly <of the homebrewer's yeast biz. !! Someone there has a confused idea of <capitalism; I know for a fact that Dave and his wife, Jenny, have busted <their asses to make WYeast a successful business. They provided a <breakthrough package and exquisitely high quality control (they come by <it honestly; both of them were Food Science students under my pa!) and <created an economic niche that didn't exist previously. A brief look at <the recipes of winning beers in the last few years' AHA competitions is <enough, I think, to convince anyone of the quality of their product. <What isn't obvious is the number of microbreweries and brewpubs who rely <on WYeast to maintain their yeast bank or supply.

<Ooog, what a diatribe!

<- --Jeff Frane

Jeff is right, Dave and Jenny have done well. The problem is they charge an outrageous amount for thier product and they wont sell direct to YOU the homebrewer (I know, cause I tried hard). So Jeff is right, capitalism is not dead and no longer does Wyeast have a monopoly on the market. They do have a monopoly on that fancy package that seems to explode on so many of us (my friend lost \$4.50 worth of the stuff last night :-) :-). So the market has responded with another manufacturer. This guy provides the basics, a Yeast bank (if you want it), and culture media. Granted, its not as easy as breaking a seal but, you get what you need for massive cost savings. Think about it, is 50 ml of yeast slurry out of some package that was sittin around for how long, in how hot a temperature really what you want to throw into your seven hour labor of love? And if you are making a starter, then how much more effort is it to make several starters and work the yeast up? That way you know what you have and you can culture your house flavors/ house characteristics if you want to. Once again, I HAVE NO FINANCIAL INTEREST IN THIS EFFORT. I JUST WANT MORE HOMEBREWERS MAKING BETTER BEER FOR LESS MONEY! If interested,

Subject: Re: Liberty Ale (OOPS)

I forgot to answer Caitrin's question of HOW to get that great Cascades aroma. You're right -- *dry hopping*. Add a ounce of Cascades leaf hops (the fresher the better -- they start to smell stale after six months or so -- even refrigerated) to the primary, immediately after the kraeusen collapses. The acidity, alcohol and very active yeast should take care of any nasties that may be lurking among the hops. Just make sure the hops are stored dry so they don't begin to mildew. I love dryhopped beer so much that my brewpartner had a heck of a time talking me out of dryhopping a brown ale we made (not true to style, you see).

Al.

From: John Dilley <jad@aspen.iag.hp.com>
Subject: Quantity of yeast to use

The last time I was at Beer Makers, my local brew store, they sold me some G. W. Kent dry yeast. I used it to make my beer, which practically fermented overnight (VERY rapid fermentation; I still let it sit seven days in the carboy). I commented to them thusly: "If that one packet of yeast fermented that fast I could have probably have done OK with half the packet." They told me that I should always use the whole packet, that using half the yeasts in one batch and half in the other was not a good idea. "Why?" I asked. The answer was on the order of "just because" ... no real reason.

So, home brewers of earth -- is there any reason why one cannot use half a package of virile yeast such as the G. W. Kent English Ale and save the other half for the next batch? Inputs appreciated! Cheers,

From: tony@tag.co.uk (Tony Quince)
Subject: American brewing terminology

As an English new subscriber to HBD, I am finding some of the terminology used by the transatlantic brother/sisterhood a mite confusing. With particular reference to HBD#820, what the hell is 2-row/6-row malt?

If I can sort out what it all means, I'll post one or two of my favourite recipes in a form that can be understood over there.

Also, I've caught the end of the discussion on using bleach as a sanitizing agent. This has probably been said (and shot down in flames) here before, but I find the use of any chlorine-based sanitizer "a bit daft". So, ok, it kills all known germs, but it also kills all known yeast. Therefore, you have to rinse the equipment. If you rinse with tap water, you might as well not have bothered to sanitize, if you use 'sterile' water, you're going to spend a lot of time/money boiling rinse water.

"So what do you use, you smart-ass limey?" Basically, a strong, warm solution of sodium metabisulphite acidified with citric acid. Because the yeast can withstand sulphite ions in low concentration, you don't need to rinse at all - just drain it off properly. I've been using this approach for 15 years and have only ever lost two batches of beer (due to infestation by a wonderful British phenomenon called thunderflies). Sorry if this sounds a bit self-righteous.

From: polstra!norm@uunet.UU.NET (Norm Hardy)
Subject: Wyeast Starter - DO IT

While one can just allow a Wyeast pouch to puff up before pitching, there are some problems:

(1) Timing: it is tough to get the pouch to be at the right place when YOU

want it to be. Some brewers have had exploding pouches.

(2) Quantity: some beers like lagers need a higher volume of yeast to get off the starting block.

Making a starter is pretty routine stuff, after a little practice:

[1] sanitize a 32 oz bottle, cork, airlock

[2] boil 50 oz water w/.75 cups light malt extract (I use the dry stuff) for

30 to 45 minutes or until you have 22 to 26 oz, or thereabouts.

[3] Chill in sink down to 65-75f.

[4] Add contents of pouch. Shake well. Put air lock on top.

[5] Leave at room temperature for a day or so. High krausen should occur within two days easy.

[6] a sprig of hops can be used if you wish.

Read Papazian

for his treatment of the issue as well.

Subject: Hazel Nuts in Bottles

Hello All:

I just racked a batch of Hazel-Nut Brown Ale into my carboy and I got a crazy idea. What would happen if I put a hazel-nut in each bottle as a form of "dry-hopping" (actually "dry-nutting" in this case)? I have been reading the HBD and rec.crafts.brewing for sometime now and have not seen this question asked, so I dont think it is a FAQ but if it is I apologize. Anyway would this add to the nut flavor of my ale? Or would it add some possible contamination of some kind? I dont know, I was at a micro-brew festival and they had a special edition of Rogue Red where they had dry-hopped the keg, so would this work with the nuts. Or is this just a nutty idea? I might add that I added some crushed roasted hazel nuts to the boil for 25 minutes, I dont know if that makes any differnce to this situation or if will effect the brew in anyway whatsoever, good or bad. Well let me know what you people think... Thanks!

Subject: Keg modifications for brewpot - Request for info

Based on discussions on the digest, I've obtained a keg which I intend to modify to use as a brewpot. (I've also ordered a propane King Kooker, can't wait for my 'toy' to arrive).

I've read different opinions on how to modify these from DIY with a metal cutting blade and circular saw to take it to a welding shop and have them cut it with a plasma cutter. I tend to do things myself, but would hate to ruin the keg.

I've also read that it should be cut at the weld running around the keg at the top. Has anyone ever considered cutting through the top, keeping the existing handles in place?

What does one use as a lid? If I decide to take it to a welder, what costs should I expect? Should I have a tap installed at the bottom?

Please respond via email and I will summarize if there is interest.

Thanks,
John Link

I too re-used B-Brite, until my supplier told me that B-Brite solutions
are
only effective sanitizers when fresh, and should not be kept around for
re-use as one might do with a metabisulfite solution. I asked this digest
for opinions, and was ignored. So I'll try again with a currently topical
twist... Assuming B-brite solutions lose their sanitizing ability over
time, would it not be a septic-tank-friendly method of cleaning/
sanitizing
equipment if one waits a day or two before disposing of "spent" B-Brite?

>the club to be held responsible.

Great subject, thanks for bringing it up. Unfortunately, I can't add anything to what you wrote, because we function the same way as you do, i.e. we all have an understanding that "you're on your own". Basically, I think members who host meetings in their homes are covered under their homeowners or renters policies, and members going to and from those meetings are covered by their car insurance policies. If someone "gets into trouble after a meeting", they'd have to be a real sh*t to go after the club or the meeting host. Perhaps we ought to draft a release and get members to sign it.

Which brings up my own question on this subject. Our club is planning a bus trip to four Vermont breweries in March. We expect several non-club members to attend. Anyone know what our liability is? There's no autos involved during the trip, but there will be before and after, since we'll be meeting at a central location. I imagine the hotel's policies provide some coverage while we are there, and the same for the breweries. And I'm guessing the bus company has some liability coverage. Just wondering.

If any armchair lawyers care to reply to me via mail with comments or suggestions for a release statement, I'd appreciate it.

Subject: Recession Era Beer Sales

Thanks for the great post for relating last year's beer sales! The alcoholic beverage industry has seen declining unit sales as a result of less consumption per capita. This is hardly surprising considering our national hypochondria despite great gains in health and fitness. As a result the beer industry is in a pickle because consumption equals unhealthy behavior. It would have been interesting to see figures for "light" beer sales. It is the only segment keeping the beer industry healthy. Recent ads suggest that you can guzzle beer yet keep that firm chisled look--well, maybe. The industry is becoming increasingly fragmented, which means that brewers can't simply push and rely upon one brand to support the firm. AB's declining Budweiser sales reflect this trend. The industry is changing into many different niches, with each group representing different consumption patterns and lifestyles.

On a different note, the unit sales figures are also interesting because recessionary times usually brought spurts of growth in the beer industry. You know, down on your luck, out of job, stressed about the economy--go drink more beer. Maybe it was because the recession didn't really hit home until the latter half of 1991. Any decline in sales for any fully American firm such as AB is indeed distressing. Less sales means less employment--and that is not encouraging.

From: Bob Jones <BJONES@NOVA.llnl.gov>
Subject: Measuring Levels from Micah Millspaw

There is a rather simple solution to the problem of determining the amount of wort in your kettle. Instead of mugging the wall of your kettle and then still not be able to see the markings. Why not calibrate the side of your brew spoon or paddle or whatever else you stir the wort with. Measure the inside diameter of the kettle and the depth of the kettle, use this to find the volume. There are 231 cubic inches per gallon, use this to determine how far apart to place your graduation marks.

My brew spoon is a large oak paddle it is graduated from 5 to 20 gallons, the division lines were filed in then I stamped the numbers above them. I just dip it in touch bottom the pull it out to see the wet line. Works great, no head burns.

Micah Millspaw 2/7/91

Subject: re cheap liquid yeast

from NCDSTEST@NSSDCA.GSFC.NASA.GOV (re Wyeast):
>Jeff is right, Dave and Jenny have done well. The problem is they
charge
>an outrageous amount for thier product and they wont sell direct to YOU
>the homebrewer (I know, cause I tried hard).

There are very few manufacturers of anything who will sell directly to
an end user. (I've tried for a lot of different items where I was buying
so
much it should have worked, e.g. \$1-2k of electrical conduit.) There are
a
lot of reasons for this; probably some B-school theories, the differences
between a cash-register operation and a billed account, the desire of
one's
retailers not to lose business (some won't carry any products from a
manufacturer who also retails). I don't know the specifics of Wyeast, but
I
don't think it's reasonable to slam them for not doing retail even if
they're not a corporate giant. (Look at how many ads in ZYMURGY say
-"dealers only"-!)

As to cost---see if you can find out how much your shop pays for
Wyeast.
Consider that books, which don't spoil, are wholesaled for AT LEAST 40%
off
cover price (the big chain stores sometimes squeeze out the jobbers and
deal directly with publishers for something like 60% off). The marginal
cost of manufacturing a product is a tiny fraction of what it has to be
sold for to be worth the stages of getting it to the user, especially
when
the product is sold a long way from where it's made. (Think what you'd
pay
for soda if it weren't packaged nearby.)

My personal slant (sorry...) is that I would have to put a very low
value on my time to get an economic justification for homebrewing. This
doesn't mean throwing away money, but it does mean that ~\$4 to virtually
guarantee the quality of a critical element in brewing can be reasonable.
If I ever get time and space I may try culturing my own yeast---but more
because I miss lab work than for the \$/time tradeoff.

>6-row has more husk material per kernel than 2-row (2-row is plumper)
>and the current 6-row varieties have proportionally more protein.
>
>Bob "now raising computer programs, not cows" Devine
>
```

I'd like to add that whether it's 2-row or 6-row, it could be undermodified or well-modified. We can get Pale Malt here in the states and if you post a recipe in which you describe an (single-step) infusion mash, we will interpret it as requiring well-modified (Pale) Malt. Lager Malt is what we generally call undermodified malt (i.e. requiring either step infusion or decoction, with a protein rest).

Subject: Grain Storage

From: hartman@varian.varian.com (John Hartman)

>In HBD #819 Walter Gude asks for feedback on long term storage of
>crushed grain. I asked the same question around Christmas time and got
>no response--not even private e-mail. My conclusion is that no one has
>experienced any problems with crushed grain going bad. My supplier,
>Brewmaster in San Leandro, CA, told me it would be fine for six months.
>I suspect that if kept clean, cool and dry it will last closer to a
year.

OK, here's a data point. I stored about 20 lbs. of *uncracked* grain for
three months. It was in a paper grain sack, which was placed in two
plastic
trash bags that were sealed by tying knots in their open ends. It was
kept
in my basement (which is dry) at about 60 degrees.

Upon opening, I was struck by a distinct lack of malt aroma. The grain
was
a bit soft, and the flavor was less malty than before. It tasted somewhat
"stale". Being suspicious of the grain's freshness, I got a new bag (both
came from Brewmaster in SL) and compared them side-by-side. The old grain
seemed even worse next to a fresh bag.

I decided to go ahead and brew with a 50/50 mixture of old and new malt.
The resulting brew tasted fine (pale ale) but the extract was lower than
I usually get. I attribute this to the grain. The brew did not feature
malt as its primary flavor component, so it's possible that defects were
masked - don't know.

As others have pointed out, the ability of grains to keep is highly
dependent
on storage conditions, and this was by no means a controlled experiment.
However, it is reasonable to assume that cracked malt would stale more
quickly than whole, whatever the storage conditions. I can't store whole
grain for three months, so I wouldn't try it with cracked.

Another data point:

Three years ago or so, I was visiting the old Devil Mtn Brewery in Walnut
Creek. They had cracked their grain that morning in preparation for the
day's brewing. Subsequently, a valve failed that prevented them from
brewing, and they were unable to brew till the following day. They deemed
it necessary to compensate for this delay by adding 10% more grain to get
the same yields. Your mileage will definitely vary!

From: "John Cotterill" <johnc@hprpcd.rose.hp.com>
Subject: Marcon Filter
Full-Name: "John Cotterill"

I finally broke down and bought a filter system for my beer. I know this is extravagant, but what can I say? I just like gadgets! Anyhow, I pumped my first batch through it over the weekend and thought the gang might want to hear how it went. BTW this was a timely purchase as I am doing a blind tasting of commercial beers at a party next weekend. I intend to slip one of my beers in to see where it gets rated. The haze would have given it away for sure.

I purchased the five plate version and used two #00 and two #4 filters in it. My first concern was sanitation. The unit could be sanitized without any troubles, but the filter pads were another story. The guy at Marcon said to just use them out of the pouch. He did not recommend any pressure cooking either (they destroy the filter). I decided to soak them in Iodophor for a minute. Then I put the filter together and pumped 3 gals of hot boiling water through it. The filter leaked quite a bit around the pads but the amount was acceptable. I then hooked up my keg of beer it pumped it through. The keg was set to 15 psi, and the beer temperature was about 36 Deg F. The transfer took about 15 minutes for 5 gals. Cleanup was a snap, and the leak rate became slower during the transfer. I think the beer crud plugged the leaks.

Observations and comments: The beer came out crystal clear (e.g. free of haze/particles - the malty color was still there!). I was very impressed. Before filtering, I poured a sample glass. The color was identical between pre and post filtering. The only thing missing was the cloudiness. I did a side by side tasting, and noticed that the filtered beer did taste different. It seemed a little less hoppy, and bit weaker in body. The taste was not objectionable at all, but I think that I would take this into account during recipe formulation.

I also pounded the beer (and hot H2O) through the filter. I had my beer system already at 15psi and just made the connection to the filter. I think that this pressure shock broke small pieces of filter pad off into the brew. Next time, I will hook it up with no pressure, and slowly increase to 15psi. I also changed the nylon hose barbs (come with system) to stainless flare fitting for compatibility.

All in all, I am satisfied. I will have to do a few more batches before I

can really recommend the expense to anyone. I'll pass on data once I get a few more batches with the filter under my belt.

Does anyone have any suggestions on better ways to sanitize the filter pads, and how to was the taste of the pads, and the cleaner out before forcing beer through it?

Subject: Extract Efficiency
Full-Name: "John Cotterill"

How do you calculate the extract efficiency when doing full mash batches? I have been using the following method, but I think that it may be incorrect. I take the total weight (lb) of grain, and divide it by the batch size (gal). I then multiply this number, by the theoretical amount of S.G. expected for 1 lb of grain in 1 gal H₂O (e.g. for barley this is around 1.028 - I would strip off the 1.0 and use the number 28 as the multiplier). I then compare this result to the original gravity of my brew. Comment?

Look, I hate to say it, but IMHO the fact that a *blind* tasting was not used invalidates your results. The placebo effect is extremely powerful, and it operates at the sub-conscious level. I.e., the placebo effect can easily make one have "no doubt" about something that's absolutely false. Even when you are tuned in to the possibility of being fooled by the placebo effect ... you can be fooled by the placebo effect. There's really no way around this except by using a blind study. It's regrettable, but that's just the way our minds are constructed.

Mind you, the special caps may in fact really help. For all I know, they do help dramatically. We'll never know for sure until a blind study is performed.

> the homebrewer (I know, cause I tried hard).

I have no quarrel with Jim's posting of information about an alternative to WYeast, and he's correct: that's how capitalism is supposed to work. I do not think, however, that WYeast's prices are outrageous, given the reality of marketing homebrew supplies. The production and packaging of yeast is very labor intensive, and you must take into consideration the fact that WYeast themselves, get only about half the package price; the rest is mark-up at the retail level. (Incidentally, here in Portland the price is \$3.50.) I've also never considered that price to be for one batch of beer; personally, I've always re-used my yeast and figure I get ten to twenty gallons for a single packet. Not such a bad deal, considering the quality of the resulting beer.

It's also a mistake, I think, to get chuffed at them for not dealing with homebrewers directly. Having been involved in direct mailing work myself, I understand what an enormous pain in the ass it is. This is particularly true with a perishable product like the yeast, which is shipped cold. Imagine yourself trying to fill orders for one or two packets of yeast, hundreds a day, all over the country. You've got to deal with UPS, get labels on everything, get it all shipped out and deal with all the returns, all the complaints, etc etc etc.

Sound like fun?

If someone else once to do all that work, and deal with individual homebrewers, I wish him/her luck, honestly. I think it's a great idea. I'm just glad it isn't me.

Subject: Trying again and again

This is an attempt at remailing something that got bounced on the first attempt. Some mis-information about the nature of malt and moisture that I wanted to correct, got junked, so this looks a little out of context:

Malt is dried to protect it from the environment. When the moisture content rises about 4.5-5%--which it is prone to do after being cracked--the malt is much more vulnerable to mold, and becomes attractive to insects and rodents. This is neither supposition nor m****y, but information from the horse's mouth: a presentation at Great Western Malting given to microbrewers. I've got the pictures of bugs, etc. at home. The best solution for malt storage, according to the people who ought to know, is to keep it tightly closed in a dry area, and keep it whole.

I did a beta-test on the Belgian ale yeast a couple of months ago, and made a high-gravity beer that differed greatly from yours in composition. I fermented at 65F (got similar fermentation: 1072 to 1012 in less than a week), and got big banana nose. Martin Lodahl tells me that Chimay yeast should be used at 60F or lower and I'm sure he's right. I will be doing that as soon as possible, brewing another batch. When I first tasted the bottled beer, the banana ester was overwhelming; it dropped considerably after the yeast had completely cleared out, and has continued to recede as the bottles age.

(This yeast and temperature would be a good way to replicate the old Red Hook--if anyone wanted to!)

This has been a real headache for Dave, as I know the new packaging was supposed to resolve burst seams. Dave has been hassling with the production firm, but in the meantime the solution is probably to try starting them while the homebrew shop is open, and well before you actually need to brew with the yeast. *All* retailers should refund on a burst package, or provide a replacement, and certainly any outfit interested in return business will do that.

>but instead side-by-side, but there was no doubt regarding differences
>between the beers.
>
>I have no other information on the bottle caps. I am a member of AHA,
>but have no affiliation with the manufacturer of the caps.

I recently visited Great Fermentations in Santa Rosa, CA (very
impressive),
where I saw SmartCaps(tm) and Super SmartCaps(tm). SmartCaps are
supposed
to be O2 barriers, superior to standard caps, while the *Super* caps
contain
a substance in the plastic seal much like silica gel, and will actually
absorb O2 from your precious neck-space.

To activate this 'wonder of modern science', you simply moisten the cap.
This
can be done with beer or during sterilization by boiling...cap your brews
and
all the residual O2 in the bottle will be bound within the cap.

I posted a query to 'rec.crafts.brewing' and recently got an email from a
fellow that worked for a brewery (name deleted to protect the holy). He
stated that the manuf. of this product was named Zapata, and that his
(ex?)
company used the SmartCaps for their premium lager; the next product was
called SorbCap (for absorbtion), and his company was in a trial with it.

I believe that SorbCap and Super SmartCap are one and the same, based on
my discussions with those at G.F. and the product label <include std.
discl>.

One hint: my package didn't come with any O2 absorbing material for
storage,
though they were in a sealed bag with little air space. He suggested
that
I store them in a bag with silica gel to keep their effectiveness.

I paid \$3.95 for 144 (\$0.0273 each). If they work as well as I have
heard,
they are well worth the extra \$0.02 (just *my* \$0.02 worth!).

Subject: carbonation

Hello,

Date: Wed, 12 Feb 92 08:17:22 -0600
From: melkor!rick@uunet.UU.NET (Rick Larson)
Subject: Re: Liberty Ale

In the 1990 Special Issue on Hops, Quentin B. Smith recommends Chinook at 24 BU, Cascade at 12 BU, Cascade at 9 dry hopped (total 45BU). OG=1.062.

Then, He wins first place in the Pale Ale category in the 1991 AHA Nationals.

His recipe uses 14 pounds Klages, 4 oz 40L crystal, 4 oz 90L crystal (and of course different hops :-). This had a OG=1.062 and TG=1.010. He mashed all grains for 90 minutes at 150F. Mashed off at 170F, sparged with 170F water.

Given this I would propose:

Taking Liberty Ale

14 lbs Klages, 2-row Malt
4 oz. 40L Crystal Malt
4 oz. 90L Crystal Malt
1/2 oz. Chinook (12%), 60 minutes
1 oz. Cascade (5.5%), 30 minutes
2 oz. Cascade (5.5%), dry hopped
1 t. Irish moss, 15 minutes
Wyeast 1056 American ale
3/4 cup corn sugar to prime

Mash all grains for 90 minutes at 150F, adjust PH as needed. Mashed off at 170F, sparged with 170F water.

This has a total BU of 43.7. If you don't reach around 1.060, adjust the dry hopping accordingly.

Subject: Measuring Levels, HB info

Micah Millspaw:

Your simple solution to measuring volume in the brew pot can be simplified even more. He says to measure the inside diameter of the kettle, the depth, calculate the volume, and then calculate the height for each gallon of liquid. This is all fine, but I'd use this simpler method: pour a gallon of water (from an old milk jug) into the pot. Dip your spoon and mark it. Pour another gallon. Lather, rinse, repeat. This should be at least as accurate as his method and avoids having to find the calculator that my 15-month-old has hidden under the sofa, behind the washer, etc.

Bob Hostetler:

You should look at one of the much-talked-about-on-the-homebrew-digest (MTAOTHBD) brewing bibles. I recommend The Complete Joy of Homebrewing by Charlie Papazian. There are others - they are all well worth the investment for the information received.

From: tooch@auspex.com (Michael J. Tuciarone)
Subject: Re: Freezing hops

It works for me. Use a tightly closed bag or Ziploc(R) so your frost-free freezer doesn't dehydrate them, for then you'd wind up with freeze-dried hops (though I suppose they'd actually work, too).

Since I don't use an entire 2 oz. packet for finishing, the excess 1 to 1-1/2 oz. goes into a Ziploc and into the freezer. I use the freezer hops for bittering, and I usually buy "fresh" hops for finishing when I make the next batch, saving the excess, etc.

Come to think of it, although my favored supplier (Fermentation Settlement in San Jose) takes care to seal their hops in airtight packages and keep them under refrigeration, I wonder if my frozen hops aren't actually "fresher" in some ill-defined way.

I'll probably never know.

In HBD #822, hall@buffa.enet.dec.com (Dan Hall) writes:
> If someone "gets into trouble after a meeting", they'd have to be a
> real sh*t to go after the club or the meeting host.

Ah, but you're missing the more likely scenario: Mr. Irresponsible Club Member gets drunk at a club meeting at your house. On his way home, he drives into a wall at 73 MPH and buys the farm. His wife (mother, sister, brother, best friend, dog), understandably, is grief-stricken. It just doesn't seem right. Here was my husband (son, brother, master) just yesterday, happy, healthy, productive, bringing home a fat paycheck every day. And now he's dead. It's not fair. I never liked him hanging around with all those beer-making drunks anyway. It's THEIR FAULT he's dead! And now I'm miserable and lonely and suffering. And bored. And I can't sleep at night and I have a lot of free time, and I'm going to see if I can make somebody PAY for this injustice!

Get the idea? It's all about the psychology of grief.

Worse, consider what happens if Mr. I. C. Member slams his car into *somebody else's* car at 73 MPH on his way home, killing or maiming an uninvolved person. You don't think that person or his survivors are going to look for compensation?

> Perhaps we ought to draft a release and get members to sign it.

Based on the kinds of wierd court decisions that seem to get made in personal injury lawsuits, I for one wouldn't trust such a release to make a bit of difference. It might even be construed as evidence of prior intent to get Mr. I. C. Member drunk.

A better bet would be to establish a club culture (no, not yeast) in which Mr. I. C. M. would absolutely *not* be permitted to drive himself home.

> after a meeting", they'd have to be a real sh*t to go after the
> club or the meeting host.

Spoken as one truly committed to beer and the zymurgic arts, and I couldn't agree more. HOWEVER, there is no shortage of real sh*ts in the world ... But I'm frankly more worried about the unfortunate member's non-brewing next of kin, shocked by the accident and frightened of the financial impact of a lengthy hospital stay. They are likely to see us as the agent of the disaster that they're suffering, and it wouldn't take much of a legal mind to establish a connection between the plaintiff's admittedly disgusting condition at the time of the accident, and the normal brewclub activities of tasting commercial style references, tasting/judging member attempts to meet a style, troubleshooting clinics, and general social sipping. Our strength is also our weakness.

Our mature, long-established brewclub has recently begun grappling with this question, and it frankly gives me the grues. I suspect, though, that we have a lot of company out there ...

From: Timothy Mavor <tmavor@pandora.cms.udel.edu>
Subject: Water

After 18 months of extract brewing, I am preparing to shift to all-grain recipes. Also, since I am in a new location, I am concerned about my water. Upon receiving a water analysis from my VERY cooperative and interestd water company, I tried to compare my ranges with that in Dave Miller's book. Unfortunately, several of his ions lack ranges as to what is acceptable, or give answers such as "Large amounts are undesirable" or seemingly contradictory (at least to me!). If some kind soul would comment either here or thru email, I would appreciate your input. All readings are in PPM:

WHAT	PPM	Comments
Total Alkalinity	45-65	
Total Hardness	100-130	
Calcium	75-95	Miller says 50-100
Chloride	35-50	
Chlorine	1.0-2.0	
Flouride	0.8-1.2	Miller says 1-10
Manganese	0.05	
Nitrate	1.0-5.0	Millers says <25
pH	7.2-7.6	
Silicate	2.0-5.0	
Sodium	5.0-10.0	
Sulfate	15-25	

If you notice any omission of importance, please let me know. I will be contacting the lab again, for I realize I do need the carbonate-bicarbonate level.

Thanx!

Hazel nuts in a brown ale sound like they would add a nice element to the
flavor. I'd be concerned about head retention though. Nuts have oils, and
oils are notorious for destroying a beer's head. You might try adding a
nut to half of your bottles as an experiment.

From: Bob Jones <BJONES@NOVA.11nl.gov>
Subject: Soda Keg Dispensing help needed

I recently put together a draft system using a frig. The frig. has 5 taps mounted on the front door. The frig. can hold 6 cornelius kegs. A CO2 manifold allows connecting 5 kegs up at the same pressure for dispensing. Now for the question. I would like to know what your procedures are for using these drafts systems that insure the best and most consistant beer quality. I have experienced a few problems with foaming and I am uncertain about the proper dispensing pressure. I know alot of people who brewers who have these draft systems but everyone seems to have varying amounts of problems with them. Someone out there must have nailed down the ABC's for using these systems. If you have the rule book that works for you I would really like to read it. I posted a related question several months ago about CO2 vs natural carbonation differences with no response. Does anyone have any comparisons of the two methods as far as the taste/mouth feel is concerned?

Thanks for your help,
Bob Jones

Subject: Wyeast storage & STUFF

I have a couple of questions for you HBDers:

1. The local homebrew supply store received a fresh supply of Wyeast after a long "dry" spell. Of course, I went nuts and bought way too many packets for my own good. Now I have 5 packets sitting in the fridge (after having used 2 on recent batches). My question is how long should I expect the yeast to last (two of them are dated Dec. 19 and the other three are Jan. 21)? Is three months pushing it? I guess I can always brew a batch a week for the next month, that ought to do it!

2. There's stuff floating in suspension in the bottles of a recent batch of pale ale (bottling date Jan. 30). I had a bottle and aside from it tasting young or "green" I couldn't identify any off-flavours. It looks like the "stuff" might be yeast which hasn't sedimented but I've never seen this before in a 1.5 week old bottle so I'm not sure. Here's some more info: all the bottles have the stuff, it is an all grain batch, Wyeast #1098 (is one of the 3 strains of Whitbread responsible?), dry-hopped it in the secondary with whole hops (is the stuff hop-related?), O.G. 37, F.G. 6, used 1 T of gelatin (mixed in pre-boiled and cooled water) 2 days before bottling. Anyone else have the same experience?

I would like to enter this in an upcoming contest, but not if the stuff is still floating around.

Thanks in advance,
Paul.

>starting them while the homebrew shop is open, and well before you
>actually need to brew with the yeast. *All* retailers should refund on
>a burst package, or provide a replacement, and certainly any outfit
>interested in return business will do that.
>
>- --Jeff Frane

I just received an order from Alternative Beverage which included a package of the new Belgian Ale yeast. Alternative Beverage included a flyer stating that they would no longer refund/exchange failing packages of WYeast. They suggested NOT using the method outlined on the new package (using the heel of the palm, etc.) and instead use a hammer on the inner pouch!

I don't think I'll be trying their method, but whatever method you use, caution seems to be the watchword here. I always make a starter days beforehand; this gives me the opportunity to replace a misfire. No misfires yet, but who knows? (BTW- AB's price - \$3.50 - is no better than what I can find at the brewshops in the area; why I ordered it from them is yet another story...)

From: martin@daw_302.hf.intel.com (martin wilde)
Subject: Cutting kegs

The Brewer's Warehouse in Seattle (206-527-5047) will take a keg and perform any operation you want on it. They are doing this for a keg that I have. For about \$150 they will do the following:

Cut the top off
install a nice stainless steel tap (welded)
install a perforated stainless steel bottom (5/32" offset holes) 18 guage
remove the concave from the bottom for better heat distribution

This may sound like a lot of money for what they are doing, but the work they have done for me on other things has been very high quality (this is what they do for a living). The welds are seamless and they have a good turnaround (usually a week). Of course I have no connection with them other than a highly satisfied customer. I don't remember what the price is to just have the top cut, but you can call them at the number mentioned above M-S 11-6 (PST).

Subject: Measuring levels

I did the same as Micah, but put only one mark on my charismatic wooden spoon -- I filled my carboy with water dumped it in the brewpot and marked *that* level on my spoon. Currently, I'm only brewing for single, 5 gallon carboy, blowoff method batches so I only need one mark. My four 7 gallon glass carboys are on order, so when they come in, I'll add a 7 gallon carboy mark. The level will actually be a bit lower than a full carboy because I leave the hot and cold break in the kettle. The 7 gallon carboys will allow me to fill 12 bottles for contests and club meetings and still be able to fill a 5 gallon Cornelius keg -- currently, I'm bottling 12 and then putting the other 3.5 gal in the carboy.

Subject: How do I bitter an American Pilsener?

I sometimes use Alternative Beverage's kits, and this weekend I was going to brew an "American Pilsener"--for my friends who would like a flavorful beer, but can't handle my stouts, etc. Anyway, the kit uses like 4 lbs. of light dried malt extract, and bitters with 3/4 oz. of Hallertau. No alpha acid rating, but I'm assuming 4.5 to 5.5. I understand an American Pilsener is not supposed to be loaded up on hop bitterness, and also 4 lbs. of DME is not a lot, but what bothers me is this: Normally, the kit uses Wyeast 2007, Pilsen Lager yeast, but they were out and substituted Wyeast's Bohemian Lager yeast. While the Bohemian Lager is probably a better yeast, I noticed in my stockpile of literature that the Bohemian Lager's attenuation is only 69-73%, and it ferments "clean," but with a "rich residual maltiness" which I interpret as meaning "malty but sweet." Now malty is fine, but I HATE sweet beers, so I'm worried that 3/4 oz. of Hallertau may not be enough bittering hops. Normally, just to be safe, I would tweak the hops a little bit. But I have no experience with this yeast, and I also have no experience brewing beer with so little extract. So on the one hand, I'm afraid I'll make beer that is too sweet (for me at least), and on the other hand I'm afraid that if I jack up the hops a bit I might produce the Bitter Beer from Hell (which I would probably drink, but my friends would hate). So help me out: I have plenty of hops on hand, so I can get any desired IBU. What should I do? The details are about 4 lbs. of light DME, a little bit of specialty grain, some Saaz finishing hops, and a starting estimate of 3/4 oz. of Hallertau using Wyeast's Bohemian Lager. Like I said, I wanted to brew this weekend, so if you can get an answer into the Digest by Friday, cool. Otherwise, email me and I'll report back.

Hell, maybe I should just throw in some black patent and make a porter..
..

Only kidding.

Subject: Eric M's porter

Ed Kesicki writes:

At what temp. did you ferment your porter using the Red Star lager yeast? We have been messing with various ale yeasts and hadn't considered trying a lager yeast for our porters...however, we ferment at room temp and were wondering if you might have done this batch at room temp also. Looking forward to your reply.

I fermented at room temp. I still think the dry lager yeast is much better than the dry ale yeasts but, since my post, I've had to eat a little crow. A buddy of mine from San Diego recently brewed a really fine stout using Wyeast Irish Ale yeast. I thought my porter tasted pretty good until I tasted it side by side with this stout. After a sip of the stout, all I could taste from my porter was the muddy taste of that damned dry lager yeast!

All that to say: if you *have* to use dry yeast, I recommend trying the Red Star lager yeast. If you can see your way clear, by all means, use the liquid!

From: dbreiden@mentor.cc.purdue.edu
Subject: Glass and temp

Here's a question for all you who know more about the physics of glass:

Is glass more likely to break from the thermal shock of hot -> cold or from the shock of cold -> hot.

Seems I can boil boiling water in a room temp glass bottle with no problem.
But last year when I put my carboy in a snow bank (yeah, it was warm, but not HOT HOT DAMN HOT), I returned to the earth what the earth had given me -- and kissed a carboy good bye.

So my personal experience seems to indicate that glass can handle cold->hot better than hot->cold.

Support? Refutation? Explanation?
Thanks,

Subject: Snail Trail Pale Ale

I've been busy trying to make the perfect IPA. Here's my latest recipe.

9 lbs Pale Malt
3/4 lb Crystal Malt
1/2 lb Carapils Malt
1.5 oz (4.9%) Kent Goldings (60 Minutes)
1.5 oz (4.9%) Kent Goldings (15 Minutes)
1/4 oz Kent Goldings (dry)
1 tsp Irish Moss (15 Minutes)
2 tsp Gypsum
2 oz Oak Chips
Wyeast 1059 American Ale

Mash Pale malt at 153 F for 30-60 minutes. Test after 30 minutes. Add Crystal and Carapils and mash-out at 168 F for 10 minutes. Sparge. Bring to boil. In a saucepan, boil the oak for no more than 10 minutes, then strain the liquid into your boiling kettle. Boil the wort, adding boiling hops after 30 minutes and the flavor hops and Irish Moss after 75 minutes. Chill and pitch a quart of 1059 starter.

Dry hop in the secondary fermenter. The beer will clear in the bottle.

Primary: 7 days
Secondary: 5 days
Original Gravity: 1.056

Subject: Re: Freezing hops

This topic is discussed in an article by Pfenninger et. al. in the book "Brewing Science", ed. by Pollack, Academic Press (1979).

They compare the composition of Brewers Gold hops that were kept for 10 days in either the absence of air at 32F or a paper bag at 68F. The

composition of the hops stored in the absence of air did not significantly

change, however the alpha acid content of the bagged hops dropped from 7.9% to 6.6%, while the beta acid content went from 8.1% to 7.3%. The total oil (% dry basis) dropped from 1.98 all the way down to 0.78.

I'm by no means an expert in this area, but based on this, I would definitely recommend storing hops in an airtight container in your freezer.

BTW, "in the absence of air" means in the absence of oxygen, not necessarily in a vacuum.

From: Gordon Baldwin <hpubvwa.nsr.hp.com!sherpa2!gbaldwin>
Subject: Infected batch

Well after 66 batches over 5 years it looks like I've lost my first batch. After aging my last batch of lager for 2 weeks the beer has little white dots floating on the surface in the bottles, and there is a ring around the inside of the neck. I havn't tasted it yet, but I am assuming that it is ready to be used to water the plants.

I am trying to determine the souce of this. I am not overly anal about sanitation, but every thing I use to brew with gets a rinse of clorine. The bottles were soaked overnight in a TSP solution, then run through the rinse and dry cycle in the dishwasher. The one abnormality was during the fermentation. This is an all grain brew 8 lb klages, 1/2 lb crystal, 1/2 lb dextrin, 1 oz cascade flavoring, 1 oz saaz finishing, 2 packs Red Star lager yeast. I do primary in a bucket then transfer to a glass carboy for secondary. When I transfer to the secondary my all grain brews usually only have a little cloudyness, this time it looked like industrial sluge. Could I have gotten a bad batch of yeast? I have had very good luck in the past with Red Star Lager. (I agree that Red Star Ale is no good). The fermentation usually takes less than a week, but this batch took close to 3 weeks.

Subject: UPS and shipping Alcohol

Well, first off, my apologies for not checking both sides of the story. I've now rechecked with several (3) UPS people who tell me that I was badly misinformed by my first contact, and who tell a consistent story.

Here are the rules for UPS shipping counters.

Alcoholic beverages may only be sent to and from the following four states: California, Colorado, Oregon, and New Mexico. UPS is not supposed to accept alcohol to or from any other states.

Exception: Alcoholic beverages may be shipped to a laboratory for analysis, as long as no one will consume them.

Alcoholic beverages may NOT be shipped by air, they must go by ground transport.

UPS Agents such as Mail Boxes Etc. can pretty much do as they please in refusing anything, but are supposed to adhere to the UPS guidelines. In other words, they can refuse (in CA, CO, OR or NM where it's ok by UPS), and there's not a lot UPS can do about it. If a UPS counter person refuses, AND the package is both TO AND FROM one of the four states, you can complain to management and get results.

The other states represent a patchwork of laws, and UPS doesn't want to spend the time and money figuring out what's legal where, and so just refuses to deal with the matter.

Subject: dispensing pressure

Bob Jones inquired about dispensing pressure for soda kegs of beer. The uncertainties he refers to are centered around a general misunderstanding of dispensing pressure and carbonation level or soda keg pressure. The dispensing pressure is not the same as the keg pressure because of the resistant to flow in the dispensing tubing. You generally want the keg pressure to be about 10 psi in order to have properly carbonated beer. A dispensing pressure anywhere near this will cause excessive foaming. The solution is to use a long dispensing tube. 1/4" vinyl tubing will drop the pressure about 1 psi per foot. So if you use 6' of tubing and set the tank pressure to 10 psi, the dispensing pressure will be about 4 psi which will cause much less foaming. The length of tubing that each individual wants will depend upon a number of parameters such as the individuals desired carbonation level, temperature of the beer, and amount of foam desired.

There is no difference in the taste of naturally carbonated beer and beer force carbonated with a gas tank. CO2 has no memory of whence it came. If you use dry malt to prime however, there will be a slight change in the beer due to the unfermentable sugars (about 1/3 of the weight).

From: YATROU@INRS-TELECOM.UQUEBEC.CA (Paul Yatrou)

>My question is how long should I expect the yeast to last (two
>of them are dated Dec. 19 and the other three are Jan. 21)?
>Is three months pushing it?

I had a surprising experience recently along these lines. I moved at the end of January, and in the process of cleaning out the fridge I found an old package of Wyeast hiding back there. I don't recall which strain it was, but it was dated June 1990. As I was about to throw it out, an idea struck me.....

So I popped the package, not really expecting anything to happen to my 1 1/2 year old yeast. Much to my surprise, in 2 days the package was all puffed up and ready to go. Because of the move, brewing wasn't an option, so I had to be content tasting the wort from the package. It was yeasty, but clean.

I'd never recommend storing Wyeast for this long intentionally, but my experience is a testimony to the fine work done by those folks. Now, if they'd just fix those damned packages.....

Subject: Dry Hopping

I've dry hopped a pilsner, per Miller's Continental Pilsner book, with 1.25 oz of Saaz pellets. All of the hops have now floated to the top and kinda formed a cap. Should I stir the hops into the beer? Will the hops eventually sink? I feel like the hops should be better mixed in with the beer. It's in the secondary right now.

Subject: Philadelphia Brew Pubs

I'm new to HBD but wanted to first say how jealous I am that you have all those brew pubs on the west coast because here in Philadelphia we have a grand total of two, if you drive out to Lancaster in the Amish country there is another one, but it's a microbrewery and not a brew pub in the true sense. If there is anyone out there from Philadelphia or the area please drop me a line -- it would be nice to know.

Dock Street Brew Pub

22nd and Cherry Streets (not exact address, if it matters send me mail)
They have typically six beers on tap on any given night, and the quality is generally very very high. The place is huge and very very expensive (\$3.50 for a small 10oz beer or higher for a cask conditioned ale) and it is a very corporate environment (ie, people in suites with expense accounts etc..)

Sam Adams Brew Pub

15th and Samson Streets (again, not exact. This is off the top of my head)

smaller, more intimate, cheaper. 45 bbl capacity (3 tanks of 15 bbl).
The beer is good, but not exceptional.

Thanks,

Tod Breslow

Subject: Wyeast shelf life

To Paul Yatrou:

I punched a Wyeast packet that was 9 months old (thats right, N-I-N-E months old). The yeast came out just fine. I obviously had disregard the old "one extra day for every month past the stamped date". The yeast in question was a Bavarian Lager. I punched it on a Wednesday night and by Friday morning it was ready to be fed. I gave it a quart of sterile wort to build up (ala Dave Miller) the count and by Saturday afternoon me and my merry little friends were ready to go to work. Beer turned out just fine.

From: Lee J. Slezak <slezakl@atlantis.CS.ORST.EDU>
Subject: Hazel-Nuts in Beer -UPDATE-

The following is referring to an earlier post about the use of Hazel-Nuts in beer and bottling. As stated previously I have a batch of dark brown ale fermenting away in my carboy that had about 1/4 cup roasted hazel nuts added to the boiling wort for about 25 minutes.....

Thanks to all who responded to my previous post. Basically most everyone seemed pretty excited about the idea, but everyone was quite concerned about head retention, as am I. In search of a deep rich head I treked to my local homebrew store looking for help. What I found was a small package of what is called "Heading Mix" (a mix of dextrose and gum arabic). Has anyone ever used this stuff before? Is it something I should consider using, I dont even know if I was supposed to use it in the boil or what. The only thing on the package besides the name and ingredients said to: "stir contents of package (1 ounce) into one pint of cold water. Mix thoroughly, for best results use a wisk or electric mixer." When though? Before bottling? I need some more help here - should I use this stuff or just take a \$.75 loss I am not too concerned about the cost - just the quality if my beer...

Thanks again and Happy Brewing!

Lee J. Slezak

P.S. What is gum arabic?

> Gosset. At the time Gosset was working for an Irish brewery that
> disallowed publication of research he published his work secretly
> under the name 'Student'."
>
> Once again, the art brewing inspires scientific advancement! Does
anybody
> know if the "Irish brewery" was Guinness?

The Irish brewery was indeed Guinness. Gosset was actually brewmaster,
and
the basis for the Student's T was so that he could do small sample
scientific comparisons whose data analysis was to be used to standardize
the brewing process (it's been a while since I perused the historical
side
of his paper).

Another interesting note is that R. Fisher, a very famous statistician,
knew
and corresponded with Gosset (and Fisher later improved on Gosset's
original
formula). One letter he wrote asked Gosset about hints and techniques to
make his (Fisher's) homebrew better. The gist of Gosset's reply (boy I
wish
I had the reference, the actual quote was a beaut!) was to stick with the
statistics (which would directly help Gosset and indirectly help
Guinness)
and let him (Gosset) handle the beer (i.e. the advice was basically :
"Drink
Guinness").

You'd have to read the rest of the letters to realize that Gosset was a
wonderful character - just about everyone liked him (among his friends
were
some pretty strong enemies) and he basically felt that Fisher would be
wasting his time homebrewing, when he (Fisher) could be assured that
Gosset
was doing his best to insure that every batch of Guinness would be great.
..

That, and the quote from Hilbert about that if it can't be done with beer
mugs, tables, and bar stools it just isn't mathematics, are probably my
favorite math-stat/beer stories...

From: ryan@phmms0.SMITHKLINE.COM (Dominic Ryan)
Subject: Cracked carboy

Glass can be cracked from thermal shock in either direction. What counts is the rate of temperature change and the thermal expansion factor for the glass. The lower the expansion factor the better the glass is able to withstand thermal shock. This is why Pyrex is good and quartz even better, they have very low coefficients.

I suspect that the reason your carboy did not survive hot->cold but did cold->hot is that you are not able to heat as fast as you are able to cool. Heat transfer to a snow bank will be much faster than heat transfer to the bottom of the carboy from your heat source. If you were to get a big enough flame localized on one part of the carboy it would crack. There is an old technique for cutting the top of a wine bottle. This consists of filling the bottle to the desired level with oil and plunging a hot poker from the fire into it. The glass will be cracked very neatly around the surface of the liquid. I have a book from the late 1800s that describes this as an 'old' trick. I have not tried it, but modern glass may have more trouble with this since it is much more uniform.

Finally, the older the glass the more susceptible it is to thermal shock. This is because glass is actually a liquid and flows however imperceptably slowly. The effect of this is not to actually change the shape of the glass, but to build up strain in the glass. This strain makes it much more liable to crack on thermal shock. Repeatedly heating glass to only one or two hundred degrees will also accelerate this. Modern glass is gradually cooled after casting/blowing/forming in order to prevent this. Glass may also be annealed to remove strain by slowly heating to just below the softening point of the glass in question and then cooling even more slowly. For Pyrex glassware this will mean heating to about 800 oC over a few hours and holding there for a few more and cooling over about 12 hours. For glass with a greater thermal expansion coefficient a slower heating and cooling rate is needed. This operation is carried out in an annealing oven. The effects of strain can be visualized with a polarizing screen, strain in glass will rotate plane polarized light non-uniformly. Annealing glass is also important if it to be subjected to pressure or vacuum. If under vacuum the pressure differential is about 15psi, beer bottles hold around 5-10 psi pressure usually. They are also built to withstand more than that.

Various people have commented in the past on the use of the oven or dishwasher to sterilize bottles. These considerations would argue in favor of using the dishwasher but not the oven. The temperature increase in the dishwasher is minor, and not likely enough to affect the glass much. However, a temperature of 400F (~200C) is enough to expand the glass and increase strain, but *not* enough to anneal it, which would require about 1400F (800C) for while. I don't actually know what the composition of beer bottle glass is, anyone else know? I no longer work with glass since I am no longer a 'bench' chemist, but I witnessed the unfortunate effects on improperly annealed apparatus on several experiments...

>hot
> better than hot->cold.

I'll bow to a ceramist if there's one reading. My impression, though,
would be that it doesn't matter if you're going hot->cold or vice versa.
What is important is the temperature difference between the hot and cold
and the absolute lowest temperature.

The resistance of glass to thermal shock should decrease with
temperature;
the colder it is, the more prone it will be to breaking. So a 100-
degree
delta between your hot and cold masses would be more likely to cause
breaking if your cold mass is at 0 Fahrenheit than if it's at 90
Fahrenheit.

From: pyle@intellistor.com (Norm Pyle)
Subject: Infections, Red Hook yeast

To Gordon Baldwin:

A friend of mine (who brews very high-quality beer) had an infection problem which was traced (as well as possible) to the dishwasher. Just because the dishwasher has worked for years doesn't mean it will work always. I assume food particles get trapped periodically in strange places and bacteria sets up camp. I use bleach in my dishwasher (no detergent) and haven't had a problem (although I'm not claiming I won't ever have one). I would also suspect your RS yeast, but either case will be tough (impossible) to prove.

To all you Yeast-meisters:

I've noticed a distinct taste in Redhook products (Redhook, Redhook ESB, Ballard Bitter) that I'm having trouble nailing down. It is a sour-milk sort of a taste that is not at all unpleasant most of the time (I've got a six of RH ESB in the fridge which is to die for!). The exception was a BB which had an overwhelming sour milk taste - I couldn't finish it. This is not a hop bitter, it is a definitely sour taste. I've mentioned this to others and they looked at me like I've got three heads. Have others noticed this taste? I'm guessing that this distinction is in the yeast. With that in mind, I noticed on the bottles the following: 100% Barley Malt (I would expect no less) Top-Fermented (of course), *Saccharomyces Cerevisiae* (obviously NOT the name of the brewmaster). So...

Questions:

- Is *Saccharomyces Cerevisiae* the general name for yeast, brewing yeast, or ale yeast?
- If not, is it the particular yeast strain they use?
- If it is the particular strain, is it the source of the unique Redhook taste?
- Is there a good yeast reference (written for idiots) out there?
- Is Dave Logsdon's yeast book coming out soon?

Thanks for your patience,
Norm

From: eisen@kopf.HQ.Ileaf.COM (Carl West)
Subject: Glass and temp, Gum arabic

It's the temperature gradient in the glass, not the temperature change itself.

If the gradient is steep enough, the glass will crack. The thicker the glass, the worse the problem.

When you boil water in a glass container, you're not shocking it the same as if you poured already boiling water into it suddenly.

If you put a room temperature glass vessel filled with room temperature water on a stove, the water will serve as a heat-sink for the glass (which is the idea) and the glass will probably not suffer thermal shock because it's a 'buffered' situation.

The problem with the snowbank trick (I've done it too, with gallon jugs) is that the top of the bottle remains HOT while the bottom is getting COLD, the temperature gradient gets too steep, the glass at the top of the bottle cannot accommodate the contraction of the glass at the bottom, and it cracks. This is the reverse of pouring boiling water into the bottle.

Gum arabic is the dried sap of um... some plant that has 'arabicus' in its name. The 'tears' that can be found under a cut in a cherry tree are a similar material. If you add a little mint flavor, you can use gum arabic to seal envelopes and hold stamps on them, all the kids are doing it. Gummed envelopes are the way to go! :-)

From: oconnor@ccwf.cc.utexas.edu (donald oconnor)
Subject: hop storage

two factors are important to the stability of hops, oxygen and temperature.

Of these, exclusion of oxygen is the most important. For example, hop pellets vacuum packed in foil packs and stored at 68 F will lose about 10-15% of their bitterness in the first 3 months and virtually nothing for the next 9 months. This is presumably due to the oxygen contained in the hops when packaged. The same hops stored at 32 F will lose virtually no bitterness in a year.

this dependence of hop stability on oxygen is the reason that hop pellets are nearly always fresher than whole hops <which ironically are often called 'fresh' hops>. Refrigerated whole hop bales will lose 16-52% of their bitterness (depends on variety) within one year under the best of conditions.

The anecdotal reports regarding old Wyeast packs rising up in a couple of days point out that the viability of the yeast depends to a large extent on its history. If the yeast was shipped during cool weather and kept refrigerated at all other times, then the yeast may well remain viable for several months or even a year.

Subject: Re: Wyeast packaging

grumpy!cr@uunet.UU.NET (C.R. Saikley) sez:

>I'd never recommend storing Wyeast for this long intentionally, but my
>experience is a testimony to the fine work done by those folks. Now, if
>they'd just fix those damned packages.....

You know, I've heard a lot about these exploding Wyeast packets, but I've never had one. A friend of mine had two of them go off, though. Turns out he was pushing all the "guts" of the package down to one end and then hitting it with the heel of his hand HARD.

I find that I can get the inner packet to burst just by pressing it between my hands. The pressure of the outer packet never gets high enough to rupture the seam.

If your packets rupture when you SMACK them, then don't SMACK them!

If I'm way off base, here, then never mind.

From: gkushmer@Jade.Tufts.EDU
Subject: Sam Adams news

I was doing some reading and ran across an article on sales for Sam Adams. Thought the rest of you might like to see it:

MORE BREWS, MORE SALES FOR SAMUEL ADAMS

Copied Without Permission from the Boston Business Journal
February 10, 1992

The Boston Beer Company, which brews Samuel Adams Boston Lager, increased its sales to 160,000 barrels last year, a 45 percent increase.

One reason for the impressive statistics is that the company's small size allows for plenty of room to grow.

"We're still infinitesimal in the beer business," said Jim Koch, president of the six-year old Boston outfit.

"We make as much beer in a year as Anheuser-Busch makes in 45 minutes," Koch explained. "We can grow with almost no impact on even a Heineken."

But the beer's skyrocketing popularity does not seem to be leveling off. The company is out of beer until the end of March. Because it takes six months to brew Samuel Adams beer and the company does not keep inventory on hand, demand can easily outstrip availability, Koch said.

Another sign of growth is the tripling of the number of visitors taking tours at its Jamaica Plain brewery, the former Heffenreffer facility that Koch renovated in 1988.

In 1985, Koch began making Samuel Adams beer in Pittsburgh under contract with the Pittsburgh Brewing Company. The company also operates at the Blitz Weinhart brewery in Portland, Ore.

Koch said the other brewing locations help guarantee freshness for consumers across the country.

And the brew is indeed selling across the country. For the first time, Samuel Adams sales in California have passed those in Massachusetts.

The beer is also selling in Germany - in fact, it is the only American brew sold there - and can be had aboard the President's Air Force One.

-Tina Cassidy

I wonder if George actually DRINKS the stuff?

Subject: My Honey Basil Ale

I finally made the Honey Basil ale that I've been asking for advice.

Here's what I did:

2.5 lbs barley malt
0.5 lbs wheat malt
0.5 lbs 40L Crystal malt
2 lbs honey
1 lb dried malt extract (pale)
2.25 oz Mt. Hood hops (3.3%, bittering)
0.5 oz Cascade hops (5.9%)
1 oz Basil leaves
Whitbred dry yeast

I did my partial mash, then boiled the wort with the honey and DME and the Mt Hood for 70 min. I then turned the heat off, added the Cascade and Basil, and covered and let sit for 30 min.

The basil I added may be a lot; it was about 1/3-1/2 of the "bunch" I bought at the grocery store. I talked to the brewmaster at the pub where I had the original Honey Basil and he said they used four "bunches" in 800 gallons. So we'll see.

Now it is fermenting, and is a pretty murky brown color. I didn't think that much 40L Crystal would make it this dark; much darker than I wanted. We'll see what happens when it is done--looks like I'll need to add the gelatin this time (I've had good luck with this in the past). I'll let you know what it tastes like.

And I hope the hops are light enough to let the basil and honey through. I think I have a pretty heavy hand with hops usually.

From: Robert Schultz <SCHULTZ@admin1.usask.ca>
Subject: Re: Glass temp

>From my physics (which was a long time ago) I would put my money on the temperature differential/rate of energy gain(+/-). Heating the carboy is relatively slow with a fairly constant heat source. Cooling, especially into a snowbank is extreme, the rate of cooling is dependent upon the density of the surrounding fluid (i.e. air cooled may be OK, but snow, i.e. water @0'C, is much more dense) and the temperature differential.

Also imperfections, shape of the container, and the number of cycles (hot, cold, hot, etc) may provide a basis for early fatigue of the vessel.
Best to use a SS keg if you plan to throw it into the snowbank.

Rob.

From: ktk@nas.nasa.gov (Katy T. Kislitzin)
Subject: Nutritional Value of Homebrew

I was reading a recent (jan or feb) issue of nat'l geo over the weekend. The main topic for that issue was "Alcohol -- the legal drug". It contained some speculation that beer was one of the earliest fermented beverages, and may have been the first reason people had to cultivate grain. the article went on to claim that it is likely that "primitive" beer was highly nutritious, in fact, in all likelihood brewing barley made more of the nutrients in it available than baking bread with it. They implied this for all grains, but barley was mentioned by name. The article then says that given today's very light brews, modern beer has virtually no nutritive value.

So, my question is: how nutritious can a homebrew be? or a good stout for that matter? how would one go about making a "healthy" beer? given the emphasis that current nutritionists put on grain consumption, and given the comments of nat'l geo, it seems that one could concoct a brew that would be a very enjoyable way of "having one's daily bread" as it were ;-)

Least my question be interpreted as anti-bread, let me state for the record that i enjoy baking and eating bread at least as much as brewing and drinking beer!

From: NCDSTEST@NSSDCA.GSFC.NASA.GOV
Subject: Forced CO2 vs natural

In HBD #824, Donald Oconnor comments on forced CO2:

<From: oconnor@ccwf.cc.utexas.edu (donald oconnor)
<Subject: dispensing pressure

<There is no difference in the taste of naturally carbonated beer
<and beer force carbonated with a gas tank. CO2 has no memory of
<whence it came. If you use dry malt to prime however, there will
<be a slight change in the beer due to the unfermentable sugars
<(about 1/3 of the weight).

I do agree that forced CO2 works fine, BUT, naturally developed CO2
produces smaller bubbles wich change the way the beer is perceived
by the drinker. In some beers this has no significance. In others,
like fine Pils, the effect is more dramatic. I personnaly like the
natural CO2 better because of the feel of the finished product. The
head is creamier and the retention is better.

Just another .02 worth.

From: gschultz@cheetah.llnl.gov (Gene Schultz)
Subject: Recipe for brewing Full Sale Ale

FULL SAIL ALE

About four years ago I ordered a bottle of Full Sail Ale while having lunch in Portland, Oregon. Full Sail was the most expensive beer on the menu, and I figured that at \$2.75 a bottle I didn't have much to lose. Several others who were with me did the same, and were pleasantly surprized--Full Sail offers a reasonably complex (a hint of sweetness along with medium strong hops and a rich malty flavor) taste and aroma in a medium-bodied ale.

Since I first tasted this ale, I had to rely on others making trips to the Northwest to bring back six packs of this ale. A few months ago, I visited the Hood River Brewing Company in Hood River, Oregon. I was able to get enough information to experiment with a homebrew recipe for Full Sail Ale. My first experiment turned out remarkably similar to the real thing in body, aroma, and flavor:

To make 5 gallons:

7 lb Australian Light Malt Syrup
3/4 lb Light Crystal Malt
2 1/4 oz Nugget Hops (1 3/4 oz. for boiling, 1/2 oz. for finishing)
2 tsp. Gypsum
1 oz Dextrin Malt
3/4 cup Corn Sugar (priming)
Wyeast London Ale Yeast

Crack and steep crystal malt at 155 - 170 F for about 45 minutes in 1/2 gallon of water. Add extract, gypsum, dextrin and 2 gallons of water. Bring to boil, then add 1 3/4 oz. hops. Boil for 45 minutes, then add 1/2 oz. hops at the end of the boil for 15 minutes.

Primary 3-5 days
Secondary 7-14 days

Subject: First-Timer

Dear Fellow Brewers,

I've just taken my first steps toward becomming a home brewer. Just last night around midnight I took my very first hydrometer reading and pitched my very first yeast! But today, like an expectant father, I'm finding it hard to "relax, don't worry, and have a home brew." That is why I'm writing this letter: to get support and advise from veteran brewers who are familiar with both the subtleties of brewing quality beers, as well as the tendencies of first-timers like myself to over-compensate in the areas of.... well everything, ultimately killing both the beer and the fun of making it.

So, while I'm not looking for a "BrewAnon" type of support network I do still have a few questions that I couldn't find answers to in either Papazian's "Joy of Home Brewing," or Burch's "Brewing Quality Beers." Perhaps I can find a few here?

For example, is it possible to kill your wort by burning it before it boils? Initially, my wort showed little activity, then only a weak boil. Shortly after, I stirred it. Then all hell broke loose, over the pot, and onto the stove. Is this bad for the wort?

Secondly, after painstakingly following the directions for sanitizing the utensils, fermentation chambers, etc., I'm worried that if I muck around in it AT ALL, I'll ruin it. So is it possible to get TOO caught up in cleanliness in the search for godliness??

Finally, just how much protection from the light do I need to worry about? While I don't want a skunky ale, nor do I want to deprive the yeast of any light necessary for their healthy little lives. Right now I've got my primary fermenter sitting covered by a large box in the corner of my pantry. As of this letter, I haven't see any signs of fermentation yet, but I suspect it's still too early.

Any advise out there??

John

From: Gordon Baldwin <hpubvwa.nsr.hp.com!sherpa2!gbaldwin>
Subject: Infected batch

>Well after 66 batches over 5 years it looks like I've lost my first batch.

I would be interested to know how many of them were made with Red Star. One of the details that I had missed is that many of the infections caused by Red Star take weeks or months to develop. If you are a big drinker, you could get lucky and go through life thinking it's great yeast.

> After aging my last batch of lager for 2 weeks the beer has little white dots floating on the surface in the bottles, and there is a ring around the inside of the neck. I haven't tasted it yet, but I am assuming that it is ready to be used to water the plants.

I can tell you exactly what it will taste like and I doubt even the plants will like it.

>I am trying to determine the source of this.... Could I have gotten a bad batch of yeast? I have had very good luck in the past with Red Star Lager. (I agree that Red Star Ale is no good).

Bingo!

Personally, if I believed a manufacturer produced one product that was substandard, I would not even consider using another similar product from the same company. It just is not worth the 40 cents difference and "substandard" is probably too gentle a word. Furthermore, you just encourage them to continue making the lousy product.

> The fermentation usually takes less than a week, but this batch took close to 3 weeks.

I had a batch that tasted fine when I racked to secondary. It was bubbling vigorously after two weeks so I took a sample to see what was going on and it tasted absolutely vile. It continued fermenting like new beer for almost two months and the taste (if possible) got worse.

Switching to EDME yeast has done more to improve my beer than ALL of the other procedures I have changed since I started reading HBD.

Subject: Using spent grains for making bread

>Stephen Mahan asks if anyone has had any experience using crystal malt
in
making bread. While I have never done this, I have had some bread that
was
made by the Berghoff brewery here in Chicago. They make fresh bread
using
their spent grains and it turns out really good. At \$4 a small loaf
though,
it's pretty expensive.

Here is my recipe for "BEER BREAD"

- 2 cups spent grain
- 1 cup warm water
- 1 cup flour
- 1 tsp yeast (Wyeast bread yeast, of course:)

Mix ingredients and let sit in warm place till fermenting vigorously.
Several hours, overnight.. doesn't matter much.

Add 1 tsp salt and flour (a cup at a time) and nead or mix in mixer with
dough hooks till the dough is dry enough not to stick to fingers (about
5
cups). Nead or mix till dough has silky finish. Let rise (covered) in
warm
place for several hours or until it doubles bulk.

Roll dough into bars about 2" in diameter and the length of your baking
sheets or form loaves for bread pans.

Bake at 375 F for 25 min.

This makes an incredibly natural tasting bread for next to nothing in
cost.

You can say goodbye to colon cancer worries, this stuff will really
clean you
out.

I always save part of my grain for bread making. I put it in two cup
freezer
containers and freeze till I need it. I keep enough in the freezer to
keep
me in bread till the next brew. The rest goes into/on the garden.

Subject: RESULTS: Axbridge beer kit

Ok, 21 days after the initial beginning of the kit, as the instructions said, I drew off a small amount.

The beer is malty/hoppy flavored. The beer itself is still somewhat cloudy. The resulting flavor is a tad bit bitter.

The instructions said to wait an additional week if the beer is cloudy. This I WILL do. I DID cheat however. yesterday, I pulled off a small amount. Mostly foam and MUCH MORE BITTER. I had no idea ONE solitary day would make a difference. I suspect that if I wait an additional week, the cloudiness *may* go away and the flavor will mellow. The kit is supposed to be an old english ale.

Those are the results. I wouldn't go out and buy one again! For the same money spent, I could have bought a whole kit and recipe. This is true for convenience. If you don't mind waiting, and cleaning up after yourself, I recommend the regular kit from mail order. Cheapest I have seen was \$30 for a single stage kit.

I will follow this up with the final results for my last draw next weekend.

Subject: Calgary, Alberta pub...

I have just returned from the subject city (nice place) after a week at DECUS Canada. Much of my meal/free time was spent at a place that is reputed to have the largest selection of beers in the city. It is Bottlescrew Bill's Old English Pub at 10th Avenue and First Street. It is next door to Buzzards Wine Bar.

Bill's has a nice drinking atmosphere, but not the character of an English pub (I don't think that can be done without the English present). Dart boards abound, a couple of TV sets are set on The Sports Network, and it is a good open atmosphere. Their selection of potables is large, and includes many British beers, as well as Belgians, etc. They also have the required set of representatives from Mexico, Japan, Germany, etc. They have about five varieties of Sam Smiths, but they are \$9.50 CDN for the 341 ml bottles! They are not the highest priced brews available either. I stuck with the Buzzards Breath Ale (the "house" drink), and Cold Cock Winter Porter. They were \$3.95 per draught mug (\$2.95 at happy hour). The BB is a pale ale, and not bad at all. I was partial to the CCWP myself. Both (and a couple of others) are brewed in Calgary at the Big Rock brewery. As it was 35 blocks away, I did not visit - it might be worth the effort to do so however.

All in all, a pretty good time. I would definitely do it again (even if in a better spirit of moderation, but that's another story).

Cheers...Gary

Subject: Filtering wort

I performed a small experiment recently which convinced me of the value of wort clarification prior to the boil. After mashing out and sparging, I split the wort in two and allowed one half to cool to an ambient temperature of 9C, before racking into the boiler. The other half was boiled immediately. What were the differences ? The test half showed a pristine white collar when coming to the boil, and, prior to fermentation, was a lighter shade and tasted significantly less bitter. I interpreted all this to mean that boiling even small amounts of silt from the mash tun can increase the tannin content of the brew.

So now I'm contemplating methods of filtering out the silt entirely. One idea is to pass the wort through a lauter tun containing an artificial filter bed, preferably made from something cheap and available such as polyester filling. (In order to forestall endless flaming about the inertness of such materials, I won't mention that some winemakers employ asbestos :-)) Sandy substances are another possibility I guess, eg, perlite. I realise any such filter is likely to be torturously slow, so am thinking in terms of an overnight continuous trickle arrangement. Has anybody tried something like this ?

Subject: Burst WYeast packets and mailorder

dougd@uts.amdahl.com (Douglas DeMers) sez, in HBD #823:

>I just received an order from Alternative Beverage which included a
>package of the new Belgian Ale yeast. Alternative Beverage included a
>flyer stating that they would no longer refund/exchange failing
>packages of WYeast. They suggested NOT using the method outlined on
>the new package (using the heel of the palm, etc.) and instead use a
>hammer on the inner pouch!

I just received three packets from St. Patricks of TX brewers supply.
They included a sheet entitled "Breaking the Yeast Package." It reads:

>The weak seam in the latest packaging of Wyeast liquid yeast cultures is
>the bottom seam. I have folded and taped this seam to give added
>support. To insure the seam does not fail when you break the inner
>pouch, PRESS THE BOTTOM SEAM FIRMLY AGAINST THE TABLE WITH EITHER YOUR
>HAND OR BETTER YET, A BOOK, AND THEN BREAK THE INNER POUCH WITH YOUR
>OTHER HAND. This should eliminate nearly all package failures.

I followed the instructions. I was bearing down mighty hard with my
other hand when the inner packet burst. The seam held, so I'm happy.

A related question: I received two packages of Wyeast European Ale
yeast, #1338. It is from Wissenschaftliche in Munich, according to the
literature I have. What kind of beer/style would be appropriate for this
yeast?

Subject: re:glass breaking & spent grains

>From digest #824

Broken glass

Danny asked about glass breaking due to temperature extremes. I always thought that glass breaks under extreme temp changes because the glass either expands or contracts unevenly. If these changes in dimension are radical enough and close enough together the glass will break. If this is true, it does not matter if the glass is hot or cold. It only matters that there is a difference in the temperature of the glass at different spots. Glass has a low rate of thermalconductivity. This means that if you heat glass at one end, the energy will not travel through the glass very quickly. This contributes to why glass breaks so easily under these conditions.

The answer is simple: brew British beers. 65F is just about spot on for
the
top fermenting yeasts used for these. I know of two books which between
them contain recipies for about 200 different British beers, including
medieval ales from before the days of hops. Don't regard this as a
disaster:
a whole new world of beer has just opened up for you!

Subject: krausening

I worry about Papazians formula for krauesening. It uses O.G., but i think that the change in S.G. would be more appropriate. Somebody once posted this formula to krausen a 5 gallon batch :

$$\frac{\text{change_in_SG} * (\text{quarts_of_gyle})}{3.2} = \frac{20 + \text{quarts_of_gyle}}{20 + \text{quarts_of_gyle}}$$

which simplifies to :

$$\frac{64}{\text{quarts_of_gyle}} = \frac{\text{change_in_SG} - 3.2}{\text{quarts_of_gyle}}$$

I do not have papazians formula with me, but i do know it gave a MUCH smaller answer. BTW... i am assuming that change_in_SG is acually change_in_SG * 1000. like for my current brew, i expect to go from 1.063 to about 1.013, hence quarts_of_gyle = 1.37 qts. i think papazians number came out to be less than 1.

Does the above formula seem OK?

Subject: Baltimore micros

Hello - there are two micros in Baltimore City, both of which produce a pretty decent brew.

A) Baltimore Brewing Company - just a short walk from the Inner Harbor, this joint serves it's own (Pilsner, Dark,, Amber and one monthly "specialty") along with some good, medium-priced, pub-food-'n'-burgers type fare. It's located at 104 Albemarle street, between Pratt and Lombard.

B)Sisson's - the site of the local homebrew club's meetings (none of which I have attended yet). Sisson's has pretty good deals (\$6.50/pitcher) and some fare similar to BBC's, but it also features a posh Cajun restaurant as an adjunct. The food is good as is the beer. One of the only micros I know that serves beers fro around the world in addition to its own! Can be very crowded. Address: 36 E Cross St, right across the street from the Cross St Market, between Light and Charles.

Hope this helps! Best Volker Stewart Langsdale Libr., U. of Balto.,

>of homebrew left!!

I brewed in my apartment in Boulder from January to May of last year, and didn't have any problems until May. During winter and early spring the temp. stayed between 60 and 70 degrees, fine for most ales. Some of the lighter ales had a mild diacetyl taste, probably due to the warmer temperatures, but I like that.

When May rolled around it became impossible to keep the temp below 70 without paying exorbitant air conditioning bills. The beers began tasting a little too funky even for me, and we moved the brewery to my friend's basement in Denver, where the temp never got above 70 all summer (eat your hearts out, flat-landers!).

So, my advice is to go for it, but line up a good basement or spare refrigerator for this summer.

> So, my question is: how nutritious can a homebrew be? or a good stout
> for that matter? how would one go about making a "healthy" beer?

I'm no nutritionist, but I've been reading Steinkraus' "Handbook of
Indigenous Fermented Foods" pretty assiduously. From what I can gather,
the most nutritious "beers" of the third world are those in which the
entire mash is fermented out. The resulting product would resemble
alcoholic oatmeal more than what we have come to call beer. There does,
indeed, seem to be ample evidence that the nutritional quality of the
grains fermented in this way does actually increase.

I think it would be iffy to do barley beers this way, since the
percentage of husks in the mash would be more than a bit unpalatable.
Using wheat malt, or perhaps better, maize malt, would result in a gruel
of greater "organoleptic" quality.

I'm hoping to do some "thick" beers here in a few weeks, using
techniques similar to those reported in this book. If anyone's
interested, I'll be glad to keep you posted.

Subject: natural CO2 vs forced

jim busch contends that the source of CO2 determines the size of the bubbles formed in the beer. i will emphasize again that the co2 molecules do not float around with little signs saying "i came from a sugar" or "i came from a 5 gallon gas tank". The head formation and retention are effected by a number of factors in beer but one of them is not the source of c02. the size of the co2 bubbles depends on a number of factors but one of them is not the source of the gas. if you would like to know more about what determines bubble size and such, i would recommend an article that appeared in Physics Today about 4-5 months ago by a Stanford chemist and one of his post-docs.

Subject: WYEAST package breakage/recipes

Hi!

I'm new to this this conference...so hello. I am just getting into homebrewing. I bought a pre-package ingredients kit at my local supplier. It contained a package of WYEAST Danish Lager yeast. I followed the directions, that is, broke the inner bag with the palm of my hand and place it for one day in a warm place. The inner contain broke without any trouble, I kneaded it gently and kept it at about 72 degrees F over night.

The next morning (about 18 hours later) I found the package had broken at the seam and the mixture was leaking from the package. Is this the failure scenario people have been talking about? Or did I do something wrong (which there really isn't must to screw up here!). I will request a replacement, but was curious if I happen to just get an older package or if this type of thing should be expected on occasion? Thanx for any input.

Also, I'd be interested in any "online" recipes that anyone would be kind enough to forward me directly...or any other useful information to assist me in the wonderful new hobby.

Thanx all,

/Glenn Tremblay

Geez, Eric, relax (don't worry, etc.). I've been brewing at "room" temperature (69->71 deg. F) for 2 years now, and everything is fine! Granted, I'm not making lagers, strictly ales, but they taste great. I do keep the carboys covered with a T shirt or two to keep light off them, and also keep them away from the heat registers, but that's the extent of my caution.

If you REALLY want the lower fermentation temp, why not buy a used refrigerator and crank it up as high as it will go?

Subject: mashing in a microwave?

A question for the grain mashers.

Mashing involves raising the grain and water to a certain temp. and letting it sit there for a specified length of time. Some technics call for this to be done in stages. ie one temp for an hour then raise it to the next temp etc.

My question is can this be done in the microwave oven? My micro is programable to allow this staged approach using the built in timer and probe. Anyone have any experience with this? Comments?

Post or reply and I will summarize.

Thanks

"Date: Fri, 14 Feb 92 12:35:59 -0800
From: ktk@nas.nasa.gov (Katy T. Kislitzin)
Subject: Nutritional Value of Homebrew

"I was reading a recent (jan or feb) issue of nat'l geo over the weekend. The main topic for that issue was "Alcohol -- the legal drug". It contained some speculation that beer was one of the earliest fermented beverages, and may have been the first reason people had to cultivate grain. The article went on to claim that it is likely that "primitive" beer was highly nutritious, in fact, in all likelihood brewing barley made more of the nutrients in it available than baking bread with it. They implied this for all grains, but barley was mentioned by name. The article then says that given today's very light brews, modern beer has virtually no nutritive value.

"So, my question is: how nutritious can a homebrew be? or a good stout for that matter? how would one go about making a "healthy" beer? given the emphasis that current nutritionists put on grain consumption, and given the comments of nat'l geo, it seems that one could concoct a brew that would be a very enjoyable way of "having one's daily bread" as it were ;-)"

I've thought about that, also. One of my brothers has pointed out to me that the malt I put into proto-beer is identical to that added to 'malted' milks, and suggests that the complex of sugars and proteins are very good for you.

Of course, the yeastie-beasties eat a lot of it up, but I'd guess that a fair amount remains.

This would also explain how some of my barfly friends remain alive despite never appearing to eat much of anything ... (-:

"Least my question be interpreted as anti-bread, let me state for the record that i enjoy baking and eating bread at least as much as brewing and drinking beer!"

I've been experimenting with making pizza, myself ... and thanks for the beer bread recipe, Jack ...

An interesting variation on a recipe has occurred to me recently. I was in Chinatown recently, contemplating ginger root and wondering what it would do to my beer ... or ginseng, for that matter.

Yesterday, I was in a health food store in Santa Cruz, pondering a wide array of herbs, and wondering what orange peel might do to a brew.

I tell you, the possibilities are infinite ...

I received some vary good ideas in response to my recent plea for help. I had asked what to do about brewing in a house where there was no basement or other cool room. For those of you with similar problems, here are the responses:

- 1) Place your fermenter in a shallow pan whose diameter is greater than that of the fermenter. Fill the pan with water. Drape some cloth (e.g. a t-shirt) over and around your fermenter so that the cloth comes in contact with the water in the shallow pan. The water wicks up from the pan into the cloth. The water evaporates from the cloth and cools the fermenter. You can cool the fermenter even more by blowing air past the system with a fan.
- 2) Get a freezer that no longer works (to save money). Buy a Hunter airstat for about \$25.00 to cool the freezer. The Hunter airstat can maintain temperatures in the required range (e.g. 60F).

The moral? When it comes to brewing, you have to be cool.

John writes:

>For example, is it possible to kill your wort by burning it before
>it boils? Initially, my wort showed little activity, then only a
>weak boil. Shortly after, I stirred it. Then all hell broke loose,
>over the pot, and onto the stove. Is this bad for the wort?

Only if you try to scrape the burnt wort off the stove and put it back into the kettle.

>Secondly, after painstakingly following the directions for
>sanitizing the utensils, fermentation chambers, etc., I'm worried that
>if I muck around in it AT ALL, I'll ruin it. So is it possible to get
>TOO caught up in cleanliness in the search for godliness??

I'm not clear on what you mean by "muck around in it AT ALL." Sanitation is the most important factor in making good beer. (Avoiding excessive amounts of cane or corn sugar is #2 and good yeast is #3.) You should sanitize everything that will come in contact with your wort, preferably, just before you use it, so it doesn't get contaminated by airborne bacteria or wild yeast or pick up the same by contact with unsanitized surfaces in your brewing area. Once you get a routine down, sanitation will not be such a big pain anymore -- but no less important.

> Finally, just how much protection from the light do I need to
>worry about? While I don't want a skunky ale, nor do I want to deprive
>the yeast of any light necessary for their healthy little lives.

Protect your wort/beer from all light, if you can, especially fluorescent and daylight. Yeast don't need any light at all, and you're right: light struck beer smells skunky.

> Right
>now I've got my primary fermenter sitting covered by a large box in the
>corner of my pantry.

Great. Leave it under the box.

>As of this letter, I haven't see any signs of
>fermentation yet, but I suspect it's still too early.

Could be. Depending on the yeast, the temperature, how much you aerated your wort, if you used a starter or not, etc. etc., it can take anywhere from 4 to 48 hours to see activity. I may have recently killed a starter.

My basement is about 10 degrees colder than my kitchen. I culture yeast in my kitchen. I recently made a 500ml starter from a package of Wyeast #1028 (London Ale). It was going well as I poured 100ml of that starter into another 500ml of wort the morning I was going to brew. In the evening, that starter was going well. While chilling the wort to pitching temperature, I had the starter in the basement with me. After a few minutes, I glanced over and noticed that the airlock was going in the wrong direction.

The cooler temperature was contracting the starter and the air in the starter bottle! Not that it was a big deal or anything, I decided to put

the starter in the warmest place in the basement -- the heater room:
on top of the heat plant (DUH!) for 30 minutes. Well I pitched the
yeast and had no activity for 36 hours. It was still too early to worry,
so I leisurely poured 100ml more from the first starter into the primary.
8 hours later, fermentation was active -- after 8 more hours, blowoff
had begun. There's no way of telling if the original 600ml starter took
48 hours to start or if the 100ml starter did. In any event, the moral
of the story: don't let the temperature of the yeast change too
dramatically
or get too high and don't worry.

From: Jay Hersh <hersh@expo.lcs.mit.edu>
Subject: Wyeast Monopoly

Hmmm MeV going out of business leaves Wyeast as sole supplier, but this isn't a classic monopoly, it's not like they used predatory pricing or other aggressive business tactics, just good service, good quality, and a good product (though pricey). Too bad more American firms don't have the Wyeast ethic.

On a related note a local homebrew shop owner has gotten hold of commercial yeast culturing equipment and is considering doing limited production runs

I have been lucky enough to get some test batches and the quality so far has been good. Perhaps if other local industrious types take up this approach fresher, less expensive yeast can be had. This will of course cut into Wyeast business, but that's capitalism...

Subject: Beer gone bad?

To all on homebrew,

I need your assistance. I'm a beginning brewer, with my first batch in its second stage of fermentation. Today, I noticed a thin scum on the top, it isn't covering the whole top. The beer has kept an average temperature of 78 degrees, and other than the scum seems fine. Should I worry at this point? Is my beer ruined? Can I do *anything* to salvage it?

Awaiting your guidance...Thanks in advance,

N. Strangelove

Subject: Keg relief valve leaking

Has anyone experienced the problem of a leaking relief valve on a Firestone soda keg? If so, how did you fix it? The valve has a removable assembly, and the rubber seal has a surface that looks sort of like a raisin. I hope that the assembly can be found at some homebrew supply store. One thing I noticed is that there are many different types of relief valves. I have four Pepsi kegs, and have three different types of valves.

PS. I posted an article a while back about a homemade pH meter. I got one request to post the plans. I am not very good at ascii graphics, and I don't want to take up Digest space with it. If anyone wants a schematic and circuit description, send me a Self Addressed Stamped Envelope.

From: PEPKE@SCRI1.SCRI.FSU.EDU (Eric Pepke)
Subject: Re: Mashing in the Microwave

Tom Haley asked about mashing in the microwave.

The problem with this is that the heating in microwaves is very uneven. You would get hot spots which would destroy enzymes and may even burst the starch granules, which would not get a chance to undergo saccharification because of a local lack of enzymes. A microwave chamber would only be a satisfactory heat source if the mash were stirred constantly. Because of the more rapid local heating of the microwave, the stirring would be much more important than with a heat source.

I've done decoction, infusion, and stovetop mashes. IMO, the easiest is the stovetop mash a la Dave Line, unless you have a very large mashing tun, in which case a single-step infusion mash is the easiest.

From: mtavis@saturn.hyperdesk.com (Mike Tavis)
Subject: Batting .250

After almost 2 years of fairly successful brewing, I have falling into a "infection" slump. Three of my last four batches have gone South. The first batch I attributed it to lax cleanliness (the sin of hubris - -- "My batches never get infected"). The next one went fine, so I figured I had learned my lesson. Then the third went bad. With the fourth batch I was more careful than any batch in the last 2 years and still it is infected.

After I calmed myself (I couldn't RELAX because I was out of homebrew), I started to think more carefully about what was different about the second batch. The only thing that I came up with was that I had used hop plugs for the three bad batches and hop pellets for the one good one. I have had successful batches with hop plugs, but I am pretty sure that these three are the only ones in which I used plugs for the finishing hops. Could it be that the finishing hops plugs are the culprit?

I noticed that when I toss them into the boil they take a minute or two to break up (unplug?). This is also about the time that I stop the boil. Perhaps, nasty microbes are hiding in the center of of these plugs and are not exposed to the boil long enough? What do say ye? Is this a good possibility or a red herring?

Thanks.

Subject: cold break

i brewed a extract brew this weekend, chilled the wort fairly quickly with an immersion chiller (<15 mins), and then poured the cool wort into the carboy leaving behind a small amount of trub. after about 10 minutes, when i was going to add the yeast, i noticed a considerable amount of matter (protein?) precipitating out of the wort. i added the yeast anyway and the matter settled out after about four hours (before the yeast took off). the yeast have not stirred up the precipitate and i will rack to a secondary after seven days.

now the questions: should i have let the precipitate drop out first, then rack into another carboy, or continue as i have been? is this a sign of poor extract? (john bull amber unhopped)

Subject: Re: Help!! I'm trapped in a non-brewery!

In Homebrew Digest #825, Eric Mintz <ericm@bach.ftcollinsco.NCR.COM>
writes:

> It's finally happened: I had to move and my new house doesn't have a
> basement or any other room that is cooler than 65F.

I once lived in the Central Valley of California and tried brewing
where the summer temperatures soar in to the mid-hundreds. Well, OK,
the low-hundreds, but it *felt* like the mid-hundreds. Even our air
conditioned house didn't get much below 80.

My solution was to place the fermenter in our spare bathtub half full
of water. I made sure the water level was above the wort level, but
below the top of the fermenter. Of course, this assumes you have
ample air space at the top of your fermentation vessel to prevent the
tub water from sloshing on top of it and possibly leaking in.

To control the temperature of the tub water, I kept a couple of gallon
milk jugs of ice in the freezer. I would monitor the water temp, and
as it crept up a few degrees from 65F, I would plop the milk jugs in
the tub and wait until it dropped a few degrees below 65. Then I'd
return the jugs to the freezer and start the cycle again.

Using this method, I was able to keep the temperature within a few
degrees of 65 with only one or two dippings a day. With the ice in
the tub, the water temp would drop below 65 within about 10 minutes.
Naturally, your mileage may vary...

Subject: Why's this? and culture supplier comment

First, an interesting thing happened on a batch of India Pale Ale that my brew partner and I brewed in January. When we were ready to pitch the yeast, we siphoned off a sample of the wort to take a gravity reading. We both have hydrometers so we took two readings on the same sample. The interesting thing is that my hydrometer read 1.088 and his read 1.080. When we racked to the secondary, we again took gravity readings with both hydrometers. Mine read 1.022 and his read 1.019. When we bottled, mine read 1.020 and his 1.018. Anyone want to venture a guess as to why there is a difference and why it lessened as the wort fermented out? The hydrometers came from different places and their appearance is slightly different if it matters.

Second, I would like to thank whoever posted the information about the new yeast culturing equipment supplier. It was concise and informative. Darren also posted a comment on the supplier as he had received a catalog. I see absolutely nothing wrong with either of these posts. I have obtained a wealth of supplier information from these pages and it is one of the most useful functions of this digest. Relax people. To paraphrase (the real) Ferris Bueller, don't be so tight that someone could shove a lump of coal up your *ss and get a diamond. Keep the information flowing. Also, someone mentioned that a local homebrew supplier was culturing their own yeast. The Homebrewers' Store, 1-800-TAP-BREW, cultures their own yeast. It comes in a vial with a Teflon cap and costs \$2.00 if ordered with at least \$10.00 of other merchandise. It costs \$3.00 otherwise. I have only used it once but I was quite pleased with it. The prices are great and \$10.00 buys a good deal there. Even with shipping to Alabama from their location in Washington state, I find it hard to beat his prices on most items. Just another information point. My only affiliation is that I am a satisfied customer blah blah blah.

Subject: Sourdough starter

Someone inquired a few days ago about making a sourdough starter from scratch. Here is a technique I found in the LA Times, 31Jan91 p. H20, that worked the one time I tried it (and since then I've just kept my starter going with water and flour each week)

Recipie: 2.5 oz. Russet potato, peeled and cut into small pieces
unbleached (organic if possible) white flour

1. Combine potato and 1.5 cups water in a saucepan
2. Bring to a boil, reduce heat, simmer for 15 minutes.
3. Pour contents into a glass container and mash potatoes with a fork
4. Cool to room temp
5. Gradually stir in 7.5 oz flour until it forms a stiff batter
6. Cover tightly with plastic wrap and store in a warm place
7. In 6-8 hours it will begin to grey. Stir vigorously and recover
8. Taste after 24 hours--should taste like mild cheese
9. Stir, let stand another 24 hours covered
10. After the second 24 hours it should have a sour taste
11. Stir in 4 Tablespoons of water and 1.25 oz flour
12. Let stand another 48 hours
13. Stir in 4 T water and 3 oz flour until sticky and heavy
14. Let stand until it triples in volume (about 8 hours)--Don't cover!
15. Starter is complete! Refresh every week by stirring in 1/8 cup water and 1 oz flour. Keep covered, but loosely enough to allow gases to escape.

If you want more details, or are interested in recipies, check out the article in the LA Times. As I said, this method worked for me the first time, although the tastes and smells didn't occur at exactly the times listed in the recipie. Don't sweat it. Good luck.

Subject: Thanks You For Your Support

Dear Fellow Brewers,

It's been four days now since I embarked on this odyssey of home brewing and I think I'm coming to grips with the idea of parenthood. Thanks to the advise, guidance, and experience from other brewers, especially from those who contacted me directly, I no longer fear that my firstborn will be deformed. (Unique, certainly, but not deformed!)

My concerns now are more along the lines of particular methods of fermentation. Presently, I'm planning to rack my beer off to a second, closed fermenter (glass carboy) and store it for about two more weeks before bottling. My question is whether or not in the future I should just stick with a single-staged fermenter. My primary fermenter now is a trash-can-like container with a tight lid, but no fermentation lock. (There's enough space between the beer and the lid that I'm not worried about the top blowing off, and I'm under the impression that the lid is tight enough not to allow nasties in, especially with the negative pressure created inside by the fermentation process, while still allowing those gasses to escape.)

If I use the single-staged method, should I install a lock on the lid of the trash can, or employ a Barton Union System with a blow-off hose at the top of the carboy? And if I use the carboy, what's the best way to get hydrometer readings? Finally, although I've already heard from a few others on this topic (thanks!!), what's the best way to use a syphon for racking and bottling?

Again, thanks to all for your input. I'll keep you informed.

John

Subject: KWAS

Date: 18-Feb-92 Time: 02:30 PM Msg: EXT02864

Hello.

Sorry I've taken so long to get back with this. Work has been very busy.

The recipe for Kumiss is eluding me. I know I have it in a book somewhere. As I recall, there was something about putting mare's milk in a leather sack (perhaps an old stomach of some animal?) in the sun by the front door and kicking it as you went in and out. I'll still look for that one.

Now that we have Jack's bread recipe (which I plan to try next time I brew), we have to make beer, make bread with the grains, take any leftover bread and make kwas, and take the kwas leavings to make bread pudding.

This is from FOLK WINES, CORDIALS AND BRANDIES by M.A. Jagendorf Vanguard Press ISBN 0-8149-0125-5 \$22.50. When he refers to yeast and sugar he means fleischman's bread yeast and household cane sugar.

Bread Wine and Kwas

If you are adventurous in your viniculture, and if you have made it a truly exciting avocation or hobby, make a wine of the Staff of Life.

A wine of bread, a semi-wine I would call it, is very common among Slavic people. I have spoken earlier of Kwas. It is a wine, a very mild one, containing about 6 percent alcohol. It is very common in Russia, Parts of Austria, and Rumania -- in fact, in all countries that have a Slavic population.

To make it pleasing for your use, you will have to add spices or honey -- unless you develop a taste for its particular sour flavor.

Of course, the lore of bread runs through the world without end. It was a food from the earliest days of time. There are innumerable miracles connected with it. There are innumerable references to it in all the lore and history of the world. But it is far too great a lore to set down, so

I will turn to the wine.

You need: 1 to 2 gals. water
2 lemons
raisins
spices (different kinds, but not too much)
1 to 2 lbs. sugar for each gallon of water
2 to 3 lbs. black bread for each gallon of water

1. put the water into an enamel pot.
2. wash and peel the lemons thinly, and put the rinds into the water. Squeeze the juice of the lemons and put that in. add the raisins, cut up as well as possible. put the spices (cloves, caraway, coriander, a few peppercorns, and any others you favor) into a little cloth bag and put it in the pot. bring the water to the boiling point.
3. dissolve the sugar in the boiling water.

4. slice the bread and toast it, taking care not to burn it. put it into the crock. (if you have stale, hard, whole-wheat bread, it can be used without toasting.)
5. when the water is still quite hot, pour it over the bread. cover the crock and set it in a warm place. if you have used good wheat bread, it will start fermenting very quickly without any yeast. stir it with a wooded spoon every day.
6. when it has ceased fermenting, let it rest for a few days so that the bread settles. then siphon off the wine and clear it.

It is best to put the wine into strong bottles -- champagne or heavy burgundy bottles -- then cork it, wiring the corks. You may get a powerful, bubbling champagne, which will force out any ordinary cork or even explode an ordinary bottle.

Bread wine matures quickly, but it is best to let it rest for a year.

KWAS

There are many ways of making kwas. The method varies with the locality. In Bukowina, a province of Austria where there are many Slavic folks, kwas was made with apples and had a pleasant cidery, slightly sourish taste.

I have chosen the simplest of the recipes, and you can try it, making it once for the sheer novelty of it. It is modified from a recipe of Harry Rubin and Vasily Le Gros, of the Monastery of Our Lady of Kursk, about a mile from my farm. The kwas is made at the monastery by one of the monks.

You need: 3 lbs. stale, well-baked rye bread
5 gals. water
3 lbs. raisins
2 lbs. dark molasses (or honey)
1/2 oz. yeast (2 pkgs)

1 tsp. whole-wheat flour

1. Cut the bread into small pieces and put them into a crock or barrel.
2. Boil the water and pour it over the bread. Add the cut-up raisins. Cover the crock well with a tablecloth and let the liquid stand until it cools.
3. Filter it through a napkin or towel, but do not squeeze it.
4. Pour into the liquid the molasses (or honey); use a greater amount if you want a sweet wine. Mix thoroughly.
5. Dissolve the yeast in 1/2 cup warm water and pour it in, and also add the flour.
6. Cover and place in a warm room (65 - 70 deg.). Let the must stand until it starts fermenting, then filter it. Pour it into bottles, putting two raisins into each bottle. After a few days, it should be good to drink.

At the monastery, the priest makes it somewhat differently, using little syrup and no raisins. The result is a very sour drink.

In Bukowina, small whole apples were put in the water before boiling it, and one was put into each glass of kwas when you bought it.

Subject: Nutritional Value of Homebrew

>So, my question is: how nutritious can a homebrew be? or a good stout for that matter?

I will leave that to the nutritionists.

> how would one go about making a "healthy" beer?

I feel the most unhealthy aspects of beer, homemade or otherwise is the nitrosamine factor. This is an issue that has been glossed over by the industry and totally cured by some and banded by others.

The first step to nitrosamine free beer is to use only malt produced by indirectly fired kilning. Several companies produce such malt and I buy mine from Minnesota Malting. One of the largest producers of homebrew malt, Breis uses DIRECTLY fired kilns for all except crystal malt and should be avoided like a plague. It took about an hour on the phone to squeeze this information out of them. They would like to talk about anything but nitrosamines.

The next step is to remove all chlorine from the brewing water before it gets anywhere near your malt. I boil all water before use.

Although the jury is still out on aluminum and Alzheimer's, I would avoid using aluminum anywhere in the brewing process.

If you have a thing about organic food, Minnesota Malting will even provide an organically grown malt.

Aside from those few things, if you stick to Reinheitsgbot, there is nothing else to talk about.

>Least my question be interpreted as anti-bread, let me state for the record that i enjoy baking and eating bread at least as much as brewing and drinking beer!

Considering the wonderful bread that can be made with spent grain, you have just compleated the circle.

Subject: Homebrew Club E-mail Database...42 clubs so far

Greetings, all.

In my quest to get an e-mail address from as many homebrewing clubs in the US and Canada as possible, I posted a call for folks to send their e-mail addresses to me.

The twin goals of this database: to aid the clubs in recruiting new members and to promote interclub activities.

So far, I have gotten responses from the following 42 clubs:

Madison Sobriety Club (Madison, AL)
Barley Bandits (Orange County, CA)
Hoppy Campers (Modesto/Stanislaus County, CA)
The Draught Board (East Bay, CA)
Maltose Falcons Home Brewing Society (San Fernando Valley)
Gold Country Brewers Association (Sacramento)
San Andreas Malts (San Francisco)
Brewing Students of Harvey Mudd College (Claremont, CA)
Santa Clara Valley Brewers Association (Santa Clara, CA)
Worts of Wisdom (South Bay, CA)
Deep Wort Brew Club (Colorado Springs, CO)
Hop, Barley and the Alers (Boulder, CO)
Mash Tongues (Fort Collins, CO)
Brewers United for Real Potables (Washington Metro Area)
No Name Yet (Athens, GA)
Heartland Homebrew Club (Grinnell, IA)
Chicago Beer Society
Trubadours (Springfield, MA)
Boston Wort Processors
Chesapeake Real Ale Brewers (MD)
Ann Arbor Brewer's Guild
Keweenaw Real Ale Enthusiasts United for Serious Experimentation in Naturally-
Effervescent Refreshment Science (KRAEUSENERS) (Houghton, MI)
Minnesota Brewers Association (Minneapolis/St. Paul metro area)
Minnesota TimberWorts (Rochester)
St. Louis Brews
Fish n'Brew's (Newfoundland and Labrador)
Brew Free or Die! (Manchester, NH)
Bellhops (Bellcore, Piscataway, NJ)
Los Alamos Hill Hoppers (NM)
Ithaca Brewers' Union (Ithaca, NY)
Sultans of Swig (Buffalo)
Bloatarian Brewing League (Cincinnati and Northern Kentucky)
Society of Northeast Ohio Brewers (Cleveland Area)
CAMRA of Ottawa, Ontario
Heart of the Valley Homebrewers (Corvallis, OR)
Oregon Brew Crew (Portland, OR)
Palmetto State Brewers (Columbia, SC)
Berry Brewers (Saskatoon, SK)
SCA Brewers Guild (Bryan, TX)
North Texas Homebrewers Association (Dallas and northern Texas)
James River Homebrewers (Richmond, VA)

Brews Brothers (Seattle)

=====

If anyone wishes to contact one of these clubs, please send e-mail to me with your request (no auto-daemon, I'll be doing this manually).

If anyone else wishes to be added to the database, send me e-mail with your state/provincial two letter abbreviation and club name in the subject header (such as "MN/Timberworts")

Note: I still have yet to hear from anyone in Connecticut (hey Steve Morley, aren't you out there??), PA, WI, much of TX, and other places where I do know that clubs are 'thick'. Even in my home state, just 2 of 11 known clubs have responded.

Still, it's a start. I would appreciate it if you would inform members of your club with e-mail who are *not* on the HBD of this database.

Cheers and beers,

STEVE

From: Conn Copas <C.V.Copas@loughborough.ac.uk>
Subject: Starch ferments

I'm afraid to say that I am confused and, consequently, less relaxed. All these recipes for bread wine, sake, etc, appear to employ starch as an energy source for yeast, which leads one to question why we brewers are so fussy about conversion to sugars during mashing. Even the making of bread itself is a classic example of something some brewing texts would claim should not work. Surely the yeasts being employed are not especially different. Are there enzymes present in rice/wheat flours which do convert starch over a wide range of temperatures ?

Subject: CAMRA...

As a member of CAMRA, I was a bit disturbed about the comments made in the HBD regarding CAMRA Canada. I sent the two complaints that were logged in the Digest (anonymously and with permission) to CAMRA for comment. Below is their reply, exactly as scanned and OCR'd. I have added notations to represent the logo and signature where they occurred, and have corrected the footer to account for the inability of the OCR package to interpret the strange font and color correctly. If anyone wishes, I will post the letter I sent to CAMRA as well.

I have been a happy member, and what they say is true - the newspaper (What's Brewing) is good, albeit topical. Since I plan to spend as much time there as possible, I think it is useful. Those who don't go to the UK may not.

Cheers...Gary

Dear Mr Mason,

Thank you for your letter about CAMRA Canada.

I must point out that CAMRA Canada has no organisational link with CAMRA UK. We are entirely separate organisations, although we recognise them as a 'sister organisation' with shared aims. Many members of CAMRA Canada are also members of CAMRA UK.

I am sorry if people have had difficulties dealing with them. CAMRA UK is large enough to have a full-time staff, whereas CAMRA Canada, I believe, is still run entirely by volunteers.

I very much doubt that CAMRA Canada are 'a bunch of swift-talking con artists'. We understand from individual members over there that they are having problems at the moment, but I doubt this is due to any deliberate intention to take people's money.

I'd be grateful if you could publicise the above through the computer network, for the benefit of those interested.

You might also tell people that joining CAMRA UK costs only fourteen pounds per year, for which you get our sixteen page monthly paper airmailed - reliably! Pretty good value, we think.

Thanks for writing. I appreciate your concern.

Yours sincerely

From: abirenbo@rigel.hac.com (Aaron Birenboim)
Subject: Berliner Weisse tasting results

I went to the Unfermentables meeting last night (denver area brew club).

I got some feedback on my "Berliner" weisse:

This was a beer soured a la papazian, except that i added some acidopholis capsules to the souring mash. I believe that most of the souring was due to the bacteria in the capsules.

Many commented that the sourness was in fact different from the usual sour mash. Different, but not necessarily better or worse. All said the beer was clean, which is unusual for sour mashes, a good point for my technique.

Most said the souring (caried out to pH 3.4) was about right on, although i found it to be a bit too sour for my taste.

Most said the hop level was about right on (1 oz. hollertau boil).

The only consistent criticism was a grainy flavor. This could be due to many things. It may just be that letting the GRIST sour extracted something nasty from husks, etc. My fix for that problem would be to sparge, then sour the LIQUOR with pills ONLY, no raw grain. I will most likely do this for my next experiment. I am trying to plate the capsules out now, to try and seperate bacteria strains out. If there are any differences i can see in the colonies, I will sour some wort from a single colony, and taste/smell the results. I will use only the most pleasing sour wort for the next souring.

Another souring method id to use a prolonged acid rest in the mash (like 3-5 days at 90F). One fellow said the best sour mashed beer he had was made with this technique.

Now we fall to the discussion with another guy trying to make a berliner weisse. he had seen the brewery in germany. He said they pitch a pure Lactobcillus Delbreuckii along with a standard ale yeast. If anybody knows were i can get a pure L. Delbreuckii, let me know.

One other interesting part of the brewery was that they put the hops in the MASH! This allows them to use more wheat. My recipe had little wheat, it was about like:

5 lbs. pale
1 lb munich
1 lb barley flakes
2 lb wheat malt

Next time i will try something more like

3.5 lbs pale
1 lb wheat flakes
2.5 - 3 lbs wheat malt
1.5 is oz hollertau IN THE MASH

Oh one more thing on the pills. They do not smell much like other sour mashes. I cultured some up in a test tube and smelled

it. It has a grainy putridness, but not as strong as a sour mash. It is possible that the "grainy" character was due to the bacteria strain. I will try to see if culturing up from single cells will yield a clean strain of lactic acid producer.

And, of course, I'd like to hear about any sour mash/sour beer experience anyone has had.

From: charlto@ccu.UManitoba.CA
Subject: Cold Break

jeorg@chs.com (Houck) asked about cold break. My personal feeling is that you should try to get as much of the trub as you can comfortably get (without worrying) out of the fermentor before pitching the yeast. For some people, this means that they don't remove any of the trub (I think they worry too much about infection, but to each their own...). In general, it seems that it takes at least 30 minutes for the majority of the trub to precipitate after cooling (this is based on my own observations). As long as the wort is cool (below 70F, is my recommendation), you shouldn't have too much problem letting it sit in a sealed carboy for a couple of hours.

NOTE: I did not say that you *can't* get an infection. You certainly can get infections, but I've been using this method for a couple of years without any problem at all. After the trub has settled, you can rack it off. I lose about 1/2 gallon of wort using this method. I've heard that the wastage can be recovered by filtering it and using it for priming, but I've never tried it (a 10% loss of extract and hop utilization is not significant to me).

In actual fact, I cool my wort down to about 45 degrees F and then let it sit in the carboy for up to a day before I rack and pitch. I then use a non-blowoff method for fermentation. I've heard rumors that a blowoff method negates the need for removing the trub, but I find it hard to believe and have not heard of anyone who has done a side by side comparison. All I know is that after I started doing this, my beer has improved immensely (the improvement was better than going to all grain, or switching to liquid yeast). I will go as far as to say that if you do not use blowoff and do not make an effort to get rid of a significant quantity trub BEFORE you pitch the yeast, you will almost certainly have a fusel alcohol problem. (OK, wait a second while I put on my ring of fire protection -- there we go, flame away!). I've never used a blowoff method, so I can't make any rational comments on it (though I do find it fascinating that people claim that their beer is less harsh using blowoff. I don't buy the hop resin argument, so maybe it does have something to do with trub...). Anyway, sorry for the length of this post, but this is something of a religious topic with me...

Mike

P.S. All unhopped malt extract will produce large quantities of trub when used. It is not really a function of the quality of the extract.

> thanks, jeorg houck, jeorg@chs.com
>

No, it's a sign that you did everything correctly, and got the
boil going really good for at least an hour. With strains of
yeast that take off quickly and vigorously (i.e. most dry yeasts
like whitbread ale/lager, or M&F ale), the yeast will stir up the
trub on the bottom of the fermenter. with these, you should wait
for the trub to settle, then rack to a new carboy, aereate, and
then pitch. If you pitch before you rack, when you return to siphon,
it might bee too late (It's impossible to siphon vigorously fermenting
wort - the CO2 released keeps stopping the sipon, and in this
particular case, the chunks of trub will clog the siphon or any
sort of filter you try to put over it).

Most wyeasts are so slow to take off that you are safe pitching
and then racking later. A friend of mine feels that you should always
do vice-versa, since much of the yeast will settle out with the trub,
but I feel this stuff is mostly dead yeast, and that that the healthy
yeast will stay in suspension. With a lager yeast at cold temperatures,
It will probably never ferment vigorously enough to stir up the
precipitate, but you are still better off racking, because of
"yeast autolysis" (according to Miller), but I have left lagers on
the bed of trub for months, and never noticed a problem. Then
again, most of these batches have had polyclar added.

If I fail to siphon the wort from the trub and it gets stirred up
back into solution, I always use a clarifier - usually gelatin,
but polyclar works great at a low temperature, and I always use
polyclar If I feel that a great deal of tannin made it into the boil
in the form of grain husks not filtered in the sparge.

bb

P.S. you will usually notice significantly more hot break in the bottom
of the fermenter when using hop pellets.

From: sterling@glorfindel.umcs.maine.edu (Sterling Udell)
Subject: light on fermenting carboy

I recently got a new carboy, and since it came in a box, a method for ensuring darkness seemed obvious. I cut a ~2" diameter hole in the bottom of the box, and now when it's fermenting I just invert the box over the carboy. A perfect fit, with the fermentation lock sticking out the hole.

I'm sure a little light gets in around the hole, but not much. Whenever I want to look at the ferment, I can just lift the box. Very nice. The box isn't even ruined for its original use: the hole isn't big enough to damage its structure, so I could still store/move the carboy in it.

Anyway, just my \$0.02 worth . . .

From: <BOEGE%UORHEP.bitnet@CUNYVM.CUNY.EDU>
Subject: Heat Yield and Measure Conversion

Greetings,

I have an electric stove. Were I to buy a 6 gallon SS stock pot, would I be able to bring 5 gallons of wort to a boil? I'm not asking for armchair calculations, I am asking for empirical observations. It seems like most people who mention boiling a large wort also mention doing so with high BTU devices. If you have boiled 5+ gallons on a regular electric stove, please let me know. I would hate to invest in a large brewpot and then have it produce only warmish wort.

Is there a reference wherein the densities of cooking ingredients are listed. I have many recipes that give amounts in mass units. I do not own a kitchen scale, and so I would like to be able to convert masses into volumes. I am specifically interested in doing said conversion for honey, flour, and sugar. I realize that densities will vary, but I don't think ballpark conversions are unreasonable to expect. Thanks, Mr. Schmidling, for the bread recipe. I'll be sure to give it a try.

Cheers,

Steven J. Boege

From: chrisbpj@ldpfi.dnet.dupont.com
Subject: Heat Yield and Measure Conversion

About a week ago, I brewed a batch of extract/mash weiss bier that was supposed to make six gallons. Since I don't have a six gallon *glass* carboy and didn't want to have any leftover ingredients, I figured I'd make the 6 gallon recipe in a 5 gallon carboy. I knew under-dilution would make for a thick wort, and figured the alcohol content would be higher in the fermenter than usual, but I calculated max alcohol content at around 7 percent, so I figured my yeast should be fine.

Everything seems fine so far, though a bit slower than usual. The ferment IS thick, but seems in good shape, and is just finishing fermentation. I plan to rack to a 6 gallon plastic bucket, dilute to approx 6 gallons (proper SG), prime, then bottle. Has anybody ever tried this approach before? As I said, my main concern is that the higher concentration of alcohol could kill the yeast before it has a chance to fully ferment all fermentables. If this happens, I could end up with exploding bottles. Also, I thought the higher concentration might tend to change the flavor of my brew. Any thoughts, experiences, etc out there? I'll be bottling shortly, so if there's interest, I'll let you all know how it turns out.

-Pete

From: JOE@syd.deg.CSIRO.AU
Subject: refractometers et al.

Date sent: 20-FEB-1992 07:59:57

Greetings from an exiled US Hombrewer in OZ!

1) I inherited a "hand-held-temperature-compensated-optical refractometer" (whew!) from my wine-making dad. I've been using it for a while now in place of my hydrometer and I wondered if other homebrewers have used one. I think its a great tool since it only uses a drop or two of beer (no waste and no dunking in the carboy etc.

)
Mine reads out in degrees Brix (~ percent sugar content by weight I think) from 0 to 30 with 0.2 gradations. Since its weight % I've just been subtracting final from initial readings and dividing by two to get alcohol % by weight (i.e. $14B-4B=10 \ 10/2 \Rightarrow 5\%$ by weight). Any experience with refractometers and a "correct" conversion from Brix to HBD SG would be appreciated!

2) Any other HBD'ers from Australia out there?

G'day (yes the actually say that here :))

Subject: Aluminum and Alzheimer's Disease

gEnter your message below. Press CTRL/Z when complete or CTRL/C to quit. I know this is a bit off the theme of the digest, but it has come up several times over the last few months. I've reviewed the literature on Alzheimer's Disease (AD), as part of my medical education. I believe the jury is IN on aluminum, and the verdict is NOT GUILTY. Several studies

clearly show Al does not directly cause AD. While it is still possible, other culprits, namely amyloid acumulation and genetics, appear much more likely to the cause (etiology, in the vernacular). The brain lesions found in AD do indeed contain Al, but the same levels of Al are found in normal peoples' brains. Al may contribute to the disease in those who are susceptible, so the "watch out for demon aluminum" may be valid for those whose ancestors died of AD. The rest of us can RELAX!

One of the pieces of evidence supporting the genetic origin of AD is interesting...Down's syndrome victims have a much higher incidence of AD than the normal population. Since these people have an extra chromosome 21, the search for the AD gene has focused there. One attempt has failed, but the gene can't hide forever.

Sorry for the deep science, but with all the (interesting!) physics and chemistry that get tossed around this digest, I had to put my \$.02 in. BTW, thanks to those who post recipies; I've brewed two and both were excellent. Also, if anyone wants references for the above, Email me.

End of HOMEBREW Digest #828, 02/20/92

Date: Thu, 20 Feb 92 6:57:27 EST
From: Jim Grady <jimg@hpwald.wal.hp.com>
Subject: Weights & Measures

Steven Boege asked about weight to volume conversions for some of his recipes.

I found the following on pages 221-222 of "The Cook's Companion" by Doris McFerran Townsend. Any brewing cooks may want to check the book out. Anyway,

Flour (all purpose): 1 lb. = 4 cups
(cake): 1 lb. = 4 + 3/4 cups
Honey: 1 lb. = 1 + 1/3 cups
Molasses: 12 oz. = 1 + 1/2 cups
Sugar(granulated): 1 lb. = 2 cups
(brown): 1 lb. = 2 + 1/2 packed cups
(superfine): 1 lb. = 2 cups
(confectioners): 1 lb. = 3 + 1/2 cups

My own experience is that the flour measurement is for SIFTED flour. Flour settles a lot and 4 cups of unsifted flour will be much more than 1 pound. I bought my kitchen scale so that I could weigh my flour (pre-brewing) and now it's great for malt & hops as well!

Subject: questions

I have some basic questions for any who choose to answer me...

1. My first batch of beer (pale ale) came out pretty good... except it has a rather weak alcohol content - 2.5% Is this normal...?? if this is weak ...why...??
- 2 This same batch of beer is inconsistent... I have a couple bottles that are just great... and then one with a strange aftertaste.. I'm sure I just need to be more sanitary in the bottling process... but what does that mean... how compulsive are you in your sanitization process...?? what lengths does/should one go to..
- 3 bottling seems like a giant pain in the ass.. with the beer kit I received a bottling wand was included... I do not understand the advantage of this tool over a plain tube... I didn't have time to play around with it because I was too busy bottling... so what's the use of this thing.
.
why is this orange cap on the end of the wand... ?? is it just for transferring beer from the fermenter to a secondary...??
- 4 use of hops... during boil... end of boil... or both.. why...
- 5 stout... I would like my next beer to be a stout... I'd appreciate any stout algorithms from the homebrewing population... I'm fairly new at all of this... so any/all information would be great..

lastly - thank you in advanced for any answers provided.. you can mail responses directly to me or send them to the list if you feel so inclined

thank you... Marc W. Julian (email - CMSMARC@UGA)

Subject: boiling on electric stove

Steve Boege asks about getting big pots to boil on an electric stove.

A looong time ago I recall someone (was it the sorely missed Pete Soper?
)

reporting great results by wrapping the pot in a 1/4 - 1/2" blanket of newspaper. The insulation reduced heat loss through the sides of the pot and enabled a relatively low-BTU stove to boil a big pot vigorously.

ANNOUNCING
THE TENTH ANNUAL
OREGON HOMEBREW COMPETITION AND FESTIVAL

On Saturday, May 2, 1992.

The Heart of the Valley Homebrewers ("HVH") invites you to participate in their TENTH annual homebrew competition and festival, the longest-running event of its kind in Oregon. The focus of the event will be a judging of homebrewed beer sanctioned by the Home Wine and Beer Trade Association (HWBTA). In addition, the Club will host a festival to promote awareness and knowledge of various beer styles, provide opportunities to share information about the homebrewing craft, and encourage interaction of homebrewers in a social atmosphere.

Entries will be received for judging in the nine following categories:

- 1) Light Lager (includes American and Continental styles)
- 2) Dark Lager (includes bock)
- 3) Stout
- 4) Porter
- 5) Light Ale (includes Golden)
- 6) Pale Ale (includes IPA)
- 7) Dark Ale (includes Brown Ale)
- 8) Specialty (includes wheat, fruit/herb beers, steam beer)
- 9) Strong Beer (includes doppelbocks, barleywines, and imperial stouts)

ENTRY REQUIREMENTS FOR THE COMPETITION:

Please contact Ted Manahan (tedm@hp-pcd.cv.hp.com) for further information. I will send you email with full entry requirements.

Subject: summary of previous thread on dry hopping and sanitation

There was a thread on dry-hopping and sanitizing hops last fall. Short of looking it all up again, I'll attempt to summarize.

You can:

- late hop during the boil, say in the last 1-2 minutes before end of boil.

- hop right after boil, say steep the hops for 20 minutes before chilling.

- hop right after the boil in the manner of some big brewers, namely, put some hops in a "hop back" and strain the beer through the hops on the way to the wort chiller.

- steam cook or pressure cook the hops before adding them to secondary. I recall George Fix describing this in some detail. If I remember, double the amount of hops you would otherwise use and steam cook them (as you would some vegetables) for 15 (?) minutes before adding to the secondary. (I apologize for not looking up the original, but that's too much like work right now!).

- just throw the hops in.

There is no question that hops have some bacterial content. The arguments for just throwing the hops in are:

- if the yeast took off in the beer, and subsequent handling of the beer is done quietly, the beer is essentially anaerobic.

- the beer is low ph.

- the beer has some alcohol in it.

- the hops themselves have a "preservative" (infection-inhibiting) property (due to humulone content?).

The above points do not make for a sure thing, but are simply points in favor of everything working out all right! Relax, don't worry...

From: mvalent@calstatela.edu
Subject: S. cerevisiae

First of all, please forgive my inability to refer you back the recent postings to which I am about to refer. The other day, someone was asking about *Saccharomyces cerevisiae*. Speaking as a grad student in Microbiology,

S. cerevisiae is the genus species classification of the yeast. Nearly all of the yeast used for fermentation is this species. When you use a "different"

yeast for your beer, it's a different strain of *S. cerevisiae* and not a different species of yeast. Of course other species of yeast are used for fermentation as are some species of bacteria, but the majority of alcohol production is due to our little yeasty friend. By the way, as far as I can tell, *Saccharomyces cerevisiae* means sugar eating beer fungus.

Now, on an entirely different note... Somebody else was wondering if one could boil 5 gallons of water in a 6 gallon pot on an electric stove. My answer is "yes." My friend and I do. It does take quite a long time, though.

That's OK... We drink while we wait.

Subject: Hop growing question

What causes a hop plant to set blossoms?
is it:
the length of the vine?
the height of the plant?
the time of the year?
the length of the day?
the change of temperature?
the phase of the moon?
the Dow?

Nothing I've read addresses this question.

The reason it's a question to me is this:
I've been growing cuttings from my hop plants through the winter in hopes
of getting a head start in the spring. I'm wondering if I might manage to
get a small, early harvest before planting time if I treat my plants
right.

Subject: Wort Chillers

Could someone explain the operation of a wort chiller? I'm getting ready to get into homebrewing, but I'm still waiting for my books to arrive. At this point, everything I know has come off r.c.b, HBD and mthvax. A wort chiller seems to be a device to chill wort (duh). Any other operation involved? I have a tube run through a bucket of ice that I use for a still; would that chill the wort satisfactorially? Why (or is) wort chilling desirable? Should the wort be filtered or something before being chilled?

Thanks in advance for any possible responses I might get.

Subject: Two Beers from One Mash (from Micah Millspaw)

This winter I've been brewing some high gravity beers using the first runnings from the mash only. In the past I did a mash and then built up the gravity with dry malt extract, but this is very expensive (and I'm cheap). What had made me balk at this first running only method is the waste of grain. So I began making low gravity beers from the second runnings, low grav beer can also be low alcohol beer.

This is what I do. After collecting the first run wort I restrike the mash. Before I restrike though I add in a pound or so of specialty grain, I have even added in a couple lbs of corn starch to make a cream ale. This Monday I brewed a Scotch ale (wee heavy) and got a stout for the second run with a lb of roast barley added. The first beer was 1100 OG and the second 1040 OG. Although this makes for two boils in one day you only have to do one mash. So anyone out there doing barleywines or dopplebocks give this a try. Use different yeasts for more variety.

Subject: Electric Stoves

I use a 10 gallon SS pot to boil 5-6 gallons of wort on my electric stove.

I have an older model with the real wide heating coils. It gives a good rolling boil, especially when I keep the pot partially covered. Because the pot is so big (diameter), heat dissipation on the stove surface is a problem. I often smell burnt paint while I'm boiling. I just wonder how long my stove is going to last. I'm usually relaxing and enjoying homebrew instead of worrying about it.

Subject: Blowoff vs. trub removal

Mike writes:

> I've heard rumors that a blowoff method
> negates the need for removing the trub, but I find it hard to believe
and
> have not heard of anyone who has done a side by side comparison.

I think the rumor was the other way around: that removing the trub
negates
the need for blowoff. I'm not sure how the two are related. I faintly
remember something about the yeast using the trub for nourishment if
there
isn't enough oxygen in the wort, but I'd like to read *a lot* more about
this before I'm convinced either way. Biologists, Zymurgists: Please
comment.

> All I know
> is that after I started doing this, my beer has improved immensely (the
> improvement was better than going to all grain, or switching to liquid
> yeast). I will go as far as to say that if you do not use blowoff and
> do not make an effort to get rid of a significant quantity trub BEFORE
you
> pitch the yeast, you will almost certainly have a fusel alcohol problem.

I'm not going to flame, rather I'd like to learn more about this. Why do
you propose this correlation? Do you have a reference?

> I've never used a blowoff method, so I can't make any
> rational comments on it (though I do find it fascinating that people
claim
> that their beer is less harsh using blowoff. I don't buy the hop resin
> argument, so maybe it does have something to do with trub...).

I don't see why you should be amazed. I used to be a die-hard supporter
of the blowoff method, because the smell of the blowoff was so horrid
that I figured there was no way I wanted that gunk in my beer. Recently,
with the resurgence of this topic (probably it's 10th time around since
1988) I decided to be reasonable and re-evaluate my position. I've since
been brewing oversized batches and doing side-by-side brewing blowoff/
non-
blowoff. The jury is still out -- the beers are either still fermenting
or
still carbonating. I did, however, take a sniff of a recent blowoff jug
and the smell was not unlike normal beer. That led me to re-think what
other changes have I made in my technique since those days of bile in the
blowoff jug. The changes were:

1. Wyeast in stead of dry yeasts maybe
2. 65F ferments in stead of 70F doubtful
3. full boils (6gal) in stead of partial (2gal) doubtful
4. immersion chiller (leaving SOME trub behind) maybe

Well, 1 and 4 could be the big difference. Note, I say SOME trub
because I have been experiencing the same phenomenon as Jeorg -- I
leave behind what little trub there is in the kettle after chilling,
but a lot more appears shortly thereafter in the fermentor. I'll
try waiting an hour or so after chilling and see how much trub remains.

What we need is some science to solve this problem! Side-by-side tests: 1. trub/noblowoff, 2. notrub/noblowoff, 3. notrub/blowoff, and 4. trub/blowoff. The resulting beers should be chemically analyzed for higher alcohols and anything else that might be produced. The only snag is the cost -- I've already spoken with J.E.Siebels & Sons -- these tests cost BIG BUCKS. Another sad story of science vs. funding.

A1.

Des--

Although I don't own Line or Harrison, I've read that Line's recipes include many ingredients that we here in the states have great difficulty in purchasing, for example Golden Syrup, Demerara Sugar and Invert Sugar. Line's book *is* available in the states. There are ways around the shortage of certain ingredients, but they take some experimentation (how much Blackstrap Molasses should be substituted for the Demerara?, etc.) I just wanted to warn newcomers, that it's not as easy as it sounds. There is another wrinkle in Line's books: he used very attenuative yeast, therefore, his sweet recipes call for saccharine tablets, for example. Another variable to work out. I plan to buy Line's book, but based upon what I've read over the years in the HBD, I think that a U.S. "translation" would be a big improvement -- a noble undertaking, indeed!

Subject: Dryhopping sanitation

JC writes:

>When dry hopping, or pouring the wort over beer after chilling, what is
the
>best way to sanitize the hops to reduce infections?

The easiest method of hop sanitation is what I do: NOTHING.
I have not been sanitizing my hops for dryhopping and my beers
have not developed any infections. I add the whole hops immediately
after the krauesen falls, but the beer is still fermenting actively.
The active yeast, the low pH and the alcohol all add up to an
uninviting environment for infectious beasties. I think the only
thing you need to worry about might be mold if the hops were dried
improperly. I've also used pellets, but prefer whole hops because
they float right up to bottling/kegging time -- the pellets eventually
sank and were covered over by pooped-out yeast -- the final effect (the
WONDERFUL bouquet) was diminished.

Subject: Who would have thought...

Indeed, miracles never cease. This article appeared in this morning's edition (02-20-92) of the Birmingham Post Herald (reprinted without permission).
It was written by Post Herald reporter Nancy Bereckis:

Roll out the barrel, local brewery's coming back

Local beer lovers' saddest hour occurred in 1907 when city politicians made alcohol illegal and forced the Birmingham Brewing Company to pour 300 barrels of beer into the street.

In the 85 years since, the ban on alcohol was lifted and beer lovers could have their fill of Budweiser, Miller, and Strohs.

But if they wanted some home-brew like the Birmingham Brewing Co. produced, they had to go to Pensacola Fla., where a small brewery is located, or New Orleans where Abita beer is brewed.

Until now.

Lee Nicholson, Birmingham native, musician, and brewmaster, is ready to usher in a new era of happy hours for beer lovers by reviving the Birmingham Brewing Co.

"Beer is always best when it's brewed in your backyard. And when you've got one of the best water supplies in the US, like Birmingham has, it should be outstanding," Nicholson, 43, said yesterday from the office of his attorney, who is helping him get the brewery off the ground.

So far, Nicholson, attorney Ben Hogan, and a slew of investors have purchased the building where the brewery will be located at 3118 Third Ave.

South. They've gotten the blessings of the city of Birmingham. And they plan to receive the vats and brewery equipment in April.

Hopefully, Nicholson said, the first bottle of Red Mountain Beer will debut at the City Stages music festival, which runs from June 19 to June 21.

Nicholson hopes to distribute Red Mountain at local grocery stores, restaurants, and bars. At first, he will brew a red beer, which is like an ale, and a lighter lager. The beer will cost slightly more than domestic varieties and less than imported brews.

Nicholson, an accordion and banjo musician who recently played in the Birmingham-Southern College production of "The Grapes of Wrath" first started brewing beer about 10 years ago as a hobby. He operated a store in Homewood for a while, where he sold brewing equipment. And in recent years, he opened a brewery and restaurant in Tampa, Fla.

When Nicholson opens in Birmingham, he will become part of a new industry of local beer compaines, called microbreweries. In the past five years, the microbrewery business has grown from around five, which were located in CA, to more than 200 nationwide. Some of the most successful microbreweries are the Abita brewery in New Orleans and the Redhook Ale brewery in Seattle.

Nicholson is friends with the Abita brewers and will call on them and other local brewmasters for help.

"This is the right time to do something like this in Birmingham because people are starting to realize that beer can be as complex as wine," Nicholson said.

To Nicholson, all American domestic beers taste the same because each is brewed the same way. All large breweries make their beer quickly, in large quantities and often use corn and rice to supplement the traditional barley, hops, yeast, and water.

Nicholson will only use the traditional ingredients as well as Birmingham's pure water to make his beer that will taste like...well, he's not sure.

"It won't tase like the beer I make on a small scale and since there hasn't been a brewery here since 1907, I really don't know exactly what it will taste like," he said.

Re: Will an electric stove heat 5 gals of wort?

Being cheap, I use two large chili pots (3-4 gals each) to heat my wort, one on each large burner of my electric stove. I then siphon them both into the carboy. This works well, and also allows fun hop recipes - you can mix hop times and varieties by using, say, 1.5 oz Perle (a very underrated hop, IMHO) in one pot for 60 mins, and 1.5 oz Hallertau for 60 min in the other pot, and then mix. There's enough voodoo in me to believe that that produces different results than dumping them both in one large pot.

Re: brewpubs

Went to a new Chicagoland brewpub yesterday - Millrose Brewery (really brewpub) at the intersection of I-90 and Barrington Road north. Excellent beer; Goose Island fronted them some beer till their pipeline is full. The northern star (brown ale) is superb. E-mail me for detailed directions.

Query: growing hops

It's about that time - I'm planting hops in every friend's back yard who has a fence next month. Any reco's on varieties that will work in Chicago?

I grew some Cascades last year, and BOY, were they flowery. Almost too much so. Yikes! Also, anyone know where one can get alpha analysis on a homebrewer's budget?

Eric

From: UNDERWOOD@INTEL7.intel.com
Subject: Responses to reusing yeast

Greetings,

Just wanted to say "Thanks" to all who responded to my question of reusing yeast. After going through the responses, and comparing them to Papazian, it seems CP goes more into preparing the starter than where to get the yeast to put in it!

To summarize for those folks who have never reused their yeast:

1. Rack your wort into your secondary leaving the slurry behind.
2. Pour some boiled water into the primary to slosh around the slurry.
3. Pour this into a clean, sanitized, mason jar. Cap and shake.
4. Let this settle for 10-30 minutes. The mixture will separate into layers. The white milky layer is the yeast. Spoon or pour off the rest.
5. Add more water, cap, shake, settle, pour/spoon.
6. Do this until what you have left is mostly yeast.
7. Transfer this to another clean sanitized jar and store for up to a month in your refer.

Of course, sanitation is important, flaming jar mouths, boiling your jars, lids, etc.

Thanks again, hope this may be of help to others.
Any errors are probably mine, if this isn't quite right, please correct me as I haven't tried this yet!

Subject: Thanks, and a pump question

First off, thank you very much to all who sent me copies of number 825. I did receive many, but that is much, mmuch better than not having it, so I sincerely appreciate all transmissions, regardless of duplication.

I'm still looking for a pump for beer. A friend to whom I pass on this digest spotted something interesting at his workplace. There is a bottle of generic bottled water, a 5 gallon plastic type, with a small, battery powered pump on top of it. It doesn't have much info on it, just the English letters MK on to p, and the note that it delivers 5.5 gallons per minute. There is also some Japanese writing. Seems like this might be the perfect way to get beer out of the carboy if it didn't oxidize things too much. Does anyone know what on earth this is? Is MK a brand name? Beer-sodden minds want to know...

Dan

From: wegeng.henr801c@xerox.com
Subject: Re: boiling on electric stove

I missed the original question about boiling on an electric stove, but since I've been doing this for several years I'll make some comments. It takes me about 30 minutes to bring 5 gallons of cold water to a rolling boil (covered lobster pot). One way to shorten this time is to start with hot water instead of cold.

I like the suggestion of using some sort of insulation around the pot, but would caution that newsprint is flammable, so be very careful that it doesn't come in contact with the electric burner. I'm sure that there are better readily available materials that one could use (cotton, for example).

I read somewhere that invert sugar is not really necessary as ordinary
sugar gets inverted anyway as part of the brewing process. Can a chemist
elucidate?

Golden Syrup? Don't you have **any** form of sugar syrup or cane syrup in
the States? What about Maple syrup, has anyone tried that? It won't taste
the same, but nor do different brands of golden syrup here.

As for Demarara Sugar: molasses is **much** stronger flavoured, so you
would
only want tiny amounts, 4oz or less, plus white sugar to make up the
weight.
We have several varieties of brown sugar here, ranging from very light
and
mild to very dark and strong flavoured. Line does not make it clear which
to use so experimentation is necessary, but that's part of the fun :-)

Perhaps a supplement explaining what ingredients to substitute, unless
someone **wants** to try to re-duplicate all known British beers - could be
fun trying.

Subject: Summary of Responses re: Single v. TwoStage Methods, etc.

Dear HBD Readers,

I received a lot of responses with regard to my last batch of questions concerning fermentation methodology, syphons, and hydrometer readings. Here's a summary of the responses so far:

I got mixed responses with regards to the Burton (not "Barton" as I had written earlier) Union System, the single-staged system with a blow-off hose afixed at the top of the carboy during the initial stages of fermentation. Although this system is not regarded highly by Burch, it seems to work well for those who use it properly. Remember to replace the blow-off hose with the fermentation lock after the initial fermentation subsides (usually 2-3 days, being careful not to replace lock too soon). Some of the benefits of this particular method are that the risks of infection are decreased and hydrometer readings can be saved until bottling time, usually 2-3 weeks (?). The drawbacks, however, are that this might lend itself to a cloudier product, as it is not separated from the sediment. I must reiterate that I am still quite the novice at this, but I suspect that this system would be inappropriate for more complex recipies. For example, Tony Babinec suggests that a two-staged method facilitates clarity of the beer, and is the place to try dry-hopping, a technique I'll have to try after I've gained a little more experience.

The strongest response in favor of the two-staged method came from John DeCarlo. His suggestion that those of us who are thinking about such a system invest in a 7 g. carboy as a primary is well taken. With the "headroom" in such a container, one can attach a fermentation lock directly, without the concerns of clogging a blow-off hose. Further, glass is less likely to get scratched, and therefore ruined.

As for syphons, many who replied relied on the old "fill the hose with water" method. Invariably, each emphasized the importance of a sanitized syphon hose, as well as hands. (Sorry, Tony, but my printer neglected to print out your more elaborate syphoning instructions, and I didn't catch the problem until after I cleared out my mailbox of old e-mail. Maybe you could resubmit?)

Further, it seems that there's an overwhelming preference for sanitized turkey basters for drawing off samples for hydrometer readings. (That's three "for"'s in one sentence!!)

Finally, it seems that aligator clamps enjoy a good reputation for stopping the flow through a syphon when bottling. I'm not yet at that stage, but I'll give it a shot when I am. What's the scoop on buckets with spiggots? It sounds easier, but wont that lend itself to splashing the beer?

My racking to a secondary carboy went well enough, though I still had about a half gallon's worth of space between the surface of the brew and the air lock. I called a local home brew supply shop who said that, though this was not desirable in the future, to add that much water at this stage might damage the beer. Secondly, since the fermentation seemed to still be in full swing - co2 is coursing through the lock - concerns of oxydation are lessened. My question now is, if infections were introduced, would that be visable, or left to taste? In other words, what are the visible signs of infection at this stage,

if there are any? My last question is, when the water in the lock begins to level out - when co2 slows or ceases - is this bottling time, or can I let my brew age right there in the fermenter?

Thanks for the responses, and I'll stay in touch.

Subject: Re: Lemon Beer

A few years back I tried a lime beer. I grated the rinds of five small limes added them to the boil along with all the the juice I could squeeze. I don't remember the exact recipe, but it was relatively light on both malt and hops. The early results were way too limey, but it seemed to mellow some with age. I had no trouble getting rid of the stuff, so it was certainly a success in that regard. I guess I would suggest trying the rinds and juice from three medium lemons for a 5 gallon batch. Good Luck!

From: RANDY OLINGER <"MOL104::ROLINGER"@est780.decnnet>
Subject: Alcohol, bottling, inconsistencies, etc...

Here's my best attempt at answering a gentlemans questions. I'm a relatively new brewer, but believe all should contribute to the wealth of info on HBD.

1. My first batch of beer (pale ale) came out pretty good... except it has
a rather weak alcohol content - 2.5% Is this normal..??

Alcohol content is controlled by how many fermentable sugars are in the wort.

To increase alcohol, use more malt extract syrup or dried malt extract (DME). If you try to go too high, the yeast may not be able to stand it and die, so shoot for no more than 5-7 percent. Some add sugar to boost alcohol, but the savings in cost is not worth it IMHO.

- 2 This same batch of beer is inconsistent... I have a couple bottles that

.....
How did you prime? Some people recommend adding 1/2 tsp to each bottle and then filling with wort. In addition to being a pain in the ass (as if bottling is not already) there will be inconsistencies. Use 3/4 to 1 cup CORN (or other non-refined) sugar mixed evenly with the entire batch. Some unclean bottles could also be to blame.

Regarding cleaning, I soaked my bottles overnight in a mild bleach solution after cleaning out the gunk with a bottle washer. I then rinsed (which is constantly under debate here on HBD :*)) and then stuck them in the dishwasher on HIGH HEAT (no detergent or anything) for a cycle. Took them out and immediately bottled. System worked great. For cleaning other utensils, soak in mild bleach solution for 30-60 minutes and it should be OK. Kind of depends on the quality of your water I would think.

- 3 bottling seems like a giant pain in the ass..
with the beer kit I received
a bottling wand was included... I do not understand the advantage of

I just recently learned that the tip on the end should be used thusly... Stick the long bottling wand through the carboy stopper and put the plastic thing on the end. Then submerge the whole thing in the carboy using the plastic thing to keep the end away from the dead yeast sediment on the bottom. This makes it easy to do transferring to a bottling bucket. We used the tube as a measure of when the bottle was full. Start each bottle with the tube at the bottom (to reduce aeration) and gradually pull it higher until the bottom of the wand is about at the bottle's halfway point. Now fill the bottle to the brim, and when you remove the wand there will be the 1-1.5 inch space. This takes a bit of practice..... I bought 2 tubes and use them both during bottling. One on each end of a 3/8" hose.

4 use of hops... during boil... end of boil... or both.. why...
Good question. A matter of taste. Most extracts are available hopped.
At

the end of boil, adding hops will add some aroma to the beer, but at that
point my whole house already smells like a brewery, so it is kind of hard
to notice the hop aroma. (Not that I'm complaining, I like that smell.)
Maybe my olfactory senses leave a bit to be desired.

5 Stout...

Sorry, out of my league. :-) I did get a kick out of the way you
referred to the brewing procedure as an algorithm. We computer people
are
surely a unique breed.

Good luck.

Subject: re rare ingredients in Line's recipes

I was in Beer and Wine Hobby a few months ago and noticed Demerara sugar among several shelves of assorted interesting-looking adjuncts; I didn't check Brewing Beers Like Those You Buy against their stock, but they might be worth a call for anyone trying to use the recipes in Line's book. B&WH may have more of an English influence from the area (our first brewpub specifically produces English bitters and stouts, initially overseen by a brewer imported from Burton), but other large homebrew shops may also be carrying more out-of-the-mainstream supplies (and if you ask and they don't, maybe they'll start). I don't know how B&WH compares on prices or quality as I don't normally go there (just not as convenient as two other places). They're at 180 New Boston St., Woburn MA 01801, phone 617-933-8818, fax 617-662-0872, orders 800-523-5423.

>"different"
>yeast for your beer, it's a differnt strain of S. cerevisiae and not a
>different species of yeast.

While it's true that there are many strains of S. cerevisiae available
to us, it doesn't stop there. S. cerevisiae is what we commonly refer
to as "ale yeast". Lager yeast on the other hand is S. uvarum. It is
often referred to as S. carlsbergensis, a name which speaks of the
pioneering work done by the brewmaster at a certain Danish brewery.
The name S. uvarum seems to be preferred.

Bavarian wheat beers are made with S. delbruckii, often in conjunction
with S. cerevisiae. There are other yeasts that are sometimes used in
the production of wine (S. bayunus me thinks). Then there is the
microbial
zoo of Belgian brewing, though many of these critters aren't yeasts.

On a related note, Conn Copas asks about fermentation of starches. There
are super attenuating yeasts (S. diastaticus, etc.), which are capable
of fermenting the "unfermentable". I remember reading somewhere that
these
yeasts produce their own diastatic enzymes, and then metabolize the
resulting sugars.

Happy Fermenting,
CR

>
> 3 bottling seems like a giant pain in the ass.. with the beer kit I
received
If the batch is inconsistent in the bottle, then you probably have a
problem with your bottling sanitation. You *should* be compulsive, if
you want consistently good beer. There are a lot of ways to sanitize
bottles; my own preference is to put clean bottles in the oven, raise
temp to 350, and leave them for 1-1/2 hours. If I'm not going to use
them the next morning, I put little aluminum foil caps on them before
they go in the oven.

>a bottling wand was included... I do not understand the advantage of
>this tool over a plain tube... I didn't have time to play around with
it
>because I was too busy bottling... so what's the use of this thing..
>why is this orange cap on the end of the wand... ?? is it just for
>transferring beer from the fermenter to a secondary...??

>
The wand is really helpful; the problem with a simple tube is that it
tends to leak and drip. The bottling wand should have a spring-loaded
tip that only opens when pressed against the bottom of the bottle. On
the other end of the apparatus is a little orange foot (maybe this is
what you're referring to) that keeps the in-flow end of the tube about
the level of sedimented yeast and trub. This helps keep the beer clear.

> 4 use of hops... during boil... end of boil... or both.. why...

>
> 5 stout... I would like my next beer to be a stout... I'd
appreciate any
Well, yes. Hops are added early in the boil for bittering, but the

flavor and aroma compounds are very volatile and boil away. To get lots of hop flavor and aroma, you need to add hops again late in the boil, or at the end of the boil, or after the boil (in the fermenter). The later you add them, the more aroma you will get.

The hops added are either spent (from previous use) or aged. What they do is provide a replacement for the barley husks that would ordinarily build the filter bed in the lauter tun. Anchor apparently uses spent hops this way in its wheat beer.

Subject: Where did I get my hops rhizomes?

Wow! Ask a few hard questions about hops and people assume I know the answers to all the easier ones. Instant authority! :) Wrongo.

What I know about growing hops is this:
I got mine in too late last year and ended up with four vines from 3' to 7' tall. I harvested 20 cones off the tall vine (Bullion) and that's it. I took cuttings before the frost (pretty much) and now have a 3' hallertaur growing about an inch a day in my kitchen, and some short sickly looking Saaz plants that may never go anywhere*.

The book I have is Homegrown Hops, I forget the author's name. I have seen this book in every homebrewing shop I've been to.

I got my rhizomes from Dave Wills at:

Freshhops
36180 Kings Valley
Philomath, Oregon 97370
(503) 929 2736

He'll take orders on his answering machine, he takes credit cards.

*I suspect my Saaz rhizome has a virus, anyone know what to do about it?

Subject: KWAS

> Now that we have Jack's bread recipe (which I plan to try next time I brew), we have to make beer, make bread with the grains, take any leftover bread and make kwas, and take the kwas leavings to make bread pudding.

However, we need a recipe for bread pudding.

.....

I took my spent grain reprocessing one step further on the last batch.

I dried about 5 pounds and then ran it through the blender and produced something with a texture very much like wheat bran. As it is dry, it can be

stored more easily and used in the same ways as bran. I tried it with oatmeal and it is delicious but the amount used must be reduced from what one

would use with bran. One part grain to 3 parts oatmeal seems to be about right.

To cook it, add double the amount of water and a dash of salt. Nuke it for

two min then stir and nuke it for another one min. Top with brown sugar, syrup or honey. Your colon will love you.

I used to use bran in my bread but I now use the spent grain instead and like

it a lot better..

For those who saw my video, I used the same set up to dry the spent grain as

I used in the video to dry the sprouted barley in the malt making segment.

For those who have not had the pleasure, I made a frame out of wood and window screen that sits on top of a box fan which sits on two by fours, which

sit on a table, to allow air to be drawn through the grain and out the bottom.

Overnight and then some on medium speed, dried it nicely.

Subject: roasted grains

> Can i make a reasonable chocolate or black patent malt by roasting my pale malt in the oven? If so... what temps... what times.

Does anybody know how to make roasted barley? What kind of barley? (un-husked?? pearled??) roastin time, temp?

Don't know what to officially call what I make but I have three batches going now (one almost gone) that I made with kitchen roasted grain.

1. The first one used a pound of barley, roasted at 450F for 40 min.

The barley was left over from the malt making demo in the video. It is viable seed barley from a feed store. For roasting, I would think you could use any form of barley.

It is as hard as stone until some critical point around 30 min, when it becomes crunchy. More roasting time, increases the "coffee" taste and darkens the color.

The resulting beer initially had a definite roasted grain taste but it eventually mellowed into just a general, overall heavier taste.

2. The second one used a pound of Klages, roasted at 450F for 15 min.

Malt takes much less time/temp to roast and I just continued till I got a roasted flavor. It is also a very convenient way to darken the color naturally.

This batch is waiting for an empty keg and I can't comment on the taste.

3. The third batch used a pound of each.

It just went into secondary so, again, no comment on taste.

All used a total of 9 lbs grain to yield 7 gal wort.

I was going to ask about the same question you did and I hope someone comes up with the "facts". It seems to me that, aside from crystal malt and inherent differences in barley, one should be able to simulate most speciality malts by further kilning of a basic malt.

>>yeast). I will go as far as to say that if you do not use blowoff and
>>do not make an effort to get rid of a significant quantity trub BEFORE
you
>>pitch the yeast, you will almost certainly have a fusel alcohol
problem.
>
>I'm not going to flame, rather I'd like to learn more about this. Why
do
>you propose this correlation? Do you have a reference?

In general, my comments come directly from my experience. I have tried
to dig up information on the subject, but it is hard to come by.
I know I'm going to get into trouble here, but this is my understanding.
When yeast is in it's respiration mode, it takes some time off from
reproducing to build and repair its cell walls. It can do this by
manufacturing the materials it needs using oxygen. However, it so
happens
that trub contains exactly the right material to rebuild cell walls with.
The yeast will, in fact, use this material *in preference to* oxygen
when rebuilding its walls. However, using this material produces fusel
alcohols. Note that I am not saying that respiration is bypassed
altogether.
The yeast still uses oxygen. It's just that it does not use it to
rebuild
its cell walls. As far as a reference is concerned, I'm afraid I can't
be much help. I honestly can't remember where I read this. Likely
places
to look are Dave Miller's article on "Yeast Bite" in one of the
transcripts
of the AHA conference (1987 probably), and George Fix's book. I also
looked
up this subject in a textbook on yeast that had a whole section devoted
to brewers yeast, and another on brewing (perhaps Malting and Brewing
Science?)
Unfortunately, this was all a few years ago and I didn't take any notes,
thus I can't be more specific. If I get some time, I'll try to track
down
the info. I do remember that the information I got was vague and often
contradictory (I was really confused by Dave Miller's article since yeast
bite has nothing to do with fusel alcohols (according to that textbook on
yeast whose name I can't remember...)). Also, Dave Miller recommends
racking just after high krausen to eliminate fusel alcohol production.
Unfortunately, if what I am saying is correct, the damage will already
be done (to a significant degree) by then. I have tried racking just
after
high krausen, with very little improvement in flavour compared to not
racking at all. I have been very interested in this topic for quite
some time. When I took a tour of Samuel Smith's brewery last summer,
I asked one of the brewers whether they remove the trub before they
pitch the yeast. His answer was, yes, they used a whirlpool to separate
the spent hops and trub from the cooled wort before they pitch the yeast.
They are careful to get all of it out, and aren't worried about wastage

because they put the remaining wort (mixed with the hops and trub) into the lauter tun for the next batch and remove the rest of the stuff when they sparge. I find this significant, because Samuel Smith's uses a Yorkshire stone system which is the commercial equivalent to a blowoff system crossed

with a yeast recirculation system. On the other hand, I attended a seminar given by a former head brewmaster of Molson's brewery. He gave a few bits of advice to homebrewers, one of which was to ferment at low temperatures. He claimed that you can't make good beer fermenting at high temperatures, because the fusel alcohol production was too high. Given this remark, I found it hard to believe this guy was from Liverpool.

However, I asked him whether removing trub before you pitched the yeast would reduce the amount of fusel alcohols and he looked at me as if I had rocks in my head. He claimed that no major Canadian brewery removed the trub from the wort before fermentation. He also said that German breweries routinely do it, but that he didn't know why.

As far as doing some good scientific work on this subject, I'm with you. I'll be the first to admit that my notion of the idea is very vague, and though I'm getting a significant improvement in my beers using the trub removal technique, I can't claim to understand why. As luck would have it, though, my dad is a professor of chemistry at the University of Manitoba and has offered to analyze beer samples for fusel alcohol and ester content as a matter of interest. We've been discussing how best to approach the problem. Unfortunately, the best approach would be to split a 20 gallon batch of beer in to 4 fermentors, each pitched with the same yeast and fermented at the same temperature. I don't have the resources to make such a large amount of beer (I might be able to manage 10 gallons, if it were fairly low gravity, but this would require 2 2.5 gallon fermentors and 2 3 gallon fermentors, which I don't currently have). Compounded with all these problems, is the fact that I have no time to do this until about May or June...

Anyway, I hope the length of this message doesn't put you off. I find this area intensely interesting and would like to hear comments from anyone (especially if you actually know about this stuff). I sometimes find that people who know the answers to questions are the last people to open their mouth (the inverse also seems to be true...). I should probably put in a disclaimer that the above message is only my understanding of the topic. I might be spouting pure garbage, and the fact that I haven't given a clear refernce to my impressions should make people suspicious that I don't know what I'm talking about. Having said that, I hope the above was not just a colossal waste of bandwidth.

In HBD # 829, Darren Evans-Young <DARREN@UA1VM.UA.EDU> sez:

>Because the pot is so big (diameter), heat dissipation on the
>stove surface is a problem. I often smell burnt paint while I'm
>boiling. I just wonder how long my stove is going to last. I'm
>usually relaxing and enjoying homebrew instead of worrying about it.

Indeed. I just replaced two bakelite insulator plugs and two heating elements on my electric stove (a Tappan) to the tune of \$79. The stove is about eight years old. The bakelite parts were just oxidized and crumbled into bits! The insulators at the ends of the heating elements were also damaged. The gentleman at the "U-Fix-It" store where I bought the parts said it is a common failure. It is clear that with a big wide 33 qt brewpot sitting on the stove and the element cranked up to high the stove parts are getting quite hot. The hot bakelite has a very noticeable odor. I have thought of modifying the stove to increase air cooling on the affected parts. Of course, this may only be a problem with Tappan stoves. I think gas stoves are much better for cooking beer.

Subject: Re: Homebrew Digest #828 (February 20, 1992)

my first attempt at home brewing was taken from AMATEUR WINE MAKING by S. M.

Tritton pp. 152-58. we used 3lb. in a gallon of water and a sedimentary wine yeast.

it seems to be progressing well but the fermentation appears to have

stopped while it is still quite sweet and its specific gravity is about 1.10.

the yeast may not have been activated immediately because i forgot to add citric acid. i may also have been a bit excessive with the addition of campden

tablets (ie. four to the gallon). what to do? add more yeast and try to get

fermentation started again or wait and let it clarify?

Subject: Results of Hazel-Nuts in Beer

Well the results are in.. I have tapped into my supply of Hazel-Nut Amber Ale that was brewed using crushed roasted hazel-nuts. I did an experiment and put a hazel-nut in a few bottles. Most people seemed to think that due to the oils in the nuts that I would have a problem with head retention. Well I had no problem with head retention, but there was very little if any of a hazel-nut like taste. There was basically no difference in taste between the bottles with nuts compared to those without. It is a great amber ale, medium bodied, with a nice amber color. But not much of a nutty taste. I really like the ale but not much of a nut taste. I think maybe next time, if I try it again, I will use a cup of the nuts in the boil and possibly putting some in the carboy. I almost used a heading agent which basically consisted of dextrose and gum arabic. But after hearing that gum arabic is used to make the gum that seals envelopes I decided to skip that one and take my chances with the head. Well, I guess this little experiment basically says, if you use a little bit of nuts, like 1/4 cup, it really will not effect the beer at all. I will keep you all posted if I try it again, and thank you very much to all those who were nice enough to respond to my previous posts with all of your helpful advice and suggestions.

Happy Brewing-

Subject: **Brewing with Chocolate**

I want to brew with chocolate. I know this topic is not new, but it came back to my mind after reading the proceedings of the AHA Conference (Volume 11). Fred Eckhardt mentioned using dark cooking chocolate when brewing in the report on his beer and chocolate tasting. Does anyone have any more info on this?

My latest plan is to use the brew pot as part of a double-boiler to properly melt the chocolate before stirring into the wort. As others have noted, chocolate will tend to clump and not melt (if not worse) when just dumped into hot water/wort.

>
> How could the controversy ever have arisen if that were true?

Yeh, they couldn't say it if it weren't true. Right.

I work at the University of California Medical School Department of Neurosciences with a number of scientists doing basic research on the subject of Alzheimer's disease. In fact, I've recently done 3D reconstructions of nerve cells from biopsy and autopsy specimens, detailing the progression of the disease from onset to eventual death. Nowhere, I repeat, NOWHERE in this study has aluminum played the slightest part. There is a bunch of glop called neuritic plaque that seems to form at the synapses. I don't know what it is composed of, offhand (I'll ask when one of my colleagues shows up this morning) but it isn't made of Reynolds Wrap, I know that much.

Note: I'm not a biologist, I'm a computer graphics nerd, and the closest I've ever been to a medical degree is the one hanging in my doctor's office. But I have access to people who do have MDs and PhDs in the subject in question and I've asked about the correlation between Al and ALZ on a number of occasions. None of the scientists that I've asked has said that there is anything more than the slightest correlation between the two.

If you want to worry about something, worry about the supposedly "safe" ultrasound scans that are in use all over the place.

On second thought, screw it. Have a home brew.

I'm obviously a little behind on my reading but I couldn't find anyone else answering this question in a quick scan of contents.

This month's "Rocky Mountain Brews" - a newspaper like "The Celebrator" - has an article on Xingu. The story is that a "beer consultant" (who's name

I've forgotten) has this great scam where he finds people to pay for his travels all around the world to find beers to import. Back in the days of lighter-is-better mentality he was in Brazil where he found a type

of "black beer" that was based on an ancient recipe documented by the first white explorers in the region. When someone asked him for recommendations about importing dark beers to compete with Guinness he remembered Brazil and probably thought "Great another free trip to Rio!" so he went down and found that Lagers had replaced the "black beer" but that it was still "home-brewed" in the Amazon. He went in search and found plenty of people that brewed it the old way. However, the old way was one of these chew-the-grain and-spit-based recipes which was unacceptable for import so he contracted with a brewery that was on the edge of ruin and they brewed the beer according to his all-grain no-spit recipe. It was subsequently imported by his wife's company so he could promise the brewery that they would have a market.

If anyone is particularly interested in this guy's name or less hazily remembered facts then I'll look up the article again. By the way this was one of the (if not THE) best article I've ever read in the "Rocky Mountain Brews."

Subject: boiling on an electric stovetop

****theory_without_experience_alert****

For boiling in a large pot, would it be helpful to cover the stovetop around the burner with a couple layers of aluminum foil?

It seems to me that this should help keep the heat from the stovetop and direct it toward the pot AND aid cleanup in the event of a boilover.

Or could it cause some bad/dangerous heat concentration?

****end_alert****

From: ISENHOUR@LAMBIC.FNAL.GOV (John L. Isenhour)
Subject: Gas Burners

ingr!b11!mspe5!guy@uunet.UU.NET asks:
(edited)

>I've seen references to using an old gas water heater burner to
construct a
>beer cooker. My question is, how would one go about constructing a
cooker out
>of this? I know I'd have to cut the thing open to get the burner and
change
>the gas ports for LP instead of natural gas but what else should I know?
d

I have pulled the gas burner out of a couple of water heaters, its pretty
easy.
I then welded up some angle iron (1.5 inch on a side) into a box shape
that
would allow a 33 qrt cooker to sit inside on the angles (just so happens
that
given a wee bit of tolerance, a SS keg will rest inside this also). I
then
welded a piece of flat stock across the center, just underneath the angle
that
the pot rests on, bent such that the burner was held at the right height
from
the pot. The burner had a little screw-like item in the bottom center of
the
burner so I drilled a hole in the flat stock - the screw slides into that
for
positive positioning). I attached another section of flat stock on one
side to
brace the bottom of the burner where the gas is injected. (sorry, theres
no
way to describe this better on character cell media)

There is an (aluminum?) tube that comes off of the burner and attaches to
the
gas control box which has a flange fitting. I cut that off with a pipe
cutter
(hacksaw would work). I went to an automobile supply and got 30 feet of
rubber
like gas line that fit the tube. I attached the rubber tubing to the
aluminum
tubing with a hose clamp. About 5 or so inches down the rubber tubing
from
that connection, I put an inline on/off valve (I used a welding O2 needle
valve
but a variety of items would work). This is for adjusting the flame to
perfection and as an emergency shutoff (like for boilovers). The other
end of
the tube is connected to a "barb" with a hose clamp then a shut-off
valve.
This connected to the natural gas supply (typically near my gas dryer).
This stays turned off at the supply side when not in use.

I am sorry I cannot send a picture, If you mail me I can send measurements
or
whatever you need. The bottom of a 33 qrt cooker is about the size of
one of

the squares that makes up the box. This size in case I wanted to bolt it to something higher (gravity hop back) but I can easily pull the burner off and throw it in the yard and attack it with oven cleaner if I get a boil over. I also typically put an aluminum foil skirt around the thing when I am cooking outside to keep the heat concentrated.

I have used the system for over three years now (extensively) with no apparant wear on the hosing. I have enough tubing to brew outside in the summer, and I can run it in the basement or kitchen in the winter. I used natural gas because thats what the burner was made for and thats what I had access to.

From: joshua.grosse@amail.amdahl.com
Subject: Trub and blowoff

Michael Charlton discussed trub in HBD 830. Miller's TCHOHB recommends trub removal for the very reason he stated. The O2 will be taken from the trub instead of from free O2 in the wort. Of course, I don't have a copy with me at the office else I could quote the reasoning.

For five out of the last six years that I've been brewing I've used a blowoff tube, and found the results much improved. That first year, though, I used a plastic fermenter and had lots of sanitation trouble. My switching to a carboy and going with closed fermentations helped the sanitation, which likely help the flavor more than the blowoff tube.

The last 6 months or so, I switched from extract based brewing to all-grain, and added a wort chiller. I've noticed tremendous amounts of trub, and now delay pitching for 3 or 4 hours after sparging and racking into a carboy. Then I rack again before pitching. As I culture yeast in a carboy, I typically rack onto my starter. The last batch, I left nearly a gallon of trub behind.

Lately I've been using Wyeast 1059 - American (Chico) Ale yeast. This yeast never needs a blowoff tube. I find that the combination of no (or little) trub and no blowoff makes a great tasting beer.

In the article he mentioned a brewmaster who recommended staying away from high temperatures due to fusel alcohols. My understanding (Millerazian) is that higher temperatures promote esters and reduce diacetyl. I also learned in my BJCP class that the level of Valine in the malt will affect diacetyl levels perhaps more than the yeast or the temperature. The instructor, Fred Scheer of Frankemouth Brewery, says that he adjusts mashing and fermentation schedules depending on the results of the malt analyses he gets with each batch. Homebrewers don't get analyses. In general, Scheer believes that maltsters sell overmodified malts to homebrewers because they think, perhaps rightly, that we're more concerned with degree of extract than any other aspect of our malts.

The jury may be out as far as blowoff is concerned. However, there appears to be documented evidence (Miller, et.al.) that trub will affect yeast behavior in ways which may be harmful to quality beer.

Subject: Artificial Carbonation

First, let me thank all those that responded to my request for the CO2 chart. I appreciate the fast responsees.

Now for another question: the chart doesn't provide all that I was looking for. What I need to know is how long at a particular pressure and temperature does it take to carbonate to the level that is shown in the chart? If I wanted to obtain the level of carbonation of a British Ale as shown in the chart, how long should it take at the indicated temperature and pressure?

I know I should relax and all, but tapping a glass of beer each day to check for the right level of carbonation will undoubtedly empty the keg by the time the right level is reached. So far, I've had the keg at 8 psi and 40 degrees F for a week and the level of carbonation is not nearly enough - only a very few bubbles initially (other than a very nice head) which disappear relatively quickly.

Any input would be greatly appreciated.

Subject: Trub: a data point

Here is one data point in the trub vs no-trub debate.

Joel Bauman, a member of the Boston Wort Processors, conducted a trub/no-trub experiment for our club in 1989. Please note that this was a 2-stage, no blow-off fermentation in glass. Also note that this was an excess-trub experiment, since the full trub was fermented with half the volume of wort.

The following except is taken from the club newsletter:

Fermentation on trub vs racking off before yeast pitching.

The beer was an all-grain pale ale. Starting gravity was 1.052 (I didn't get a complete recipe. A liquid ale yeast was used). After the boil, the wort was cooled, then racked into a sanitized container which was stoppered and placed in a refrigerator to achieve a good cold break. After the trub had fully settled out, half of the wort was syphoned into another sanitized container, taking great care to leave all of the trub behind. The same yeast was pitched into both containers and fermentation was allowed to proceed normally. Joel commented that the trub-containing beer fermented out in 5 days while the trub-less beer took a bit longer, 7 days.

Comments from a blind-tasting that the club held:

Opinion was virtually unanimous: almost everyone favored and could pick out the trub-less beer. It was smoother and seemed better balanced. The beer fermented on the trub had a harsh bitterness to it that stuck on the tongue.

This experiment convinced me to start racking my beers off the trub before fermentation. I do two-stage ferments in glass, no blow-off. If you do blow-off, your mileage may vary.

Subject: My new wort chiller!

Hello all you that have considered a wort chiller but thought it would be too much trouble! After the recent banter about the virtues of wort chillers, I decided I had to have one. It was relatively cheap (about \$18) and easy (10 minutes to assemble) and it cooled my wort (cool to the touch) in 30 minutes!

Here's what I did: at the local hardware store, I bought a 20' coil of copper tubing (ID = 3/8", OD = 1/2") and enough clear plastic hose (ID = 1/2") to reach from the brew kettle (on the stove) to my sink and back again. I already had the fittings to connect the plastic hose to the sink faucet. The coil fit right inside my 15.5" dia brew kettle and the plastic hose fit right onto the sink fitting and the copper tubing. That's all there was to it! Turn on the cold water; cold break in 30 minutes!

Subject: Kolsh, Kegs, and Krausening

I've got 3 K's on my mind this morning ;-)

1) I have a friend who likes Kolsh.... and I'd like to try and make him some. I think Kolsh is an Alt... but i expect that it is somehow different. In a competition letter i just got they had Kolsh as a seperate sub-class of Alt.... just like they had Berliner-Weisse as a seperate sub-class of Weizen. Anybody have a recipe or suggestion on how to emulate Kolsh? I've never seen it, so i need some help here.

2) I never thought i'd be saying this, but here i am.... looking at getting a keggng system. Unfortunately, I've always ignored the keggng stuff here in the past.

- a) What is a good price? Is Alt. Bev.'s \$139 package a good deal? Which type of keg is the Kornealius (Kornealius?) (ball or pin). Alt. Bev's system uses 1 guage... Will this be all i need to ARTIFICALLY carbonate?
- b) I seem to remember an artifical carbonation discussion discussion a while back. Apperently this method is not at all trivial. There was some kind of carbonation chart... Anybody have it? Any references on artificial carbonation? Any reason why true keg conditioning is better than artificial?
- c) Quick disconnects... are Alt bev.'s a good price? Foxx?? Others?? I'd like to keep several kegs around, and move the CO2 supply around between them as needed.
- d) How well to counter pressure bottle fillers work? Is \$30 for one fair? It seems to me like the best thing would be to rack into keg, artificially carbonate, then just use counter pressure filler to bottle for portability/competition. Will my flavors be effected by this? BTW... what the heck is a counter-pressure filler? How does it work? What does it look like?

There will be an equipment auction tomorrow (tues) benefitting the boulder brewing club (name unknown)... i might try to pick some things up there...

thanks for any advise!

Subject: New Brewers

Why do people brew their own beer? We all have our answers to this, but I thought I would tell a little story related to this question and to the issue of teaching others how to brew.

I have got one friend started in brewing awhile ago, and another just got a kit for Christmas. Both are fairly sophisticated beer drinkers and neither had really tasted much fresh brew except my own and that at brew pubs. OK, they can taste that my brews aren't professional quality :-)

Anyway, I think that both were somewhat intimidated, one tasting some obvious and not-so-obvious defects in his beer already. So, I got them to join the local brew club and go to meetings. After helping judge the latest contest, at which there were quite a few obviously and badly contaminated brews, they felt much better. I figure this is the "I have made/may make in the future mistakes in brewing, but they can't be *this* bad" (or at least if they are, it gets dumped).

Trying to figure out the source of a bitter, slightly metallic off taste is a very different thing from a beer that smells bad and tastes sour, or one that is so oxidized it shrivels your tongue.

Anyway, paradoxically enough, both my friends are much more enthused about their own beer brewing after seeing such horrible examples of the art. It is making me completely rethink my philosophy of getting others to brew.

From: DAMON_NOEL/HP0800_01%hpcsee.col.hp.com@col.hp.com
Subject: boiling

I gave up stove top boiling after the wife became unbearable about burnt paint and discolored stainless. The biggest need was for lots of hot water and often quickly. My answer was brute amps. A 7 gallon plastic pail with two 4500 watt hot water heater elements (available cheaply from a discount plumbing supply) inserted through the bottom, an adjustable thermostat also bolted to the bottom (underneath), an aluminum ring about 4" tall bolted to the bottom lip of the pail, a heavy 220 switch and a cord to plug the whole thing into the dryer outlet. This rig will bring 6 gallons of cold water to a boil in 4-5 minutes. I was surprised to find that the heater elements don't burn the plastic. The water keeps them from getting too hot. The only caution is that if the elements get out of the water they will quickly burn up. I got tired of trying to pour boiling water out of this rig into a mash tun or whatever, so my next task is to convert a 1/2 keg into a similar outfit, but with a 3/4 gate valve on a tap into the bottom. I keep the thermostat set for 170 water which makes for a ready supply of sparge water. I think converting an old hot water heater would be more trouble than it's worth.

Invert sugar is available from candy making suppliers. They also sell a product for converting your own, I think they said it was some form of acetic acid?

There was a reference to an Aladin thermostat a while back...I tried to get one at a local hardware store and what they showed me was what appeared to be a thermostat controller for a furnace. It wouldn't work without a thermocouple, presumed to be in the furnace. I'd like to find a rig to put on my reefer to be able to get the thing warm enough for controlled fermentation. Could somebody fill me in on what the unit was like that was mentioned in here a while back and how it was adapted to the reefer?

From: Jacob Galley <gal2@midway.uchicago.edu>
Subject: My first lager needs advice

I have a few questions about what to do with my first lager, but first, I'll tell you the long history of what is turning out to be a very pleasant beer. I based the recipe on Charlie Papazian's Rocky Raccoon:

SURPRISED FROG LAGER

3.3 lb Munton & Fison extra light extract
~.4 lb Briess amber extract
~.5 lb Crystal (40 ^L, if anyone cares)
12 oz Clover honey
.5 cup Corn sugar (I couldn't help myself. I wanted a strong beer!)

1 oz Cascade hop pellets, 4.9% AA (60 minute boil)
3 oz Fresh grated ginger root (15 minute boil)
"the obligatory 1/3 licorice stick"

Pilsen lager Wyeast

I measured the OG at 1026, although in hindsight I think the brew was still a little warm. . . . Let's call it 1035 or so.

I put this in my fridge (42 ^F) on 9 December, in hopes that it would be finished by the time I got back from Xmas break. It certainly wasn't! On 16 January I measured the specific gravity at 1021, and it was still pretty sweet. On 8 February, though I knew that it was not done fermenting, I bottled with .5 cup corn sugar and put all the bottles back in my fridge. A day later, I decided to move two bottles into my pantry, to see if anything interesting would happen.

Well, two weeks later (last night) I compared a re-refrigerated finished-at-room-temperature bottle to one of the normal cold ones. The cold one had NO head, was still plenty sweet, mild carbonation, very distinct ginger character, and had a "final" specific gravity of 1013. The warm one had a killer head that headed down the side of the bottle and stuck to the glass. It was not at all sweet; the ginger apparently contributed a significant amount of bitterness, and was no longer very recognizable. It comes off as a rather hoppy pilsner "with a twist." This is my best beer yet.

But now I'm wondering, how much am I going to ruin the flavor if I move the rest of the bottles into my pantry to finish at room temperature? How long is it going to take the beer to finish in my fridge? My only two reasonable options are fridge (42 ^F) and pantry (68 ^F).

I'm also wondering why this recipe took so long to ferment. My roommate was not too pleased at the space in the fridge the carboy hogged for an extra month. Is 42 degrees on the low end for lagers? How much does that variable affect flavor and fermenting time? (And while we're at it, how much does fermenting time affect flavor?) I'm not really this patient, just this cautious.

I'm also wondering about brewers licorice as opposed to other heading agents or none at all. In my experience, "the obligatory 1/3 licorice stick" makes a good head in, say, a three-week-old beer, but open a bottle of the same batch at three-months-old, and you need to get a

sponge.

Okay, I've probably taken up too much space now with these questions, but I bet there are several people out there who could learn some from our expert panel on these issues.

I'd just like to say again that I highly recommend the above recipe, and Rocky Raccoon as a base for experimenting with specialty lagers.

Cheers,
Jake.

The pump in question can usually be purchased from the company distributing the water. I purchased one some time ago for \$12 although I have not used for this purpose. If you unable to locate one try a hand powered bilge pump from your local boat dealer.

I don't know much about beer pumping, but with sanitation always an issue, i thought you should know about peristaltic pumps. They run in the \$400 range and function by having rollers pushing on a u-shaped piece of hose. The rollers squash the hose against an outer housing and move along the length of the hose-sort of a progressive cavity pump. Anyway the beer or whatever you are pumping only touches the hose, so it is easy to clean or you can simply replace the hose. Good luck with your search-hope this helped some.

Subject: Great Eastern U.S. Invitational Microbrewery Beer Festival

The following is a letter sent to micros/brewpubs in the East Coast region. If your local micro has not been contacted and wishes to participate, Ed Stoudt or Tom Rupp (Brewmaster) can be contacted on 215-484-4387.

I hope this event takes off because it sounds great. Adamstown is located below Reading, PA on Route 272. The Brewery and Brewery Hall is connected to a large Antiques Mall (held Sundays) and an excellent restaurant (Stoudt's Black Angus). Reading also has many factory outlets, so if your married like me these trips can end up costing \$.

I do not know how much general admission will be or how to purchase in advance. One problem for some folks is that the AHA conference is being held the same time.

Dear Fellow Microbrewer,

We would like to introduce you to the Great Eastern U.S. Invitational Microbrewery Beer Festival, and to invite you and your fine microbrewery to participate in this existing first-time event.

The Festival will be held Saturday, June 13, 1992, in the Stoudt's Brewery Hall in Adamstown, Pa. from 1 to 5 p.m. Our large, appealing pavilion will be the setting for up to 50 "Tasting Tables" where guest will be offered samples of microbrewed beers. We will provide ice or a tapping system according to your preference, and each brewery will be identified by an attractive sign to be furnished by the festival promoters.

This tastefully planned event will include a luncheon provided for guest as part of their admission fee. Participating microbreweries will receive complimentary passes and have the opportunity to preview the event before general admittance.

We want to emphasize that this expo-type event is NOT a competition. It is an opportunity for you to share your prized microbrewed beers with a large, specially targeted audience -- customers who appreciate the type of beer created only by microbreweries. In addition to cultivating a demand for your particular product, you will be helping to generate interest in our industry's craft.

The festival promoters will arrange extensive media coverage including television and radio publicity. We will be mailing news releases to more than 100 newspapers, and will send invitations to more than 13,000 beer lovers.

All we need from participating microbrewers will be seven cases or one half barrel of each beer offered for tasting, with a limit of three products per brewery. We will be happy to work with you to arrange delivery of your product.

The only beers accepted for tasting will be those produced by North American microbreweries (producing less than 15,000 barrels annually) or specialty beers brewed by contract breweries; all beers must follow traditional English brewing standards or the German Purity Laws of 1516.

No American-style beers made with corn or rice will be featured.

We're looking forward to making this an annual event, one that will be eagerly anticipated by beer connoisseurs and speciality brewers alike! Press fill out the form enclosed and send it to the Great Eastern U.S. Invitational Microbrewery Beer Festival as soon as possible to reserve your space at the Festival. Remember, early commitment will ensure inclusion of your brewery's name in pre-event press releases.

Thank you, and we look forward to seeing you in June.

Sincerely,

Ed Stoudt

Hope to see you there!

>fermentation. Although this system is not regarded highly by Burch, it
>seems to work well for those who use it properly. Remember to replace
>the blow-off hose with the fermentation lock after the initial
>fermentation subsides (usually 2-3 days, being careful not to replace..
.

Why is it important to replace the hose with a fermentation lock
after the bulk of fermentation? I am assuming that the other end
of the hose is sitting in a jar of clean, probably sanitized water.
Is this not enough "lock"?
I`ve never had any problems with this method yet anyway.

Subject: Water heater parts for an electric immersion heater?

Hi all;

I've been toying with the possibility of building an immersion heater to heat sparge water and boil wort outside of the kitchen. It started while considering the Bruheat boiler, followed by my buying a 6000watt 240v (9.6 amp) "tank heater" for a few bucks at a surplus shop.

My idea is to suspend this heater (a rod-shaped loop) dipping into the wort, (so I don't have to bore into my boiling vessel) but I'm having a problem finding either a switch to regulate the output of this thing so I don't have to turn it on and off by yanking the plug (conveniently located behind the dryer).

I first considered an electric stove knob, but after looking at those on my stove, I see that these 240v switches use a +, -, and comm connection instead of the two-leads on my heating element, and I'm unsure now if this will work.

Now I'm thinking about electric water heaters... These clearly have switches for similar heating elements, and I might be able to use a thermostatic switch too (that would be ideal). Electric water heaters are pretty rare here, though, and I haven't found the parts, (or better a free leaky heater to scavage them) and I remain uncertain if this will work as planned.

Does anyone here have the slightest idea what I'm talking about? The guy at the hardware store thinks its all pretty funny, and the only other advice I can get here is to pay up my fire insurance before I plug it in. Any input on how you guys might have built similar items, or sources for the kind of switches I need would be very much appreciated.

thanks,
dennis

From: korz@ihlpl.att.com
Subject: Large Fermenters

Does anyone know if it is safe to keep beer in HDPE for a year? The Cole-Palmer reactivity chart says HDPE has "no effect after 30 days" or something like that for both beer and chlorine water. I plan to make a 15 gallon batch of pseudo-lambic (including Brettanomyces and Pediococcus cultures) but since the cultures are so expensive and the beer takes so long to mature, I want to make 15 gallons of it. The only reasonably-priced 20 gallon container I can find is a HDPE bucket with big, molded handles from Cole-Palmer (~\$25). I've considered using my SS keg, but it's a Heileman's Sankey keg and thus has no handles (just the thought of lifting it up onto the drier gives me a backache).

I've also considered making three 5 gallon batches side-by-side, but I anticipate problems splitting the cultures among the three carboys. On second thought, maybe I *should* make three of the same batch, but then pitch the culture starters at different times. It only makes sense that the more sugar I let the Saccaromyces eat, the less there would be for the Brett and Pedio, so I could try to find the proper SG to pitch the "other" cultures for the proper amount of their respective flavors.

While I'm at it, I might as well ask about 7 gallon carboys. It appears that my retailer's distributor no longer carries them. Does anyone know where I can buy some?

Al.

From: Lee J. Slezak <slezakl@atlantis.CS.ORST.EDU>
Subject: Yeast in the Secondary for a Framboise?

Hi all:

Currently I have a Framboise in the carboy fermenting away nicely. I got the recipe out of the cats-meow, anyway it (the recipe) says to add an additional 10 cups of raspberry puree to the secondary fermentor. My question is, should I pitch some champagne yeast in with the secondary and the new raspberries? What would that do? The only reason that I ask about champagne yeast is because I have heard of people putting it into the secondary on imperial stouts. So, should I pitch any type of yeast into the secondary? The recipe doesn't call for it, but I would think I would want something in the secondary to work on the new raspberries. Anyway what do you people think? You were all so helpful with my question about the Hazel-Nuts in the bottles, so how about this one? Thank you all very much and I will look forward to hearing from you.

Happy Brewing-

I did not think to test this with my almond beer because barbarian
that I am, I drank them from the bottle.

> Well I had no problem with head retention, but there was very
> little if any of a hazel-nut like taste.

It may have been a placebo effect, but I think in my brew, bottles
with almonds in them tasted nuttier than those without. I put 3
almonds in each of 12 bottles in a 5 gallon batch of light brown ale.
Finding an almond in the bottom of your bottle is tastier than finding
a worm. :)

From: rcd@raven.eklektix.com (Dick Dunn)
Subject: electric stovetop problem

There is one definite problem I've seen with brewing on an electric stovetop with a big kettle: If the burner isn't flat enough (or pliable enough in the right direction) to be in good contact with the bottom of the kettle, it builds up way too much heat. Other folks have already noted this phenomenon; what I've seen that I haven't seen described is that you can get enough heat to take the temper out of the trivet-like metal widget which holds up the burner. It gets tired and sags, which gives less support to the burner element, which means it makes poorer contact with the bottom of the brewpot...[positive feedback loop on negative effect]

I don't have the problem; I have a gas (sic) brewing...but I have seen this effect of destroying electric burners.

Subject: Hop growing

I had a terrible experience last year attempting to grow hops. I bought some cuttings from an outfit in Oregon and when they arrived by UPS ground I immediately opened the box and stuck them in the ground. They looked kind of dried out and I was not relaxing. I waited weeks and nothing. I finally dug them up and all four were dead.

Anybody know of a place on the east coast where I could buy some cuttings so that they would not have as much a chance of drying out before I get them? Anybody want to sell me some cuttings of their own?

It's either that or try the same place again (they promised to "take care of me" because of what happened last year) except maybe have them next day air them at great expense.

Subject: first batch

hello:

First I just wanted to thank everyone that sent me info on the '.Z' compressed files.

Secondly, I would like to discuss my first batch of homebrew and get any comments on the way that I may improve. (Techniques, Ingredients..etc.) The technique that I used was by taking a can of M&F hopped malt extract (pilsner), added it to 1.5 gal of H2O with corn sugar and brought this to a boil for 30-60 min. I then poured the wort into a 7 gal pail with 3.5 gal of cold water. I let it sit until it cooled to room temp and then put the yeast in. (RED STAR ALE). I put the lid on with the ferm. lock and let sit for 7 days. afterwards I mixed 3/4 cup dextrose with the 5 gal. batch bottled and let sit for 2 - 2 1/2 weeks. I refrigerated a few bottles and drank. It tasted weak and had a sweet-sour taste.

It was well carbonated and had a big foamy head. Now if any of you could make some suggestions about my technique (pros and cons) and maybe diff. yeast and ingredients, it would be very helpful for my next go 'round.

Actually, there are many types and flavors of sugars and syrups here
(read:
we're not **totally** uncivilized) 8-). I can think of about a half dozen
different types of dark and light sugars and syrups, but I don't know how
they relate to Golden and Demarara. To quote an old movie: "What we have
here, is a failure to communicate".

and...

Perhaps a supplement explaining what ingredients to substitute, unless
someone **wants** to try to re-duplicate all known British beers - could be
fun trying.

You've hit the nail on the head. Ideally, some homebrewer who's lived in
both
the UK and the US for a few years would volunteer. Maybe a tall order
but
this person could do us all a great service.

Cheers!
Norm

From: YATROU@INRS-TELECOM.UQUEBEC.CA (Paul Yatrou)
Subject: Magic bottling wand

A couple of you were wondering about the use of bottling wands. Well there's a new magic bottling wand around (at least in my part of the world). I just used it recently to bottle a couple of batches and it works like a charm! It works along the lines of the spring-loaded bottling wand but **without** the spring. The idea is to let gravity close the valve instead of the force of a spring.

The advantage is that you don't have to keep the tube pressed down inside the bottle you are filling but just let it rest there --- the valve will open. In the mean time you can cap the previous bottle while it's filling. When finished you simply pick up the tube and VOILA ... gravity closes the valve. If you think there's too much headspace you simply nudge the valve open on the inside of the bottle's neck to get a little more beer in there. Another nice thing about this wand is that it doesn't foam as much as the spring loaded one and it **doesn't** leak. Also if, in the middle of bottling, you want to stop the flow for a while (to answer the phone, put out a fire, open a bottle of homebrew, etc...) just clamp the wand with a clothes pin so that it rests inside the bottle without touching bottom -- gravity will close the valve. Now, that's some **gadget**.

****Standard Disclaimer****: NO, I won't be making a million bucks out of this post; just thought I'd pass on the info. In fact I can't even remember the name of the dang thing. I'll find out what it's called and post it later. (BTW It's **not** PHils Philer either).

Paul Yatrou.

From: Bob Jones <BJONES@NOVA.llnl.gov>
Subject: CO2, pumps, lemon tastes and frig temps.

I few random answers to recent questions :

Keith Winter ask about the CO2 charts. These pressure/temps are for a saturated solution. So you apply the specified CO2 at the measured temp and shake, shake until no more CO2 goes into solution. This gives one the specified volumes of CO2 desired for a particular style beer. Now dispensing is a whole different topic, I am still learning in this area.

DRCV006::Graham ask about pumps. I use, and recommend a magnetic drive pump. These are sold by several manufacturers. Little giant has a wide range of models for our purposes. Grangers is a good source for a local distributor.

Jeff Rickel ask about lemon tastes in beer. Most bacteria are acid producers, Lactobacillus, pediococcus and acetobacter are all acidic acid producers. I would expect you have a very infected beer. Microscopic examination or gram staining would identify. Your nose is probably the best instrument for analysis you have and it worked. Now move on to the source of the bacterial infection.

A few people have ask about modifying a frig. for better temp control. On most frigs, you can look closely at the thermostat and find a small hole for calibrating the thermostat. Pull the knob and look closely. You will see a small hole with a set screw behind it. Turn this tiny set screw one direction until the compressor kicks on. Now you know the other direction is warmer(usually the direction you want). Keep track of your turns(in case the experiments don't work) and monitor the frig temp everyday until you get the temp you want. Some thermostats still don't have enough range to get to the desired temp. In that case you need an external temp control.

Happy Brewing,
Bob Jones

From: rich@bedford.progress.COM (Rich Lenihan)
Subject: Another blow-off question / digital thermometers?

The recent "to blow-off or not to blow-off" debate has made me wonder if the answer to this question isn't dependent on the type of yeast being used.

Except for my last batch, I have used a blow-off tube for the last year and

have seen enough improvement in my beer to be a blow-off supporter. Of course, other variables have changed in that time as well. I recently purchased a 6.5 gallon carboy and used it for my last batch (no blow-off).

I'll find out if my beer takes a turn for the worse. But back to my theory:

I brew ales, exclusively. Since ale yeast is, by and large, top-fermenting,

wouldn't there be less interaction between the yeast and the trub? Lager brewers (like Dave Miller) may find it more important to rack the beer off

the trub while ale brewers may find it more beneficial to "skim" off the krausen via blow-off. Comments?

On another subject: I recently brewed my first partial mash ale.

Everything

went fairly smooth except for temperature readings. I found my glass thermo-

meter responded so slowly that I had to estimate when the mash was in the proper temp. range. Also, the thermometer I have contains mercury, which

is one additive I'd like to keep out of my beer. So, can anyone out there recommend a good digital thermometer for less than \$50 US? Thanks.

..

-Rich

From: hartman@varian.varian.com (John Hartman)
Subject: Electric Stoves, Dry Hopping

Electric Stoves--

I've wrapped a packing blanket around my SS boiler while keeping a towel on the top while boiling. My pot is big enough to cover two burners--a big one and a little one--on my ordinary electric stove. While bringing worts to a boil very little heat appears to escape and as a result I routinely boil ten to twelve gallon batches. I have actually managed to boil FIFTEEN gallons using this technique. The boiling time for a ten gallon batch is about thirty minutes if I start with hot mash runoff. Of course the boil time is reduced by starting the boil early with the initial runnings and then adding the final runnings in piece-meal fashion.

Dry Hopping--

In HBD 829 Tony points out several ways to dry hop, the last of which is to simply throw them in. I find that throwing them in gives the best results. Since the hops are not sterile and since the wort is most vulnerable right after chilling, I wait until the secondary for dry hopping. I have achieved good results in the secondary in anywhere from two to eleven days. Has anyone thrown dry hops into the fermenter AT PITCHING TIME? If you have I'd like to hear whether or not you've had any infections.

Cheers,
John

From: sherwood@adobe.com
Subject: beer gone bad

A friend of mine has had absolutely terrible luck lately with his beer making. After fifty or so batches with only two (easily explained) problems, he has had to dump 3 out of 4 of his last batches. The symptom is a horrible smell which carries somewhat into the taste. The closest thing we can come with is a sour smell fairly similar to milk which has clotted and gone bad. Definitely not appetizing. The smell starts mild, but then gets stronger as time goes on. It sounds like an infection to me, but he is careful about sanitizing everything that touches his beer.

Stuff which may or may not be relevant:

All of the batches which have gone bad have been all-grain. His successes were with extracts (with adjuncts). He has had several good all-grain batches, though, with identical procedure and recipe. He has fermented both in a SS keg (Bud) and in plastic buckets with identical results. He brews 15 gallons at a time, and so uses 3 fermenters when he uses plastic. When there has been a problem, all have gone bad (ie, never just one fermenter).

He has had this problem with a variety of yeasts (Wyeast Irish, Munton&Fison ale, Wyeast British). Around this time he started using a homemade counterflow chiller which drops the temp to around 68F. He sanitizes the chiller well, letting a bleach solution soak in the coils for a while, then running boiling water through it to clear the lines. He has also had a lot of problems (but only very lately) with stuck fermentations. In fact, without exception the sour beers have ALL had stuck fermentations (though we were able to rescue one by repitching a Munton & Fison yeast. Obviously a stuck fermentation could give a competing yeast and/or bacteria a chance to grow, but why, suddenly, are all fermentations sticking? I had always heard that extract brews were more likely to stick; experience has shown exactly the opposite.

We figured maybe the pitching temp was too cold so upped it to 90F (about where we had been pitching when he used an immersion chiller) for this last batch. We also 'fanned' the wort against the sides of the fermenters to try to ensure oxygenation. This batch started like gangbusters but seems to have stuck at 1030. Based on past experience we expect around 1018-1020. No sour smell this

time, though. Fermentation temp has been fairly constant at 65F. (I ferment at 58F with no problems).

There are no visible problems with the sour beers. Even after a month in the fermenter the beer appears perfectly normal (if you hold your nose). No visible growths, normal ring of trub around the surface.

So anybody have any ideas? Before this string of problems there was NEVER a stuck fermentation. Never this sour, rotting odor.

Geoff Sherwood

Subject: disclaimer

Dear Brewers,

In the last HBD (#831), Brian Gross made an excellent observation in response to my summarizations regarding blow-off v. fermentation lock methods. In that summary I suggested that the homebrewer take care not to replace the blow-off hose with a lock too soon. But, as Brian points out, the blow-off method is in fact a fermentation lock of sorts and need not be replaced with a conventional lock at all.

Thanks for the clarification. I'm still only just waiting for the birth of my "firstborn" and am quite new at this. As was quoted in the HBD #832 (?): "When I stop learning, someone put me to bed with a shovel!" (I get quite a kick out of some of these quotes!!) Anyway, Brian thanks again for pointing that out to me and the other new-comers to this craft; I know my next batch (which I plan to do using a blow-off hose/lock with) will be the better for it. My only remaining questions are, since I plan to use this method, and to let it ferment outside in the cold Chicago weather (actually, I'm going to keep the carboy in our closed-in back porch, and under a box to keep it from light) am I increasing the risks of infection this way? Especially when fermentation stops? And is there a risk of backwash from the tube in the event of a quick Chicago climate change?

Thanks and Happy Brewing

From: Don Reid <donr@hpcvcab.cv.hp.com>
Subject: Boiling on an electric stove (insulation)
Full-Name: Don Reid

The discussions here prompted me to try and insulating my brewpot.

I have a 5 gallon stainless steel pot with lid and a standard electric stove.

I got a sheet of closed cell foam (sold as a backpacking pad), and put a strip around the top of the pot. To reduce the chances of melting and/or fire, I left the bottom 4 inches above the bottom of the pot. I cut slots for the handle which also served to keep the foam from sliding down. Finally, I cut a circular piece to go on the lid.

It worked well! I normally have to keep the stove at Med-Hi to maintain a boil, with the insulation, only Med-Low was necessary. There was also no burned wort on the bottom of the pot.

Subject: Re: Yeast in the Secondary for a Framboise

Lee Slezak asks:

> should I pitch some champagne yeast in with the secondary
> and the new raspberries?

No, that should not be necessary. There is sufficient yeast still
in suspension to ferment the raspberries.

Be sure to carefully watch the fermenter so that the raspberry skins
and seeds don't clog your fermentation lock. In a couple of days
the skins and seeds should settle to the bottom of the carboy with
general proteins and dead yeast. The trub will be a disgusting-looking
reddish-brownish sludge. Racking once more will aid in cleaning the
beer.

[Style note: unless you are really making a Belgian lambic, it is not
correct to call your raspberry ale a "framboise".]

Subject: Electric Stoves & Propane

Hate 'em! I'd throw mine in Lake Michigan if I could lift the damn thing. I experienced similar problems: waiting for boils, discolored stainless pots, scorched wort rings. I purchased a Bruheat Boiler and found it was slower than my stove and the heating element kept encrusting itself due to my hard water. I finally decided to bite the bullet and go propane.

I had intended to dismantle a hot water heater but once I discovered all the loose ends involved, welding a stand, finding someone with a welder, getting hoses, etc., I decided to buy a burner instead. No fuss, no muss.

Although I'm sure there are more, I had discovered two. The first being something called a Kajun Kooker. I had read somewhere that this was 125,000 BTU but don't hold me to it. I talked to someone who owns one and he described it as a rocket engine in sheeps clothing. He was quite pleased. I don't recall the price.

The second type I found, and ended up buying, was a 35,000 BTU burner. It set me back \$59.95. All I needed was a propane tank (the Weber type) and picked on up a Sears for \$20.00. Tank refills are \$10.00 with an exchange.

Since I have switched over to propane I haven't looked back. I get a rolling, and I mean ROLLING boil, in about 20 minutes. I later upgraded to SS kegs and luckily the kegs fit perfectly. Now I'm no longer tethered to the kitchen. I have since relocated to the basement where there is a work sink, and more importantly, a floor drain. My big problem now is boiling off too much volume. Eventually I will get around to using the house gas line to eliminate tank exchanges.

The company is: Superb Gas Products Co.
423 South Church St.
PO Box 99
Belleville, IL 62222
(618) 234-6169

PS. The type I purchased was 16-20E. They do mail free catalogs.

PPS. I am in no way connected to this company . . . etc.

Subject: blowoff/trub, Student's t, experiments

Subject: Blowoff/Trub, Student's t, Experiments

Mike and Al have been discussing blowoff versus trub removal (HBD 829, 830) and have proposed experiments to identify what effect (if any) various combinations of blowoff/trub removal might have. Al's proposed experiment seems especially appealing. But before you begin boiling wort, take a moment and consider how to run and evaluate the experiment.

I've read many accounts of "A vs B" experiments in the digest. Some brewers make an experiment out of every batch, and have done so for 20 years!! I fear much of this effort is wasted by failing to recognize and allow for the variation inherent in the brewing process. Will the changes you taste and smell be due to the amount of trub left over, the amount of beer blown off, or purely chance? And how can you find out without repeating the experiment many, many times?

This was the type of problem faced by W.S. Gosset (a.k.a. Student) when he was working for Guinness. He was trying to correlate the behavior of beer produced at his experimental brewery with such things as the analysis of malt and hops, and brewing and storage temperatures. These were the days (1900s) when unsuccessful brews had to be drained into the Liffey. The analysis of experiments was so important to Guinness that Gosset spent a year in London studying under the great statistician Karl Pearson. Here Gosset invented Student's t statistic (Guinness refused to let him publish under his own name).

Student's t led to Gosset corresponding with R.A. Fisher, who, inspired by Gosset (he also helped Fisher get his job at the Rothamsted Experimental Station) went on to invent the design and analysis of experiments.

Gosset was an influence on Fisher in ways most digest subscribers can understand: Fisher asked for guidance from Gosset about home brewing and what computing machine to buy. Gosset's home brewing advice is a little disappointing to me though: "less trouble to buy Guinness and let us do the work for you".

Although it would be desirable to run the blowoff/trub experiments with one batch of wort, there are ways (invented by Fisher) of using two or more batches and getting a meaningful result.

Any influence the trub or blowoff has on the beer will much easier to evaluate if your brewing process is in statistical control. Large uncontrolled factors in the process may overpower changes due to blowoff/trub.

How much variation is there from one batch to another? How much variation is there within a batch? I seem to get bottle to bottle variation in

my beer (and the differences aren't always bad). If you know how much variation occurs naturally in your brewing process, you'll be able to judge if blowoff/trub removal makes a significant difference in your beer.

Al's experiment is a good one since it takes into account not only the influence of blowoff and trub removal independently but the interaction of both blowoff and trub removal. This is one of the advantages a designed experiment has over "one factor at a time" experiments. Another major advantage of designed experiments is that MANY more factors can be tested with a modest number of runs. For example, the main effects of seven factors can be evaluated with only eight experimental runs.

Mike, no matter what the experiment shows, the worst that can happen is you'll end up with lots of beer. Contact me if you need someone to help drink it.

Dave S.

Subject: Dave Line, invert sugar & saccharin

Making Beers Like Those You Buy by Dave Line was the book that first got me into grain brewing & I can wholeheartedly recommend it. It contains some excellent recipes including a rheinheitsgebot (well, almost) Guinness which comes out as near as dammit to the real thing (has anybody out there worked out a cheap & easy method for bottle pressurization with nitrogen?)

Invert sugar can be made in the comfort of your own kitchen by acid hydrolysis of normal (upright?????) sugar. This involves boiling a sugar solution with a small quantity of citric or tartaric acid for half an hour. I can't quite remember the quantities involved just now, but I have it written down at home and will post it tomorrow, if I remember.

Line's recipes which call for saccharin tend to use only one tablet per gallon. Now maybe smoking Dutch shag tobacco at an alarming rate has somewhat desensitized my tastebuds, but this seems to me to be a negligible amount (try dissolving a teaspoon of sugar in a gallon of water and seeing if you can taste it). 'Nuff said?

Subject: Hops, ginger, and heating elements

I've just returned from 2 weeks in the land of Red Stripe, Dragon Stout and other wonderful intoxicants and have been catching up on my digests, so some of this may be a little old.

There were a number of posts about storing hops. The Zip-Loc and similar generic food storage bags that you buy in the grocery store are actually quite permeable, and herbs (of all sorts :-) stored in them in the freezer will freeze dry. This can be slowed down a great deal by double bagging. Cheap and very effective. Great Fermentations of Santa Rosa says in their ads that they are now shipping their hops in zip lock barrier bags, which should be MUCH better. I have an order in to them and will report what I think at some point in the future. Anyone have any experience with them (the bags, not GFoSR)?

One person mentioned seeing ginger root in the chinese store and was wondering about using it in beer. Go for it! I'd recommend grating it before adding it to the boil. I have a heavy spiced beer which has a fair amount of ginger in it (recipe is not at hand), and it is pretty neat.

I have built a boiler using two 4500 watt elements (yes, I know that I never finished my series of posts describing its construction - come soon mon...) and it really can make that electric meter spin! A post described using a similar setup in a plastic (!!) bucket, and said that it would boil six gallons in 4-5 minutes. Are you sure about those times? My calculations say 15-18, which agrees with what my boiler does. Another post described a heating element as 6000W, 240V, 9.6amps. Unless my mind is a lot more fried than I think, 9.6 amps at 240V is 2304W.... I know my 9000W boiler draws almost 40 amps. I use them that way to boil water, and then connect the two elements in series (2250W) for boiling the wort, which eliminates scorching.

Subject: WYEAST BULLETIN--read this!

Brewers,

I've just gotten off the phone with Dave Logsdon, head of WYeast Labs. They have finally managed to determine the cause of their recent packaging failures, and have begun to address the problem. Actually, Dave thought they were addressing the problem all along, but nothing they did seemed to work. After considerably back-tracking through the industrial trail they have determined that the failure could be traced to changes made by the oil company that makes the plastic their new packager is using! The resulting plastic is of an inferior quality and has structural weaknesses that have caused failures of about 10%.

WYeast will be going back to its previous package supplier, but in the meantime, they will be packaging yeast WITHOUT STARTERS! The packages will include instructions on how to make a starter. For about one month, however, striking the package as per the old directions will accomplish nothing! Dave has been on the phone with his major retailers, and they feel this is the right way to go: people are interested in getting the yeast, and not having package failures, so the general feeling is that a little inconvenience now is preferable to not having any yeast at all.

I will be getting WYeast's starter directions by FAX today so I can put together a new label. If there is interest, I will post them here.

From: polstra!norm@uunet.UU.NET (Norm Hardy)
Subject: Kolsch vs Alt

Reading the literature of the beer styles will show the differences between the two styles, but from hands-on experience this is what I know: Both are top-fermented and both are cold-lagered after the primary ferment is done, down to 32f in most cases. The Alt (popular in Duesseldorf and Munster and a few other places) is dark, malty, and bitter with an almost citric taste in the bitterness. The Kolsch (only allowed to be brewed around Cologne) is very pale, moderately bitter, and moderately malty. Some of the locals praise it for its "softness" and claim it to be good for uneasy stomachs. It is also said to reduce gastronomical flatuance.

Personally, I found the Kolsch to be boring. The Alt was more robust. While in Koln I ordered an occasional Kolsch but usually stuck to the always excellent Pilsners.

From: imagesys!smb@uu.psi.com (Shawn M Bilodeau)
Subject: Hard Cider

I apologize in advance for this not being specifically about beer, but I thought that if anyone knew the answer to this, they'd probably be reading this digest...

Just how does one go about making REAL hard cider? That's real as in similar to the cider one can get in a British pub (as opposed to real hard - I don't really require that it have a high alcohol content).

My step-daughter just got back from a semester of school (exchange student) in England. She's not a real beer drinker (although she is interested in trying the apple beer that I brewed recently), but she was very impressed by the sparkling hard cider that she could get at the local pub. I had a chance to try some of this at a transplanted British pub in Rochester, NY (The Old Toad), and liked it myself.

After that I tried to make a batch of hard cider myself, based on a method that a fellow brewer and I worked out (in complete ignorance of how it should be done). I started with three gallons of (preservative-free) cider, which I brought to a boil in my brewpot. I let it boil covered for an hour, which brought the wort (well, maybe not wort, but I don't know what you would call boiled cider) down to about two and a half gallons. I dumped the wort into my primary fermenter, and let cool to pitching temperature (roughly 80 F), and pitched a packet of dry champagne yeast, added cover and air-lock, and left it alone for a week.

At the end of the week I racked the cider to my bottling bucket, added 2/3 cup of corn sugar, and bottled. What went into the bottle was a very pale yellow liquid with little resemblance to cider, or even apple juice. The trub was a very dark rust red. The S.G. was 0.998 (and of course, I forgot to get an O.G. - very annoying!).

I tried a bottle of it a week ago (this was nearly three weeks after bottling) and what I had was "firm" cider. There is almost no apple taste, and almost no color. There seems to be alcohol present, but I have no way of telling how much, other than the fact that I didn't get smashed on the single bottle. So, how do the British get such a deep yellow color out of their hard

cider? Not to mention a much stronger apple flavor? The only thing that I have been able to think of is that I may need to start with more cider, and do a much longer boil, with cover removed. That should concentrate the essence of the apple before the fermentation, shouldn't it?

I'd appreciate any help, suggestions, pointers, etc. that anyone can give me. I remember that someone mentioned having a book on making hard cider in a previous HBD - does anyone remember if a title was supplied? Thanks in advance for all of the help!

This is a classic symptom of a an infection, probably pediococcus (sp?).
Poor sanitation ANYWHERE in your brewing system, post-boil, can allow the infection to take hold. If it varries in the bottle, say some show signs of the infection but others do not, then you didn't clean all the bottles as well as you should have. If the entire batch is bad then the source could be anywhere.

The only thing to do is scrub everything you can and sanitize as much as possible. The infection becomes more prominent with age as the bug consumes the residual sugars and produces the acid which gives the resulting liquid that citric character. BTW, this characteristic is desireable if you are brewing a Berliner Weisse, however you want to be able to control the bug and only get it into certain brews. It can easily become a "house characteristic" of your beers if you are not careful. Last fall I got an assortment of bottles (Black Bavarian, Oktoberfrst, Amber, and two wheats) from Sprecher Brewing in Milwaukee. Randy makes several traditional wheat beers and I believe his Milwaukee Weiss is in the style of the Berliner Weisse Aat least the ones I had tasted that way!). Alas, every bottle of the assortment had signs of infection! All the date codes indicated that the beers were from September, 91. I believe that Sprecher is having some of his beer brewed under contract now. Perhaps the problem is with the contract brewer...

From: T2R@ecl.psu.edu
Subject: Kegging my first batch.

This last weekend I kegged and forced carbonated a batch for the first time. The results were fantastic. Here's what I did:

1) Obtain an empty keg from distributor. I used a Rolling Rock 1/4 keg with a ball lock (I think the same kind as A-B or Coors).

2) Remove lock-valve assembly. (release any internal pressure first, unless you want a stinky beer shower) There is some kind of locking spring that can be carefully removed with a small screwdriver and a pair of needle nose pliers. Once this spring is removed the entire assembly lifts out.

3) Clean keg. I rinsed it a few times to get the worst of the stale beer out then hit it with a baking soda solution to remove the worst of the smell and such. I then sanitized it with a bleach soln. for 30 min. and finally rinsed it twice with boiling water. (oh, washed the valve also)

4) Fill keg. First I purged the keg with CO2 and then I carefully siphoned the beer into it. (a amber ale) It was only a 5 gal. batch so there was some room left at the top of the keg.

5) Replace the valve. This was a real pain in the butt. There is a large O-ring, which seals between the valve and keg, that must be compressed to get the locking spring back in place. I managed to do it with a hoseclamp-gearpuller-1 1/8" socket combination. If there is a trick to replacing this valve will someone please post it or send it to me!

6) Carbonate Beer. I guesstimated the temp. of the beer to be about 45°F and used the "Digest CO2 Chart"™ to figure the proper CO2 pressure. I then inflated the beer to this pressure and let it sit for 10 min. at which time I shook the keg quite vigorously. I left the pressure on for about three hours, every quarter hour or so giving the keg a good shake. At the end of the three hours I could hear no more CO2 bubbling in so I shut off the gas and let the whole thing sit over night. It did get down into the low 30's that night and I think this may have helped the CO2 to dissolve better. I hit it again with some CO2 (and shook a little) about an hour before I served it (the next day), it took in a little gas but not as much as the day before.

7) Drink. Though the keg did foam a bit at first, the beer was excellent. The carbonation was just about right, maybe a hair under what I had

wanted but this was my first time. I have no complaints about the bubble size,
the beer held a creamy head to the end of the glass.

Hope this helps.

Subject: Malto-dextrin

In TNCJOHB, Papazain again just slightly mentions malto-dextrin. In the latest batch that me and my brew partner brewed we wanted to use some, but we forgot to add it to the boil. So when we racked it to the secondary, we added a little water, sugar and malto-dextrin. Is(was) this a silly idea? We just couldn't stand to see the extra space in the carboy, so we figured cup of sugar, 1/4 cup of malto-dextrin, water and boil and don't worry.

This brings up the point of how much malto-dextrin to use and when. Anybody with experience of malto-dextrin(I figure why even use it, brew partner said, If you got it use it.) and its advantages/disadvantages would be helpful. We'll keep you posted on the results of our experience.

Also:

eisen@Kopf.HQ.Ileaf.COM(Carl West) wrote a while back:

What causes a hop plant to set blossoms? Is it :
The length of the vine?

.

Subject: Kolsch

Here are some comments on the Kolsch style, along with a recipe.

My friends who have traveled to Cologne came back raving about the Kolsch style. If you think about it, its appearance is not much different than the light American lager, but its flavor is more interesting, and being an ale, a Kolsch is easily made by homebrewers.

First, let's look at the style. A Kolsch has starting gravity of 1.042 to 1.046, IBUs of 20-30, and SRM of 3.5 to 5. The Zymurgy description of a Kolsch is: Pale gold. Low hop flavor and aroma. Medium bitterness. Light to medium body. Slightly dry, winy palate. Malted wheat okay. Lager or ale yeast or combination of yeasts okay.

Malts can be U.S. or continental, including a fraction of wheat malt if desired. Hopping should be continental noble hops. The yeast is the tricky part, as to my knowledge there is no available Kolsch yeast. The Goose Island Brewery in Chicago brews a Kolsch using a Kolsch yeast from Germany. The Free State Brewery in Lawrence, Kansas, brews a Kolsch using Wyeast "European" ale. This yeast is suggested by Fred Eckhardt. I've used the yeast from time to time and think it's a great yeast, so use this in preference to any generic ale yeast.

Now, for the recipe. I've tried this a few times, never the same twice, but can say that it makes a good beer, and if your process is good, will get you a ribbon in competition!

6 pounds U.S. 2-row malt
1 pound Vienna malt
1 pound wheat malt
0.25 pounds light (10L) crystal malt

1 ounce Hallertauer (a=2.9) 60 minutes until end of boil
1 ounce Hallertauer 30 minutes until end of boil
0.25 ounce Tettnang (a=3.8) 15 minutes until end of boil
0.25 ounce Tettnang2 minutes until end of boil

Wyeast "European" ale yeast

Note that your milage may vary, and I'm assuming 80% extraction efficiency. The hop schedule broadly follows the "German" method, and you can substitute Perle or Spalt, and mix and match however you want.

Following Fred Eckhardt's description of Widmer's mash sequence, mash in at 122 degrees F and hold for 30 to 45 minutes, and then raise to 158 degrees F for starch conversion. Following conversion, raise to 170 degrees F for mash out and hold for 10 minutes.

Primary fermentation should be done in the mid-60s. This beer benefits from cold-conditioning, so rack to secondary and "lager" at 40 degrees for a couple weeks.

Subject: boiler

A number of people have had questions about the boiler I mentioned a couple of posts back:

1) The thermostat I used is a garden variety unit used I believe as a replacement unit on hot water heaters. It's a small unit about 2x3x2 which mounts to a flat surface with 4 screws and reacts to the surface temperature of its mounting face. There's a small screw adjustment for temperature (like on the back of battery operated clocks). This together with the high amp switch is available at plumbing supply houses.

2) The switch I used has a 20 amp/240volt rating and is a single pole, single throw unit wired in series with one hot leg of the 240 volt pair. The neutral lead of the 240 volt circuit is not needed for power. Be sure to wire a safety ground wire from the 240 volt neutral to the switch and the metal base of the pail/keg. The current rating is not to big a deal on the switch, given the low usage. The 20 amp switch can easily handle one heater element.

3) The heater elements mount to the base of the bucket through a hole bored in the bottom. I used the rubber gasket which came with the element on the exterior of the bucket. The element mounts with four bolts also through the bucket base. I put plastic washer under the heads on the inside of the bucket.

4) A variable resistance switch from a stove top could be used, these are available from appliance repair shops. I found one of these in the yellow pages and have gotten used parts from them dirt cheap. This, like the thermostat would just be wired in series with the element and the two hot legs of the 240. Use a drier cord or range cord depending on whether you have a 30 or 50 amp outlet. You can get the cords from either a hardware store or a plumbing supply.

From: Bruce Mueller <mueller@sdd.hp.com>
Subject: HDPE and beer

Al asks about using polyethylene for long-term storage of beer. Beyond what Cole-Parmer says, I use some of their HDPE tubing for dispensing from my keg. It imparts no flavor to the beer, and it doesn't discolor like the Tygon (vinyl) junk commonly available at HB suppliers.

A caveat: polyethylene is notoriously permeable to oxygen, so this might be a concern. It wouldn't worry me, because the Brits have those polypins (sp?) which are made of PE. Knowing Cole-Parmer's quality, I expect that you can use the PE container without fear. Most all PE these days is food-grade, especially labware.

Cheers!

From: Bob Jones <BJONES@NOVA.llnl.gov>
Subject: Dry hopping & Blowoff from Micah Millspaw

I have some info on the dry hopping issue. J.X. Guinard did some research a few years back in the sorts of bacteria that live on hops. The results were published last year in the MBAA's newsletter. I had discussed this issue with Guinard prior to its publication and was told that there is almost no danger of hop-born bacteria being able to infect a beer. The reason being that the hop residing creatures do not compete well in the environment that was created for the yeast. The pH of the wort tends to not allow a population level to be reached that can be detected. JXG's work also indicated that 3 days into a ferment no hop-born beasties would be able to compete at all with the yeast.

So wait 3 days if you're going to dry hop. This also should remove a lot of problems with plugged blow off tubes and fermentation locks.

I also would like to point out that the blow off tube and fermentation lock perform the same function in the same way and I do not see that one can have any effect over the other. My own brewing equipment uses both, the half barrel primary has a 1/2 inch copper line that runs into a gallon jug, if I brew 5 gallons or less I use a carboy with a fermentation lock. I've been using this equipment for years and have never been aware of any difference in the quality of beers made with either process. IMHO the quality is always the highest!

Subject: review of Coors tour (241 lines long)

The "Deep Wort" club took a VIP tour of Coors brewery on February 8th. Since I promised a write-up of the tour, here it is. I tried to record all the info but my pen lost the tiny roller about midway through. If anyone finds it in a glass of Coors, please return it! :-) :-)

Coors is located in Golden Colorado. This is a town west of Denver and is right along the foot hills at the base of the Rocky Mountains. The brewery is easy to find since the town is small the brewery is big. Just look for the tavern that advertises "The Freshest Coors Possible" and you are close!

Our tour guide was Susan. She conveyed enthusiasm and joy in working for Coors without being a cheerleader. Plus she was full of knowledge. She was good -- not a corporate drone nor someone who just memorized a script.

THE FACTS

- - - - -
Coors has the world's largest single-site brewery. It's HUGE! It makes 1.5 million gallons of beer per day. The old definition of a microbrewery being one that makes less in one year than a major brewery spills is definitely true here.

All of Coors' beers start with the same basic grains and use the same yeast.

The beers are:

Coors - a light American lager; their mainline beer.

Extra Gold - in the jargon of US beer distributors, this is called a "super premium" beer. This beer has won its category at the Great American Beer Festival a couple of times.

Coors Lite - 3rd largest selling brand among all beers; its accounts for 60% of total sales

Keystone and Keystone Dry - aimed at the cheap beer crowd (has pictures of NASCAR race cars on the packaging)

Coors just went national with Keystone Dry.

Cutter - their new low-alcohol beer. Cutter is the only Coors beer that is pasteurized.

Killian's - Coors bought the rights to the beer's name 10 years ago when the Irish brewery shopped its name around because of it was near bankruptcy. The recipe was changed from the original...

Herman Joseph - this is a premium beer. The name comes from the founder of Coors: Adolph Herman Joseph Coors.

All of the beers are made at the Golden Colorado brewery except the Cutter line which is made at their new West Virginia location. Coors also has an agreement with a South Korean brewery named Jinro (Ginrow?) where some production will be done for the Far East markets.

All beers are (now) sold nationwide. The Coors Extra Gold is exported to Greece now and will soon be sold across Europe. [This information caused a lot of sniggering from the club, with a few suggesting that Coors will have to label it a "light" beer. -Bob]

Coors is structured as a nearly self-contained corporation:

- it has agreements with farmers to grow certain strains of barley

- it makes its own cans and bottles through a wholly owned subsidiary that is located a few miles away from the brewery
- it owns hundreds of insulated rail-cars and trucks to ship its beer
- the brewery itself does the grain storage, malting, mashing, fermenting, and lagering all in one connected series of buildings

BREWING PROCESS

The tour was organized to follow the process of making beer. We started with the a description of the grains and adjuncts used and then moved through the malting house, into what the guide called the "production room" and then finished in the packaging area.

Ingredients:

Barley:

Coors supplies the barley seeds to farmers in Colorado, Idaho, and (I think) Wyoming. At the end of the season, grain is bought from those farms where the crop produced barley of sufficiently low nitrogen and protein levels. Any rejected grain is either used by other breweries (no names mentioned...) or sold for cattle feed. If anyone is driving through Colorado's San Luis valley, you will see billboards proclaiming that "this farm grows barley for Coors". There are yearly awards given to the barley farmers who produce most or best grain.

The "triumph" and "moravian 3" strains are used now. Others were used in the past and, undoubtedly, others will be used in the future.

Adjuncts:

This is added to make a lighter bodied beer but with the desired alcohol level. Both rice and corn starch are used in all the beers except the "Herman Joseph" brand.

The rice comes from California and Texas. Not much else said. The corn starch is derived from corn grown, for the most part, in the US Midwest "corn belt" of Nebraska, Iowa, Minnesota, etc.

Crystal and other specialty grains:

Are made on-site. However, the sample of crystal that is used to make the Killian's Irish Red brand didn't look like the typical crystal that homebrewers buy. It looked less shiny and didn't have the crystalline crunch when bitten [okay, okay I'll repay Coors for the few kernels that I ate -Bob]

Water:

Water comes from underground springs located around the town of Golden. The guide, when asked how the water is treated, said "nothing is added or removed" from the water. As someone who has lived along the "Front Range" of the Rockies in Colorado, I can tell you that the water is very soft. There is little hardness because the water passes over mainly granite and sandstone as it drains out of the mountains.

Hops

Coors currently uses the following blends of hops for all beers:

- 40% imported aroma hops (Perle, Hersbrucker, Hallertauer and Strissol-Spalt) from Germany
- 40% domestic aroma hops from Washington, Idaho, and Oregon (Cascade?)
- 20% Chinook hops for bittering

All you hop heads would have drooled over the hops ready to go into the boil. There were 3 containers (should I call them "hoppers"?) near the boilers, each the size of large garbage cans, that were filled with loose, whole hops. Everyone wanted "samples" ;-).

Malting:

Steeping

The grain undergoes a 48 hour steep in water. We walked into the area where this is done. I didn't count but there must have been about 25 tanks on the 6th floor. Each circular tank is 24 feet deep and 16 feet in diameter. Grain is dumped in wet from a spout located in the ceiling. When the steeping tank is filled, it holds about 78,000 pounds of grain!

When our tour was there, several tanks were being filled. There is something amazing to watch as nearly a _railroad car_ load of grain is dumped into one steeping tank.

There is considerable out-gassing of the grain as it steeps. I asked the guide if the water was treated in any way. She said that it wasn't and what I was smelling was just the effect of that much raw grain added to water. It smelled like "eau de barnyard" when a blast of water hit the grain while one was sniffing.

Germination

After the steeping is over, the grain is allowed to germinate. This occurs on the 4th floor. The wet grain is dumped in rows that are about 5 feet deep, 15 feet wide, and approximately 70 feet long. I counted about 16 such rows. In the germination room, the temp is kept at 53 degrees Fahrenheit and humidity is at 100%.

As you can probably guess with such a huge amount of grain, all grain is moved mechanically. An intricate series of augers and pushers will move the grain after it is finished germinating.

Kilning

The germinated grain is kilned for 14 hours. The temperature used in kilning determines the color of the grain (ie, pale or amber). As an example of getting every little bit of worth from the grain, all of the rootlets that were formed during the germination but are broken off during the kilning are sold as cattle feed.

Mashing and Boiling:

Coors has 50 gorgeous copper brew kettles in their "production room" on the third floor of the main building. Some of the kettles are for mashing and some are for boiling. The boil kettles had a larger exhaust "chimney". When we went to the floor beneath the kettles, I could see that each kettle is wrapped with an insulating blanket.

Because we toured on a Saturday, there wasn't anyone present in the room even though several kettles were in use. I don't know what the normal weekday operations would look like but I'd guess that only one or two people would be working per shift because everything is highly automated. A large control panel is on one wall that was festooned with lights and digital read-outs.

To make the Coors Lite or Keystone Dry beer, a proprietary process is used. Details are scant but one Coors representative said that the mash is 4 hours longer for for the Coors Lite brand a more complete starch conversion. The new Dry beers undergo a "double chilling" process after fermentation [sorry, I could not find out the full details - Bob]. The alcohol level is higher in the Dry beer because its starting starch level has been nearly all converted

to fermentable sugar.

After the mash, a huge press is used to get the most out of the grains I didn't see it in operation but it appears that the spent grains are loaded and then a hydraulic press squeezes to get a final running.

Fermenting:

The beer is fermented at 8 degrees Celsius (~46 degrees Fahrenheit) for 7 days. Coors does a high gravity fermentation and adds water afterwards to get the desired gravity and alcohol levels.

Filtering:

While lots of breweries use diatomaceous earth to filter beer, Coors uses a series of huge cotton pads. I didn't count the number of cotton filters used in sequence but I'd guess about a dozen stages. After the filter has been used, the pads are ripped apart, cleaned, and then reformed into new pads.

We sampled the beer as it left the filtering line. It was better tasting than any Coors I've had. The beer didn't have the crispness that lagering gives but it had a maltier flavor. In fact, the beer we tasted was Coors Lite which surprised a lot of us.

Lagering:

Since Coors cranks out 1.5 million gallons a beer a day and they lager all of it, that means a LOT of lagering tanks. There is a building devoted to holding at least several weeks production. (quick math: 1.5 million gals/day * 21 days ~= 30 million gallons and since a gallon weighs approx 8 lbs, this is 1/4 billion pounds!)

Packaging:

We saw a can line in operation. Coors was the first to use aluminum cans and also first to use seamless cans. The latest trend is to minimize the can cost by reducing the size of the can top [hmmm, I vaguely remember a calculus test question just like that! -Bob]. Each can is x-rayed twice to check for fill level and can problems.

FINAL COMMENTS

- - - - -

The tour ended in the visitor sampling area where everyone could have up to two beers. We all hit that quota!

I left Coors with an very high appreciation for their production facility.

If doubt if there is a better run large brewery. Everything was clean and there is a lot of attention to detail and efficiency.

However, seeing the majestic facility then points out some drawbacks. First,

one immediately understands that this is an American brewery that is extremely aware of marketing battles and current tastes. That is, the primary

goal is to please the most people so as to capture the largest market.

This

thinking dominates. Second is a feeling best expressed by Dave Resch:

"with a

place like this, they have the ability to produce a really fine beer, but choose not to...". In the past, Coors made a bock beer. Coors'

production

of a special Christmas beer each year is to be commended and encouraged.

I wish that there would be more special beers made, not just beer

intended

for the widest possible market.

Finally, there are certain times when a camera is desperately needed; this was one of those times. The sight of a dozen homebrewers all wearing hairnets, safety glasses, and earplugs was worth preserving!

From: mikel@attmail.att.com (Michael P Lindner)
Subject: Some Questions on Procedures, etc.

I am (almost) new to homebrewing, and have some questions. So far I have made (from a kit) an India Pale Ale, which my friends and I much enjoyed, and would like to try some other brews soon.

- 1) I'd like to try brewing with grain (rather than extracts), and have read some on the subject. I have no problem with cooking at various temps for various lengths of time, but books (and HBD) mention "sparging" the grain. The best definition I can find is "spray the grain with 160 oF water.

How is this normally done? Do I put the grain in a strainer and pour water through it, or leave it in the pot and spray the water on it? Should I use heated tap water, or some of the water the grain has been cooking in? Should I stir the grain while I spray? Do I need a sprayer, or is pouring adequate? Well, you get ther idea.

- 2) I recently discovered I should get a license to brew in NJ. I'd like to abide by the law, but I'm unsure of wheret to apply. Does anyone know how to go about this, or should I start calling people in Trenton?
- 3) Is there a good source of bottles by mail or something? I went to my (fairly) local homebrew supply store (The Wine Rack), and they gave me a case of returned-returnables for \$1.20. OK, but these bottles were gross and labelled, and I spent quite a while cleaning and sterilizing them. Yes, I know I can reuse these, but friends sometimes throw them out by mistake, and a couple broke when capping them, and I find I'm a few bottles short for my next batch (and I don't want to clean another case of bottles with labels and inhabitants).

Anyway, I'd like, while I'm at it, to thanks the contributors to HBD. I've learned a lot so far, and I'm still learning a lot.

> If you have, how would *you* classify it?
>

I would say that It's much more of a porter than a stout. I would
use ~3/4 lb black patent in a 5 gal. batch, and no chocolate malt
or roasted barley. I can't remember the hop character.

+++++

> I just put up a real high gravity (1.088 !!) stout: 12.5 lb grain for 2
> gal of wort (ok, I wasn't aiming that high but the boiling time got

> I used 2oz of Cascade .5 alpha.
>
> The question is this: should I dilute the wort some or should I expect
> reasonably good results as is? (or maybe a better question would be:
> am I correct to expect a FG of 1.022 given the above description?)

by all means, don't dilute it!

I've made 3 decently-strong stouts with Wyeast 1007 german ale
yeast, and totally love the results. It finishes more malty
than creamy (like irish ale yeast), but I prefer the maltiness.
The hops are leaf unless otherwise noted:

Batch 17: 3 cans extract, variety of grains, 6 gal O.G. 1.065
1.5 oz bullion (boil), 1/2 oz hallertau (finish).
My english ale starter had soured, so I popped the german ale
packet, and only let it sit a few hours before pitching (at 95F).
it took 4 whole weeks to ferment at room temperature, FG 1.017.
bottled with 6 oz corn sugar - either too much, or it still
wasn't done fermenting.

Batch 18: (oops - not a stout) 10 lb pale ale malt, 2 lbs munich
malt, 2 lbs wheat malt, 1 lb brown sugar. 42g hallertau (75 min)
19.5g fuggle pellets (75 min) 17g hallertau (45 min)
14g fuggle pellets (45 min) 7g hallertau (finish)
OG 1.065 - pitched at 80F with german ale slurry from batch 17.
racked 8 hrs later off of lots of hot break. (it think it
was almost exactly 5 gal after siphoning). It took 3 weeks
to ferment out, FG 1.021 bottled with 4 oz corn sugar,
and was tasty (and hoppy) - similar to bass.

Batch 20: 10 lbs various light malts 1/2 each of chocolate malt,
roasted barley, and black patent. 2 lb flaked barley.
14g bullion, (110 min) 16g cascade(110 min), 10g bullion (60 min)
14g cascade (60 min) 4g hallertau (5 min). 5.5 gal, OG 1.068
pitched slurry from batch 18. very little hot break, so
I didn't siphon off the trub. I think most of the hot break

came out in the (too-hot) sparge, then I let the wort settle afterwards and racked. It was ready in < 2 weeks, FG 1.027. My best stout ever.

I put the hallertau finishing hops in to help keep the strainer from clogging when I transfer to the carboy (esp. when I use pellets), but in my last batch of stout, I put an entire 7g of fresh hallertau in the finish, and it ruined the stout character.

Anyway, the more you re-use your 1007 german ale yeast, the less attenuative it gets. I doubt the SG will get down to 1.022, but it might come close. If it doesn't, all the better malt character!

+++++

> Why is it important to replace the hose with a fermentation lock
> after the bulk of fermentation? I am assuming that the other end
> of the hose is sitting in a jar of clean, probably sanitized water.
> Is this not enough "lock"?
> I've never had any problems with this method yet anyway.

If the temperature of the wort drops too low after most of the yeast activity has subsided, it can potentially pull sanitizing solution back through the hose into the beer. Of course, this can happen with the 3 piece airlocks, too, so I'm a fan of the S shaped ones. I've had it happen to a lager that was in the bottom of my fridge (too cold, really), but only a little got sucked back in, and the beer was fine.

cheers!

Subject: mead query

Our first attempt at homebrewing has been a batch of mead. We followed a recipe from AMATEUR WINE MAKING by S.M. Tritton pp. 152-58. We used 3 pounds of honey to a gallon of water and sedimentary wine yeast. We forgot, however, to add critic acid initailly and added it only after fermentation had already started. About two weeks latter the alcohol percentage has fallen to about 11% and fermentation has stopped completly. The mead is still quite sweet and bit too thick. What so we do? Is adding more yeast advisable?

From: mtavis@saturn.hyperdesk.com (Mike Tavis)
Subject: kettles & hops

I'm finally going to dump my enamelled canning pot and buy a real SS brew kettle. I have talked to a friend of mine who owns a restaurant about getting it through her supplier (and using her discount). However, there are about 150 different choices so I could use some help on the parameters.

What size do most people get? Assuming I make 5 gallon batches is 24-30 quarts about right?

What gauge SS? I will probably use it on my electric stove until I get a King Kooker (or some other prpose stove).

What dimemnsions? Should I get a tall, skinny pot or fat, short pot?

Is a cooper bottom important?

About a year ago I found a hop called "Pride of Ringwood" at my local supplier. I used it in an IPA and loved the result. I have been looking for them ever since and have yet to find them. Has any one seen these elusive hops. A mail order place that had them would be great. Thanks.

Subject: Cider making

I've made hard cider two years running, both times in the Fall, during the apple harvest. I used the same method both times and had a fair amount of success. Both batches consisted of:

3 Gallons Preservative-free apple cider
1 Pkg Champagne (First batch) or Whitbread Ale (Second batch) Yeast

Place cider in sanitized carboy, add yeast, and fix airlock. It may take upwards of 7 days to ferment out, depending on yeast chosen. Bottle with corn sugar as you would with beer, if you want a sparkling cider, or without for still.

I can almost hear the howls of protest now, "what, no boil, no sulfites to kill wild yeasts", but this has worked for me. One important caveat, champagne yeasts cause a COMPLETE fermentation of the available sugars in the cider. My first batch smelled like cider but was the driest tasting beverage you could imagine. Hydrometer reading indicated a F.G. of 1.001. This batch was more like an apple wine than anything else. The batch using ale yeast was much sweeter, much lower in alcohol content but not as clear. My advice is experiment, and enjoy the mistakes.

Subject: Dry Hopping

To the gentleman who wanted to know the timing of dry hopping:
I just throw hop pellets in a hop bag and drop them in the carboy at
pitching time. I have done this for the last three batches with no
problems. The last has been sitting in the fermenter for about 3 weeks,
as my wife decided to redecorate the kitchen and I have been reluctant
to bottle in the middle of the current disaster area.

Also, to the gentleman making hard cider -- Don't Boil It. The
cider ferments quite nicely by itself. If you can get fresh squeezed
cider, it will start fermenting by itself from the natural wild yeasts
already included with the (chopped/compressed) fruit.

Subject: CP filler review

I recently obtained a counter pressure bottle filler and thought I would pass along my experiences with this unit. For the uninitiated a CP filler is used to fill bottles from a keg under counter pressure to prevent foaming.

You must have a source of CO2 and a keg of beer to use one of these gadgets. The CP filler's body is made of food grade plastic, brass liquid in

valve and two hand triggered needle valves for CO2 input and foam output. The CP filler fills any size bottle, although I have only used it for

12 oz bottles. The unit worked as advertised, ie it CP filled bottles. The

foam out valve, with a hose attached, really cuts down on the mess when using one of these gadgets. You just direct the hose into a bottle or down

the sink drain as I did. The unit is made of high quality parts and manufactured to a very high standard. I have seen other CP fillers that cost much, much more and don't work as well. It is advertised in the back of Zymurgy and soon to be reviewed in an upcoming issue of Zymurgy. I was very satisfied with the unit. It can be obtained from Benjamin Machine Products, 1121 Doker Unit #7, Modesto, Ca. 95351 for \$49.95 + \$5 shipping and handling. The unit comes without hoses and Tee for hookup to CO2 tank.

I have no interest in this company, only a satisfied user of their product.

A proposed taxonomy for breweries:

Brewery BudMiolob, Coors, etc.
Milli-Brewery Schells, Leinenkugles, etc. -- small regional breweries
Micro-Brewery Under 3000 bbls (legal definition?)
Nano-Brewery Non-comercial brewery making more than 200 gal/year
(These shouldn't really exist right?)
Pico-Brewery Brewery making between 31 and 200 gal/year
Femto-Brewery Less than 1 bbl (31 gal)/year production

So, where do the brewpubs fit? Micros?
How about Sierra Nevada? Milli?

Mike
(Black Swan Femto-brewery, Eau Claire, WI.)

Subject: Hop growing

>I had a terrible experience last year attempting to grow hops. I bought some cuttings from an outfit in Oregon and when they arrived by UPS ground I immediately opened the box and stuck them in the ground. They looked kind of dried out and I was not relaxing. I waited weeks and nothing. I finally dug them up and all four were dead.

Alternate Garden Supply sells hops plants growing in peat pots. They are about \$6 ea but leave no doubt as to their vigor. I bought two Chinooks a couple of months ago and they grew so vigorously on the windowsill that I started pruning them and sprouting the cut ends. I now have about 10 plants ready for planting in Spring.

Subject: Electric Stoves & Propane

>Hate 'em! I'd throw mine in Lake Michigan if I could lift the damn thing. I experienced similar problems: waiting for boils, discolored stainless pots, scorched wort rings. I purchased a Bruheat Boiler and found it was slower than my stove and the heating element kept encrusting itself due to my hard water. I finally decided to bite the bullet and go propane.

I do not understand the binary logic here. Why does everyone who takes brewing out of the kitchen plunge into propane? A few pipe fittings and some plastic hose will bring NG just about anywhere.

One can make a burner for next to nothing out of pipe fitting and fire bricks. I am not much at ascii drawings so let me try describing one in words.

Start with two, 10 in lengths of 2 in pipe with a T between them. The side of the T gets reducers, a shutoff valve and a barb fitting to the gas line.

On one end of the 2 in section, mount a small muffin fan any way convenient.

The other end is the "burner" that is poked into a little "house" made from fire bricks. Getting it to work is simply a process of finding the proper air/gas mixture.

That is the LCD with lots of refinements possible.

> Eventually I will get around to using the house gas line to eliminate tank exchanges.

Oops. You see the light but I do not understand why you didn't start there in the first place.

From: eisen@Kopf.HQ.Ileaf.COM(Carl West

> What causes a hop plant to set blossoms? Is it :
The length of the vine?

There are many factors that cause plants to flower. In the case of hops, it is most likely, the photoperiod, assuming a reasonable amount of vigorous vegative growth.

Most people think that apples, for example, don't do well in the tropics because of the heat but it is simply that, the daylight hours must exceed the night time hours by a very specific amount to trigger flowering and this does not happen near the equator.

As hops is a perennial, there is no magic point when it can be considered to be mature and further considering that it flowers every year at the same time in the seasons, I vote for photoperiod. Simulate the photoperiod of Fall, and it might just flower.

From: joshua.grosse@amail.amdahl.com
Subject: Miller on Trub, O2, and Fusel Alcohol

I went back to my Miller to try to figure out WHY he recommends leaving trub behind, and what it had to do with oxygen, and what caused fusel production.
For brevity, I'll paraphrase from his chapter on fermentation.

1) Oxygen is used during respiration to synthesize sterols and other complex fatty substances that make up the cell wall and other structures. The limiting factor in yeast growth is either amino acid or oxygen, usually the latter. Yeast can grow without oxygen if the wort is rich in sterols and unsaturated fatty compounds. Trub contains a lot of these.

2) Fusels are formed when amino acids are broken down into keto acids, then aldehydes and then alcohols. High temperature fermentations encourage this. Esters are formed by combining these alcohols with fatty acids, which is why warmer temperatures encourage esters. More fusels to combine with fatty acids mean more esters. Esters will only be formed after all the oxygen is used up, because if oxygen is present the fatty acids build up sterols instead. The more aeration, the less esters.

- ----

In his section on procedural practices, he differentiates between commercial and home procedures. But in re-reading this, I now understand a little more.
He recommends:

Pitching yeast as soon as the wort is at pitching temperature. Then, he suggests racking within about 8 hours to get the wort off the trub.

The reasoning is that during respiration, the trub is good for helping to build cell walls and other cell material. After that, the excess protein content of the trub will build fusel alcohols by the breakdown of the amino acids. If you remove the trub before pitching, you lose out on good yeast cell building material. And, if you wait a few hours (like *I* do) for the trub to settle before pitching, you also risk infection.

I'm going to change my procedure to match his recommendation on my next batch.

From: korz@ihlpl.att.com
Subject: Re: use of hops

I'm afraid I've lost the originator (sorry) of this question:
>4 use of hops... during boil... end of boil... or both.. why...

Randy took a shot at this question -- I'd like to add more.

Hops add bittering, flavor and bouquet. They also have antiseptic qualities, i.e. they *reduce* your chances of getting an infection.

All hops are not created equal. All can provide bittering, the level of which is dependant on the amount of alpha acid that they contain. Some produce a pleasant bouquet, some an unpleasant one. Some that have traditionally used just for bittering (Nugget, for example) are now being used for aroma also. Each variety of hops has a range of % alpha acid (%AA), which depends on the region and how their growing season went that year.

Bittering:

Bittering hops, aka boiling hops, aka copper hops (the Brits call the kettle a copper), aka kettle hops... all of these describe the addition of hops for a long boil -- this addition of hops will provide bittering. The amount of bittering that they will provide is dependant on their %AA and on the length of the boil. If you boil an addition of hops longer than 15 minutes or so, you will certainly boil away all the bouquet and probably most of the flavor. Therefore, any hops you boil for longer than about 15 minutes are effectively only for bittering. It has been recently noted in this forum, that maybe the variety of the hops you use for bittering can make a difference in the flavor. The jury is still out on this issue. Why use a high alpha (high %AA) hop for bittering? Well, you can get the same amount of bitterness from \$1 of Centennial as you can from \$8 of Saaz.

Flavoring:

Hops that you boil for more than about 5 minutes will lose most of their bouquet and if you boil less than 15 minutes, you won't get much bittering from them, so what good are they? Well, they provide flavoring. I haven't found much on "flavoring hops" in literature, so I can't say much more about them. I usually don't use them unless I'm following a recipe directly.

Aroma:

Aroma hops are those added in the last 5 minutes of the boil (aka finishing hops) or dryhopping hops (adding the hops in the primary or secondary fermenter). The less you boil, the more fragrance you'll get. Try a bottle of Sierra Nevada Pale Ale -- it's dryhopped with Cascade hops. *That's* what dryhopping is all about. Another example is Young's Special London Ale -- it's dryhopped (I'm quite sure) with East Kent Goldings hops. Since starting to dryhop, I've stopped using finishing hops. The dryhopping is much more effective for creating a hop nose. I suggest using whole hops for dryhopping, simply dumped into the primary after the krausen falls or in the secondary. Pelletized hops can also be used, but the whole hops float, whereas the pellets float for awhile and then sink. After which they get covered up by dead yeast and therefore don't provide as much bouquet. I haven't worried about sanitizing the dryhopping hops and have not had any problems -- the alcohol, acidity and hungry yeast should be enough to fight off any

infections at dryhopping time. Don't add the hops till the krauesen falls -- they will most certainly clog the blowoff tube if you use one and the high rate of CO2 early in the ferment will scrub-off a lot of their bouquet also. Wait a short while to get the most out of them.

Aging:

Both the bittering and the bouquet will diminish over time, so if you've used too much, don't fret, wait 3 or 6 months. Then again, you can't expect that bouquet in that perfect batch of Pale Ale to last 9 months - -- drink it when it's at it's peak, and simply make more!

Varieties:

There are many types of hops and I don't have all my notes here, but here's a few things off the top of my head:

Saaz -- the classic Pilsener hop -- used exclusively in Pilsener Urquell.

Cascade -- a U.S. hop; aroma hop; used in many of the American Pale Ales.

Kent Goldings -- a British hop; aroma hop; used in many English Pale Ales.

Centennial (aka CFJ90) -- a high alpha U.S. bittering hop.

Nugget -- a medium alpha hop used mostly for bittering.

Hallertauer -- a European hop (also available grown in the U.S.) which is often used both a finishing and boiling hop in German styles.

Hersbrucker -- a cousin of Hallertauer -- used similarly.

Fuggles -- British (also available US grown); similar in use to Kent Goldings.

Well, that's plenty for now. For more info, I suggest the Zymurgy Special

Issue on hops as the most highly concentrated source of information on hops. While you're at it -- buy all the Special Issues -- each one is some of the best information on homebrewing there is. One more thing... when I'm just starting to develop a style that's new to me, what I do is pull out my old Zymurgy's and see what the prize winners used. You can get a good idea of the types and amounts of hops to start with and then adjust in subsequent batches. Papazian's The New Complete Joy of Home Brewing is another good source for starting points.

Subject: Yeast Wash Method?

Hi all:

I have yet another question for all of you out there in net-land. I have been corresponding back and forth with another user about my version of a Framboise, really a raspberry ale, anyway we came across a question. I was considering saving the trub out of my secondary fermenter and trying to re-culture the yeast and re-pitch it. Anyway here is what has been transpiring between us -

<Lee> if I save the trub at the bottom of the secondary, in a <Lee>sanitized container, and refrigerate, would I be able to re-pitch the <Lee>remaining yeast into my next raspberry ale? Just wondering-

<Bob>Hi Lee, that is sort of iffy. There are lots of weird stuff <Bob>in the trub (dead yeast, mutated yeasts, proteins, etc).

<Bob>Sometimes this works fine ... but I've had a taste of a beer where <Bob>the person did this and the beer was infected with either mutated <Bob>yeasts or bacteria.

<Bob>The best approach is to do a yeast wash on the trub and then <Bob>save the good stuff. Sorry but I don't know how to do that. <Bob>I've only seen references to the "yeast wash" method.

So, what do you people think? I have only just recently become a member of the AHA and I do not have the special Zymurgy Issue on yeast, so I have no real references on the subject. You all have been so helpful in the past what do you people have to say about this one? All and any advice, help, and insight will be appreciated. I will post a summation of the results to this query. (as usual) Thanks again and I am really looking forward to hearing from all of you!

Happy Brewing-

Subject: Beer Drinkers Phrasebook

Well, now that the Beer Judge Exam Study Guide is done, I need to find something else to keep me off the streets.

For about a year now, I have been discussing the idea of compiling a beer drinkers phrasebook. Folks seem to like the idea.

This would be a collection of about 50 phrases and words in 6 or so languages that are of particular interest to the traveling beer drinker. The idea would be to create a companion to the standard tourist phrasebooks.

Here are some examples to get you thinking:

Languages:

- American
- English
- German
- French
- Flemish
- Dutch

Phrases:

- I would like a _____ beer.
- I would like a table for ___ please.
- I would like my check please.
- I am looking for a bar/restaurant that serves _____.
- I am buzzed.
- I am drunk.
- Hello, I am a rich American.
- May I buy you a beer?
- Would you recommend a beer?
- Did you hear the one about _____?
- Where is a good beer bar/store?
- Where is a good brewery?
- Where is this address?
- Where can I exchange my currency?
- Where is the toilet?
- My hovercraft is full of eels.
- Is this the train/bus to _____?
- Which is the train/bus to _____?
- I'd like to buy an antacid/aspirin/condom.
- I've fallen and I can't get up.

Misc:

- Brewing terms
- How to count
- Tipping
- Toilet fees
- Jokes

You get the idea.

I am looking for more suggestions, but more importantly, I need some

volunteers to do the actual translations. There is no deadline, but I will have an opportunity to try some Dutch, Flemish, and French phrases on March 20th.

The Phrasebook would be distributed via HBD, and like the Study Guide, non-commercial reproduction of the Phrasebook would be allowed with proper credit.

From: aew@spitfire.unh.edu
Subject: Wheat Beer, Mixing Beers

Fellow Homebrewers:

I have recently brewed a wheat beer that I was modeling after the Australian wheat beer RedBack. My recipe was as follows:

7.75 lbs 66% Wheat 33% Barley malt extract syrup (bulk)
1.0 lb Crystal (Steeped + removed prior to boil)
1.0 lb Amber Unhopped Dried Malt
1.5 oz. Kent Goldings 5.6% Alpha Leaf hops (60 min boil -
bittering)
.5 oz. Kent Goldings 5.6% Alpha Leaf hops (10 min boil - flavor)
.5 oz. Kent Goldings 5.6% Alpha Leaf hops (5 min boil - aroma)
.5 oz. Kent Goldings 5.6% Alpha Leaf hops (aroma - see note)
.5 oz. Irish Moss(15 min boil)
.75 oz. Burton water salts - for water hardening - chill proofing
2 pkg. Doric Ale yeast (Started 2 hrs. prior to brewing)

Note: Last .5 oz. hops put in funnel/strainer and wort strained through into carboy with cold water in it a la Papazian. Blow-off method was used.

My primary ferment started in 1 hour and was surprisingly vigorous for 36 hours. It finished in 48 hours. It has been fermenting slowly for 5 days and now has stopped blowing CO2 through the airlock at any noticeable rate (less than 1 bubble every 3-4 mins) I took a hydrometer reading last night and it read 1.018. This seems high for a F.G. in comparison to my other beers of the same approximate S.G. My question is, Do wheat beers commonly have a higher F.G. than all Barley beers of similar S.G.s? Also, should I consider my beer done? (The sample tasted great but was slightly sweeter than I am used to - DUH of course there's more sugar in it.) Should I go ahead and bottle or pitch in some Champagne yeast?

Second question: Two of my previous batches had flavors that made combining them together in a glass seem a good idea (Like a Black and tan or Light and Bitter) One was a lightly hopped brown ale and the other was a highly hopped light bitter. When I combined the two the combination tastes good, but within 5 minutes the entire glass fills with a precipitate that looks like cold break. (Cloudy white/translucent fuzzy clumps) Neither beer alone does this if poured into a glass and left alone. This precipitate will settle somewhat and usually ends up settling to half the volume of the glass. It doesn't change the taste of the mixture but is so visually disturbing that I can't bear to drink it. I have tried combining several beers from both batches (in small quantities to avoid ruining good beer:-) and always get the same results. Has anyone ever had this happen to them? What is it? Can I mix these beers and avoid this result. I really enjoy those first few sips before the beer 'explodes'!

Thanks in advance,
Allan Wright

Subject: pride,ss,weast

Pride of Ringwood (Ringwold?) is an Australian hops, I believe. A discerning nose can find it in most if not all Australian beer, such as Fosters or Coopers. It's got an earthy aroma that I really like. I've never seen any or heard of anyone using any in the States. If anyone knows if it's available please let me know too.

Re. SS pot size: If you plan on doing all-grains batches, you'll need at least a 7 gallon (28 qt.) pot. 10 gallon (40 qt.) is best.

Wyeast packages: I popped the inner seal on a Wyeast package, dated January, yesterday. This morning, less than 24 hours at about 80degF, it was puffed up to about 2/3 of capacity. It is on the verge of breaking through at the upper right, just about where it says "Cut here" on the back. It almost looks like it was designed to puff up more there, to help in cutting or pouring or something, but that would be a dumb design. It's in a sanitized sealed bag now, so if it pops, no problem, but is this package slightly defective? I seem to remember the problem was usually with the bottom seal, which held fine on this package (I did the book trick).

>then just use counter pressure filler to bottle for
>portability/competition. Will my flavors be effected
>by this? BTW... what the heck is a counter-pressure
>filler? How does it work? What does it look like?

That's exactly what I've started doing. The way a counter-pressure filler works is to pressurize everything in the system and then use gravity to transfer. The filler is a tube that goes through a cork into the bottle. The cork doesn't hold pressure perfectly but works pretty well. The top of the filler tube is connected to two inlets - one for gas and one for beer. (Actually mine has 3 but only 2 are used.) You connect gas from your CO₂ tank to both the keg and the bottle filler using a "T". That way the keg and the bottle are at about the same pressure. A standard beverage line goes from the 'beer out' on the keg to 'beer in' on the counter pressure filler. Put the keg up on something and put the bottler lower. Both the 'gas in' and 'beer in' on the filler have valves. By turning off the gas and on the beer you can start the flow. Then turn off the flow of beer. Put the whole thing in the bottle. Turn the gas back on and the beer back on and gravity will fill the bottle at the same pressure as the keg. Its pretty simple but there is plenty of room to do the wrong thing and spray beer all over the place :-)

Subject: The HBD and how it operates

A couple of questions -

1. How often does the HBD come out and what dictates when it comes out? The other day, I didn't receive one, but the numbering on my copies is continuous, so I assume no HBD was published on that day...
2. How long (and by what mechanism) does it take to have a message posted? Is there a cutoff time? I've sent in two questions and one answer over the last week - the answer was never published and I'm still waiting to see one of the questions... I guess I just assumed that if I post, the message will appear in the next day's HBD... Are "answer" messages not posted if a lot of people respond? Could it be I'm having communication problems?

Thanks -

-Pete

From: tix!roman@uunet.UU.NET (Daniel Roman)
Subject: Cider making

You may want to subscribe to the cider-digest feed. It's not very active now, but really takes off in the fall. I've been told by long time cider makers NOT to boil the cider as it affects the flavor and the aroma. Most just pitch the yeast, some use sulfites to kill off anything and then let the sulfites evaporate out. Not the way to achieve 100% sterility but who am I to argue with success. If you want your cider a little sweeter, use ale yeast, it is far less attenuative than Champagne yeast.

I won't tell you about my cider making experiences since they have not been 100% successful in my opinion and I only work with cider once or twice a year in the fall in small batches.

Subject: Mead problems

Well, besides the acid you also need a healthy dose of yeast nutrient. You generally need more than what the label on the yeast nutrient specifies for mead since the label usually gives the amount for wine.

You'd think that honey would be high in nutrients that yeast needs but apparently this is not the case. One thing to watch out for is that too much yeast nutrient can adversely affect the taste or may require that you let it sit even longer than a year to get rid of the taste. Last time I made mead I used twice the recommended amount and it could have probably used even a little more than that.

From: "John Cotterill" <johnc@hprpcd.rose.hp.com>
Subject: Long Fermentation
Full-Name: "John Cotterill"

I brewed an all grain IPA about a month ago. The original gravity was around 1.052. I am using 1056 yeast at a temperature of 66F. The fermentation started normally about a day after pitching (I used a starter). I fermented in a SS soda keg with a blow off hose. After 8 days I checked the gravity. It was around 1.032, much higher than I would have expected. I let it go another 7 days. The gravity was 1.030, still pretty high. I pulled the blow off tube out, and just sealed the keg with the normal fittings. Every day I give the relief valve a pull and get about a 3 second blast of CO2. The gravity, however does not seem to be changing. The beer tastes OK. Why is it not fermenting out? I am very careful about sanitation, and, unless the yeast was trashed from the factory, I doubt I introduced any kind of a wild yeast. But I think even if I did have a wild yeast, the gravity would be dropping. The only anomaly that occurred was during mashing. Instead of 153F in the mash tun, I was low at about 148F. Does anyone have a clue what the trouble is?

From: Bob Jones <BJONES@NOVA.llnl.gov>
Subject: Heaters from Micah Millsapw

There has been some discussion lately about immersion heaters and their abilities. It is easy to calculate the wattage required to heat a given volume of water a certain amount. Or the heating potential of a given wattage heating element. I recently built a hot liquor tank that will turn itself on heat up to strike temp a hold that temperature, during the mash it will heat up the sparge water to the desired temp. It uses a 1500 watt element and is controlled by a modified Hunter Air Stat and a temperature sensitive switch. I wake up with ready to mash in water, plus it is energy efficient because the thing starts at a predeterimed time that is just long enough to heat up to the desired temperature.

- 1) know the total weight of the water to be heated
1 gallon water = 8.35lb.
- 2) determine your total temperature change (ΔT)degrees F
- 3) multiply the weight by the ΔT . This is needed Btu's per hour do the job.
- 4) divide the Btu's by 3.412 to find the watts per hour
- 5) divide by number of hours desired and select the appropriate heating element.

Or reshuffle this with what number you have to find those you don't.

From: Bob Jones <BJONES@NOVA.llnl.gov>
Subject: British Beer Flavors from Micah Millspaw

The duplication of British beer styles. While sugar may be a common adjunct to British brewers it is not usually a main flavour component. The sugary tastes and esters often associated with British styles can usually be attributed to their crystal malts. British barley is different from the US/Canada barley and the malting process can make the grains flavour contribution even more different. So when trying to copy British beers take the time to try find and use British crystal and pale malts. They may cost a little more, but this is a hobby so what the hell.

From: hartman@varian.varian.com (John Hartman)
Subject: Kettle Hop Schedules

I know that many brewers use a hop schedule for their kettle hops. For example, they add 40% an hour before the end of boil, 40% 30 min. before the end of the boil, and 20% at the end of the boil. I always add all my kettle hops one hour before the end of the boil. Am I missing something?

What's the point of using such a schedule? I've never used the technique and I'm skeptical about its effectiveness vs. simply adding 100% all at once. Could those who use hop schedules please enlighten me?.

Thanks,
John

Subject: OG 1.088 Stout status report

I got 2 votes out of 2 not to dilute the 1.088 OG stout (thanks for your opinions!). Well, I didn't. I racked to the secondary yesterday and, man o man, It tasted GREAT!! It was late at night when I racked and I was sleepy and careless, I hope I didn't infect it.

The only lingering problem is that, after the full malt tast -- WHAM! That tanin-like hop taste hits ya'. I used 2oz of .5 alpha Cascade for about 2.5 gal. Will the "wham" age out or will it remain a "feature" of this beer?

Subject: Reaffirming Propane

Dearest Jack:

It is my belief that the more uses you devise for a tool or gadget, the better you spent your money.

Take turkey basters. I use mine for starting siphons, drawing gravity samples, blowing wood shavings out of dowel holes and basting an occasional turkey.

Now lets look at portable propane burners and LP propane tanks. Besides brewing, I use my setup for post-game tailgating, chili cookoffs, soil sterilization for indoor potting, teaching a homebrewing course at the local college and roasting red bell peppers. I have many uses for a portable, non-electric heat source in the home, the backyard and at remote sites.

Now granted, your setup does sound very inexpensive. If I were the tinkerer type, I would probably build one like yours. But I'm not so I won't. Do you have other uses for your "little fire-brick house"? Do you lug your bricks out back and run a gas hose? How much time does this take? Do you lug your bricks to the park and follow with a gas line? Is there going to be another video on this?

I did not imply that my way was the only way. I posted my experience so that if someone else does decide to go the portable propane way, they may do so with their eyes a little more open.

>> Oops. You see the light but I do not understand why you didn't start there in the first place.

Very simple, Jack. I did see the light. Maybe I need to expand. Eventually, when I OWN the house I'm living in, I will make modifications to the inhouse line. Landlords can sometimes be kinda funny about their property if you tell them your going to start making permanent modifications.

I hope this sheds a little light. If you have any problems understanding any of this, I would be more than glad to educate you at next weeks meeting at the Goose.

Hind sight is always 20/20,

Subject: Invert Sugar

As promised in HBD #832, how to make your own invert sugar....

Boil 8lb of ordinary (cane/beet, white) sugar and a teaspoon of citric acid in 2 to 3 pints of water for half an hour. When cool, make up to a gallon with (boiled) water. And lo, you have 8 pounds of invert sugar in 8 pints of liquid.

The measurements here are English Imperial, which I believe is different to US. The actual amounts don't matter too much ... what you're after is an easy to use concentration (e.g. 1 lb per pint).

Have fun y'all.

From: bickham@msc2.msc.cornell.edu (Scott Bickham)
Subject: Skunked beer in cans

I am familiar with the phenomenon of light-struck beer in bottles, where UV radiation breaks an isohumulone bond, creating a ketyl-acyl radical pair. Loss of CO by the acyl radical forms the 3-methyl-2-butyl radical, which then combines with a thiol radical from sulphur-containing proteins to produce 3-methyl-2-butene-1-thiol.

In college, we learned the hard way that when a previously cold can or bottle of beer is warmed up (say, in the trunk of a car), and then cooled down again, the beer develops an off-flavor which is similar to, if not identical to light-struck beer. Does anyone know if the temperature changes in the absence of light can lead to the same chemical changes that produce light-struck beer? Or is this phenomenon perhaps related to "freezer-burn" that happens to other foods?
Just curious,
Scott

Subject: side-by-side yeast comparison

In response to some recent questions about the affect different yeasts can have, I dug out some notes I made on a side-by-side comparison of 11 beers. All the beers were made from the same original wort but were split up into 11 different carboys and given different yeasts.

I and others did a blind taste testing (the beers were presented randomly and without any description beforehand. The yeasts were a variety of ale and lager yeasts with a few "surprise" yeasts promised.

All beers were tasted before the actual list of beers or the answers were given. The base beer was light bodied (probably 1.040 OG).

Beer Description

- ---- -

- 1 clean aroma, slight fruitiness, high head
guess = ale
answer = Wyeast 1098, British Ale yeast from Whitbread
- 2 clove phenolic, minimal carbonation, no head, slight astringent
guess = german wheat??
answer = Wyeast Pasteur Champagne 3021!
- 3 ale estery, low head, smooth
guess = whitbread
answer = Wyeast American Ale 1056
- 4 yeasty aroma, sour, sulfury, sweet non-attentuitive, probably
infected
guess = RedStar
answer = RedStar lager!
- 5 huge dense head, sweet, sherry aroma, no esters
guess = unknown ale
answer = RedStar Ale
- 6 ale estery, sweet, spicy, lots of off-aroma, sulfury, weird!
guess = high temp lager?
answer = reused Wyeast American Ale from trub
- 7 quite sweet malty, clean, slight fruitiness, nice head
guess = german ale
answer = Wyeast Bavarian Weizen 3056 (50/50 blend of S. cerevisiae
and delbrueckii)
- 8 dense head, clean aroma, sour aftertaste, slight yeasty smell
guess = unknown ale
answer = dry Edme ale yeast
- 9 sweet, clean, a little off aroma that I couldn't identify
guess = ale?
answer = Wyeast Bohemian Lager 2124
- 10 clove phenolic, sour, astringent first taste followed by sweet
guess = german wheat?
answer = Wyeast Munich Lager 2308 (Wyeast literature mentions that
this yeast is sometimes unstable)

11 semi-sweet, estery/fruit nose, medium head
guess = ale?
answer = Wyeast Danish Lager 2042

Subject: Australia visit

Sb: In Australia

Just thought I'd drop Internet beer forum a message I just posted to Compuserve. I'm currently traveling in Australia, visiting homebrewers, brewers and attending a brewers convention. here are a few notes.

I've been meeting scads of homebrewers while having visited Sydney and now Melbourne. The quality of the homebrew I've had has been exceptionally good for the most part. The all-grain brewers, while in the same kind of minority as the U.S. and Canada are quite knowledgeable and show no less ingenuity in building their contraptions, mashing, sparging, boiling, etc. vessels. Very clever indeed. The quality of the ingredients has really got to be very good. I don't know what it used to be like but of the relatively few shops that are around, they stock some quality stuff.

Their hops are almost all Australian or New Zealand grown. From what I've gathered the NZ hops have the reputation of being exceptional. Most hops are in pellet form and well packaged.

They have access to Wyeast liquid yeasts now for over a year. A few are using it with great results. At \$8 - \$10 a pack. They also have the advantage of being able to culture yeast from Coopers Sparkling Ale. A great beer and great yeast for a particular style of beer.

The shop owners all generally subscribe to zymurgy and do a great job of spreading the word about knocking off the sugar in kit beers. There is adequate "kit supplements" packaged in about 1 kilo containers : malt syrup extracts, light, amber, dark, crystal type to use in kits instead of sugar. Also dried extract. Coopers is pretty big here. Most other kits are from

the UK. The Aussies all wonder why there aren't many American made kits.

I guess in summary the homebrewers are making some great beers. I had an all grain barely wine last night OG 1.100 FG: 1.012. 12% Exceptionally good. And a good doppelbock as well.

The weather is pleasant and good for BBQ's and beer drinking. I'll be off to the Aussie/New Zealand brewers convention that begins this evening. tomorrow off to visit some of Melbournes brewpubs and homebrew shops. It's 5:15 p.m. Sunday here while I suppose 12:15 a.m. there MST. solong

p.s. I enjoyed some of the best dark bock beer I've ever had anywhere in the world. Place: Scharer's Brewery and Inn in Picton, just 1 1/2 hour southwest of Sydney. Wonderful German style beer in a pub brewery restaurant hotel inn. Well worth visiting if you're ever in the Sydney area.

From: trwagner@unixpop.ucs.indiana.edu
Subject: What to make first

Hello. Well, after my "convenience" mistake with Axbridge, I want to make a GOOD batch of beer. The Axbridge kit was a total failure after following the directions almost religiously. It just didn't work.

I will be making a batch of beer (probably 4 to 5 gallons) this May. I have a few questions....

I want to use a "kit." (I believe that is what it is called). The kit has the extracts, sugars, and yeast. What type of "kit" is best for a good *first* home brew? I want something tried and true! My taste is for a George Killians (owned by Coors) Red. I also adore Sapor. I just want a smooth, non-harsh beer. I assume there is an easy "Lager" kit to use. However, I do not know what to get. Could someone give me some feedback? Any feedback as far as what to use in the line of extracts is greatly appreciated. I have looked and looked and there are a multitude of extracts out there.

My tastes are large and flexible. Here are my favorite American Commercial Beers:

Coors
Budweiser
Killians
Olympia
Little Kings ;-)

Import:

Sapor
Tsing Tao
Fosters
Molson

If you know of a good tried and true extract "kit" please, please let me know. Thanks...

Ted

End of HOMEBREW Digest #834, 03/02/92

Date: Sun, 1 Mar 92 11:47:53 MST
From: chinook!smithey@rmtc.Central.Sun.COM (Brian Smithey)
Subject: recipe formulation (long, ~130 lines)

In a recent HBD, Tony Babinec (tony@spss.com) gave a nice description of the Kolsch style, along with a recipe and notes that reminded me quite a bit of my own recipe formulation process. This finally inspired me to sit down and write this note that I've been intending to put together for quite some time. Recipes and requests for recipes show up quite a bit in the HBD, but I can't recall ever seeing a recipe "algorithm" posted. Hopefully some of you will find this useful.

When designing a new recipe, there is often a particular style that a brewer has in mind; witness the number of requests for "clone" recipes that get posted here. A book that I find invaluable when trying to invent a recipe for a style I haven't brewed before is Fred Eckhardt's "The Essentials of Beer Style". The main section of this book is a self-described "beer catalog", with brewing profiles for 38 categories of beer. These profiles contain original and final specific gravity, color, hop bitterness, and alcohol content for several commercial examples in each of the categories. Other references that I consult are the Zymurgy Yeast and Hop special issues (and now also the latest Beer Styles special), and Dave Miller's TCHOHB.

Generally, building a new recipe involves selecting the appropriate kinds and amounts of malt (for flavor, gravity, and color), selecting the appropriate varieties and amounts of hops (for bitterness, flavor, and aroma), and selecting the appropriate yeast (for attenuation and flavor)

As in all facets of homebrewing, malt selection is always subject to the brewer's discretion. My flexible rule of thumb is to use British pale malt and optionally crystal and dark (chocolate, black) malts for British ales (pale, brown, porter, stout); American 2-row (the widely available Klages) in place of the British pale when doing American microbrewery styles; and Klages, Crystal, Vienna, and Munich malts for Continental lager styles. A wide variety of crystal malts, from 20L to 120L color, are available to allow the brewer to adjust the caramel sweetness and color of the finished beer. Getting the malt flavor that is appropriate for the desired style is often a matter of getting the appropriate proportions of specialty malts; again, Eckhardt gives lots of hints. For example, for Bock/Dopplebock, Fred suggests dark Munich, dark caramel, dextrin, and black malts for darker color and sweetness. Black malt is convenient for adjusting color for dark beers, as 1 or 2 oz of 500+ L malt can make a great difference in color with a minimal flavor impact.

For roughly calculating the color of the finished beer, one must know the color (in degrees Lovibond, L) of the malt one uses in the mash. Color of typical beer malts runs from less than 2L for pale lager malts to greater than 500L for black malt and roasted barley. If your supplier isn't providing the color of your malt, you may want to ask him if he can do so. On pp. 54-55 of Miller's book there is a table of malt colors from Briess Malting, and a formula for calculating wort and beer color from the

colors and amounts of malt used. For extract brewers, you're pretty much on your own. If any extract brewers have some empirical numbers for colors of malt extracts, you may want to share them with this group. Miller's formula will result in a color in degrees Lovibond; unfortunately, Eckhardt's profiles give a color value on a 1-10 scale, with a mapping from his 1-10 to the SRM degree, which he says is roughly equivalent to the Lovibond degree. For example, he says that Ayinger Export Weissbier is color 4, and his table says that 3.5-4.5 is "light amber", 5.5-10 SRM. I usually look at several examples of the style that I'm trying to brew, and get a rough idea of the SRM color I want from Fred's book.

Calculating original specific gravity is a matter of knowing how many points of specific gravity you get per pound of malt per gallon of water for your particular process, and then calculating for the combination of malts that you're using and the size of the batch that you're brewing. Miller (on p. 196) and Papazian both give points/#/gallon figures in their books. Miller's tend to be quite a bit higher than Papazian's. Grain brewers will have to brew a few batches to get a feel for how well they extract malt sugars from their grain, and use the values that their particular process gives them. Extract brewers are probably pretty safe in assuming that the numbers in Miller's book are accurate, as one should expect to get 100% efficiency when using extracts.

Selecting hops is another personal decision; typically one will use English Goldings or Fuggles when doing British ales, noble Continental hops for European lager styles, and popular American hops (such as Willamette or Cascade) for micro styles. Again, this is wide open, and many brewers will also find use for the super-high alpha bittering varieties that are becoming popular (Eroica, Chinook, etc.). Whatever hops you decide to use, you'll need to know the alpha acid content in order to calculate the bitterness contribution from the hops. Again, if your supplier doesn't provide this information, request that they do so. Eckhardt's book gives profile bitterness in IBU (International Bittering Units). Formula for computing IBU from alpha acid content are available in several references available to the homebrewer; those that I know of are Eckhardt's "Beer Styles", Rager's article in the Zymurgy Hop special issue, and Byron Burch's "Brewing Quality Beers". Using any of these to compute bitterness, and comparing to the profiles in Eckhardt, there is no reason to be under- or over-hopped for the desired style. For extract brewers using hopped extracts, there is a table of many of the more popular hopped extracts, with bitterness values, in the Zymurgy "Hops and Beer" special issue; unfortunately they are in the infamous "HBU" units. A little math should be able to get you to IBU's.

The other issue involved in hopping is bitterness vs. flavor and aroma. Long hop boils are necessary to extract the bittering acids from hops, but this tends to drive off volatile flavor and aroma compounds. Late additions are used when hop flavor and/or aroma are desired. Rager's and Burch's IBU formula have utilization factors for late additions. I know of no way to quantitatively measure the aroma and/or flavor contributions of late hop additions. You'll have to experiment with this until you get the desired effect. Eckhardt's book hints occasionally when a hop flavor or aroma may be appropriate; also note that German (lager) brewing practice often calls for 3 separate hop additions, while British (ale) brewing adds all hops at the beginning of the boil. Aroma may be added later by "dry hopping", a topic frequently covered in this digest.

Finally, one chooses a yeast. For Wyeast users, the names of the yeasts make it pretty easy to guess which one might be best for the style you're brewing. An article by Burch in the Zymurgy yeast special goes into a bit more detail describing the character of many of the Wyeast varieties. If you're using dry yeast, your choice is more often limited to a couple of brands, and "lager" or "ale". Use a yeast that you're comfortable using that provides results with which you're happy. If you know anything about the the degree of attenuation to expect with your choice of yeasts, the final specific gravity information from Eckhardt's book and/or sweet/dry descriptions of the styles can help you select an appropriate yeast.

When you put it all together, you'll find out that things like wort specific gravity affect hop bitterness utilization, and you might discover that computing all of this stuff becomes an iterative, fine-tuning process. Fortunately, there are ways to make this easier. There are a couple of free spreadsheets floating around that include the formulas that I've mentioned. I use one for the Unix "sc" spreadsheet and wouldn't do it without (thanks, Tom). There are also commercial software programs available for home computers, check Zymurgy for advertisements if you're interested. I believe that Darryl Richman's program for the Mac does all of this and more, including water chemistry if you're interested in fiddling with that.

Beering is my hobby, not my business, I don't receive money from any sales of books, software, etc. mentioned here.

Happy brewing,

Brian

Subject: kegging

Well I finally had someone knowledgeable take a look at my keg, and the prognosis is very good. The only concern is the relief valve in the cover. There doesn't seem to be any way to engage it; it has no ring to pull. I took it apart, and it seems that it might release if you press

on the top of it with a pointed object. I tried that with the keg pressurized, but nothing happened. Is the valve defective, or is that just the way they work? The Foxx catalog has replacement valves, but to get a ring-pull valve I'd have to replace the whole cover.

Actually there's another concern: there's no check valve for the regulator. Foxx doesn't seem to have them. Could some kind soul point the way to someone who does? Thanks.

Russ (btw, the Wyeast package that was about to burst did *not*)

Date: Mon, 2 Mar 92 09:12:51 -0800
From: sherwood@adobe.com
Subject: bad beer

Thanks for the many mail messages I received with regards to my friend's beer. To recap, he had over 100 good extract batches, switched brewing equipment and went all grain, then had 4 of 5 batches turn out to be undrinkable due to a sour-milk sort of odor, all with stuck fermentations.

The consensus was underoxygenation causing the stuck fermentation, with the bad odor and taste being a byproduct of that. I have two more data points.

When I tasted my (ie, not his) beer again (this time looking for that off-taste) I found the same taste, though very slight. In addition, he finally got around to dumping one of his kegs of bad beer. It had sat at about 45F for two months. It was now HIGHLY carbonated. He sprayed maybe a gallon of foam into his sink when he noticed something -- it didn't smell bad anymore. He tasted it -- and immediately stopped dumping it. It now tasted just fine. I had a glass; he was right. Not even a trace of the odor that was once so overpowering we considered the batch a total loss.

So I have a conjecture. I recall mention here on the HBD of some chemical that yeast produce while reproducing that they then reabsorb later. I thought that that was a mild offtaste. Maybe not and that is what we have here? The stuck fermentations perhaps preventing the reuptake?

On the latest batch, we oxygenated the wort fairly well and had it take off like gangbusters. Very active fermentation, kicked off no doubt by a large amount of pitched yeast (from a starter). But it still stuck, this time at 1030 but without the off smell of previous batches. He racked it to a secondary, and fermentation picked up immediately (glub every 3 seconds). I assume this was either to more oxygen or rousting the yeast. But he racks gently to minimize oxygenation, and racks carefully to avoid racking the trub. So if he didn't pick up much O₂, and siphoned off only the yeast that was already in suspension, why the dramatic increase in activity? In fact, would oxygen help at this point at all? There was obviously enough yeast for a vigorous start. So why do they stop? Do the yeast get 'tired' after a while and require O₂ either to get rejuvenated or to reproduce (so you get some new, more vigorous yeast)? Do they just like the change of scenery ? (:-))

Any help with these questions is sincerely appreciated.

Geoff Sherwood

From: Conn Copas <C.V.Copas@loughborough.ac.uk>
Subject: Re : blow-off vs trub

Reading the post on scientific and statistical methods prompted me to think that there are two quite distinct claims being made about the effects of trub. The first is, that because trub is largely a tannin-protein precipitate, contact with the brew may dissolve some of the tannin and produce astringent flavours. This effect is presumably what those who have tasted blow-off have detected, although it is often mislabelled as having something to do with 'hop resin'. The second claim is that yeast will extract oxygen from the trub and in the process produce more fusel oil, which at low levels can be interesting, but at higher levels tastes solvent-like and possibly harsh.

So here is one suggestion for an (incomplete) experimental design. Take some trub and strain it. Dry it roughly by pressing between paper towel. Now place it in an appropriate amount of water, preferably acidified and fortified with pure alcohol to obtain a beer-strength mixture. Let sit for a period around 2 weeks, maybe with some agitating, then note whether anything has dissolved.

Incidentally, I understand that some breweries actually employ tannin as a clarifying agent. I've demonstrated this to myself at home when making yeast starters with malt extract. Adding a pinch of grape tannin (reputedly equivalent to tannic acid) causes the wort to drop star bright without ever being brought to the boil. It also results in a darker wort and the most evil looking trub one is ever likely to encounter. Presumably, the breweries then precipitate the dissolved tannin out with something else like gelatine or Polyclar. Just to complicate the issue, tannin is also regarded as a haze precursor, so my chemical musings cease at this point.

I bought from Freshhops and had success with 8 out of the 10 rhizomes
that I bought, 2 rhizomes of 5 different varieties. The Cascades did
much better than the Hallertauer, Tettnanger, Mt. Hood, and
Willamette.

Just a data point.

BTW: I actually live in DC -- I'm just visiting the Left Coast.

Lots of great info about hops and ...

>Aging:

>Both the bittering and the bouquet will diminish over time, so if you've
>used too much, don't fret, wait 3 or 6 months. Then again, you can't

Is this true? I've noticed in some brews (which accidently lay around
for a few months) that there was a distinct loss of sweetness over time which,
to my tongue, came off as an increased bitterness. The sweetness normally
balances the bitterness, so it seemed more bitter over time. I
attributed the loss of sweetness to a mild infection of a wild yeast or a bacteria
which was able to ferment the "unfermentables" given enough time (I noticed no
real "off flavors" other than this phenomenon. I suppose with better
sanitation this would not occur and that the effect of which Al speaks would be more
evident. What have others found? I've got a vested interest in this
question since I've got a bock in the basement which is pretty high on the
bitter side. If the bitterness fades a bit, it should be incredible.

From: loc@bostech.com

Subject: Yeast Washing Info

Yeast washing basically is a process of mixing the yeast with enough hydrochloric acid to bring the ph of the slurry to 2.2. You want to do this with yeast that has as little trub in it as possible. (yet another reason to use a wort chiller and separate the trub from the wort)

By bringing the ph to this level you kill off any mutant and weak yeast. This then gives you a strong yeast colony to start with. Big breweries only wash a yeast batch 10 times. After that the chances of getting a mutant strain in the brew increases dramatically.

With acid this powerful make sure you have the right tools and meters to do the job. Mistakes and inappropriate choice of tools and containers can be costly.

cheers,
rogerl

Subject: non-lambic and non-Trappist Belgians

OK, I've finally kicked myself into asking about the availability and semi-reproduction of Other Belgian Wonderful Stuff (other than lambics and Chimay, for which there is a lot of info).

When I was in Belgium (beer trip) this past winter, I found that my favorites were Rodenbach Gran Cru and Leifmann's. I also loved a bunch of other things which were not lambics or Trappists (not that I don't *love* lambics and Trappists. . .)

First thing is: is there anyplace in the country which can get Rodenbach? I found a distributor which can get Leifmann's, but they don't handle Rodenbach. Does Manneken Brussel in Austin handle any Belgians besides Chimay? (and the easy stuff to get: Orval, Grimbergen, St. Sixtus, Lindeman's, Duvel)

Now, to get down to the get down. . .
Assuming I can get fresh bottles to culture from (actually, have the microbiologist woman who runs Fermentation Frenzy culture for me), has anyone else here attempted repros of Rodenbach and Leifmann's? How 'bout a tasty, refreshing Hoegarden for those hot summer days?

Also, an alert for all you fans of Belgian beer: I picked up a Michael Jackson book entitled "The Great Beers of Belgium", when I was in Brussels.
It was in English (also available in Flemish and Walloon). I've never heard of it in the states. Is it available here? Highly recommended.

Subject: Problems with long ferment--WYeast 1056

John C relates a problem with a loooooooooong fermentation using WYeast 1056. I'm a little relieved to read this, actually, since I've been having the same problem. In fact, I've been having slow-starting problems with the yeast for several batches, but this is the first time it's gone so slowly once fermentation began.

In my case, I split a 10-gallon batch into two carboys. The ale started at 1.062. Carboy A is still obviously fermenting and is at 1.030. Carboy B was clearing and looked done but was at 1.038. I roused it, warmed it and added some wort/beer from Carboy A. We shall see. It has been three weeks.! The beer tastes fine, just too sweet.

Dave Logsdon at WYeast says he will look at this yeast and determine if he needs to go back to an earlier generation. If anyone else has experienced problems like this with 1056, please e-mail me.

From: arf@ddswl.mcs.com (Jack Schmidling)
Subject: Lager, Kitchen Aid, Wyeast, Plastic,

To: Homebrew Digest
Fm: Jack Schmidling

I would like to hear from anyone who can describe the difference between
a
lager and an ale, in terms of the taste.

I am thinking in terms of everything else being equal, just what are the
effects of cold, long-term lagering on the taste of a beer.

If one made a batch of beer and lagered half in cold and used ale yeast
at
ale temperatures on the other half, what would one expect to taste that
makes
it all worth while?

Breweries spend zillions to lager so I presume there must be a reason
but as
most of what they make, isn't worthy of the name beer, I can't help but
wonder why they bother.

As I keep looking for ways of improving my beer, I don't want to
overlook
anything but this just seems like lunacy, (sort of like using liquid
yeast).

>From: Brian Batke <bab@whydah.icd.ab.com>

>I seem to remember someone asking about the Kitchen Aid grain
mill (that fits on the PTO of your Kitchen Aid mixer) a while back,
but I don't remember seeing any response.

>So, has anyone tried it? If so, how well does it work? At \$124,
it's pretty expensive.

I have one and tried it and it is utterly useless. As a matter of fact,
I
permanently destroyed one part of the gear drive and can no longer use
the
grinder attachment. It is one of the things that drove me to build the
MALTMILL.

>From: "John Cotterill" <johnc@hprpcd.rose.hp.com>

>Every day I give the relief valve a pull and get about a 3 second blast
of
CO2. The gravity, however does not seem to be changing. The beer
tastes OK.
Why is it not fermenting out?

Standby! I had a similar problem with a batch that fermented like new
beer
for several months. A vile taste eventually caught up with the bubbles.

I suspect you have unwittingly exploded the myth of "Wyeast purity".
Sounds like they cheated on the old family recipe and slipped you a bit of Red Star.

>From: akcs.chris@vpnet.chi.il.us (chris campanelli)

>It is my belief that the more uses you devise for a tool or gadget, the better you spent your money.

> Now lets look at portable propane burners and LP propane tanks. Besides brewing, I use my setup for.....

That's a tough act to follow but I obviously did not have you in mind. I was simply trying to save others the expense of investing in a propane setup if they have a gas line handy.

> Now granted, your setup does sound very inexpensive. If I were the tinkerer type, I would probably build one like yours. But I'm not so I won't. Do you have other uses for your "little fire-brick house"? Do you lug your bricks out back and run a gas hose? How much time does this take? Do you lug your bricks to the park and follow with a gas line?

None of the above but I do use it as a melting furnace to make all the castings used in the MALTMILL.

> Is there going to be another video on this?

You haven't been paying attention. It most certainly will be a segment in my new video on all grain brewing... the EASYMASH way.

>I hope this sheds a little light. If you have any problems understanding any of this, I would be more than glad to educate you at next weeks meeting at the Goose.

Better yet, I will bring some of my latest brew and you can then join the millions who recognize ARF GENERIC as the "WORLD'S GREATEST BEER".

>From: mstrange@alfred.ccs.carleton.ca (N E N Strangelove)

>Is there any problems associated with using the plastic 1 and 2 litre plastic pop bottles for bottling beer?

There are no mechanical problems but there have been allegations that something in them is soluble in alcohol and a rebuttal that said, not so.

The only problem I have had with them is that they retain the smell of what ever was in it last and what ever goes in next taste like the last.

This is easily remedied by soaking in bleach between uses.

I always fill a few plastic bottles when bottling a batch to monitor the carbonation.

I also fill them from the keg to bring to parties and brew club meetings so that I can share the "WORLD'S GREATEST BEER" with the world.

> Also, I would like to hear of other bottling options - such as the use of champaign bottles.

Champaign bottles are ideal for beer for two.

You can use plastic champaign corks or crown caps on most of them.

Most garden suppliers will reship under these conditions. Did you even try calling or writing them? They should know that they are shipping a perishable product that sometimes won't make it, and should be willing to replace them.

On the issue of "dead" plantings: It's not always so obvious. Two years ago, we ordered two grape vines (just for eating, not wine). By the time I got around to planting them, one was apparently totally dead. I planted anyway, figuring that I would lose nothing by doing so. The first produced leaves pretty quickly, while the second one just sat there. A couple of months later, I noticed that the "dead" one had put out a couple of small leaves. It continued to grow, and is now almost as big and hearty as the other.

Subject: Priming Sugar

Priming Sugar

Aaargh.

I've got a batch of Pale Ale burbling away nicely in my closet (no geyser this time). But, while making plans for bottling it this week, I've discovered that I forgot to order priming sugar when I mail ordered my ingredients. Normally this wouldn't be a problem, I'd run out to a friendly neighborhood homebrew supply store and just buy some. Only two problems with that: 1) There isn't one in my neighborhood; the nearest 40 miles away and 2) some pinhead decided to plow into the side of my car so I'm without transportation.

So, I was wondering if corn sugar was available in any other type of store that might be closer by (it's a lot easier to mooch rides when you don't have to go far), or if I could use cane sugar to prime. Anyone have any suggestions? I'm finding it hard to RDWHHB without my car.

From: cmilono@netcom.com (Carlo Milono)
Subject: Brewing Variables

There are several aspects of brewing that are escaping me, and I would love to understand the process better.

If I take the exact same ingredients and in the same proportions, I notice that there are many ways to manipulate the final product. In some cases, the body and perceived alcohol content differ widely.

Here are some of the topics I'd like to understand:

- 1) Affect of thin vs. thick mash
 - different enzymes are activated (like pH changes??)
- 2) Affect of single step (~153F) vs. Step vs. Decoction
 - Acid Rest->Protein Rest->Starch Conv. (depends on type of malt and style, but what are the processes?)
- 3) Attenuative Yeasts vs. Unattenuative
 - some can't ferment the more complex sugars (sweetness or body?) (which yeasts are which, and are some more than others within a category?)
- 4) Variables to increase/decrease fusel alcohols and/or esters
 - is there a relationship between these two? (re: trub removal)

I realize that I've gotten close to answering my own questions, but I feel my knowledge isn't enough. I want to be able to change the mechanical steps to match particular styles, and ingredients alone are not enough.

Thanks...

Subject: Wyeast London Ale

From: Ray Mrohs
Systems Programmer
Smithsonian Institution

I must say, my first encounter with Wyeast was very 'enlightening'. Knowing what I did about Wyeast (mostly thru HBD), I was very delicate in trying to break the inner packet while, of course, holding down the whole envelope above the bottom seam. All the packet did was squish around the inside of the envelope until I gave it a good whack and then *SPLAT*, the contents shot out the middle of the *SIDE* seam, across the counter and onto our 6-month-old baby girl. After the ensuing carnage (my wife just *happened* to be there watching), I checked the envelope to find a 1/4 inch hole in the seam and the slippery little packet of yeast still intact! I then pinched the envelope between the thumb and forefinger which finally broke the packet. I mended the seam with heavy-duty duct tape and propped the envelope on its good side. The product swelled as advertised and I pitched the following day. Bubbles appeared in the air lock after 24 hours, so fermentation *LOOKS* OK.

My point is, a product with a good reputation can't afford to be compromised by sub-standard packaging. This envelope had a recent production date of FEB 19. Coupled with the number of similar experiences I've read about in HBD and the fact that the problem has existed for so long, it seems that someone in Oregon has not been minding the store (my opinion).

BTW - to keep the Ralph Nadarites at bay - my daughter really didn't mind what happened. I just didn't think her first home brew experience would be so soon!

Subject: Pride of Ringwood hops

Being Australian, I was pleased with the recent interest expressed in this digest in Pride of Ringwood hops. Basically, these are virtually the only hops grown in Australia (with the exception of a few low volume finishing styles such as "Southern Brewer") and are used, as far as I know, in all Australian beers. They are one of the most bitter hops around, but produce little in the way of hop aromas.

Although I live in Wollongong, New South Wales (just south of Sydney) I buy my Pride of Ringwoods from a home brew shop in Tasmania. This is by far the best source of FRESH hops I have found, which is not surprising since virtually all of Australia's hops are grown just to the north-west of Hobart, about 30 minutes from this shop. For those who would like to try this type of hop, the address is
Tasmanian Home Brewing Supplies
179 Elizabeth St.
Hobart, Tasmania, 7000
Australia

Actually this could be quite a bargain for you American brewers, as they sell these hops for \$A2.60 (about \$US2) for 200 grams (almost 8 oz)

I dont know whether they will ship overseas, but they certainly mail interstate within Australia. Not sure about shipping costs either.

As an alternative, I would like to get access to fresh American hops, so perhaps I could come to some swapping arrangement with someone in this digest. Drop me a line if you are interested, and we'll see if some mutually satisfactory arrangement can be worked out.

From: tony@spss.com (Tony Babinec)
Subject: arf asks about lagers and ales

Here are some generalizations about lagers and ales.

A lager is a beer fermented with lager yeast at lager fermentation temperatures and then cold-lagered.

A lager yeast, other things equal, ferments some of the larger molecular sugars. The end result is a slightly more attenuated beer that is less sweet and has a "cleaner" taste.

Lager fermentation temperatures are, say, 45 to 55 degrees. Other things equal, fermenting at these colder temperatures, provided the yeast is capable of it, minimizes production of esters which, if present, would produce "fruity" flavors in the beer. Fermenting at these temperatures takes longer, at least for homebrewers. If an ale can ferment in 3 to 7 days, lagers can routinely take 3 weeks or more, provided you've pitched with an adequate amount of starter. Inadequate pitching, or fermenting at a colder temperature, will prolong this process.

Cold lagering means quietly storing the beer at cold temperatures, say 33 to 40 degrees. This helps smooth and finish the beer, and helps the yeast to drop out.

Another aspect of the "clean" lager flavor is historical. Before yeasts and fermentation were fully understood, brewers would scoop the foam from one batch of beer, throw it into another batch, and keep fermentation going. As lager yeasts tended to be bottom fermenters, they were less likely to combine with or be displaced by airborne yeasts or other strange microorganisms.

An ale is a beer made with ale yeast at ale temperatures which may or may not be cold-conditioned.

Ale yeasts tend not to process some of the higher-weight molecular sugars, resulting in a relatively less attenuated and slightly sweeter beer.

Ale yeast perform best in the range of 60 to 70 degrees, although some can work well at slightly lower temperatures. Especially at the higher end of the range, esters are produced. This also varies by strain of yeast, with some yeasts (Wyeast "American" ale) fermenting "cleaner" and others (Wyeast "British" ale) fermenting fruitier. Homebrewers will sometimes make an ale and ferment with "American" ale yeast in the mid-50s. On the other hand, many homebrewers have no control over temperature, and the kitchen cupboard in the summer can get into the high-70s or more.

Ales can be "lagered," that is, cold-conditioned. This can help drop the yeast out. An example of a "yeasty" ale might be an unfiltered English real ale, while an example of an "unyeasty" ale might be a cold-conditioned and filtered German ale (Kolsch or Alt).

In addition to the above broad generalities, there are hybrid styles. A "Steam," or California Common beer (as "Steam" is trademarked by Anchor) is a hoppy, amber beer fermented with a lager yeast at ale temperatures. Fred Eckhardt describes other hybrid styles, such as Cream Ale.

Most American "industrial" beers are lagers. This in itself doesn't make them bad. They do tend to generally lack flavor, whether the flavor be from malt, hops, yeast, or anything else. One can make intensely flavorful lagers. Without getting into the "Best American Beer" debate, Sam Adams Doppelbock is a good commercial example.

Date: Wed, 4 Mar 92 9:53:47 CST
From: tony@spss.com (Tony Babinec)
Subject: HBU and IBU confusion

HBU is a recipe dosage. You take into account the alpha acid content of the hops when measuring them out for an intended beer style.

IBU is a chemical measurement of the bitterness of the finished beer. Beer styles have accepted ranges of bitterness. In general, you won't know the IBU of your homebrew or a commercial beer without getting a chemical analysis of the bottle of beer.

What happens in between hop dosage and bitterness of the finished beer are things like length of boil, vigor of boil, oxidation of the beer, and so forth.

Taking the above into account, for a given beer, the IBU number is anywhere from 3 to 4.5 times the HBU number.

You have to try a recipe or formulate one with hop additions, make beer using as good a process as you can, and taste the finished product. Then, adjust your hopping up or down.

The Hops Special Issue of Zymurgy has some good articles with formulas detailing how to guesstimate the bitterness of your finished beer.

Subject: Problems with long ferment--WYeast 1056

Hello. I don't know if this is relevant to the discussion, but I had a small problem with 1056 last November (or perhaps December, I can't remember). Anyway, my original gravity was 1.068, but it only fermented down to around 1.028. This seemed somewhat strange to me, but since I had not used 1056 for anything with a higher gravity than about 1.050, I just thought the alcohol tolerance might be low. The beer tastes great, though (maybe a little sweet...). I also made a few cultures of it. The cultures seem to look a little bit different than the last time I cultured 1056, but I can't be sure, because I haven't done it in about a year. Anyway, the yeast seemed to be fast enough, just didn't ferment out as far as I expected.

Subject: Anchor Christmas Ales

To any to all:

Having recently gained access to this wealth of knowledge digest I have decided to seek help on some questions that have been burning in me for some time.

At the risk of stepping on the recipie creators (toes, feelings) does anyone know an approximate recipie for either of Anchor's excellent Christmas ales of 1990 or 1991. That 90 was oh so wonderful. Even if you only have a guestimate of what the special ingredents were I would appreciate your input.

Thanks ... Aaron

INTRODUCTION

This guide is intended to identify the specific areas of knowledge that are required to pass the BJCP exam. It is not intended to teach you what you need to know to pass the exam, but rather to help you organize your thoughts and identify topics that deserve further study. The bibliography can help you locate sources for further information, however there is no substitute for experience.

When you take the exam, be sure to take a couple of mechanical pencils with extra leads (or whatever you like to write with), a big eraser, and plenty of lined paper (I prefer graph paper).

A note on spelling: There are no umlauts in the ASCII character set. I tried using the correct German alternative spelling by putting an 'e' after the vowel. It seems that it is customary in English to simply drop the umlaut, i.e. Kolsch instead of Koelsch, so that's what I did in this document.

INGREDIENTS

You are expected to understand the purpose and effect of the common beer ingredients. You should know which ingredients are appropriate for the various beer styles. You should be familiar with geographic variations in ingredients.

Grains

Hordeum distichon - 2-row barley
Hordeum vulgare - 6-row barley
Triticum aestivum - wheat
Anatomy - acrospire, embryo, endosperm, husk
Carbohydrates - starches & sugars
Tannins
Proteins & Amino Acids
Diastatic Power - strength of enzymes - degrees Lintner
Color - degrees Lovibond

type / degrees Lovibond / degrees Lintner / appropriate styles

Low Kilned Malts (approx 175 F)

6-row Lager1-2 / 100-200 American lagers, pilsner
2-row Lager1-2 / 63-70 lagers
Pale Ale 2-3 / 36 ales
Malted Wheat 3 / 49 wheat beers

High Kilned Malts (approx 220 F)

Mild Ale 3-5 / 33 mild, brown ale
Vienna4 / 30 dortmunder, helles bock, vienna
Munich6-20 / 30 munich

Specialty Malts

Carapils 1-7 / 0 light ales, light lagers
Crystal/Caramel 10-120 / 0 ales, lagers
Chocolate 300-450 / 0 dark lagers, dark ales
Black (patent) 500-1100 / 0 dark lagers, dark ales

Adjuncts

Roasted Barley 500-1100 / 0 stout, dunkel
Flaked Barley
Wheat ales, lagers
Corn light ales, light lagers
Rice light lagers
Oats stout

Hops

Humulus lupulus - cultivated hop
Anatomy - strobile, strig, bracteole, seed, lupulin gland
Alpha & Beta Acids
Essential Oils
Rhizome - root cutting

origin - styletype alpha / aroma

English - British ales

Brewers Gold 5-9 / poor
Bullion 6-9 / poor
Fuggle 4-6 / good
Goldings 4-6 / good
Northern Brewer 6-10 / fair

American - all styles

Aquila 5-8 / fair
Banner 8-12 / fair
Cascade 4-7 / good
Chinook 11-14 / fair
Cluster 4-8 / fair
Eroica 10-14 / fair
Galena 12-15 / poor
Nugget 12-14 / good
Willamette 5-7 / good

German / Czechoslovakian - continental lagers

Hallertauer 3-6 / good
Hersbrucker 3-6 / good
Perle 6-11 / good
Saaz3-6 / good
Tettninger 3-6 / good

Water

Gypsum - calcium sulphate - CaSO₄

Table Salt - sodium chloride - NaCl
Epsom Salt - MgSO4
Hardness - temporary & permanent
pH
Minerals
Ions
Calcium
Magnesium
Sodium
Bicarbonate
Sulfate
Chloride

Yeast & Bacteria

Saccharomyces cerevisiae - ale yeast - 50-75 F
Saccharomyces uvarum - lager yeast - 32-55 F - formerly
carlsbergensis
Enterobacteriaceae - enteric bacteria - lambic
Kloeckera apiculata - lambic yeast
Brettanomyces bruxellensis & lambicus - lambic yeasts
Pediococcus damnosus - lactic acid bacteria - lambic
Lactobacillus delbrueckii - lactic acid bacteria - berliner weisse
Isolating & Culturing

Miscellaneous

Fermentables
Malt Extract
Sugar - corn sugar, honey, molasses, brown sugar
Fruit
Clarifying Agents
Gelatin
Isinglass
Irish Moss
Polyclar
Herbs & Spices & Flavorings
Coriander Seed
Orange Peel
Ginger
Cinnamon
Licorice
Spruce
Chocolate
Coffee
Smoke
Malto-Dextrine - adds body
Caramel - adds color
Vegetables

=====

PROCEDURES & CHEMISTRY

You should be able to describe each procedure, explain its purpose, and describe how it works. You should be able to discuss how a procedure is varied for different beer styles.

Malting

step duration / temperature (F) / comments
Steeping 40 hours / 60 / 40-45% moisture content
Germination 5 days / 60 / modification

breakdown starches & proteins
Stewing/mashing 45-60 minutes / 210 / crystal malt
Kilning 30-35 hours / 120-220
Roasting variable / 390 / dark malts

Mashing

step duration (minutes) / temperature (F) / comments

Milling

Mash-in adjust pH 5.0-5.8
calcium sulphate (gypsum) - pH-
calcium chloride - pH-
calcium carbonate - pH+
Acid Rest - / 95 / pale lager malts
phytase: phytin -> phytic acid
Protein Rest 30-45 / 122-131 / dark lager malts
proteins -> amino acids
Saccharification 20-60 / 150-158
Gelatinization - / 149 / minimum temperature
Beta Amylase - / 150 / slower - less body
Alpha Amylase - / 158 / faster - more body
Dextrinase
Beta Glucanase
Mash-out 5 / 168
Sparging - / 170-180

Brewing

Protein Coagulation - hot break
Isomerization - hop bitterness extraction
Caramelization
Hop Aromatics
Cooling - cold break
Degrees of Extract = wort gravity X gallons / pounds of grain

Fermentation & Conditioning

Pitching - 70-80F
Respiration - lag phase - aerobic - absorb oxygen & reduce pH
Fermentation - growth phase - anaerobic - increase population &
alcohol
Sedimentation - stationary phase - flocculation
Ales - 55-65F
Lagers - 45-55F
Nutrients - oxygen, carbohydrates, proteins, minerals, vitamins
Products - alcohol, water, CO2
Attenuation - reduction of gravity
Autolysis
Gravity & alcohol measurements
Starches & dextrines
Sugars - glucose, maltose, maltotriose, sucrose
Unusual Systems - burton union, yorkshire stone square, lambic

Bottling / Kegging

Priming - corn sugar, malt extract
Krausening
Artificial Carbonation

=====

CHARACTERISTICS

You should be able to discuss the various characteristics of beer. You should be able to describe what causes each characteristic, and how to control it with variations in ingredients or procedures.

Appearance

- Bottle - residue & sediment
- Head - texture & retention
- Color
- Clarity
- Alcohol Legs
- Brussels Lace

Aroma

- Hoppiness
- Maltiness
- Alcohol
- Light Struck - skunked

Flavor

- Hoppiness - bitterness
- Maltiness
- Body
- Carbonation
- Alcohol
- Astringent
- Phenolic - medicinal, bandaid, bubble gum
- Chlorophenol - plastic
- Diacetyl - butter, butterscotch
- DMS - dimethyl sulfide - cooked corn
- Estery - fruity
- Grainy - husky
- Metallic
- Nutty
- Oxidized - stale, papery, cardboardy
- Solvent
- Sour - acidic
- Salty
- Sweet
- Sulphury - yeasty - burton ales
- Acetaldehyde - cidery
- Cooked Vegetable
- Grassy
- Moldy - earthy

Drinkability and Overall Impression

=====

STYLES

You should be familiar with the overall relationship of the various beer styles. You should be able to describe the ingredients, procedures and characteristics of each style. You should be able to give commercial examples of each style.

Ales - top fermenting

German Ales

- Alt - Dusseldorf - DAB Dark, Widmer, Zum Uerige, Zum Schlusel
- Kolsch - Koln (Cologne) - Kuppers, Fruh, Sion

German Malted Wheat Ales

Weizen - Weissbier - South Germany - Paulaner, Hofbrauhaus
Hefe-weizen - sediment - Spaten Franziskaner, Wurtzburger
Dunkel-weizen - EKU
Weizenbock - Schneider Aventinius
Berliner Weisse - lactic fermentation - Kindl, Schultheiss

Belgian Unmalted Wheat Ales

Wit - Hoegaarden, Steendonk, Dentergems
Lambic - spontaneous fermentation - Senne - Cantillon, Belle-Vue
Straight
Fox - young
Lambic Doux - sweetened
Vieux Lambic - aged
Blended - Lindemans, Morte Subite, Timmermans
Faro - young - sweetened
Gueuze - St Louis
Fruit
Kriek - cherries
Framboise - raspberries
Cassis - black currant
Peché - peaches
Muscat - muscat grapes

Belgian Ales

Pale - De Konnick, Palm
Saison - Wallonia - Silly, Dupont
Trappist - monastic - Rochefort, Westvlerten, Westmalle, Chimay
House - single
Dubbel - double
Trippel - triple

Abbey - commercial trappist-style - Corsendonk, Maredsous
Red - sour - Rodenbach
Flanders Brown Ale - Liefmans Goudenband
Strong Golden Ales - Duvel, Brigand, Lucifer
Strong Brown Ales - Gouden Carolus, Pauwel kwak

Biere de Garde - Northern France - 3 Monts, St Leonard

British / American Ales

National - annual AHA & HWBTA competitions
Judging Form & Scoring

=====

EXAMPLE QUESTIONS

The format of the exam is 10 questions worth 10 points each.

Discuss the causes of <a characteristic> in beer.

Describe, relate, and differentiate between <two similar ingredients>.

What characteristics does the brewmaster expect from <an ingredient>, what are the sources of these characteristics and what are the principle means of extraction.

Describe, relate, and differentiate between <three related beer styles>.

Explain the benefits of <a procedure>.

Name two <a style> beers, describe the style.

Describe what happens during <a procedure>.

What is <a style> beer?

Describe the flavor and aroma of <a characteristic>, explain its source and indicate a style of beer where it might be appropriate.

> the hops you use for bittering can make a difference in the flavor.
> The jury is still out on this issue.

At the risk of sounding contradictory, the jury has delivered judgement where I am concerned. Agreed, I would have difficulty discriminating two closely related varieties, such as Hallertau and Saaz, but no amount of boiling will disguise a generous dose of Northern Brewer in a pilsener. Goldings I find to give a very noticeable blackcurrant flavour in light beers. Last year's wild hops smelt wonderful in a dried state, but were overwhelmingly coarse/sickly in terms of flavour.

Subject: Re: Lager, Wyeast

Jack writes:

> I would like to hear from anyone who can describe the difference
between a
> lager and an ale, in terms of the taste.

Ales are inherently fruity and lagers are not fruity. The lower
fermentation
temperatures cause the yeast to produce less of the esters which give
beer a
fruity aroma and flavor. Another flavor component that is acceptable in
small
amounts in ale and not in lager is diacetyl -- a butterscotch flavor (try
Samuel Smith's Old Brewery Pale Ale or Newcastle Brown Ale for a taste of
high-diacetyl ales). (You can try Orval or St. Louis Gueuze as an
example of
very fruity ales.)

> I am thinking in terms of everything else being equal, just what are
the
> effects of cold, long-term lagering on the taste of a beer.

According to David Miller in his book Continental Pilsener, there are
three
major reasons for lagering: "clarification, carbonation and flavor
maturation,"
but adds that the last of these "can be largely eliminated by modern
fermentation techniques," which he describes. He is not very specific,
however, regarding this "flavor maturation." One aspect that is clearly
part of what he calls "flavor maturation" is the reduction of diacetyl.
Part of the "modern fermentation techniques" he describes involve methods
to reduce the diacetyl that is normally produced by the yeast earlier in
the ferment and then reduced by the yeast during lagering. A reduction
in
the creation of diacetyl lessens the time needed to reduce it.

Why not filter in stead of lagering to clarify? Well, Miller addresses
this
also. Filtering will not only remove the yeast, but also proteins which
are
essential to the head retention, body and flavor of the finished beer.
As you well know, American industrial beers don't have any head retention
and little or no body, so filtering is simply part of the process of
making
beer of the American industrial style.

> If one made a batch of beer and lagered half in cold and used ale yeast
at
> ale temperatures on the other half, what would one expect to taste that
makes
> it all worth while?

In my own personal brewing, I don't think it's worth while, but I *like*
the
fruity flavors of ales. I will be brewing lagers this summer in my
fridge
just to see if can brew a lager, but not because they are one of my
favorite

styles.

> Breweries spend zillions to lager so I presume there must be a reason
but as
> most of what they make, isn't worthy of the name beer, I can't help but
> wonder why they bother.

As noted by Miller, modern fermentation techniques can reduce the need to
lager as long, and filtering also reduces the need to lager, so modern
breweries don't need to expend gobs of money to make lager.

> As I keep looking for ways of improving my beer, I don't want to
overlook
> anything but this just seems like lunacy, (sort of like using liquid
yeast).

If you've tried liquid yeast and it hasn't improved your beer from dry
yeast,
then you've got sanitation problems. Switching to Wyeast improved my
beer
a quantum leap -- no longer was it unmistakably "home brewed"... in a
double-blind test against commercial English Ales it held it's own.

> >Every day I give the relief valve a pull and get about a 3 second
blast of
> CO2. The gravity, however does not seem to be changing. The beer
tastes OK.
> Why is it not fermenting out?
>
> I suspect you have unwittingly exploded the myth of "Wyeast purity".
Sounds
> like they cheated on the old family recipe and slipped you a bit of Red
Star.

I think you are directing the blame in the wrong place -- I've never had
a
problem with bacterial infection when I've used Wyeast and a recent batch
made with M&F dry yeast did. If there's a bacterial infection, I blame
environment (dusty basement, etc.) or technique (sanitizing the racking
tube
and then putting it on top of the drier, etc.). This brings up a point I
haven't noticed in HBD: I transfer from kettle to primary and primary to
secondary in my laundry room -- I make it a point to NOT USE THE DRIER
FOR AT LEAST TWO DAYS BEFORE DOING BEER TRANSFER. The dust that gets
kicked up is sure to find it's way into the beer.

> Champaign bottles are ideal for beer for two.
> You can use plastic champaign corks or crown caps on most of them.

Specifically, american beer (and soda) crown caps work on american
"champagne" (sparkling wine, actually) bottles. This brings up another
point I'd like to ask everyone about -- do you know where I can get a
capper and caps to fit Lindeman's bottles (they are a bit bigger than
the american crown cap)?

One could write 10 Mbytes on your questions, and I'm afraid that if I start, I will. These are pretty complex issues. I suggest you pick up the All-grain special issue of Zymurgy (call the AHA at 303-447-0816). There's a great article on Step Infusion vs. Decoction by David Miller in it. Please note that he fails to mention the down-side of the decoctions: boiling the grains will extract tannins from the husks which will increase the astringency of your beer and will cause chill-haze problems.

From: mccamljv@ldpfi.dnet.dupont.com
Subject: Effects of Light on Beer

What exactly is the effect of light on fermenting beer?? I am aware that a 'skunky' smell/taste can be produced if light is allowed to react with a batch of homebrew, but, at what magnitudes?? The reason I am posing this question, is that I successfully brewed my first two batches without any protection from light (ignorance is bliss) and both turned out fine. The batches were allowed to ferment in a glass carboy behind a shower curtain in an unused bathroom with a big window and fluorescent lights. True not a lot of direct light, but plenty of indirect. The brews were a brown ale and a stout, would the dark colors have afforded some degree of natural protection?? I have since fermented with covered carboy's with no taste difference detected. Any response will be greatly appreciated. If enough interest is generated, I will post a summary.

Thanks in advance,

>
> I've discovered that I forgot to order priming sugar ... I was
> wondering if corn sugar was available in any other type of store
> that might be closer by

If you have any dry malt, that's ideal. I think you need about 30% more than corn sugar. Extract syrup also works, but I'm not sure of the proportions there. Just boil some up in enough water to make it pourable, then use like normal.

I regularly prime with (unfermented) saved wort -- works well.

Subject: IBU, AAU's, HBU

On Mar 3, Walter H. Gude <whg@tellabf.tellabs.com > writes:

> Ay, the confusion. As I understand it:
>
> HBUs are # of oz. of hops times alpha acid.
> AAUs are (#oz. * AA) per gallon of wort. (or is it per 5 gal.)
> And IBU are probalby a linear multiplication of AAUs. (i.e. AAUs*
Constant).

Yeah, it's a pain. AAUs and HBUs are the same thing, as far as I've ever been able to tell: ounces X alpha. The problem with it is that it ignores the quantity of beer (eg: 10 AAUs in 5 gallons will taste different than 10 AAUs in 10 gallons). That's my biggest complaint -- it doesn't describe bitterness in a batch-size independent way. (In it's defense, it *is* like saying 10# grain -- in 5 gallons, or 10 gallons?)

I've switched to IBUs because I can compare with known beers bitterness like those listed in Fred Eckerds wonderfully useful (hype!) book, The Essentials of Beer Styles.

I still use AAUs or -- gasp -- ounces when I'm using the hops after the boil, when their bitterness will *not* be extracted. IBUs are meaningless there, because IBUs also depend on the hop utilization based on boiling time.

Hope this helps more than it confuses.

From: Bob Jones <BJONES@NOVA.11nl.gov>
Subject: Pure Dry Yeast?

Would any of you buy liquid cultures if pure dry yeast cultures were available? I know I wouldn't. Why don't someone take the next step and make dry yeast cultures? I would have never guessed brewers would pay \$3.50 for yeast. I suspect we all would pay even a little more for pure dry yeast. Think of the advantages, more stable, higher pitch rates and no breaking pouches. I would venture a guess that Wyeast would be out of business almost overnight. Could it be that complex to take the next step and vacuum dehydrate the pure liquid culture? Sounds like a good side business for someone.

Bob Jones

>whole envelope above the bottom seam. All the packet did was squish
>around the inside of the envelope until I gave it a good whack and then
>*SPLAT*, the contents shot out the middle of the *SIDE* seam, across the

After using Wyeast for around 7 - 10 batches I finally had my first problem and it is just like the problem Ray had in HBD #836 - the inner packet would not break. The problem I feel is that there was too much oxygen in the outer packet, so not enough pressure could be placed on the inner packet. At one point I had my entire weight (140lb) on the packet and nothing happened (I was impressed that the outside packet held), so then I tried to isolate the inner packet at one end and squeeze, but the outside packet broke. Unlike Ray I used the inner packet in a starter - hope there is enough nutrient to get it going!

The Wyeast package I used was dated Jan 1 92 - is it possible the yeast nutrient picked up some sort of infection which made the packet swell a little more than normal or could there have been just a little too much oxygen placed in the packet during manufacturing?

Priming help

Wow. Thanks to everone who responded so fast on corn sugar substitutes for priming. The suggestions came fast a furious for awhile there. Here's a summary in order of suggestion:

- 1) Honey: By far the popular suggestion; sworn by some as preferable in general
- 2) Cane sugar: Some said it would taste a little worse, but not much
- 3) DME: See past "discussions" in HBD about the merits of this
- 4) Brown sugar: Some said this was more appropriate for a Pale Ale anyway
- 5) Molasses: ditto
- 6) Corn Syrup: worth a shot
- 7) Coca Cola: just kidding

As it turns out, the net has come through and someone in my brewing club ("Hey now-") can "lend" me some priming suger (hmm, how's he going to ask for it to be paid back I wonder...). Nice to know the HBD can still show a friendly face.

From: matth@bedford.progress.COM
Subject: Liquid .vs. dry yeast

Greetings all.

The past couple of digests have had Jack indicating he doesn't feel liquid yeasts are [usable | worth it | insert word here]. Other HBD'ers indicated, in their opinions, that Jack can't be brewing *great* beer without using liquid yeasts.

My question (I'm still new at this...)

Why is using a liquid yeast *soooooo* much better?

If you make a strong starter, is there really a difference?

Thanks.

From: abirenbo@rigel.hac.com (Aaron Birenboim)
Subject: Re: Priming Sugar

Chris Shenton suggested that dried malt extract was an "ideal" priming substance. I disagree. I find that you can really taste dried malt extract in the beer. Now, while i like the daste of Dried malt extract (i often eat some while brewing) it detracts from the "clean" finish i like in a beer. Perhaps this is due to addition of trub which is not broken down/racked off/driven off by fermentation. I think corn sugar is far superior for priming.

Chris also mentions that uses saved wort (krauesening (sp?)). I hear that this method usually wins double blind taste tests. I do worry a bit about stability with this method, however, since it may introduce some (less than Dried ME priming) trub. Nontheless, i will be bottling my first krauesened beer this weekend. (its a porter, ,so i will most likely not be able to tell how it effects flavor under all that molasses and choclate malt.)

From: abirenbo@rigel.hac.com (Aaron Birenboim)
Subject: Re: Pure Dry Yeast?

Bob Jones asked why not start making pure, dry yeast? Basicly... why do brewers pay up to \$4.00 for yeast in inferior packaging?

Well.... drying yeast will select the yeast most capable of surviving drying. This is seldom related to which yeast produces good beer. In drying you will be selecting "mutants" capable of survivingthe kiln. Wyeast can culture up from a single cell, test if it made good beer, and the culture up more for market. Selecting yeast with good fermentation properties.

On package breakage: I hav never busted one. I place my palm gently over the inner pouch, then place the other hand on top, and lean into the package CPR style. I also try to concentrate my weight as much as possible on a small area of the inner pouch, so that the outside of the pouch is not shock-pressurized. This is especially important for me since i brew at an altitude of 5000 feet, and most Wyeast packages are slightly swelled to begin with here because of the pressure differential with sea-level.

(well.... i do not know that for a fact, having never seen wyeast at sea level.... but our packages do come slightly inflated here.)

Subject: fruity lager

after reading some comments on the differences between lagers and ales, I have a question. I kegged my first lager in January. It fermented at 48 degrees for three weeks. I lagered it for two months gradually reducing the temperature to ~42 degrees. The beer has an amazing apricot flavor and taste. Given that I didn't add any fruit to the brew, can anyone tell me how these fruit esters were produced?

Recipe:
6-7 pounds alexanders pale malt extract
1/4 lb crystal
2 ? oz. saaz hops
M & F dried yeast

this yeast is not a real lager yeast, but I have not noticed alot of fruity esters in my ales...

thanks

--*--

Please, keep your personal disagreement(s) with Jack Schmidling out of
the
Digest, Jeff. If you have to argue with him, do it offline. He's entitled
to be suspicious of trendy behavior if he wishes to be ... (-:

Personally, I haven't had any problems with dried yeasts, either. So far,
I've
been using Canadian ale yeasts, and am about to try recycling some of the
precipitated yeast. According to what I just read in this Digest, yeast
that's
sitting on the bottom is less exposed to stray infections, so this would
seem
to be just as 'effective' as buying Wyeast - although Wyeast does seem to
have
a wide array of variations, and this would be worth exploring.

Remember, it's that 'do it yourself' attitude that made America - and the
rest
of the world - what it is today. That applies to the people who created
Wyeast,
and the people who recycle yeasts, and the people who breed them, too,
since
their successes may some day end up retailed by Wyeast. And every person
who

has made the choice to stop buying beer and start buying brewing materials. I don't see how any of us are necessarily better or worse than any others.

<< flame ON >>

Which reminds me ... why must a person be a beer judge to subscribe to the beer judge mailing list ? Isn't that a tad elitist ? Perhaps the beer judges should unsubscribe from the homebrew mailing list, since we have so little to contribute to their omniscient perspective ... (sorry, but that sort of attitude really ticks me off. the mason digest is unrestricted ... why should the beer judges be any less free with their discussions ?)

The techniques reduce, but don't eliminate the need for more capital equipment for lagering (to say nothing of the capital that's tied up in beer that isn't ready yet). At Olympia and at Budweiser(Nashua,NH) it seemed as if half the space was devoted to lagering tanks; Carlsberg has the tanks outdoors (I guess 500 tonnes of beer has enough thermal inertia that they don't worry about the effect of Danish winters).

The direct answer to arf's question comes from the same place as "Why does Wonder Bread sell?". The American public has been conditioned to accept the lowest (least-flavorful) common denominator with regard to many food products ("food products"---that's a hint itself) because that makes it easier for giant corporations to mass-manufacture a uniform product that they can sell without regard to regional or personal variations in taste and with less concern over spoilage. Note that bread and tomatoes are longer-term examples; beer got a shock treatment called Prohibition, which flushed most of the brewers, leaving only the strong and the giants (who ate most of the merely strong).

Actually, this isn't just a lager/ale question; there are lots of microbrewed lagers in this country that are drinkable. But lagering makes it much easier to produce a beer with no noticeable flavor, which is what the marketroid suits are after as a way of keeping "share" in the uniformly blah "market" they've managed to create.

I suppose it's paranoid to write this as if there were an active conspiracy to level ALL our tastes, although it's visible that many firms develop cheap lowest-common-denominator crud then try to convince people that it's really more desirable ("Wonder helps build strong bodies twelve ways!"). Just think of commercial food as analogous to TV, and remember what happened to the Smothers Brothers....

From: YATROU@INRS-TELECOM.UQUEBEC.CA (Paul Yatrou)
Subject: Whitbread yeast questions

Hi all,

Last week my buddy and I picked up a shipment of Whitbread ale & lager dry yeast from our homebrew shop. Each one came in a 700g -- that's right, a total 1.4 kg of yeast!!! -- vacuum sealed foil package (sort of looked like freeze dried Nabob coffee package). We did this because we can't find Whitbread dried yeast in our area (only EDME, Coopers, RED STAR are available). We divided up the yeast and put it in air sealed plastic containers to be stored in the fridge.

Now, is this a reasonable thing to do, or will we end up with 3 lb of mutants? I assume that active dry yeast can be stored in a sealed container in the fridge for a long time without any infections taking place.

My other question is how would you rate the Whitbread ale yeast compared to, say, EDME or Coopers. How about the lager yeast compared to RED STAR lager. (Notice I didn't mention RED STAR ale...)
The Zymurgy yeast special issue has a favourable review of Whitbread and I think so do most of the posts i've seen on the digest, but now that i've got industrial quantities of the stuff I'd like some reassurance!

Paul (no more pitching rate problems) Yatrou.

Subject: Growing hops

Rob Winters asked in 837:

> I'd be very interested in trying out growing my own hops.
> Could anyone post a primer? Sources? Sage advice?

I've read two good books on the subject:

"Homegrown Hops" is a little 98-page self-published paperback by David Beach, a retired Army lawyer in Oregon.

It is (IMHO) simplistic, opinionated, wrong in parts, and incomplete, but it gives you all the basic information anyone would need to start growing hops at home, and for just \$8.00.

"Hops" is a scholarly 233-page hardback reference book by

R.A. Neve, Director of the Dept of Hop Research at Wye. It tells you everything you could ever want to know about the crop at \$59.95

A nice 3rd alternative is the 1990 Special issue of Zymurgy.

It contains most of the information you want at \$8.50.

Probably your best bet, in fact.

I've had excellent luck with the hop rhizomes I've ordered from Freshops in Oregon. The Cascades took off like crazy, but the Hallertauer, Northern Brewer and Saaz were no slouches either, all in the first year. Can't wait to see what happens this year! Give them a call at 503-929-2736. There are probably

other good sources, but that's the one I've had experience with. This month (March) is definitely the time to be planting your

hop rhizomes, so don't delay. Don't know where you're located, but the only caveat I'm aware of is that hops usually don't do their best below 40 degrees of latitude. I'm at 39 and no complaints.

One last point: there is nothing like the feeling you get when you use your own hops in your own beer. Good luck!

Bottom line: plant rhizomes now, give them plenty of sun, keep the bugs down, and enjoy the results.

doesn't
> understand it as explaining color to a blind man.
> ...It really gets your goat that somewhere someone is doing something
right
> and making a living at it, doesn't it?

I'm not a long-time veteran to this digest, but after half a year I know
it's good when it's above board, and it's bad when it sinks to the level
you see in this quote. Jeff, there are PEOPLE on the receiving end of
your messages, and although Jack Schmidling has dished out his share of
flames, he didn't deserve that. The rest of this issue was excellent,
and
both Tony Babinec and Al Korz found a way to explain the difference
between ales and lagers (I understood it, and I'm not blind!). So next
time
you get ready to flame someone like that, keep it private!

P. S. Brett Short---I tried to email you directly and failed (I may need
some
internet help). I'd like to trade some of my homegrown hops for your
PoR...
send me a note if you're interested.

And finally, a question...I have gotten on to the Wyeast bandwagon myself
lately
but I have to wonder about the point Jack made...just what are the
advantages
of liquid vs. dry yeast? I only made three batches before switching, but
they
were all great tasting. I'm sure purity is the main point, but are there
any
other advantages? Send me your responses and I'll post a summary.

that
>sort of attitude really ticks me off. the mason digest is unrestricted .
..
>why should the beer judges be any less free with their discussions ?)

Huh? Who said you had to "be" a judge to subscribe to this list? I am
certainly not a qualified judge, and I am quite intimidated by the study
guide, but I "am" a homebrewer and a subscriber to the list. I find the
discussions to be thought provoking nonetheless, and while I don't have
much to add, I get a lot of useful info out of it.

One thing is certain though, if you have an attitude against discussions
of
"structure", "organization", "standards", and the thought of someone else
telling you your beer isn't perfect, then you wouldn't want to subscribe
to
a list like this anyway. [You should try attending an ANSI or IEEE
standards body meeting sometime].

You may also want to stay away from competitions also, unless you enjoy
paying other people to drink your beer, keep your bottles, and then
deflate
your ego a little [as the baby in Dinosaurs sais... "Again!"].

Lighten up a little.

Subject: Re: Liquid vs. Dry Yeast

>From: matth@bedford.progress.COM

- > *Why* is using a liquid yeast *soooooo* much better?
- > If you make a strong starter, is there really a difference?

Well, as jack and others have pointed out, there is nothing magic about the word "liquid" or "dry". The practical difference to homebrewers falls into two major categories, IMHO <grin>:

- 1) The liquid yeasts available are specific strains with known behavior. If you really want something specific from your yeast, you have a much larger selection to choose from when choosing liquid yeasts. I would no longer brew a weizen without at least some S. Delbrueckii. Therefore I can buy a liquid yeast culture or borrow from a friend, but I can not buy a dry yeast packet with that particular yeast in it.
- 2) The major vendors of dry yeast use economies of scale to produce very large batches and produce it cheaply. As a result of the common methods used, only certain strains of yeast are hardy enough to survive both the drying process and the presumed practice of throwing the dried yeast directly into the wort (a strain on yeast cell walls). Another side effect is that every batch is contaminated to some degree (at least no study has ever found a dry yeast packet with no contamination). This is not necessarily a problem for the home brewer, as our beers are also contaminated from our environment. Some batches are particularly bad and some batches of dried yeast are much better.

Why aren't there more strains of yeast available in dry form and why aren't there purer dried yeast packets? I don't know. I suspect that the cost (entry cost for new producers and cost to change production lines in existing producers) is not seen as worth it, considering the size of the market of homebrewers.

On a tour of the Old Dominion Brewery, outside Washington, DC, Jerry Bailey told us that they spent a very large amount of money for a specific strain of yeast. My notes indicate that it was delivered in a compressed plug about the size of a child's fist. Obviously it wasn't a small amount and it wasn't a liquid culture.

Anyway, until more alternatives appear on the market, getting the right strain of yeast for your recipe involves getting a liquid culture, either from a big supplier like Wyeast or a smaller supplier or a friend who maintains the cultures.

Subject: Re: Liquid .vs. dry yeast

The reason that most homebrewers prefer liquid yeast is that liquid yeasts are usually a purer strain than dry yeast. This has a lot to do with how the two forms are made. I recommend the Zymurgy special issue on yeast for a more detailed explanation.

Personally, I prefer to use liquid yeast. I've made decent beer with dry yeast, but the overall quality of my beers made with liquid yeast is MUCH better.

From: STROUD <STROUD%GAIA@leia.polaroid.com>
Subject: Lemon Beer ???????

This may not answer the question posed about making a "lemon beer", but I thought that it might be of interest anyway:

According to "Reliable Receipts", an 1889 compilation of recipes from the Ladies of the Central Congregational Church in Newtonville, MA, when it comes to beverages, the lemon "surpasses all other fruits." The following fizzy concoction is "reminiscent of a light beer (to keep the gentlemen happy) without containing any demon alcohol."

LEMON BEER

- 2 large lemons (about 12 oz total)
- 1 gallon water
- 2 cups sugar
- 1 cake fresh yeast

Slice the lemons thinly. Heat the water to 110 degrees F. in a large stockpot. Remove from the heat, add the lemon slices and remaining ingredients and stir to dissolve the sugar and yeast. Cover and set aside at room temperature overnight. Serve over ice.

Makes 1 gallon.

Good luck (maybe this could be turned into a real beer by replacing the sugar with malt),

From: synchro!chuck@uunet.UU.NET
Subject: Budvar

I won't type the whole thing in, but here's a few paragraphs from an interesting article.

Reprinted without permission from the March CAMRA What's Brewing:

*** START OF REPRINT ***

EXCLUSIVE: Budweiser seeks stake in Czech rival

US GIANT IN BUDVAR BID

by Roger Protz

The world's biggest brewer, Anheuser-Busch of the United States - producer of the international Budweiser brand - has told the Czech government that it wants to buy a 30 percent stake in the rival Budweiser Budvar brewery when it is privatised.

The two beers and their conflicting trade marks have been deadly rivals for almost a century. Courts have been kept busy for years deciding which brewery could sell its beer under the Budweiser name.

Now Anheuser-Busch, which owns 12 breweries in the US and produces 90 million barrels a year, has moved to end the conflict by building a bridgehead in Czechoslovakia.

John N. MacDonough, executive vice-president for marketing with Anheuser-Busch, outlined his company's proposals in London last month following a visit to the Budvar brewery.

A 30 per cent holding in Budvar, he said, would allow the Czechs to expand capacity, currently 300,000 barrels a year.

Anheuser-Busch would also help the Czechs market the beer internationally. MacDonough said he believed Budvar had great potential world-wide. The two companies were cooperating to sell the beers as "Budweiser Budvar" and "Bud" in Europe.

The US giant would even help Budvar sell the beer in the United States with "certain label modifications".

"We can sell American Bud to Mexico and Japan but it's more difficult in Germany and the rest of northern Europe," MacDonough said.

"It's like trying to sell white wine as red wine - Europeans want a full-bodied beer and Budvar is just that."

The Anheuser-Busch proposal is just one of many that the Czech government has received concerning Budvar.

Forty-two companies, including firms in Austria, Germany, and Japan, have also expressed an interest in either buying the Czech company outright or taking a holding in it. John MacDonough claimed that his offer was the "preferred bid" in Czechoslovakia.

The Budvar brewery would neither confirm nor deny this but a joint letter from the two breweries to the Czech government said that Budvar "evaluates the offer of A-B as the priority offer" among all those submitted.

(the article then lists 8 guarantees from A-B to the workers and management at Budvar - CCC)

John MacDonough stressed that Anheuser-Busch would not attempt to put pressure on Budvar to shorten the lagering (conditioning) time of their beer - currently 12 weeks - or to use cheaper ingredients.

Budvar is an all-malt beer that meets the requirements of Germany's "Pure Beer" law. American Budweiser uses rice as well as malt in its recipe.

"Our intention is to help make Budvar one of the strongest brands in Europe," MacDonough said.

Negotiations are expected to continue for some time before a final decision is made by the Czech government, which is privatising all former state-owned industries.

*** END OF REPRINT ***

Elsewhere in What's Brewing, they editorialize that the tone of the offer sounds more like A-B wants 100% of Budvar, not just 30% as they claim. Certainly some of the promises that A-B is making require more than 30% control to guarantee. As you might expect, CAMRA is not in favor of a small traditional brewery like Budvar being absorbed by a giant like A-B.

While I agree on principle, I must admit that the idea of getting Budvar over here is attractive.

I was looking for a source for hop rhizomes in Canada (just to avoid the hassle of having them shipped across the border, and the delays that that would bring). I'm in Ottawa - does anyone have any information about local sources?

> This month (March) is definitely the time to be planting your

You must be at 39 degrees if you can plant things in March. We still have 18 inches of snow on the ground here. I would appreciate hearing from any northern hop growers about how to grow hops around here.

Email please, as I am off skiing for a week in Whistler, and might have to (shudder) delete the HBDs unread if I get too much work related email.

Subject: HB virgin

Hi all you homebrewers out there in seventh heaven. Let me introduce myself.

I'm Jack St.Clair from Folsom City California (that's CITY folks, not PRISON)

and I just recently discovered Homebrew while browsing the BB. I thought I'd

died and gone to heaven. WOW! Well, since I've already implied that I am a

real virgin at homebrew and am ready to take the plunge I have a million questions that need answers. Like, What's a carboy? Anyway, I'll list a few

here and hope some of you respond.

1. Does anyone have a comprehensive bibliography on the subject that they are willing to share?

2. How can I obtain a subscription to Zymurgy?

3. How do I get started?

4. What's a carboy?

5. Is there anyone in or around the Folsom City area that would like to share

their experience with a novice?

Thanks in advance homebrewers. I look forward to hearing from one and all.

P.S. Also looking forward to my first homebrew.

From: oconnor@ccwf.cc.utexas.edu (donald oconnor)
Subject: liquid vs dry, ale vs lager

for those who are still debating the value of liquid vs dry yeast, a couple of facts are worth noting.

Not a single winning beer at the 1991 AHA national used dry beer yeast. two, barley wine and stout (which is more of a barley wine than stout) used dry champagne yeast. All others, about 20, used liquid yeast cultures and most of those were Wyeast. it's interesting to note that the percentage of winning beers using liquid yeast has grown steadily every year.

dry yeast always have some bacteria and/or wild yeast. aaron b. essentially stated why this is so yesterday. in simple terms, if you start with a pure liquid yeast culture and muck around with it (i.e., dry it), it will no longer be pure. It's very important to note that the zymurgy article that ironically is referenced by the dry yeast advocates, clearly shows that only the liquid cultures are free of bacteria and that all dry yeasts including whitbread have bacteria.

this does not mean that you cannot make good beer with dry yeast. if the level of bacteria is low and you take measures to minimize their growth such as lowering the temperature, then you can make good beer with dry yeast. but all other things being equal, you will never make better beer with the dry yeast rather than the liquid.

I'm sure there are some who will argue that POWDERED MILK IS BETTER THAN THE LIQUID STUFF, TACK IS BETTER THAN BEEF FROM THE BUTCHER, TANG IS BETTER THAN FRESH SQUEEZED ORANGE JUICE, INSTANT COFFEE IS BETTER THAN FRESH GROUND, AND PERHAPS, YOU CAN IMPROVE THE FAMILY DOG WITH A TRIP TO THE TAXODERMIST.

the responses regarding ales vs lagers have been quite good. a couple of points have been left out of the discussion however. one reason lagers are so popular with breweries worldwide is the essentially competitive advantage they have over ale yeast. lagers can eat sugars at low temperatures while ale yeast and bacteria generally like warmer temps. prior to pasteur, brewers didn't know what the hell was going on. they were just glad to make good tasting beer with lager yeast rather than sometimes good tasting with the ale yeast.

it is also worth note that lager yeasts will make good beer at ale temperatures. as someone mentioned yesterday, Anchor is a good example. generally, all good beer yeast will make good beer below about 75F. ales essentially shut down around 55-60 while lager yeasts will keep on working down to 40 or so. some of the confusion about lager vs ale lies in the fact that lager means to cold age or some such thing in german, while at the same time lager yeast is a different critter than ale yeast.

From: chad@mpl.UCSD.EDU (Chad Epifanio)
Subject: yeast growth

Hello all,

I have an observation/question on yeast growth. I once made a batch of barley wine with Williams English Brewery Ale yeast, with cultured Sierra Nevada yeast added after a week just for fun. Last week on a whim, a friend and I streaked out several strains of yeast on agar plates. We streaked Williams American Lager, Bavarian Ale, Wheat, and the English/Sierra Nevada Ale mix. All were taken from bottle sediment. What we saw was that the English/Sierra Nevada grew MUCH faster, say 3-5 times faster, than the others. We mixed up ~5 fl.oz. starter and added it to a batch of pale ale this weekend. It was at full krausen within 6 hrs, where usually I don't see full activity until about 12 hrs after I pitch. I'm sure plating it out and getting a healthy colony had much to do with it, but has anyone else experienced this quick growth with either English Brewery ale yeast or Sierra Nevada yeast?

Just wondering,
Chad Epifanio

Date: 06-Mar-92 Time: 01:55 PM Msg: EXT03014

HI folks,

I have made 2 (count 'em 2 :) batches of beer, both of which were (if I say so myself :) wonderful. However, both had this sort of "tangy" taste at the finish of your swallow. Not really an aftertaste, sort of a before the after taste. Friends who brew a lot and who drank the beer think it might be either from not using all-grain or from using dried yeast. Opinions? (this might be an incentive for using liquid yeast, or doesn't it make a lot of difference until you go all grain?)

From: bliss@csrd.uiuc.edu (Brian Bliss)
Subject: wyeast

The main advantage of liquid yeast is that strains can be used which cannot withstand the stress of dehydration, as mentioned in the previous digest. As for why there is only 80 ml of wort into the standard wyeast package, I don't know - I wish there was more (which would require a substantially larger outer package in order to keep CO2 pressure from exploding it).

The best method I've found for breaking the inner pouch is to take a beer bottle with a slight concavity in the bottom, and place it directly over the inner pouch, and strike the top with your free hand. This concentrates all the pressure on the inner pouch, without placing undue pressure on the outer pouch.

I've found that the different wyeast strains produce a variety of different flavors, many unattainable with any dry yeast I've used, and that most of them are more attenuative than any dry yeast, at least when they aren't recultured.

However, I concur with Jack S. and personally believe that wyeast "purity" is a myth. My first package was an english ale yeast, and the starter went sour. I ordered another (dated the same), and by the time it arrived (2 days max w/o refrigeration, during april), the outer package had already swelled completely up, but the inner one was unbroken, and the package was obviously infected.

I just lost an entire batch of hefe-weizen to an infection that I believe came directly from the wyeast wheat beer yeast, though in this case it could conceivably have been my own sanitation problem. In any case, ALWAYS make a starter when using wyeast, and taste a little to make sure it isn't sour before pitching. With such little food for the yeast, which is kind of weird tasting in its own right, sometimes it is hard to taste whether or not it is slightly sour when you first cut the package open. I try to always have a package of good old dry whitbread ale yeast laying around in case the beer is already brewing and the starter is sour - I've never lost a batch to whitbread ale.

I just wish that wyeast would make larger packages, so there would be no risk of contamination from my kitchen when making a separate starter. Of course, if they did, and you tasted sour results, you (and wyeast) wouldn't have your kitchen to blame it on.

Apologies to those who think the stuff is the greatest thing since sliced bread; when it works, it works well, and hopefully we can all agree on that...

From: richard@pegasus.com (Richard Foulk)
Subject: malting?

Has anyone here done any malting? The local feed store sells whole barley for \$.30 per pound and it looks okay to me.

I'm not into copying beer styles exactly or anything like that so I'm not too worried about perfection, specific barley strains, or anything like that. (I usually brew from extract, btw.)

The question is, can I make my own malt fairly easily, and can I brew good beer from it? Any tips, hints, pointers would be most appreciated.

Thanks.

From: Conn Copas <C.V.Copas@loughborough.ac.uk>
Subject: Hop cuttings; Re : ales vs lagers

Is anybody in the UK purchasing hop cuttings, and if so, where ? The brewing books mention a couple of research organisations. Secondly, anybody know a supplier who carries retail amounts of Cascade ?

On the ale/lager issue, I always understood cold clarification was directed at protein, not yeast, due to the traditional use of undermodified malt in lager. One of the modern variations has been to employ better modified malts in all beers except those containing a high proportion of unmalted adjuncts. One possible offshoot of lagering is what M Jackson terms 'cellar character', presumably referring to a minor and desirable yeast autolysis note.

From: John Dilley <jad@aspen.iag.hp.com>
Subject: I'm beginning to worry ...

I just racked a batch of steam beer I'm making, using The Sun Has Left Us On Time Steam Beer recipe from Papazian, and I'm getting real worried. It's kind of early on a Sunday morning to have a homebrew but since I need to relax, perhaps I should ... :-). In this batch I tried WYeast California Lager liquid yeast (recommended by the brew shop for a good steam beer). This is my first experiment with liquid yeast. The primary ferment went OK but it took a while (nearly 24 hours) to get started (I popped the yeast packet 24 hours before brewing, and it had swelled up nicely). Now, three days later, the primary seems to be done. The gravity dropped from 1048 to 1020 and bubbling has ceased. But when I took the last gravity reading I noticed that the beer had a very bad odor. I'm worried that it may have spoiled. I can't describe the odor exactly -- it's not like vinegar or sour milk or anything else I recognize. What I'm wondering is whether others who have made this type of beer or used this type of yeast (at room temperature for the primary fermentation) have noticed a similar odor -- I'd love to hear that this is normal. I'm afraid I'll hear that I've just learned the smell of sour beer. This was a pretty expensive batch, and I'd sure hate for it to be my first bad batch. Any wisdom from the net will be appreciated. Best regards,

-- jad --

Subject: Lager, Wyeast,

To: Homebrew Digest
Fm: Jack Schmidling

For once, I counted ten before sending my knee-jerk response and I would like to thank all those who sent me mail and/or objected publicly. I have therefore edited my response to address the issues and not the person.

There is however, one personal issue that must be dealt with and it might as well be in public because I assume many people are thinking along the same lines as I am.

Jeff Frane has been the most vociferous advocate and promoter of liquid yeast and Wyeast in particular. He has recently made it known that he is a consultant for and writes technical manuals for Wyeast and therefore has a de facto vested interest in promoting the product.

This can be taken as a "caveat emptor" or an opportunity for Jeff to defend himself.

..... On to the issue....

It is obvious from reading the many and varied responses to my question, that the tastes are highly variable, to the point that ale can be made to taste like lager and vice versa. Therefore tasting different brands of the two styles to get the feel is utterly useless. That is why I asked for experience from anyone who has conducted experiments using the same batch of wort but different (ale/lager) yeasts and fermenting temps.

>From: korz@ihlpl.att.com

>If you've tried liquid yeast and it hasn't improved your beer from dry yeast, then you've got sanitation problems.

There are a zillion alternative iterations to that statement not the least of which is just what is meant by "improved".

> Switching to Wyeast improved my beer a quantum leap -- no longer was it unmistakably "home brewed"..

I can say the same for switching to Edme. It proves nothing other than that there was something wrong with what we used before switching.

>>>Every day I give the relief valve a pull and get about a 3 second blast of CO2. The gravity, however does not seem to be changing. The beer tastes OK.
Why is it not fermenting out?

>> I suspect you have unwittingly exploded the myth of "Wyeast purity". Sounds like they cheated on the old family recipe and slipped you a bit of Red Star.

>I think you are directing the blame in the wrong place -- I've never had a problem with bacterial infection when I've used Wyeast and a recent batch made with M&F dry yeast did.

The author of the original article said that he paid careful attention to sanitation and that usually leads one to suspect the yeast.

> If there's a bacterial infection, I blame environment (dusty basement, etc.) or technique (sanitizing the racking tube and then putting it on top of the drier, etc.).

That is all, no doubt true, in general terms but you can not rule out the possibility of the yeast being contaminated, no matter how hard liquid yeast promoters try.

>From: Bob Jones <BJONES@NOVA.llnl.gov>

>Would any of you buy liquid cultures if pure dry yeast cultures were available? I know I wouldn't. Why don't someone take the next step and make dry yeast cultures? I would have never guessed brewers would pay \$3.50 for yeast. I suspect we all would pay even a little more for pure dry yeast. Think of the advantages, more stable, higher pitch rates and no breaking pouches. I would venture a guess that Wyeast would be out of business almost overnight. Could it be that complex to take the next step and vacuum dehydrate the pure liquid culture? Sounds like a good side business for someone.

Probably a bit more than a side business but that is the only point I ever tried to make in my original debate on the subject. But all it generated was the same kind of rhetoric one gets talking about the quality of Japanese vs American cars.

The standard answer is that the desirable strains are not capable of surviving in the dried state.

My standard retorts are that people died from pneumonia before someone came up with penicillin and we don't let Bud tell us what beer should taste like, why should we let promoters of liquid yeast? If one likes the taste of beer

made with Edme, telling him that his process is unsanitary, is not very productive.

Finally, to avoid unnecessary dialog, I have no particular opinion on the various yeasts available (excepting Red Star) other than that the proof of the pudding is in the eating. Anything said for a liquid culture COULD be true for a dry culture and that is what my position has been all along and Jones comes very close to putting the discussion on the appropriate track.

.....

That was the end of my original posting sans about two pages of counter flame.

To amplify and discuss some of the thoughts put out today, I will address the predictable argument about the impossibility selecting for dry packaging.

Examples are too numerous to list, of successful selective breeding for multiple characters.

Just take corn for example. Native corn, was/is about one inch long, had a few dozen tiny kernels, grew in a limited climatic range and the production would be measured in tortillas per acre, not bushels.

Producing a yeast with the appropriate characters for beer and at the same time maintaining viability during drying is a trivial problem compared to what agronomists have done with corn.

It is particularly trivial in light of the fact it takes a year to produce a generation of corn and only minutes or hours for yeast. My guess is that it could be done in less than a year. My experience with Edme would lead me to believe that it already has but that is a different subject.

So why, if it is so easy, has it not been done, if indeed, it has not?

The largest users of dry yeast are bakeries and home bakers who apparently get by with the product that is available.

The largest users of brewers yeast are of course, commercial brewers. Because of the vast quantities they use, they typically produce their own yeast for production purposes. Because of the continuity of their process, there is nothing to be gained by drying the yeast. It is simpler and cheaper to use it in the liquid form.

The homebrew market simply has not motivated the companies currently in the

dried yeast business (so we are told by the promoters of liquid yeast)
to
produce the equivalent of a pure liquid culture.

>From: smithey@rmtc.Central.Sun.COM (Brian Smithey)
>Subject: Yet another Wyeast problem

This is a familiar enough subject line that if it was MY company, I
would do
something about it FAST!

If they are too small to deal with a sophisticated package, they ought
to
simplify it.

If it were MY company, I would ship it in two packages. The culture in
one
and the nutrient in another.

It may feel good to contemplate that nice sterile environment for mixing
but
if it doesn't work reliably, it's worse than not working at all.

They could sell the nutrient by the gallon and the user would simply
sterilize a quantity when ready to use. They could also just tell the
user
how to make an appropriate medium and eliminate the problem entirely.

That's my advice Jeff. No charge this time.

End of HOMEBREW Digest #839, 03/09/92

Date: Mon, 09 Mar 92 08:43:00 CST
From: Fritz Keinert <keinert@iastate.edu>
Subject: The German Beer Market

Chuck Cox' posting about A-B's activities in Czechoslovakia was very interesting. In the same vein, here is a brief summary of an article from "DIE ZEIT", a weekly German newspaper. (I get the overseas edition).

About a month ago, in the business section, they talked about the effects of opening the German beer market a few years back.

The fear was that cheaply produced foreign beers would flood the market and crowd out German beers. In reality, nothing happened for a long time.

Now, several years later, a foreign beer is taking over a noticeable share of the market for the first time. The winner is ... Corona. Apparently, this has nothing to do with flavor, but goes hand in hand with a current boom in Mexican restaurants and vacations in Mexico. Corona did not even advertise in Germany.

At the same time, foreign breweries are entering the German market from an unexpected direction: several large breweries have either bought or subcontracted with existing German breweries. These German subsidiaries produce versions of their parent companies' beers according to the Reinheitsgebot, for sale in Germany. The breweries mentioned in the article that have done this so far are Foster (Australia), Carlsberg-Tuborg (Denmark), Grolsch (Holland), and Guinness (Ireland).

The world's largest two breweries are about to do the same: Anheuser-Busch (USA) and Heineken (Holland). From what Chuck says, A-B might be taking the Czechoslovakian road instead, but as big as they are, I would not be surprised if they also bought a German brewery (or two or three).

>From what I understand, Bud and other brands vary from state to state here, too, and between the USA and Canada, so this approach is really nothing new. Still, a Bud with actual flavor, brewed according to the Reinheitsgebot...?

Subject: Re: HB virgin, Recipe: Honey Ginger Beer

In HBD # 839, jack.stclair@amail.amdahl.com ("HB virgin") writes:

"4. What's a carboy?" -- finally, a question I can answer!

The American Heritage dictionary defines it as "A large glass or plastic bottle [...] often used to hold corrosive liquids." Of course, we homebrewers hope our beer isn't considered a corrosive liquid! A good example of a carboy is a glass or plastic water cooler bottle (don't get caught "borrowing" one ;-)

Jack, seeing as you are just starting out, you might want to try the following recipe. This is also a good basic beer for those ready to move up from a "kit"... easy to make but much more rewarding!

HONEY GINGER BEER -- from BEER & WINE HOBBY'S RECIPE OF THE MONTH, MAY 1991

Ingredients Listing (US Measurements)

=====

1 Can John Bull Malt, Light-Plain (Unhopped) 3 Oz Diced Ginger
1 Oz Hallertaur Hop Plugs Liquid Finings
3 Lbs Honey 1 Cup Priming Sugar
Glenbrew Yeast

Their Directions

=====

"Boil malt and hop plugs for 30 minutes at very low simmer. Be sure to tie hops into straining bag so it can be easily removed. After 15 minutes of boil add diced ginger root. Continue to boil for the balance of 15 more minutes. Remove ginger. In primary fermenter or single stage fermenter add 3 lbs. of honey and pour hot liquid over it. Make up balance to yield 5 gallons. When cooled add Glenbrew yeast (this yeast is made for a specially dry fermenting brew). Starting SG 1040 finish SG 1004. 24 hour prior to bottling add 1 Tablespoon of liquid finings per gallon. Proceed with bottling as usual.

"This makes a most delightful summer beer, with a slight ginger taste, and a wonderful mellow ginger aftertaste. Chill and enjoy!!"

My Preparation Notes

=====

Started with 1.5 gals cold filtered water in stockpot. Added malt extract and began heating. At steaming, added hops in straining bag. After 15 minutes, added diced ginger (actually, slices about as thick as a nickel -- I wanted the surface area increase). Continued simmer for 15 minutes. Meanwhile, added 3 lbs honey to fermenter (using some known weights, a fulcrum and a bit of mechanics, then measuring the results, I figure this is about 40 Oz liquid measure). When simmer completed, removed ginger and hops bag, and poured hot wort into fermenter (7 gal glass carboy). Added cold filtered water to make 5 gals. Pitched yeast at about 80 deg F (I needed to go to bed, this took about 7 hours -- next project: wort chiller!). Forgot to take

initial SG reading.

Fermentation Notes

=====

Used closed fermentation with blowby tube. Fermentation took ~7 days. Light (0.5 inch) top foam layer initially, tailing off to zilch in about 1 day. Good fermentation activity... added 5 pkgs VINBRITE liquid clearing agent (they were out of liquid finings when I bought everything) 1 day before bottling. Terminal SG 1008 (pretty close!)

Bottling

=====

Racked to plastic (Nalgene) container... boiled 1 cup corn sugar in 3 cups water and added to container, stirring well to mix. Bottled into 54 std "long necks". Aged in the good old cellar... dark and cool!

Reviews/Comments

=====

Taste good/light. Very clear, with a golden brown to red color. Slight "apple" smell upon opening, but no fruity taste... just a clean ginger flavor. Good head and strong carbonation (I think I'll back off a bit on the priming sugar next time). Improved with age, 5+ weeks later it was great, still getting better 4 months later (but only 4 btls left!). No chill haze. Medium alcohol content. GREAT with asian foods (tasted similar to Tsing Tao, but better).

I wanted to make something that would be well received by my "light beer" drinking friends, without having to do all the work of a lager. You know the type -- you brew a great english bitter, they bug you for a glass, you let 'em taste it and then they ask you for a Bud... this has been my fastest moving batch to date, due to the populist appeal. And no one's asked for a Bud yet!

I think I'm going to experiment a little with some fresh rosemary in the next batch, in place of some/all of the ginger... we'll see how it goes!

Subject: starters

Howdy,

My question is, why are starters necessary & what benefits do they provide?

If the medium in a starter is wort, I don't understand what is different about the smaller quantity in a starter that is preferable over 5 gallons in a carboy? Is this only something to do when you are trying to increase the amount of yeast before pitching?

TCJOH recommends re-hydrating dried yeast to improve performance, and John Decarlo mentioned "a strain on yeast cell walls" when pitching directly into the wort. What does re-hydrating in sterile water do that your wort wont?

Thanks,

Alan

Subject: Kathy Ireland

This weekend I saw Kathy Ireland doing a Bud commercial. At least I think it was Bud. It may have been Miller or Michelob. I was so shocked at the sight that the details elude me. Anyway, how can she go from the cover of Zymurgy to the this? Has she no shame? I guess this is just another sad example of selling out to commercialism. The real question is who's next? Will we see Charlie Papazian doing Pabst promos? Or Michael Jackson marketing Miller (the beer)?

From: jmiller@anubis.network.com (Jeff J. Miller)
Subject: Using whole leaf hops

As my frozen harvest of hops from last year nears its end, I had noticed that it was taking more to get an equal bittering. After dissecting the spent hops from a previous brew I noticed that many of the glands were still untouched by the wort (this after a greater than 1 hour boil!).

So this weekend I took more hops out of the freezer and put them in the food processor. Great smell and it put the zest back into the hops.

Now all this might seem obvious, but sometimes its easy to overlook the obvious. For all of you thinking about growing hops this summer, you may want to remember to chop them up (just) before using them.

Subject: yeast debate

from today's posts on the digest, i gather that most people now accept the merits of liquid yeast vs dry. there are a diminishing few such as jack who are still burning the torch for dry. most of his posting today was of the "Is too! Is not!" variety. There was one argument he made though that I've heard quite often that i'll address. Jack points out that home bread makers and some bakeries use dry bread yeast. this is true. however, the best bakeries (e.g. those fancy-pants french places) do not. well-trained pastry chefs do not use dry yeast from the store. they buy and culture their own yeast for the same reasons that we use liquid yeasts, quality.

jeff franes flame of jack last week was a bit much and i wrote him privately to express that. however, the spanking he took on the digest the following day seemed a bit much and at the risk of offending some, a bit sanctimonious. to many referress will slow the game to a crawl.

Subject: Flavor profiles of roasted malts and barley

Greetings;

Last week I brewed an all-grain scottish ale. The recipe called for 2 oz of roasted barley and 3 oz of chocolate malt. While waiting for the mash to complete starch conversion I flipped through Papazian's and Miller's books to find out what the relative contributions of these two ingredients would be in the beer. Both books made references to color (roasted barley contributes to a reddish color and chocolate malt contributes a brown) however neither discussed flavors much, other than adding bitterness to the beer to complement the hop bitterness I have heard from other HB'ers and through the HBD that roasted barley adds a "dryness" to the beer, hence its use in dry stouts. Can any of you enlighten me on the relative flavor profiles of the various kilned malts and roasted barleys?

The beer I was brewing is supposed to mimic the Eugene, Oregon Steelhead brewery's excellent Steelhead Amber ale, a fine Scottish ale with a deep brown-amber color, lightly hopped, with a biscuit nose and clean finish. If any of you are in Eugene anytime soon you owe it to yourself to try this ale!

Second question: Can anybody recommend a good non-attenuative ale yeast for brewing English brown ales and Scottish ales? I substituted Wy'east British Ale yeast in the recipe as I was unable to get any detailed information from my supplier on the subject.

I'll summarize the responses I get in a future version of the HBD and let you know how the batch turns out. Please send your responses directly to me. Thanks and I look forward to the information.

>
> While I agree on principle, I must admit that the idea of getting
Budvar over
> here is attractive.

Take great care!! The whole point is that, time and time again, bitter
experience shows that when a small traditional brewery gets absorbed by a
giant, within a very short time there is no small brewery, and you can
kiss
goodbye to getting Czech Budvar anywhere - ever. If the small brewery
made
bad beer, perhaps no-one would mind too much, but in this case the beer
they
make is one of the finest in the world - it's a real aristocrat.

Promises mean nothing to these people, they will make them to keep others
quiet and then break them, weeping crocodile tears of remorse, wringing
their hands and pleading "economic necessity", "brewery surplus to
requirements" or whatever cynical euphemism is the trend at the time.

Many of us [in Camra] believe their real aim is to kill off a competitor.
One who brews far better beer and who, rubbing salt into the wound, has
in
many countries the right to the Budwieser name (for the simple reason
that
the Czech brewery is older than the US one). If you think the AB has an
altruistic wish to bring better beer to a wider audience, then you have
had
no experience of the ruthless practices of big breweries in this country
and elsewhere. Your naaivity would be touching if it were not tragic. Far
from supporting it, you should be backing a vociferous campaign to stop
it.

Think about it, if AB really cared for quality beer they would make it
themselves, wouldn't they?

>The liquid yeasts available are specific strains with known behavior. If you really want something specific from your yeast, you have a much larger selection to choose from when choosing liquid yeasts.

This may just be a semantic point but the dry yeast producers probably know with as much exactness the specific strain and behavior they use as the liquid producers. One assumes that they maintain a culture lab to monitor and maintain their process just like the liquid producers.

What may or may not be unknown is what else is in the dry packet besides the desired strain.

No argument about available choices except that if one liked the taste of beer made with EDME, for example, Wyeast could not satisfy him either.

>From: oconnor@ccwf.cc.utexas.edu (donald oconnor)

>Not a single winning beer at the 1991 AHA national used dry beer yeast.

Please realize that this statement at face value is nothing but a self-fulfilling prophesy. When anyone who is seriously interested in competing reads this, he will no doubt switch to liquid yeast for the next contest.

It is also quite possible that judges are so tuned to the taste of Wyeast that they look for it and reject others. If it is used as a standard for judging, the results will be skewed.

It is also quite possible that liquid yeast does indeed produce a better beer but that is not necessarily the only conclusion one should draw from your statement.

>From: richard@pegasus.com (Richard Foulk)
Subject: malting?

>Has anyone here done any malting? The local feed store sells whole barley for \$.30 per pound and it looks okay to me.

It's great fun, very rewarding and easy to do in small quantities. I demonstrate the process and how to make the necessary equipment in my video.

Perhaps one of the "reviewers" out there, who received a free copy would be kind enough to send it on to you.

BTW, I suggest you try sprouting a sample before you plunge into this. I was unable to get better than about 50% germination from feedstore barley and of course, you have no idea what kind of barley it is.

The ungerminated barley will rot and contaminate the entire batch.

From an economic standpoint, you will have to get your barley for a lot less than 30 cents a pound to come out ahead.

From: STROUD <STROUD%GAIA@leia.polaroid.com>
Subject: dry vs liquid yeast; debunking the RS Ale Momily

I know where I stand on the issue of dry vs liquid yeasts: I changed to single cell cultures a long time ago and haven't looked back. Today, I would rather not brew then throw a pack of dry yeast into my wort. I feel that strongly about it. It's not that good beer can't be made with dry yeast, it's just that it's a roll of the dice when you use it, and I'd rather not gamble with hours of my work.

On the other hand, it's a free country and I figure that everyone can use whatever makes them happy. Dry yeast is cheap and easy to use, just like corn sugar. You can make beer with both and learn to like it. Just don't expect everyone else to.

But on to the main reason for this post:

Hidden in the midst of the on-going dry vs liquid (single cell culture) yeast debate is what appears to be a universal condemnation of Red Star Ale yeast. Well, I'm here to come to the defense of Red Star Ale yeast and to break a momily:

Red Star ale is actually a nice, clean somewhat unattenuative yeast. It's the other crap inside the yeast packet that causes all of the problems.

I base this statement on an experiment that I performed for my homebrew club, the Boston Wort Processors, about two years ago. The following excerpt is from Vol. III, # 5 of our newsletter:

To quote:

"Red Star Ale yeast has a very bad reputation among homebrewers. It usually produces a unique banana-y phenolic-clove taste in any beer made with it. This may be desirable in certain wheat and Belgian brews, but is not generally regarded as a positive element in most beers.

Are these characteristics due to the particular yeast strain in Red Star yeast, or are they due to some bacterial or wild yeast contaminant?

THE EXPERIMENT

To answer this question, Sheri Almeda cultured Red Star Ale yeast on agar plates

and isolated four single cell yeast cultures. I brewed a batch of beer and split it into 5 one-gallon jugs. The 5 jugs were fermented with the four yeast cultures and dry Red Star Ale yeast.

THE RECIPE

1 can (3.3 lb) M&F Lager kit (contains 7.5 AAU's)
1.5 lb M&F hopped dry malt (3.8 AAU's)
1 cup firmly packed brown sugar
1 tsp gypsum

The above ingredients were boiled in 3.5 gallon water for 30 minutes, then 0.5 oz of Fuggles leaf hops were added, the wort was removed from the heat, and quickly force cooled.

The hops were strained off and enough boiled/cooled water was added to yield ~4.5 gallons final volume. The bitter wort was racked into 5 one-gallon sanitized jugs, filling each ~3/4 full. The yeasts were pitched (the cultured yeasts had previously been started to give 125 ml of actively fermenting starter and the dry yeast was rehydrated and active) and the airlocks were attached.

S.G. 1.042

The fermentations were single stage for 2 weeks at room temperature.

THE RESULTS

The dry yeast showed signs of fermentation within 3 hours. All of the cultured yeasts showed signs of fermentation within 6 hours.

The dry yeast finished fermentation in ~4 days, the cultured yeasts finished in ~6 days. The dry yeast's ferment looked very opaque, while the cultured yeasts' ferments were very clear with suspended particles.

Approximate final gravities at bottling:

Red Star Dry: 1.008
Culture #1: 1.017
Culture #2: 1.017
Culture #3: 1.020
Culture #4: 1.022

THE TASTING:

The five beers were served blind in random order. Everyone picked out the Red Star dry yeast fermented beer with no problem, calling it smelly, cidery, thin, and phenolic. The other brews were mostly indistinguishable, but were described as clean, sweet, tea-like, full bodied, and 'it doesn't taste like Red Star.'

THE CONCLUSION

I concluded that there is a contaminant of some kind in dry Red Star Ale yeast that is responsible for its aroma/taste reputation. The cultured yeasts'

ferments were very clean, and showed none of the phenolic tendencies of the dry yeast. The final gravities of the cultured yeasts were uniformly high, and it leads one to wonder if this is a very unattenuative yeast.

This experiment also points out the problem with using dry yeast. You just never know what's going to come out of that little packet. Even though the dried yeast was very viable and got off to a fast start, the final product had a contamination problem."

Addendum: It was suggested that a newly cultured yeast is not as active as one that has already been through several fermentation cycles. To test this, I took the slurry from the beer brewed with yeast culture #4 and brewed the same recipe again. This beer fermented from 1.042 down to ~ 1.015, an improvement, but still fairly unattenuative.

So there you have it. The problem isn't RS ale yeast, it's the purity of the yeast. In my opinion, that's also the problem with most dry yeasts. In and of themselves they are good beer yeasts, but they are produced in such a manner that their purity is compr may (aThis may (and often does) cause defects to arise in the final product.

Any comments???

Date: Mon, 9 Mar 92 11:31:11 PST
From: gummitch@techbook.com (Jeff Frane)
Subject: Yeast, Truth and the American Way

Several people have complained to me about the tone of my recent comments to Jack Schmidling. I find it a wee bit ironic to be criticized for flaming Arf, of all people, but I admit to losing my temper. Someone commented that there was a person on the other end of that flame, a fact of which I'm well aware. My disagreements with Mr Schmidling range far and wide, and if one was to read my comments without being aware of discussions in other newsgroups, I suppose they might seem pretty harsh.

So, I will endeavor to keep my temper under control.

Specifically, in the question of my credibility in re: WYeast and liquid yeast in general. As Mr Schmidling should be completely aware, from my earliest postings in HBD I've made no bones about my connection with Dave Logsdon and his company. Other than my earliest posting (which was in aid of Schmidling's "research" on nitrosamines), I started out by asking for requests for inclusions in the WYeast Book of Yeast. I have repeatedly forwarded questions to and answers from WYeast, and I have endeavored to keep people on the Digest and in rcb up-to-date on packaging problems, etc.

Mr Schmidling has previously made a similar accusation: that my boosting of liquid yeasts was a product of this connection and that I had led some sort of bandwagon against his stand on dry yeast. I would challenge Mr. Schmidling to provide some evidence of this, as I have no memory of ever having such a discussion with him, although I've disagreed with him on a number of other topics. I was, in fact, only recently aware that Arf was still using dry yeast.

As far as Mr Schmidling's opinions on the best way to package yeast, I would suggest that having the yeast and nutrient in one package was the whole point! and in fact largely responsible for the success of WYeast. I am also very aware of the huge amount of effort that Dave is putting into correcting the problem with his packaging, a problem that was neither inherent in the design nor of his own doing. He is responding as any good businessman should, repairing the damage as quickly and thoroughly as possible.

Basically, the proof is in fact in the pudding. As someone else has pointed out, virtually every winning beer at the AHA National Competitions was brewed with a liquid yeast culture. This is partly due, I think, to the fact that more experienced brewers are more likely to use liquid cultures, but also to the self-evident fact that liquid cultures are unlikely to be contaminated. It is entirely possible that in a few cases, people's packages from WYeast have been contaminated (although no one ever seems to be willing to concede that they have problems with sanitation in their brewery). This small company ships out thousands of packages a week, and if one or two people mention contamination problems, I would think that was a pretty remarkable record. People who have taken the time to plate out various dry brewing yeasts have reported various, usually high levels of contamination by wild yeasts and bacteria. Which is likely to be better in your beer?

On another, related note:

A number of brewers responded to my query about problems with slow fermentation of WYeast 1056. I spoke with David about this, having had

the same problem myself, and he has done some research. Apparently, 1056 (and one other strain) have a propensity to mutation and some batches of the yeast have gone out with about 20% mutated yeast cells, which has weakened the strain. WYeast has added another level of testing to ensure that such mutated cells don't get into the outgoing product again, and they are attempting to determine the environmental causes of the mutation.

On still another, also related note:

WYeast is considering adding some new strains of yeast to their existing line. These would sell for less money than the current package, and would NOT include a starter. I reiterate: these strains would be in addition to the regular line. I told David I believe there was an interest in such additions, but would like to hear from other brewers. Are their particular types of yeast that would be of interest (I think it's safe to say that lambic mixtures would probably not be on the list)?

Jack, the judging of amateur beers is to compare them against commercial
standards. And, as there are many different strains from Wyeast and
other
labs, attunement isn't the issue. Next week, Goose Island will begin
accepting beers for the national competition. Why not take a few of your
beers there and enter 'em? Then, should you win, you'll have done it
with
Edme dry yeast. Now, can we put this issue to rest for a few months?

From: caitrin lynch <lyn6@midway.uchicago.edu>
Subject: Liberty Ale and W'yeast

About a month ago, I asked for suggestions on how to duplicate Liberty Ale. The following recipe is based on Jim Busch's suggestions. Everyone who replied emphasized dry hopping and Cascade hops. This seems to have done the trick.

5.5 lbs light malt extract
.5 lbs crystal malt
1 1/2 oz Fuggles hop plugs for 60 min.
1 oz Cascade 30 min
1 1/2 oz last 10 min (added in handfuls every 2 min or so)
W'yeast American Ale yeast
1 1/2 oz Cascade whole hops for dry hopping

The brewing procedure was pretty much standard. Fermented from 1040 down to about 1010 in two weeks. I dry hopped it in the secondary for 1 1/2 weeks. Using only whole cascades (apart from the fuggles for bittering), really made a difference in flavour and aroma of the beer. My best beer ever, and IMHO better than most beer available in the local store (cheaper too). I attribute the success of this beer entirely to the use of liquid yeast, or perhaps also merely to changing yeast. Previous brews were marred by a slight tang, which I eventually traced to the yeast (thank you Jack Schmidling). The american ale yeast made all the difference in the world. Everyone should at least try it, if only in the spirit of fun. After all, thats why I brew in the first place.

My next brew will be similar but I am aiming for an English bitter. I plan to use the same recipe, only more bittering hops, and subsituting Kent Goldings for the cascade. I have access to whole K.G.s from British Columbia; are these any good? Should I adjust my amounts? I am planning on using w'yeast london ale, any problems with this yeast?

Thanks to all for helping me make great beer!!

Cheers,
Caitrin

Exactly! With microbrewed beer rising in popularity (and with this
year's
drop in sales of the brewing giants' "product") how long do you think it
will
be before AB or Miller or Adolph Coors, etc. "wish to buy a stake in
Anchor"
or Sam Adams or Sierra Nevada, to name just a few. The U.S. brewing
giants
have the resources to buy up the competition and would rather do so than
compete directly. Too many bean counters telling them that real beer is
a
"fad" or only a "niche" market.

> Promises mean nothing to these people, they will make them to keep
others
> quiet and then break them, weeping crocodile tears of remorse, wringing
> their hands and pleading "economic necessity", "brewery surplus to
> requirements" or whatever cynical euphemism is the trend at the time.

Sadly, the ethics of too many big businesses.

> Many of us [in Camra] believe their real aim is to kill off a
competitor.

> One who brews far better beer and who, rubbing salt into the wound, has
in
> many countries the right to the Budwieser name (for the simple reason
that
> the Czech brewery is older than the US one). If you think the AB has an
> altruistic wish to bring better beer to a wider audience, then you have
had
> no experience of the ruthless practices of big breweries in this
country
> and elsewhere. Your naaivity would be touching if it were not tragic.
Far
> from supporting it, you should be backing a vociferous campaign to stop
it.

I agree with Desmond here. I am against any of the big U.S.
breweries
getting their hands on a brewery that puts out good quality real beer.
Look
what they've done to their own beer!

> Think about it, if AB really cared for quality beer they would make it
> themselves, wouldn't they?

This is it in a nutshell. Time and again we have heard people
describe
touring these megabreweries in awe of their sheer size and resources.
They
easily have all of the tools necessary to produce real beer if they so
desired.
But, remember people, you really want clear, piss-yellow, ultra-light
rice and
corn beer! Their market researchers told them so. People who appreciate
beer
true to its tradition do not exist in these people's minds! I understand
that
Miller produces (produced?) an all-barley beer called "Miller Special
Reserve".
My cousin works for Miller in Huntsville and he said (a year or two ago)
that
they were test-marketing it in larger cities, with the closest to us
being
Atlanta. I saw it advertised the last time I was in Boulder but, with
all of
the known good beer around, I didn't get around to trying it. Anyway, I
asked
my cousin recently if we were likely to see Miller Special Reserve in
Huntsville
anytime soon. His reply? "We're more likely to see the new Ultra-light
beer
they're coming out with". Progress man, progress.

From: oconnor@ccwf.cc.utexas.edu (donald oconnor)
Subject: hop pellets vs whole bitterness

Jeff Miller points out that chopping up the hops will result in more bitterness in the beer (same boiling times). This is consistent with the fact that the %AA utilization is about 15% greater for hop pellets than whole hops for equal boiling times. That is 10 HBU of pellets is equivalent to about 11.5 HBU of whole hops.

Subject: roasted vs black barley

There are 2 'roasted' barley grains (not malted) from breiss. One is called roasted barley and the other black barley. i have been mistakenly using roasted barley to add the dry acrid flavor to stouts for several years. it is actually black barley that is principlly responsible for this. black barley is very dark, much like black patent malt. roasted barley is lighter much like chocolate malt. Chocolate malt adds a dark red hue to beer; i'm not sure what color roasted barley adds, maybe the same.

>go from the cover of Zymurgy to the this? Has she no shame?

Apparently not. Not only was Kathy Ireland on the cover of Zymurgy a few years back, but (hold on to your hats) she is also part owner of the SLO Brewing Co, a brewpub in San Luis Obispo, CA. She is unable to publicly endorse her own business because of contractual agreements with Anheuser-Busch.

Then again, perhaps it's just as well. The thought of a micro with one of the world's highest paid models as part of their add campaign is truly frightening. Leave the bikinis to the big boys.

Subject: mash/lauter tun, Bud

I made a lauter tun this weekend out of a 10 gall. cylindrical water cooler and a stainless steel bowl. I punched about 50 holes in the bowl (be careful, the burred edges are *sharp*, ouch!), and set it on a small inverted plate in the cooler. Too snug to fit in at first, but a cut in the rim of the bowl allowed it to overlap, and then it can be made snug again. It worked great! Pour whole mash and all sparge water right into it, let sit for 10 minutes, and let it drain. Recycle some. What a breeze! Seeyalater Zapap! I've heard that it's possible to also mash in the cooler. How is that done? Seems to me it would be hard to get an even mix, and there's a fairly large space under the strainer-bowl that would be just liquid, no grains. Perhaps that really has little effect? It would be nice to do an infusion/sparge all in one container.....

What is the difference between Budvar, and European Budweiser? I ask because I was just given a bottle of Budweiser from, it appears, Czechslovakia. Budvar is a different beer, yes?

-
>>hope there is enough nutrient to get it going!

>Maybe now the debate can finally be settled -- is the yeast in the
>inner packet or the outer? Geoff, let us know in a few days whether
>or not your "yeast" ferments your starter.

A description of Wyeast in a homebrew catalog that I have (BREWHAUS,
Knoxville, TN) reads:

... "The bag kit contains a small plastic bag of nutrient solution
within a larger bag containing yeast cells in suspension. The yeast
ferments within the large bag when activated by breaking the inner bag
of nutrient." ...

If that's the case, then G.C. must either have a dead batch or bathtub
gin by now. Also, Brian's YEAST was infected with NUTRIENT, and not the
other way around.

Is any confirmation available yet? Someone affiliated with Wyeast would
surely know.

From: John Post <POST@VAXT.llnl.gov>
Subject: No more BudMillCoorschlitz bashing, please!

I've read this Digest for a long time, and have observed the following dichotomy consistently time and time again:

"We as homebrewers try to maintain a persona of casual tolerance of others, both recipes, techniques, and attitudes. However, this persona has the unfortunate habit of loving to hate the large brewers of the U.S."

While I'm not partial to BudMillCoorschlitz myself, nevertheless, these brewers are extremely adept at consistently producing classic examples of North American lagers. This is a recognized style of beer, (and, BTW, VERY difficult for the homebrewer to duplicate), and should be accorded some degree of respect, however slight...

I have toured several breweries belonging to the Big Three, and have always been impressed with the enthusiastic response of brewery personnel when they find out that I'm a homebrewer. One brewery chemist (from A-B, no less!) went way out of his way to help me answer a question, consulting with his colleagues at other brewery locations and calling me back a week later...So much for the Big Brother Brewery attitude so often expressed here...

Just because we make our own beer, doesn't mean we make better beer (Ask a beer judge!). Besides, how many of us guzzled BudMillCoorschlitz like crazy before we figured this homebrew thing out? Think about it!

Flames eagerly accepted. Please forward to post1@llnl.gov.

From: quinnt@turing.med.ge.com (Tom Quinn 5-4291)
Subject: The Professor on shipping beer

The Spring issue of Zymurgy showed up at my house yesterday. Besides having lots of info about the June AHA conference here in Milwaukee, there was a letter to the Professor (Surfeit?) in which the writer asked about shipping beer. The following is an excerpt copied without permission from pages 55-56 of the Spring 1991 Zymurgy:

Writer: ...(1) I recently mailed some samples of beer and mead to a friend.

They never got there. As it turns out, the Mailing Requirements Office got it (because of damage), inspected it and decided that the contents contained "beer containing 0.5 percent or more alcohol content by weight as defined in Chapter 51 of the Internal Revenue Code." Well, I knew it had to be over 0.5 percent, but I didn't know that anything over 0.5 percent by weight was "NONMAILABLE" (their caps). It turns out that neither UPS nor any of the other carriers I've called will take it either. So how does one ship homemade beer, mead, etc.?

...

The Professor: Well, actually, beer is mailable with carriers if it is for

analytical purposes, or if it is intrastate. I know New York and California, for example, have been able to mail order wine and mead, but there are some minor regulations. Doing it interstate is technically not allowed if not for analytical purposes. How are you going to ship your brews to a friend? I don't know how you'll do it and frankly I don't need to be told as long as your friend eventually has the pleasure of enjoying your beer. Shhhh.

...

[end of excerpt]

So I guess they aren't able to offer any practical advice on getting entries to the regional judgments - I suspect they must be very careful about suggesting ways around the regulations. Think I could convince a UPS counter guy that I'm sending this box to Goose Island Brewery for analytical purposes?

Subject: Wyeast used by AHA National Competitions

Quick scenario:

1. 20 people enter a homebrew competition
2. 19 use liquid yeast
3. all 3 winners use liquid yeast

Which of the following is true:

- a. all the winners use liquid yeast
- b. liquid yeast is better than dry yeast

Answer:

- a is true  
b may be true but cannot be determined from the above scenario.

Stop using examples that prove nothing as evidence that liquid yeast is better than dry yeast. It is probably also true that all the winners at the AHA brewed beer and not wine, but this is not evidence that beer is better than wine.

Subject: What helps you in competitions?

>From: tpm@spl47.spl.loral.com (Tim P McNerney)

>Stop using examples that prove nothing as evidence that liquid  
>yeast is better than dry yeast. It is probably also true that  
>all the winners at the AHA brewed beer and not wine, but this is  
>not evidence that beer is better than wine.

Well, this is an ongoing problem, and not related to liquid yeast  
use alone. What about fermenting in glass vs. plastic vs.  
stainless steel? Many winners ferment in stainless steel, for  
example.

Most of these examples show nothing but that more experienced  
brewers tend to win more in competitions and tend to do fancier  
things when brewing. Beginners tend to do things much simpler  
and tend not to win as often. But one would expect more  
experienced people to win more often anyway.

So, how do you determine what is technically better? You do  
studies, with as many factors controlled as possible, and with as  
little known to those tasting the results as possible. Some  
clubs have sponsored these studies, some are done for magazines  
such as \_zymurgy\_. But in general, there is no funding for  
homebrewers to perform these types of studies (any advice on  
applying for a grant to do this?).

In the absence of thorough and convincing scientific studies  
(and look at how much argument there is among the scientific  
community even after some of these studies are done), beginners  
are more likely to just follow the advice of more experienced  
brewer acquaintances or to look at what competition winners do.  
In general, their beer will improve from this advice, but there  
is also no easy way to quantify the benefit from any one  
particular item.

So, proving causality is difficult, but imitating procedures or  
ingredient usage of good brewers is about as good a method as most  
people have of improving their brewing and their beers.

From: srussell@snoopy.msc.cornell.edu (Stephen Russell)  
Subject: More revealing stats: liquid vs dry yeasts

Folks,

I do agree with the sentiment that "if all the winners at the AHA competition used liquid yeast, all that might prove is that all of the participants used liquid yeast." However, here are some more \*complete\* statistics:

1990 Competition (1548 entries)

technique entered placed 1st, 2nd or 3rd

|                |     |     |
|----------------|-----|-----|
| malt extract   | 22% | 20% |
| extract + mash | 27% | 20% |
| all-grain      | 51% | 60% |

|                 |     |     |
|-----------------|-----|-----|
| glass fermenter | 85% | 86% |
| plastic         | 10% | 8%  |
| stainless       | 5%  | 5%  |

|                      |     |     |
|----------------------|-----|-----|
| 2-stage fermentation | 74% | 77% |
| single stage         | 26% | 23% |

|              |     |     |
|--------------|-----|-----|
| dry yeast    | 33% | 16% |
| liquid yeast | 67% | 84% |

(source: 1990 Special Issue, Zymurgy, vol. 13 no. 4, p. 61)

The conclusion upon first seeing these is that liquid yeast is the most important thing you can do to improve your beer, more so than mashing, lagering or fermenting in glass over plastic, although each of these seems to be a "step up".

Now, the caveat here is that more experienced, better brewers tend to use more advanced techniques, so that results attained may be the result of the technique OR they may be the result of the beer having been brewed by a more experienced, better brewer.

To me it doesn't matter, the fact that more experienced, better brewers tend to use a technique is a strong recommendation to me that \*I\* should use said technique. The conclusion is the same.

Besides, the jump from 67% to 84% in liquid yeast cited above is \*tremendous\* evidence that this is a great way to improve your beer. But again, it is only correlation, as statistical types will likely point out.

I don't have the numbers on me from 1991 although they were published. I think the jump in liquid yeast was \*not\* as high, but that was partly because the overall % of entries using liquid yeast jumped quite a bit.

Hope this helps, sorry to beat a dead horse (but note that apologies didn't stop me from posting :-),

STEVE

From: Todd Breslow <V5149U%TEMPLEVM@VM.TEMPLE.EDU>  
Subject: Budvar & Budweiser

"Budvar" and European "Budweiser" are one and the same. To be more accurate, Budwesier is the name of the beer itself, and Budvar is an abbreviated form of (Ceske) Budejovice Pivovar which means simply Budweiser Brewery -- the name of the comapny.

The bottles themselves have the word "Budweiser" in large, orange stylized script. A very nice looking bottle, if I may say so.

One of my best beer experiences concerns the real Czech Budweiser and it makes me absolutely sick to think that AB will someday own the name/factory (I am a fatalist). I think that when a country in an economic situation is facing massive investment from a mega-company like AB that it's very tempting to give in in the name of "broadening markets," etc. If I understand the Czech people at

Subject: which yeast to use

i am in the process of brewing my first batch of homebrew with a recipe that was picked out by my friends as a good starter. i have also just started to recieve the daily homebrew digest off the vax. in recent issues

there has been alot of talk about dry vs liquid yeast. at this point i am using "beer kits" with the package of dry yeast in it. i really dont have an opinion yet on what type of yeast is best(if there is one). my question

is, once you discard the dry yeast package from the kit and start using the liquid stuff, how do you match up your recipe with the liquid yeast other than knowing thats it either lager or ale?

Subject: Maltose Falcons Mafaire Competition

Regional Homebrewed Beer Competition  
Sponsored by the Maltose Falcons Home Brewing Society  
(AHA Sanctioned)

Entry forms, fees, and beer entries due: Friday, April 17, 1992  
First Round Judging: Saturday, April 25, 1992  
Awards Ceremony: Saturday, May 2, 1992  
Fee: \$5.00 per entry  
Send to: Home Wine and Beer Making Shop  
22836 Ventura Blvd., Unit #2  
Woodland Hills, CA 91364

Attention: Mayfaire Homebrewed Beer Competition

All standard AHA categories plus "Designer Beer (no commercial comparison)" will be judged.

Competitors must enter three 10 to 14 fl. oz. unmarked brown or green glass crown capped bottles per entry. You may submit multiple entries within a subcategory, but only one entry per substyle. Entries must include a recipe form and bottle labels attached by rubberband.

For more information, entry, and recipe forms: write to the Maltose Falcons at the above address or call Brian Vessa at (310) 826-5902

From: tom@eng.umd.edu (Tom Riddle)  
Subject: Larger questions / Wyeast starter problem ?

I am attempting to make my first lager and I have a few questions / problems:

1) I made a starter for the Wyeast #2007 (Pilsen) yeast I bought for this batch. The yeast seemed to like the starter, as the fermentation lock was riding high and sediment eventually formed on the bottom of the bottle, but krauesen never formed. When I went to pitch, I tasted the starter and it didn't taste right. I hesitate to say that it tasted sour, but did have a certain tang to it and it sure didn't taste like fermented wort. It may have been a bad move, but I pitched anyway. So my questions are: Did I infect the starter somehow, or is this normal behavior for this strain of yeast ? (I think krauesen should have formed) Did I just make 5gal. of fertilizer ? Do people normally pitch the entire starter, or just the sediment ? Am I worrying too much ?

More details on my procedure and timing:  
On Sunday morning I broke the inner pouch of the yeast package that I bought the day before, which was date stamped Feb. 19. By Sunday evening the package had swollen and was bulging at the seams, so I made a starter by dissolving 3/4c dried malt extract in 1 1/2 qt boiling water and boiling for 45mins. I put about 14oz of this wort in a sanitized 22oz bottle, cooled it, and added the contents of the yeast package, then fit the bottle with a fermentation lock. I then let it sit at room temp until I pitched on Wednesday am.

2) Assuming all goes well with the yeast, should I lager in the carboy or bottles ? Miller suggests the bottle approach, and Papazian seems a little vague on the whole subject, what do other people do ? And if I do lager in the carboy, should I rack to a secondary first ? And how long is a good lagering period, or is it the longer the better ?

Thanks

Subject: Ball valves for 35 gallon kettles

I am designing a modest size kettle of 43 gallon capacity, yielding roughly 35 gallons to the primary. I am looking for relatively inexpensive (< \$20 ) ball valves with inner diameter of at least 1/2 inch, preferably 3/4 inch. I intend to use this as the wort grant to feed a collection of smaller diameter copper tubing to chill the wort. Any ideas? Any ideas on size and flow rate for the chiller?

Any large kettles or fermenters out there? Anyone using V wire screen or perforated sheet? Anyone making high percentage wheat beers using a perforated screen? If so, what diameter are the holes and what spacing between the holes?? So many questions...so little brew.

From: whg@sunfa.tellabs.com (Walter H. Gude)  
Subject: IBU <-> HBU revisited...

About a week ago I asked about HBU to IBU conversion. First of all thanks for the great response. Th summary of which follows:

Josh Grosse (among others) writes:

<paraphrase> HBU's may be estimated as

$$\text{IBU} = \text{HBU} * (\% \text{utilization} / (\text{gallons} * 1.34)).$$

Several sources give the %utilization number as 28% for leaf, 30% for pellet, given a 60 minute boil of "standard" gravity wort (1.040-1.045). Plugging it all in we get  $\text{IBU} = \text{HBU}(\text{or AAU}) * \sim 4.5$ .

While persuing Micheal Jackson's New World Guild to Beer, he references 45 IBUs as extremely bitter. Now my beers with 10AAUs for 60 min. are not overly bitter. Why? Because like most partial mash brewers, I only boil about 2.5 gallons of wort. This means my boil has a gravity of about 1.090 for my "standard" beer. And my utilization is obviously far less than 30%.

Does anyone have a formula for %utilization, incorperating gravity and boil time?

(I understand that this information may be buried in a Lotus 1-2-3 spreadsheet authored by the infamous Mr. Richman.)

As always, thanks for the help,  
Walter Gude

This is almost the same setup I use: a 10 gallon Gott water cooler and a plastic collander which just fits in the bottom (beats the heck out of drilling holes!).

I mash and lauter in it, and I do make sure I mix it up well. Might even be better to add the grains to hot water, instead of the other way around. My brew partner insists he gets better efficiency and a clearer sparge by doing a stove top mash, but I haven't verified his results :-).

Pick up Fred Eckhard's book, The Essentials of Beer Style. It sounds like exactly what your looking for, plus he compares different commercial examples of a given style so you can taste what he's talking about. It's a great resource for designing a beer recipe.

(I'm not associated with Fred Eckhard, blah blah blah...)

From: gschultz@cheetah.llnl.gov (Gene Schultz)  
Subject: Full Sail Golden Ale recipe

In HBD #825 I posted a recipe for a Full Sail Golden Ale taste-alike. (I neglected in the posting to state that the recipe was for Full Sail \*Golden\*, not Full Sail Amber or Brown Ale.) Anyway, I received a number of interesting and helpful responses to my posting. One of the most enlightening of these responses was from someone who had obtained some information from Hood River Brewing Company suggesting that some of the ingredients used in Full Sail Golden Ale are different from the ones indicated in my recipe. The source of this information, which indicates that Hallertau and Tettnanger hops are used in both Full Sail Golden and Amber ales, is a \*coaster\* from the brewery itself. My recipe calls for nugget hops, however, because the \*label\* on Full Sale Golden Ale bottles states that nugget hops are used.

Can anyone help us resolve this contradictory information? I have been told that "Jamie" of the Hood River Brewing Company could do so--does anyone know how to get in touch with him?

Thanks in advance,

Gene Schultz  
Lawrence Livermore National Laboratory  
schultz3@llnl.gov

P.S.--Meanwhile, I just tasted the first bottle of the second batch of ale I have made with the recipe I posted, and the taste is pretty similar (albeit not quite as succulent tasting as Full Sail Golden Ale). My impression is that the Hallertau/Tettnanger hops taste is pretty evident in the \*amber\* ale, but I can't pick up this taste in the \*golden\* ale. I could be wrong, though, and am curious about the outcome of this one...

>Subject: Flavor profiles of roasted malts and barley

> Last week I brewed an all-grain scottish ale. The recipe called for 2 oz of roasted barley and 3 oz of chocolate malt. Can any of you enlighten me on the relative flavor profiles of the various kilned malts and roasted barleys?

I know nothing about "profiles" but I would be amazed if two ounces of roasted barley could be detected by even the most gifted nose.

I decided to put my own nose to work and made three batches as follows:

one lb roasted barley  
one lb roasted malt  
one lb each

The balace was Klages and a total of 9 lbs for 5 gal.

I was unable to tell the difference by taste or smell between roasted malt and barley. They both tasted and smelled like coffed to me.

They both had a distinct coffee flavor early but towards the end of the keg, it was not detectable as coffee just a richer flavor. In a side by side comparison, the roasted barley has a bit of an oatmeal kind of taste and we (my wife and I) liked the roasted malt better.

Either was a definite improvement on our light generic ale.

The combination batch is in the secondary, waiting for an empty keg. It has a pronounced coffee taste but I suspect if it mellows out like the other two, it could be quite excellent.

So, I think you are waisting your time with ounces.

>From: STROUD <STROUD%GAIA@leia.polaroid.com>

>I know where I stand on the issue of dry vs liquid yeasts: I changed to single cell cultures a long time ago and haven't looked back.

Although the rest of your article is science at its best, not looking back is definitely not very scientific.

>Hidden in the midst of the on-going dry vs liquid (single cell culture) yeast debate is what appears to be a universal condemnation of Red Star Ale

yeast. Well, I'm here to come to the defense of Red Star Ale yeast and to break a momily:

>Red Star ale is actually a nice, clean somewhat unattenuative yeast. It's the other crap inside the yeast packet that causes all of the problems.

Let us make sure we have correctly identified the "momily" in question.

Your article proves conclusively that selecting for survival of the drying process does not restrict the other characters needed to make a good beer.

It also proves that the drying/packaging process (as done by Red Star) is subject to contamination.

Both are totally reasonable conclusions and not inconsistant with my position before or after reading the article.

>To answer this question, Sheri Almeda cultured Red Star Ale yeast on agar plates and isolated four single cell yeast cultures.

I am having a hard time understanding what this means. Are these four colonies from each of which a single cell was taken? Were they chosen because they were the same or because they were different?

The results would indicate that they were probably the same or similar enough to be irrelevant.

What else did they find on the original culture? If the contamination is biological, they should have found either bacteria or an evil yeast in the culture.

It also sounds like the control sample was taken from a different packet.

>This experiment also points out the problem with using dry yeast. You just never know what's going to come out of that little packet. Even though the dried yeast was very viable and got off to a fast start, the final product had a contamination problem."

This also points to the solution to the problem. All the discussion about the selection problems is null and void. We need only come up with a sterile drying and packaging process.

However, it is becomming obvious that the real problem may not be what all this talk is about.

The use of a liquid yeast could be (and probably is) only a bit more

complicated then pitching a properly re-hydrated dry yeast. If the results are as much better as users contend, then the resistance must lie elsewhere.

The obvious elsewhere is price. There is an great reluctance to use something that costs 10 times what an acceptable alternative costs.

There are lots of ways the user can reduce his cost but it takes more effort and unless he does a lot of brewing, he risks the evils he is trying to avoid.

I suspect making money culturing and selling yeast to homebrewers is marginal at best and aside from simplyfing the package, not much can be done to reduce the cost at the current levels of production.

>So there you have it. The problem isn't RS ale yeast, it's the purity of the yeast.

Translated: The problem is what's in the package of RS ale yeast.

It all boils down to the same thing. Don't use it!

The only way they will ever fix it is if people stop buying it.

>Any comments???

Nothing comes to mind at the moment :)

>From: gummitch@techbook.com (Jeff Frane)

>As far as Mr Schmidling's opinions on the best way to package yeast, I would suggest that having the yeast and nutrient in one package was the whole point!

The business world is littered with failures who missed the point.

> and in fact largely responsible for the success of WYeast.

It now seems to be largely responsible for a great deal of frustration.

>I am also very aware of the huge amount of effort that Dave is putting into correcting the problem with his packaging, a problem that was neither inherent in the design

If the package does not do what it is supposed to do it IS a design problem.

> nor of his own doing.

Is the Devil making his packaging decisions?

>WYeast is considering adding some new strains of yeast to their existing line. These would sell for less money than the current package, and would NOT include a starter.

Sounds like he has been reading my mind. But why "new strains"? Why not

sell the tried and proven ones without starter? Why not just a lower  
cost  
option for brewers willing to do a little more fiddling?

My advice is to pick a standard ale and market the hell out of it. If  
they  
got the volume up, there is no reason why they could not drive dry yeast  
off  
the shelves. They are destroying any chances of economies of scale by  
spreading themselves so thin.

Hmmm. No more free advice.

Can someone recommend a "standard ale" yeast?

Stand by for:

ARF GENERIC LIQUID ALE YEAST  
Still only a buck.

Use an old darkroom trick ...

To keep dust from landing on your negatives, etc., you walk around the  
room with an atomizer spraying water mist high in the air and letting it  
settle.

For brewing I do this about a half-hour before brewing, and I use some  
dilute sterilizing solution instead of plain water.

It makes a noticeable difference in the darkroom, so why not in  
the home brewery ...

From: a-kellyc@microsoft.com  
Subject: Help! I'm about to worry!

Howdy all-

This is my first time on HBD. I've gotten some pretty good info here, and hope that some of you kind souls (snicker snicker) can help with a possible problem I'm having with my latest batch.

I'm new to brewing. I brewed my 5th batch Monday night. (3-9) My problem is a possible stalled fermentation. I don't know if I should repitch (not an option because I don't have access to same yeast), or stir it up some or do I have 5 gallons of bacteria infested waste?

I'm using the same recipe I used for my second batch. The only real difference is that I'm using liquid yeast for the first time. (WYeast European Ale) I used Edme for my previous batches, but wanted to try something new because my homebrew smelled more like a bakery than hops and barley. Also because I'm going to start all grain brewing in a couple of weeks and wanted to experiment now.

It took 24 hours to show any activity. This activity has amounted to a kreusen that never quite made it to the blow-off tube. Usually get 1-2 quarts of blow-off w/Edme. I'm getting about one bubble every 20-30 seconds 36 hours after I pitched. I broke the inner pack Sunday and it swelled to the brink of exploding by pitching time. A friend suggested I may have left some bleach in the carboy, but I doubt it.

Another strange thing with this batch is that the O.G. was much lower than the earlier batch using the same recipe. This batch 1.032 the earlier batch 1.045. The recipe was the same except I used .25 lb less crystal in the last batch.

7 lbs light malt extract (Scottish, bulk)  
\*1 or .75 lb crystal barley  
1/4 c roasted barley  
2 oz fuggles (boil 60min)  
1.5 oz halatauer (sp) (finish)  
1 tsp Irish moss.

Thanks for your time and effort. I look forward to your replies. BTW is there anyone out there from the Seattle area that can send me info on HB clubs. I'm interested in trading homebrews.

Kelly Connell-- a-kellyc@microsoft.com

See the hops special issue of zymurgy, an article by Jackie Rager  
on calculating hop bitterness. His formulae (which are sometimes  
difficult to follow, sadly), includes a fudge factor for gravities  
over 1.050. As I recall (and I am doing this from memory), for  
each 10 points above 50 of gravity, Rager figures a 5% reduction  
in utilization. I don't know what he bases this on.

> (I understand that this information may be buried in a Lotus 1-2-3  
> spreadsheet authored by the infamous Mr. Richman.)

I'm not sure to what I can attribute my infamy (I hope it was  
something really good, though), but my original spreadsheet  
was written in Excel for the Mac. It had cells for pellet and whole  
hop utilization right up at the top, out in the open. There was no  
fudge factor for high gravities, and it is naturally inaccurate  
because of that.

The Brewer's Worksheet, as I called it, has subsequently  
been ported by others to 1-2-3 and Excel for the PC, and was available  
on sumex-aim.stanford.edu and mthvax.cs.miami.edu for anonymous  
ftp. (Has this changed? I haven't looked since I uploaded it.)

Subject: lots o stuff

How many gallons in the brewery unit, bbl?

The Czech Budweiser bottle I got had Budvar in smaller letter on the label. Nice brew, lighter than I expected, but still thick as mud compared to the US version.

I've got a fridge that has 2 settings, below 0 and off. How do the Hunter Energy monitors et. al. work; are they just automatic ways of unplugging the fridge when it gets too cold, or do they work more internally?

Thanks to the IBU/HBU/AAU discussion, I've realized why my last few brews have been too bitter: I went to full boils, but never decreased my hopping rates! Thanks folks.

Re. Kathy Ireland commercial: It's actually a good ad for Guinness when they all hesitate as she says Bud is the national beer of Ireland.

Re. spraying droplets to reduce dust: Does that mean that when my brewroom gets full of steam from boiling wort, it's helping clean the air? I already knew it was cleaning the walls (the concrete gets dripping wet).

Finally, Jack asks Why Wyeast doesn't mass produce a simple ale yeast? Could it be they are not really all that interested in going "big time", but are more into the enjoyment of providing an interesting variety of clean yeast? Big time supplying means getting into the whole rat race of advertising and pushing your product, and getting caught in economic cycles and ....  
all things that can get in the way of enjoying your work. If I was Dave L., I wouldn't try to go for quantity. I'm not trying to give him any altruistic properties he may not have (I don't know him at all), but there are some people in the "marketing" business who are not just out to make gobs of money.

Finally (again): If the yeast is in the outer Wyeast packet, then why not just cut it open \*wihout\* ever breaking the inner seal, and just make a starter yourself? You should make a starter eventually anyway....

Russ the longwinded

From: tony@spss.com (Tony Babinec)  
Subject: dark grains in beer

Dark, highly-kilned grains are used for two reasons: color and flavor. In small amounts, they'll contribute color and have little or no flavor impact. In large amounts, they'll contribute both.

There are three basic highly-kilned grains:

- roasted barley, which is made from unmalted barley,
- chocolate malt,
- black patent malt.

In a previous posting, someone alluded to a black unmalted barley. I'm not familiar with it.

In darkening "power," for a given amount of malt added to a given amount of wort, their order is chocolate malt-roasted barley-black patent malt. Usage of malts should be dictated by style considerations of the beer you're making. But I don't want to legislate morality. Do whatever you want!

Roasted barley is the signature grain in dry stouts. Typical additions are 1 pound of roasted barley for a 5-gallon batch of stout. Dave Line's recipe for stout is useful here:

7 pounds pale malt  
1 pound roasted barley  
1 pound flaked barley  
hops and yeast of course

Roasted barley can be used in smaller amounts in some other styles.

Chocolate malt is described as "sweet." It can be used in such styles as mild, brown ale, porter, stout, Oktoberfest, or bock. Amounts vary. In porters, you might use 1/2 pound or so. In an Oktoberfest, you might be looking for a bit of darkening not obtained by other grains in your recipe, such as Munich or crystal malt, and so you add a couple of ounces, but maybe no more, of chocolate or black malt to your mash. After all, you probably don't want a chocolaty Oktoberfest. On the other hand, such a flavor might be desired in a Traditional Bock.

Black patent malt is predominantly used as a coloring malt in small additions. The exception is in porters, where its "sharp" flavor character is desired. A black patent malt addition to a porter might consist of 1/2 pound for a 5-gallon batch. More than that, and you might have overdone it!

From: Glenn A. Tremblay 12-Mar-1992 1052 <tremblay@vino.enet.dec.com>  
Subject: Cornelius Keg info please

I would greatly appreciate if any of you Cornelius keg users could pass on some of your knowledge on how to setup, test and use this system. I just purchased all the parts I need and am about to hook it all together and prepare to use it. I'd like to utilize all that wonderful learned experience out there to increase my success rate of using this new system.

Although I'm looking for any useful information, I do have some specific questions.

Should I expect these systems to be totally leak free? For instance, should I always leave the pressure on? Or do you turn it off when not in use (and expect it to hold the original pressure)? Assuming the beer is carbonated and is not absorbing any more CO2.

Pressures. Someone posted a real informative note about adjusting the beverage hose length to control faucet (tap) pressure. From this I understand that I should have a keg pressure of 10-12 PSI and a faucet pressure of about 4 PSI. Is this correct?

Is it ok to "larger" brew in these kegs for extended periods of time?

Where can I get a "rebuild" kit for my used kegs? Is there a well known source? Or should I contact my local beverage dealer?

Thanx in advance for \*any\* keg related information.

/Glenn Tremblay

BTW, I purchased my equipment from Superior Products, a wholesaler of restaurant and bar equipment. They carry all sorts of beer related supplies. They will sell to the general public and have a catalog. Their number is 800-328-9800 for anyone that might be interested. (...insert standard disclaimer here).

[motherhood and apple pie on]

IMHO, one of the fascinating elements of home-brewing is experiment and discovery. Sure, less experienced home-brewers will try what the more experienced brewers suggest but, then, it is up to each individual to decide what works (favorably) and what doesn't. That's the fun. Then, of course, another part of the fun is to convince others that you have discovered the magic technique :-) :-)

[motherhood and apple pie off]

[soap-box on]

So, when we disagree on stuff (e.g. dry vs. liquid yeast), we should realize that the person on the other end is as passionate about brewing as we are and is in search of the holy brew just like us. Even when we "know" the other is "wrong", just remember that half the fun of home-brewing is finding out from one's own experimentation rather than finding out from another's. If brewing were a cut-and-dry process, than the fun would be gone.

[soap-box off]

Cheers,

Subject: Flavor profiles of roasted malts and barley

From: arf@gagme.chi.il.us (jack schmidling)

> I know nothing about "profiles" but I would be amazed if two ounces of  
> roasted barley could be detected by even the most gifted nose.

I have been working on a stout recipe over the last several months. On my second to last attempt, I reduced the amount of chocolate malt from 6oz to 4oz -- 6oz tasted a little strong but 4oz was about right (I wanted just a slight hint of chocolate malt flavor). Caveats: other things changed as well from batch (e.g. mash temps, different yeast, etc.) to batch so this was by no means a controlled experiment.

A suggestion: try your experiment again (side by side taste tests using different roasted grains) but use smaller amounts. I suspect that the grains tend to taste the same (burnt!) when used in high concentration. If you try this, I would be very interested to hear your findings!

> styles to get the feel is utterly useless. That is why I asked for  
> experience from anyone who has conducted experiments using the same  
> batch of  
> wort but different (ale/lager) yeasts and fermenting temps.  
>

I've done this with several batches and I can tell you that it's  
too complicated an issue to resolve. As several people have  
pointed out there are general differences between ale and  
lager yeasts and there are general differences between the  
beers produced by each type of yeast. However there are LOTS  
of variables. The result is the differences I tasted between ale  
and lager in one batch were not the same as the differences I  
tasted between ale and lager in a different batch. It depends a  
lot on what the yeast is fermenting. Many of the differences  
between ale and lager yeasts didn't even appear in my tests  
because I used the same process (e.g. temp, duration, etc).  
Lager yeast works better with the lagering process. Ale yeast  
works better with the ale process. So even using the same  
batch of wort to really get the difference you would have to  
try both with a lager process and both with an ale process and  
probably both with an intermediary process. Then figure out  
all the differences. Then change your recipe a bunch of times.  
Do it all again. Then see if you can come up with some general  
ideas of the differences - which is what we started with  
anyway. The bottom line is yes, you can make ales that taste  
like lagers and visa versa but you will be hard pressed to  
duplicate a particular brand (or style) of beer if you use a  
different type of yeast.

From: bgros@sensitivity.berkeley.edu (Bryan Gros)  
Subject: honey basil ale--results

About my request for information on beer styles, most people said Fred Eckhard's book, and I will get this. Also, a couple of people said that the latest Zymurgy Special Issue is on beer styles, but were unsure as to its value.

The Honey Basil Ale that I made and posted the recipe to a while back was finally sampled. The result is good beer!

I used one ounce of basil, about a third of the "bunch" I bought at the grocery store. This was sweet basil. The beer had a huge basil aroma, and quite a strong basil taste. It was slightly bitter, but not too bad. I primed with 1/2 cup honey, and the carbonation is good. There is really no honey taste, however. I think all the basil and hops cover over the honey flavor.

So I will make a couple of changes next time (less basil, less hops), but I will recommend the beer. We'll see how it ages.

And to whoever was looking for "Italian beer", I don't really know what that is. But I have seen several recipes for beer with garlic, and the above basil beer would be good with Italian foods.

Recipe available upon request.  
- Bryan

p.s. The pub at which I had the original Honey Basil ale now has a fennel porter. I didn't care for it too much, with the heavy licorice (sp?) flavor, but some might.

From: mlh@cygnus.ta52.lanl.gov (Michael L. Hall)  
Subject: Non-gluten beer

A non-homebrewer friend of mine has recently been told that he has to go on a non-gluten diet. Alas, one of his favorite activities is drinking a cold one while boating on the lake. Apparently, barley, wheat, and oatmeal are no-nos, but rice is okay. Does anyone know of a commercially available beer (if you could call it that) that has no barley or wheat, and is made only of rice? Yes, I suggested any American beer :^), but \*any\* amount of barley is bad. Commercially available is necessary because he's not a homebrewer.

Of course he's thought of the standard alternatives, such as liquor, wine coolers, wine, etc., but I can understand why he wants a nice crisp beer instead. Let me know if anyone has any ideas.

From: Gordon Baldwin <hpubvwa.nsr.hp.com!sherpa2!gbaldwin>  
Subject: Low Yield

I have been getting a low yield out of my grain and I expect it to be in my sparging. The malt ingredients are :

8 lb klages  
1/2 lb crystal  
1/2 lb munich

I do an infusion mash for about 45 minutes in 2.5 gallons water. The iodine test shows full conversion. I then dump the whole mess out to my ZapPap lauter tun. I then slowly pour in my 4 gallons 170 degree sparg water, keeping the level of the water above the grain bed. I open the tap on the bottom bucket all the way and the water dumps through in about 15 minutes. I don't recycle any of the runnings.

My sg after my 45 minute boil is only 1.032. This seems to be way to low after looking at various recepies. I think I should be getting above 1.040. Does anyone have a good description of using the ZapPap? Am I not letting it sit long enough (ie letting it run too fast ?) My grain is well cracked. I crack it using the roller mill at The Cellar brew shop it cracks the grain well without powdering the husks. I checked the grind with the pictures in TCJoHB and if anything mine is cracked smaller. But then again I have never had a problem with a stuck sparge.

From: Rob Malouf <V103PDUZ@ubvmsb.cc.buffalo.edu>  
Subject: Wyeast woes

I think part of the problem certain people are having with Wyeast is that they have been reading the HBD too much. Posts about Wyeast seem to fall into two classes: complaints about faulty packaging, bacterial contamination, and odd mutations, and unsupported claims about Wyeast's overwhelming superiority to dried yeasts. I can see why this might appear contradictory and dogmatic. Perhaps those of us who have used Wyeast with no problems should speak up. Switching to Wyeast was the single best thing I did to improve my beer. It made a bigger difference than switching to all-grain brewing. I have never had any problems with the packaging, I have never had a contaminated batch with Wyeast, and I have never noticed any inconsistencies in the behavior of the yeast strains. I actually spend less on yeast now than I did when I use dried yeast. I have found that I really like their Chico Ale yeast (#1056), and I use it for everything but weizens. Before I learned better yeast culturing techniques, I kept the slurry from batch to batch in a mason jar in the back of my fridge. Sometimes it sat there for months between batches, and I never had any trouble with contamination or mutation. I've used packages well past their expiration date, and they have always swelled up within a few days. I even once used a package that had survived a week-long unrefrigerated move in the heat of August! Now, maybe I've just been amazingly lucky, but I don't think you should let all the horror stories about Wyeast scare you.

Hi folks,

This is my last post, so Thanks for the help and suggestions. I have learned a lot and hope to subscribe again once I start school in the fall.

RE: HB stores in NY. In the Manhattan yellow pages there is one listed:

Milan home wine and beer 212-226-4780  
57 Spring St. toll free 800-beer-keg  
Manhattan fax 212-431-6985

Free brochures  
Kits and supplies  
home vinegar making kits  
VISA and MasterCard

RE: Beer and food recipes. The Irish Trade Board have a free recipe book for St. Pat's day. It has recipes using Irish ingredients, among them oatmeal cookies, baked Irish salmon with ginger and beef braised in Guinness stout. You can obtain the book by calling 800-289-4735.

RE: Beer tasting Monday in NY. (quote from NY Times) Guinness is one beer that will definitely not be on tap at the third annual American Beer Tasting Monday. It's being held by the American Institute of Wine and Food from 6 to 8:30 pm at Bridgewater's in the Fulton Market Building at the South Street Seaport. This year Michael Jackson, an English expert on beer, will be the guest of honor.

To accompany mor than 25 beers from small American breweries there will be an array of food from more than two dozen New York restaurants.

Tickets are \$15 for members of the institute, \$25 from nonmembers. They can be ordered by calling 212-447-0456. American Express Cards are accepted. (unquote). When I called, they said that 24 breweries were small (Telluride, Brooklyn, etc) and that a few biggies would be there (Miller, for example). I asked, and they said Anchor and Boston BC would be there, Sierra Nevada would not.

Disclaimer: I have no association with the store and I've never been there. I

have no association with the Irish Trade Board, I'm not even Irish. :) I  
have  
no idea who the American Institute of Wine and Food are, and I'll be in  
Michigan Monday anyway.

Subject: Brewing Technique Statistics

In #842, Steve Russell gives us a table regarding the 1990 national competition, and writes:

>Besides, the jump from 67% to 84% in liquid yeast cited above  
>is \*tremendous\* evidence that this is a great way to improve  
>your beer. But again, it is only correlation, as statistical  
>types will likely point out.

Unfortunately, it's not even that. I was going to put these data through my stats program, but found the data weren't actually present in the table. It was easy to convert the percentages in the "entries" column to raw data, because the total number of entries was given. But it's not possible to convert the percentages in the "placed 1 2 or 3" column to raw data, because the total number of such \*winners\* was not given.

Without knowing the size of the data set, I don't think it's possible to determine if the difference in proportions is statistically significant. CAVEAT: I am not a statistician, and I usually don't analyze data in this form; I usually use ANOVA on data structures of my own design.

This is in fact pretty good advice--as long as you don't understand the market. When WYeast introduced their Brewers' Choice strains a few years ago, they offered one ale and one lager strain. The demand (remember supply & demand?) for additional strains was so great that David has had to continually expand his list.

Why do you continue to suggest that WYeast is a marketing failure when the evidence is overwhelming against you?

As far as a lower-cost option for brewers willing to do a little more fiddling is concerned--it already exists. Ever brewer I know that uses liquid yeasts managed to contain costs by re-using their yeast at least once. This brings the cost of using liquid yeast well down to the level of using dry yeast (especially when considering that most sources suggest two pkgs of dry yeast when pitching) while avoiding the inherent problems of contamination from dried yeast packaging.

As far as providing the packaging without the starter: a significant number of the retailers who handle WYeast said that their customers would not buy the yeast without starters. Once again, the market knows what it wants, which is not necessarily what \*you\* think it should want.

Hope this clears things up for you.

From: dek@linus.mitre.org  
**Subject: my first lager**  
Full-Name: Douglas E. Kolb

Hello homebrewers. I am brewing my first lager today (my third brew altogether). I will be following Papazian's Dr. Bock recipe. I have several questions:

- (1) Do I pitch at 78 degrees?
- (2) will blowoff begin around 12 hours after pitching like ale?
- (3) will blowoff last around the same amount of time as ale?
- (4) How do I know when fermentation is complete? With the ales that I have brewed I waited until at least 2 minutes elapsed between bubbles through the fermentation lock.

Any other comments on the differences between brewing ales and lagers will be appreciated.

(I know, "relax, have a homebrew")

thanks in advance,

Doug Kolb

> wort?  
>

I have a similar chip on the inside of my smallest enameled pot. I haven't had any problem with it so my advice (and this is not original) is not to worry about it. This is not to say that there is not the potential for problems (e.g. metallic taste in your beer) but rust isn't really terrible stuff. It doesn't hold unbound oxygen (which is why tetnus lives in rust) and any beasties that are living in the porous material are going to be boiled to death anyway. I wouldn't ferment in a rusty pot but boiling in a pot with a little rust isn't likely to ruin your beer.

If it bothers you you could try putting epoxy over the rusted area but be aware that beasties can live in scratches in epoxy too.

It is possible to re-enamal metals and I know some home jewelry makers that do enamel but I suspect that it's not worth the trouble.

>From: mmlai!lucy!gildner@uunet.UU.NET (Michael Gildner)

Hey there, I've got an enameled porcelain brew pot with a quarter sized chip in the bottom..... In the mean time, will a little rust be harmful to the wort?

We know what the mom's are going to say but I took the plunge and bought a 10 gal SS pot for precisely the same reason. However, now that I have gotten used to two kettle brewing, I can't part with the rusty old one. I use it for mashing and the new one for boiling.

As I can't tell ale from lager, I couldn't be expected to notice a little rust in my beer but I suspect most of the moms wouldn't either.

>From: pyle@intellistor.com (Norm Pyle)

>It is very possible that work will commence in this area and produce the pure dry yeast that you seek, but it will take \$\$\$'s.....

> The government obviously isn't going to invest the research money (they've got better things to do with your money),.....

I hadn't noticed.

Subject: Cat's Meow Steam Beer (page 42)

Greetings,

I would like to thank Clay Phipps (hplabs!garth!phipps) for his excellent Anchor Steam-Style Amber recipe in the Cat's Meow. We brewed this as our fourth batch just before Christmas and it was by far our best yet.

I without a doubt that the quality of our beers has improved with the purchase of a glass carboy for use as a secondary. My next brewing purchase will no doubt be a wort chiller. I'll probably wait until next year to start full mash recipes. Watching Bill Seliger, who got me into brewing in the first place, do a full mash twice a month is enough for me right now.

Last week Bill told me about an unofficial tasting here in Evanston, IL, and encouraged me to enter a beer. Believe it or not, the steam-style beer came in second, only to Bill's light lager. But by far the best part of the evening was getting to meet the judges. I also met the owner of Goose Island brewery and a few other home brewers.

Just a new brewer's recent experience.

From: akcs.chrisc@vpnet.chi.il.us (chris campanelli)  
Subject: Frustrated and Nonplussed

I'm frustrated and nonplussed. No, not about that. It's about the way hops are described in a beer.

As you know, all beers have a hop profile. This consists of bitterness, hop flavor and hop aroma. Yet when you describe a beer to another homebrewer, what do you do? It usually goes something like this:

" . . . Well sir, the <HBU/AAU/IBU> was 25 and it had some hop flavor and alot of hop nose . . ."

--- OR ---

" . . . boy I'lltellyawhat, the <HBU/AAU/IBU> was 10 but I really wanted alot of hop flavor and aroma . . ."

I'll go one step further. Lets look at the AHA Style Definition Chart. Calm down! I'm not ripping the AHA nor am I putting them on a platform. I'm just using them as an example since most of us here in the colonies are familiar with it.

If you were to brew a doppelbock and decided to use the AHA SDC as a reference, you would see, among other things, an IBU rating of 17 - 27. Thats all well and good for bitterness, but what about hop flavor and hop aroma? If you want that information you must seek out the Rules and Regs narrative of that style, which states: ". . . low hop flavor OK . . . no hop aroma . . .".

See what I'm getting at? We use numerical scales for bitterness, yet we have to resort to narrative for flavor and aroma. Wouldn't it be great if we could say:

". . . Reggie, old boy! As you were quaffing my latest creation, did you partake of the hops in this sustaining beverage? The <HBU/AAU/IBU> was 20, the hop flavor was 7.5 and the hop aroma was a bequiling 12! . . ."

--- OR ---

". . . HOY! Check this out! It's got a Total Hop Profile of 20 - 7.5 - 12. It kind of snuck up and ripped my face off! . . ."

With me now? What would it take to devise a numerical scale for hop flavor and a separate scale for hop aroma? What are the chemical compounds which provide the flavor and aroma? They're not phantoms. If you can taste/smell it, then surely you must be able to isolate and identify it. From that point its all down hill. Kind of.

Just alittle something to chew over the weekend. Email? You can do me publicly or you can do me privately. It don't matter.

chris campanelli

PS. I'm not a science weenie so don't nit-pick the minor details. Try to see the big picture here.

From: David Collins <djc@supra.ece.cmu.edu>  
Subject: An Alternative to Dry/Liquid Yeast?

Reading all the Dry vs. Liquid yeast posts reminded me of a letter that appeared in Zymurgy a few years back. I couldn't dig up the issue, so I'll try to recall the main points of this letter.

The letter was written by the owner of a homebrew store in Philadelphia, Home Sweet Homebrew or something like that. He said that he had had great success brewing quality lagers with Fleishman's Yeast. Before you start laughing, let me explain. This wasn't the dried Fleishman's yeast that you buy in the baking section in your local grocery, it was a brick of professional baking yeast that is sold by Fleishman's. He said that Fleishman's is actually owned by Anheiser-Busch Corp. and they sell bricks of yeast to bakeries, etc. He said that it was difficult to buy just a brick of the yeast, that you had to buy a case. The cost was very low per brick and gave you a large amount of yeast to pitch with. He said to avoid infection, he cut off the sides of the yeast brick that were in contact with the paper wrapper with a sterilized knife. It sounded like cutting off the sides of a pound of butter. Anyway, it sounded intriguing because it gave you a large source of yeast to pitch in a form that was very storable, cheap, and didn't involve making a starter. Does anybody have any experiences with this brick yeast? How pure of a strain it is?

Here is a stupid question? I've been reading all the articles on Wyeast, but I don't know how it pronounced? wi-yeast (Wy-east), double-u-yeast (W-yeast). Silly, but I've never had to pronounce the name. I just mail order it and use it.

From: RANDY OLINGER <ROLINGER@12.104.decnnet>  
Subject: Boiling Pots.

I have a question about my latest purchase. I'd like to preface this with the statement "I am not an idiot, really".

I recently bought a boiling pot. It is 5 gallons and will work really well for chili too! Problem is, it is aluminum. I have been told several times that aluminum is bad (since I made the purchase) but noone really can tell me why. Closest I have come is that it oxidizes the wort, which makes no sense since aluminum is not oxygen. I do not wish to re-kindle the debate about alzheimers disease, lets just say I'm willing to take my chances there. I'm only concerned with how this will affect my beer, not my brain. Beer tends to affect my brain enough without the worry of a debate over how I spell alzhimers. :-)  
Anyway...what's the deal with aluminum???

Subject: A eulogy for Cher Feinstein

Cher Feinstein died March 2 after a several year long battle with cancer. Long time readers of the Homebrew Digest will remember her as the digest's

authority on mead making, an appellation she earned through experience and

the willingness to share her knowledge. She first became interested in making mead through her membership in the SCA, a society dedicated to recreating and preserving the techniques of the middle ages. When she discovered the digest, she became interested in the wider world of brewing.

I met her through the digest, and while we never met face-to-face, we did have several interesting electronic discussions. She was always cheerful and enthusiastic, freely offering advice without being condescending.

The last time we talked, in December, she apologized for not being able to

respond in more depth to my questions, but promised to reply as soon as she

felt better. That was not to be. Even as she was dying, she had the courtesy to talk to me. Would that we all would display such courtesy to each other.

Subject: Wyeast European Ale

I've found that the slowness of this yeast is helped by racking to a secondary for an extra week or two of frementation. You'll be amazed by the amount of sed. that shows up in the secondary. Also the second pitch with the European ale is much faster. Use the sediment in your next batch for a starter.

Prime lightly, too. When I first used this, all my brews were SCUD-like gushers.

I've had the same experience with the Wyeast ALT.

From: tony@spss.com (Tony Babinec)  
Subject: new shareware program aids formulating beer recipes

I will make this short, sweet, and informational in tone.

Chris Campinelli has written a shareware program entitled Beer Recipe Formulator (BRF). It runs on DOS-compatible PCs. It's a no-frills program that's easy to use. You tell it the expected wort volume and your expected extraction rate. You can call up the target style you intend to brew, and it pops up the Zymurgy style information. You then build your recipe by toggling amounts of different grains in. Once grains are specified, you can go to a hop screen and plan your hop additions. If you have a local pc printer available, you can print the recipe out. The grain and hop information exist in editable files. It's easy to edit the hop data file and put in only hops you currently have on hand, along with their alpha ratings. The program will tell you your "expected" starting gravity, IBU, and color in SRM units.

Standard disclaimer here: I have no financial interest here. I'm simply a satisfied user. Chris is undoubtedly too modest to put any promotion in HBD, so I took the liberty of doing it for him. Being Shareware, if you obtain the program and like it, you might send \$15 to him to be on his mailing list, and help defray costs of manufacturing and mailing. Chris's network address is:

akcs.chrisc@vpnet.chi.il.us

Sorry, Chris!

From: Gordon Baldwin <hpubvwa.nsr.hp.com!sherpa2!gbaldwin>  
Subject: Ripping the Big Boys

I thing the flack we are giving to the BudMilLob breweries is deserved. I don't think anyone on the digest will disagree with the statement that they put a lot of effort (read \$\$) into producing their beer. The complaint is they only produce ONE type of beer (two if you count dry). The American Light Lager is a fine style of beer and I enjoy it on occasion. It is like spending lots of money on a state of the art kitchen with all the gadgets and cooking only steak and potatos. They make a fine meal, but I like a little more variety. I think most consumers would welcome more variety in the commercial beer market, but most beer drinkers are not even aware that there is any other type available.

I resent the fact that BudMilLob is pushing so hard dollar wise to make the American Light Lager the only style of beer available. I have a little more respect for Coors, as they do produce a few more styles that are available from time to time. I wish more of the majors would follow their lead. In the mean time I will stick with the micros here in the Pacific Northwest. There are few bars around here that don't carry at least on of the various micros.

From: lg562@koshland.pnl.gov  
Subject: re: Help! I'm about to worry!

Kelly,

The slow start on the fermentation is about what I get when I brew with liquid yeast. It seems to have about an extra day of lag time over dry yeasts. So I wouldn't worry about that or tamper with it by stirring it.

Using a smaller amount of Crystal could have lead to the lower OG, but I have noticed a number of variances in the OG when I brew up a batch. So the losses might be due to boilover, if that happened, or spilling before it got into the fermentor.

Because the OG was lower, the yeast would not have fermented with as much fervor as the higher OG batch, so that might explain why it didn't lead to blowoff. My primary fermentation is in a big plastic bucket, so I don't try to remove the blowoff. I still get great beers, so I wouldn't worry about that as well. The recipe sounds pretty good and you should have good batch on your hands.

Subject: Publicly owned micros.

No, NO, 100 times \*NNNOOO\*.

One of the biggest curses in our society is the publicly held corporation.

I hope all of the decent microbreweries stay private. If they go public, then the stockholders, whoever they may be, will be king of the brew, not the owner(s). Stockholders don't care about quality, they care about PROFIT. I know that a few true blue brewers would purchase stock, but that might account for a few percent at most. The force that drives American business, greed and profit, would reduce the micros to dust in short order.

See Sierra Nevada go public? See A-B purchase 51 % of the stock? See sierra Nevada Pale Ale Light? See you crying, remembering what snpa \* used\* to be? See my point?

From: volkerdi@MHD1.moorhead.msus.edu (volkerding patrick)  
Subject: Wicked Ale recipe

In HBD 843 John Freeborg asks about a recipe for Pete's Wicked Ale.

Not too long ago, Kelly Keuhl from the Schell brewery in New Ulm was up here as the featured speaker at a local beer tasting. He brought lots of free pamphlets and stuff with him, so I grabbed whatever I could. One of them had a list of all the ingredients for Pete's Wicked Ale, and all the Schell and Ulmer beers. They didn't list amounts, but they gave the alcohol content of the finished beer, which might help steer you toward determining the amounts you'll need.

Here's what it says:

Name of beer: Pete's Wicked Ale  
Style: Brown Ale  
Ingredients: Pale Malt  
            Crystal Malt  
            Chocolate Malt  
            Cascade Hops  
            Chinook Hops  
Alcohol by weight: 4.0 %  
Character: "Full, toasty ale. Rich caramel flavor reminiscent of classic English brown ale."

Hope this helps give you a start in the right direction.  
If there's any interest in the other beers that were listed, let me know and I'll post them.

From: Fred Condo <CONDOF@CGSVAX.CLAREMONT.EDU>  
Subject: Residual malt sweetness in Continental lager

I finally had my first taste of Pilsner Urquell last night, and I very nearly saw God. I think our beer community should start a letter writing campaign to Vaclav Havel, President of Czechoslovakia, urging him to protect that national and global treasure from a takeover by a major brewing giant.

On to the main point. Continental lagers like Pilsner Urquell have a wonderful malt sweetness that slowly fades on the tongue, yielding at last to the residual bitterness of the hops. It's a great sensory delight. I brew in warm Southern California, so I have done only ales (and Common Beers) in the 3 years I've been brewing. The only thing I've made that comes close to having this aftertaste profile is my porter recipe, which involves 2 pounds of 60L Crystal malt for a 5-gallon batch.

What is the characteristic malt that gives Continental Lager this wonderful feature?

Subject: Residual malt sweetness in Continental lager

>From HBD #841, Scott Benton asks:

>I'd like to brew an Italian beer for a family reunion this summer. Does

>anyone have any recipes? Does such a thing exist?

Well I have a Moretti Amber Lager style in lager. Tasts I have taken while doing SG tests are pretty good. Age should make it better. Here goes:

OG 1056

FG 1022

3/4 lb Crystal

3/4 Munich

6.5 IREK Munich Amber extract syrup

1.5 oz Cascade 60 min boil

1 oz Hallertauer, steep 5-min before sparge

Wyeast 2206 Bavarian

1 tsp Gypsum

1 tsp Irish Moss

All malt boiled for an hour. I started a yeast culture in 22oz champagne bottle to kick start the brew. Pitched at 83 degrees F and by morning it was at 50 degrees in the garage. It is now sitting in a spare refer at 40 degrees. Unfortunately I left the brew on the its trub for 3 weeks before becoming enlightened about the nastiness that can introduce. I must admit it has a bit of off-odor. No idea if this is normal or not.

If anyone does this brew I would like to compare notes.

From: Pierre Charles Jelenc <pcjl@cunixf.cc.columbia.edu>  
Subject: Red Star

I happened to read Steve Stroud's recent posting on Red Star ale yeast just as I was preparing a batch of YPD plates, so I decided to plate some and have a look for myself. I suspended about 1/4 tsp of the yeast in a little cold water, let it rehydrate 10 min, and streaked for single colonies.

The result is that out of about 1000 single colonies I found three unmistakable bacterial ones, one doubtful, and the rest clearly yeasts. Bacterial contamination does not thus appear terribly large (at least for aerobic and facultative-aerobic bacteria able to grow on YPD). On the other hand, of the yeast colonies some 40% were very small, presumably "petite" respiratory mutants, although I cannot exclude that some are slow-growing non-saccharomyces.

I picked a couple of healthy, vigorous colonies, restreaked them, and so far they appear to breed true, without new petite mutants.

From: orgasm!davevi@uunet.UU.NET (David Van Iderstine)  
Subject: Spiced Ale recipe

This is a composite recipe, designed to mimick Harpoon's latest Winter Warmer offering. I started with the spice list for Harpoon's Winter Warmer, as published in the Beer News (or whatever that fine newsprint rag found in various lobbies is called).

Armed with the spice list, I searched all my HBD back-issues for each spice. Whenever I found one of the spices being used, I looked for its relative weight as compared to all other ingredients in that particular recipe. By doing this for all the spices listed below, I arrived at a statistical "average" for the relative concentrations of all of them together. So maybe I should call this "Statistician's Delight"?

Well, a well-respected (I think) beer judge (who shall remain nameless, but claims to be the "Fastest Homebrewer"-hint,hint) tasted it and thought it a very good match to the '91 Winter Warmer of Harpoon. Oh Swoon! He even asked for the recipe! Double Swoon! So, I seem to have gotten it right. He suggested I post it, so here it is. I personally LOVE the stuff, and will kill it (I'm sure) in record time. I'm partial to spiced ales anyway, and tend to drink them all year long, which means I have to make my own for 3/4's of the year!

Thanks to all the spice-brewers on HBD, from whom I drew my data. Maybe this proves that composite recipes work well? Does that mean that, armed with enough recipes, all other recipes possible can be derived from them? That, and a roomful of typing monkeys?

Subject: Re: Ripping the Big Boys

Gordon Baldwin <hpubvwa.nsr.hp.com!sherpa2!gbaldwin> writes:

>I thing the flack we are giving to the BudMilLob breweries is deserved.  
and...

>I resent the fact that BudMilLob is pushing so hard dollar wise to make  
>the American Light Lager the only style of beer available. I have a  
>little more respect for Coors, as they do produce a few more styles that  
>are available from time to time. I wish more of the majors would follow  
>their lead...

I too, resent the fact that the Big Boys seem to be working so hard to  
remove  
"choice" from the beer-drinker's vocabulary. You must realize, though,  
that  
the brewers have a job to do, families to feed, etc. It's the  
marketeers,  
IMHO, who are doing the dirty work by pushing only the style of beer  
which  
appeals to the largest percent of the populace. This style of beer also,  
not  
coincidentally, is the style in which folks drink a larger quantity at a  
sitting. I don't know about the rest of you out there, but when I drink  
a  
good hearty homebrew or a nice full-bodied beer of any sort it's usually  
a  
single beer I drink. It satisfies me without me having to drink 6 or 8  
eight  
of them (which is the horror of horrors in beer market land).

I guess the real point to be made here is that there are lots of folks  
working at the BB Breweries and that, I suspect, a good portion of them  
are a  
lot like you and me.

Cheers!  
Norm

Subject: Aluminum and Honeymoon

Just a couple of comments.

On Aluminum, I have also heard all the reservations and warnings. Recently however, I was able to attend an Advanced Homebrewing seminar at University of California at Davis. The professor running the brewing department of the school said that the Aluminum issue had been looked into thoroughly. Aluminum pots, and even adding aluminum salts to the brew had no noticeable effect on the quality of the beer. However, he did say that you get what you pay for, and an aluminum pot wouldn't last as long as a stainless one, and would require more cleaning...

As for honeymoon, my Webster's (not all Webster's being alike) indicates that it's a transliteration of the Old Norse for "hjunottsmanathr" (diacritical marks not included) literally of "wedding night month". It will be interesting to see what other etymologies are identified.

Subject: The Big Boys, a different approach.

A post in today's digest reminded me that Coors makes a very good beer in the autumn/winter, "Winterfest." If the big boys started making decent beer, with their capacity for stability and repeatability, they'd make wonderful stuff. Now, they don't because they believe the market isn't there. The fact is that they have, wittingly, or unwittingly, created the market to be what it is by their ad campaigns.

Though I couldn't prove it, I bet that if they received enough mail asking them to make better beers, with specific suggestions and style ideas, they might listen. The place to start is with Coors. I suggest a letter writing campaign asking them to make Winterfest on a year 'round basis. I wonder just what they'd do if they received a couple thousand letters asking this? Maybe I'm hoping in vain, but I don't think so. It might take fifty thousand letters, but we ought to be able to generate that volume if we put our minds to it.

While I'm one of the first to bash the biggies for their beer, I am coming to think that we homebrewers cannot afford to garner their ill will. It seems to me that we are in a position to put a lot of pressure on them to make good beer. For starters, does anyone have Coors address and the names of a few top execs?

I don't think for a minute that Coors, A-B or Miller would make good beer if they didn't think there was a market for it, they aren't in the business for the art of brewing, but the profit motive can be used in both directions. I'd like opinions of others on this, am I spinning my wheels, or is there a chance?

Dan, I want my Winterfest in July, Graham

Subject: hop roots by mail

I thought I'd add my two cents worth on hop roots by mail. Last weekend I got my hops in the mail from Nichols Nursery in Albany Oregon. The roots arrived surrounded by a thick layer of moss to keep them moist, each individually wrapped in butcher paper. They sell four kinds of roots: Tettninger, Willamette, Cascade, and Nugget. The roots came with detailed instructions on how to plant and when to harvest. So this weekend I was busy getting my hands dirty putting them in the soil.

From: orgasm!davevi@uunet.UU.NET (David Van Iderstine)  
Subject: Liquid vs. Dry Yeast

My \$0.02 on the matter of liquid vs. dry yeast:

Everyone sez the biggest difference is in contaminants in the dry yeast. I brewed a dozen batches at least with dry yeast (Munton & Fison Ale) and had no contamination problems. I use standard sterilization techniques.

My reason for switching to Wyeast was that every ale I made, no matter the style, had the same subtle "bad taste" running through them. Now, it's hard to quantify or describe that "bad taste", and I fear that by describing it as "cardboard" or "cloves" I'm going to open that whole way-too-long flame session about oxidation again. Suffice it to say that when I switched to liquid yeast, the bad taste went away. Completely.

I don't believe it to be oxidation-related, or anything else for that matter, because nothing in my technique changed at all. Except the yeast. I was often disappointed by the off-flavors in my dry-yeast ales, and no longer have that problem, so I'm convinced liquid yeast has made the difference.

Maybe contamination in the dry yeast was the culprit?

Subject: Re: Homebrew Digest #844 (March 16, 1992)

On the question of Why Yeast? Wye Not.

That's to say: it's pronounced Why Yeast. It is, in fact, a regional pun, because Wyeast was the local Indian name for Mt Hood, which one can see from the window of the lab and which appears on the label. As one person has commented, though, it's kind of like calling your business Yahweh Yeast and I'm sure there are a few people around who consider this use of the name sacriligious.

Patrick: please, if you will, post the listed ingredients for some of the other New Ulm beers, particularly the wheat beer and their pilsner. Thanks.

Subject: more questions

Dear Brewers,

I have a few more questions about wort preparation. First, I've seen the phrases "cold break" and "hot break" periodically here in the HBD as well as in other published recipes. What do these phrases mean? As a beginner (relying largely on extracts and luck...) are these terms things I need to know now, or when I attempt more elaborate recipes?

My next questions are a little embarrassing to ask. I am attempting my second batch (brewed last Sat. eve.), relying somewhat loosely on Bravery's recipe for "Super Strong Ale." I should emphasize the "somewhat loosely" here. The recipe calls for 3 lbs of dark extract (I'm using approx. 4 lbs of nut brown ale extract); up to 2 gals of water [??] (I'm using about 2.5); and 2.5 lbs of demerara sugar (I'm using about 1.3 lbs. light brown sugar mixed with approx. 1.5 lbs corn sugar). I boiled for 25 min., sat the boiler in a tub of cold water until the temp. fell to about 65 F. (about 30 min ?), siphoned into 5 gal. carboy (which will act as single stage chamber), pitched (dry) and set it out on the back porch under the beer-box. I've since moved it twice (agitating it a bit ?), and it is now fermenting in the pantry at approx. 75 F. The O.S.G. was \*REALLY\* high (just over 1.1 [panic begins to set in]) and the taste was as sweet as syrup!

My concerns now are 1) there appears to be whiter/paler areas in the fermentation foam (infection?); and 2) will the extraordinarily high OSG mean that I'm brewing some God-awful monstrosity? Or that Bravery really means that this is a "Super Strong" ale? I don't want to brew a high-octane furniture polish remover, but I'm afraid that's what's happening.... Oh yeah, there's also a sediment at the bottom of the chamber, and I think it might be the brown sugar. Fermentation is going well enough.. almost too well! Is there a peak %age where alcohol production ceases? ANY insight is gratefully appreciated on this one!!

My firstborn is due on the 17th, but I snuck a peek last Sat. (to assist me with this next batch, of course). I must say that I'm a little disappointed with the carbonation, though. Then again, maybe it was still too early to tell? Any insight?

Thanks, and Happy St. Pat's to all!

John

Subject: Re: HoneyMoon

I couldn't resist this one:

>From: steve@caticsuf.CSUFresno.EDU (Steve Mitchell)  
>Subject: Papazian and "Honeymoon"  
>  
>I just ran across Papazian's account of the origins of the word  
>"honeymoon." He contends that tradition had the newlyweds drinking  
>mead (HONEY) for one month (MOON) after their wedding. This was  
>supposed to insure fertility and the birth of sons. I assume that  
>this is Anglo-Saxon in origin.

I consulted the Oxford English Dictionary on this one: Herewith follows:

"The first month after marriage, when there is nothing but tenderness and pleasure"; originally having no reference to the period of a month, but comparing the mutual affection of newly-married persons to the changing moon which is no sooner full than it begins to wane.

"1546-J. Heywood 'It was yet but hony moone.' 1552-Huloet 'Hony mone, a term proverbially applied to such as be newe married, whiche wyll not fall out at the fyrste, but thone loveth the other at the beginnyng excedyngly, the likelyhode of theyr exceedyng love appearing to aswage, y which time the vulgar people cal the hony mone.' ... 1656-Blount '...It is hony now, but it will change as the moon.'"

Sorry, no references there to mead or fertility.

Date: Mon, 16 Mar 92 13:42:59 PST  
From: Tom Bower <bower@hprnlme1.rose.hp.com>  
Subject: Dry Hopping, Ale Yeast Fermentation Temps

Recently a friend and I made a 10-gallon batch of ale which we split into two large carboys and pitched with different yeast starters: the first, with re-used WYEAST British Ale from a previous batch, and the second with some SNPA yeast (started from a six-pack worth of bottles...YUM!).

Questions for the HBD'ers:

1.) I want to dry hop. I was going to throw an ounce of whole Cascades into the carboy after the krauesen (sp?) falls. If these things are floating around loose, how do I rack to secondary without plugging up the siphon or leaving a bunch of beer behind? Is it possible to put the hops into a sanitized hop bag or something? (Then how do I get it into the mouth of the carboy!?) At least in the 7-gallon carboy I've got plenty of headroom for it.

2.) The two yeasts I'm trying are behaving rather differently. The British yeast (maybe because it was re-used and started with a greater population) took off and fermented vigorously, even at my basement temp. of 57 deg. F, while the SNPA yeast was extremely slow. In fact, I even went and got a pack of WYEAST #1056 (American Ale, which I read here IS the SNPA yeast) and pitched that as well when I still had almost no activity after 2 1/2 days. I suspect that the temperature is a bit on the cool side for this yeast; does anyone have know what the "ideal" temperatures are for these little buggers? It's now been 4 days and the British yeasties are still popping, lots of CO2 and rollicking yeast motion in the carboy, while the SNPA guys appear to be working but much more slowly. So far, no sign of contamination, just vastly different fermentation rates at this temp. Both carboys were at equal temperature, both were agitated to oxygenate the cooled wort...the only visible difference at pitching time was that the British batch had more trub in the bottom than the other.

In the meantime, I'm just not worrying, and looking forward to trying these two ales which will be the same except for the yeast they were fermented with.

Any comments from others with experience using these yeasts or with the mechanics of dry-hopping will be appreciated!

Subject: Re: Boiling Pots, Re: Ripping the Big Boys

>I recently bought a boiling pot. It is 5 gallons and will work really
will
>for chili too! Problem is, it is aluminum. I have been told several
times
>that aluminum is bad (since I made the purchase) but noone really can
>tell me why. Closest I have come is that it oxidizes the wort, which
makes
>no sense since aluminum is not oxygen.

Have you ever cooked tomato sauce in a highly oxidized (read: almost
black inside) aluminum pot? After cooking, the inside of the pot
becomes shiny again, everywhere it had contact with the acidic tomato
sauce.

Wort is acidic. (Is it as acidic as tomato sauce? Don't know, never
did a Ph test on tomato sauce!)

How much aluminum (or aluminum oxide) gets into the wort? Don't know
that either.

But when you consider that parts per million of substances like sodium
and magnesium salts have a definite effect on taste and finish,
wouldn't you rather that your brewpot *not* contribute anything to the
flavor of your beer, particularly a metallic flavor?

>consumers would welcome more variety in the commercial beer market, but
>most beer drinkers are not even aware that there is any other type
>available.

Funny, me defending A-B, but they did make an attempt to market a Dark
beer a while back. (Can't remember if it was marketed as Bud Dark or
Michelob Dark. I think it was the latter.) They even had a television
ad campaign (which I loathed), wherein Martin Mull mouthed lines like
"Some people think that dark beer is only for people named Gunter with
thick necks...", or words very much to that effect.

The slogan was "Don't be afraid of the Dark", accompanied by appropriate
"spooky" sounds, like wolves baying. Typical marketing pap.

Sure made it sound like A-B's marketing people didn't think the average
American beer-drinking public was ready for it, though.

(Not that it was anything special, anyway. It had more flavor and
mouth feel than Bud, but 1) that's not hard to do and 2) it wasn't a
particularly wonderful flavor, either. Certainly no competition for,
say, Beck's Dark or Heineken Dark.

I don't even know if they still market it.

Subject: A weird story

Here's a weird story I heard from a source that I would normally consider very reliable. According to this guy, you can stop a bottle of beer from losing carbonation by sticking a silver spoon down into the neck of the bottle (thin end first, I suppose). He says that this was real common when beer tended to come in big bottles and families tended to have a lot of actual silverware around. Indeed, that one of the outcries associated with the rise of stainless steel was that this trick no longer worked.

What do you think about this? He says the silver "bonds" with the CO₂ in some way as to create a "vapor lock" that stops the CO₂ from escaping. I would dismiss this as total hogwash except that as I mentioned, the guy is usually really on top of things. He swears up and down that you can drink half your beer, shove a silver spoon in, and drink the rest tomorrow.

Anyone else heard anything about this? I have a silver carving set that barely fits my carboy neck, but nothing else of silver, so I can't try it.

Subject: Streak plates & purity

I've been noticing alot of people talking about plating out Red Star Ale Yeast to determine its purity. The most recent posting mentioned having found 3 out of 1000 colonies being bacteria and many of the yeast colonies being slow growing. This lead the person to not worry about contamination of the yeast. The problem here is threefold. First, the media used is presumably selective for yeast. This means that there may be alot of bacteria in the yeast that simply won't grow well on it. Second, bacteria as a rule grow much faster than fungi (including yeast) That means that 3 bacterial cells stand a fair chance at overrunning 997 yeasts. Third, are the slow growing yeasts. the chance that they are mutants of the correct strain is low, otherwise they would be found to some extent on the plates streaked with the strong colonies. The mutation rate is not high enough to produce that number of mutants in a supposedly pure culture. This doesn't worry me as much as the bacteria though because the fast growing yeast should overrun the slow growers. I would be interested to see the results if someone were to plate the yeast on media selective for bacteria such as TSA or CBA. Brucella agar incubated anaerobically would also be interesting. By the way, I'm just putting forth my opinion and suggesting an experiment, so please nobody mistake this for some kind flame. Sorry if I sound paranoid.

From: arf@ddswl.mcs.com (Jack Schmidling)
Subject: Re-hydrating, Wyeast, Yield

To: Homebrew Digest
Fm: Jack Schmidling

I had habitually re-hydrated yeast in a small amount of wort until I went to my first CBS meeting where I was told to re-hydrate with plain, sterile water.

This seemed absurd to me because of previous experience with bread yeast but after trying it and getting vigorous ferment within an hour, I have become a believer.

Just to refresh my data base, I put some bread yeast in 100 ml of warm sterile water last night and absolutely nothing happened aside from dissolving the yeast.

It seems apparent that EDME (I can't speak for any other) contains a de-hydrated nutrient/starter in the yeast mix and bread yeast does not.

Does anyone know if I got this right and if it is true of all dyr beer yeast?

>From: R_GELINAS@UNHH.UNH.EDU (Russ Gelinias)

> If the yeast is in the outer Wyeast packet, then why not just cut it open *without* ever breaking the inner seal, and just make a starter yourself?

I find it incredible that, with all the expert opinion on Wyeast, this very fundamental question is still floating around.

Where is Jeff Frane when we need him?

>From: Gordon Baldwin <hpubvwa.nsr.hp.com!sherpa2!gbaldwin>
>Subject: Low Yield

>I have been getting a low yield out of my grain and I expect it to be in my sparging. The malt ingredients are :

8 lb klages
1/2 lb crystal
1/2 lb munich

>I do an infusion mash for about 45 minutes in 2.5 gallons water. The iodine test shows full conversion. I then dump the whole mess out to my ZapPap lauter tun. I then slowly pour in my 4 gallons 170 degree sparg water, keeping the level of the water above the grain bed. I open the tap on the bottom bucket all the way and the water dumps through in about 15 minutes.

Don't know what a ZapPap is but my first suggestion is to use boiling water.

If you take issue with this, I will be happy to repost my study on infusion water temp.

Secondly, it may be a momily but, most experts recommend about 15 min per gal as opposed to the whole batch. Cut the flow rate.

>My sg after my 45 minute boil is only 1.032. This seems to be way to low after looking at various recepies.

Not too shabby but there is room for improvement.

Your short boil time would indicate that you are not concentrating the wort much and this is one of the objectives of boiling. You can get at least 10 gallons of wort out of 9 lbs of grain if you use 1.010 as the low end cutoff.

If you boil the ten gals down to 5 gallons, you will substantially increase the yield.

Subject: More on Red Star

The plate of Red Star ale yeast I plated 10 days ago still has few bacterial colonies (up to 7 out of 1000 now), but it is covered with evil-looking molds, about a dozen Penicillium-like ones (white and blue and fluffy), and an absolutely disgusting slimy brownish one. This plate looks worse than any that I have ever seen!

The pure colonies on the other hand continue to grow nicely, and have not given rise to any petite mutants after two restreakings.

Subject: housing needed for AHA 92

Hello,

I will be attending the AHA '92 conference in Milwaukee with another member from our local homebrew club (Oregon Brew Crew), and was wanting very much to cut down on expenses. Would any brewers (or non) in the Milwaukee area be willing to put a few fellow brewers up, perhaps in exchange for the same at the upcoming Oregon Brewers Festival?

I would greatly appreciate it. The conference fees are \$220, the flight will be 200-300, and the ... We can guarantee a six pack of homebrew to sweeten the deal. Any takers?

Doug

From: osiris%polari@uunet.UU.NET (J.David Ruggiero)
Subject: The homebrew FAQ...a few modest suggestions

The current FAQ (created by Kurt) is a great start, but needs to be expanded greatly. Some topics that seem to come up over and over again, which should be addressed in greater or lesser detail by the FAQ:

- What are the differences between different styles/brands of yeast?
- What is a minimal list of equipment to get started brewing (extract)?
- What is 'all-grain' brewing? Why should I consider doing it?
- What are the differences between various types of barley (2-row, 6-row, Klages...)
- What kind of equipment do I need to start kegging my beer? Where can I get it?

I could go on and on, but for now...while it is still small, you should also

consider organizing the FAQ by sections, as it is kind of randomly un-organized at the moment. Given what's there so far, I'd suggest:

- Introduction (how is beer made, etc)
- Brewing equipment and suppliers
- Brewing techniques
- All-grain brewing
- Recipes and sources (Cat's Meow, etc)
- Resources/clubs/literature (AHA, Zymurgy, Papazian, etc)
- Net stuff (what is the HBD, etc)

Also, you might watch out for assuming that *everyone* has access to ftp archives and the like. Many of us are at leaf sites and can only dream of that kind of access that you kids [:-)] at institutions of higher learning take for granted. If other sources are available, you might want to list them also.

A great start; let's work together on it and then we, too, can smugly answer questions with the infamous "Look it up in the FAQ!"

From: mcnally@wsl.dec.com
Subject: Sparge water temperature

Jack S. offers advice that boiling sparge water is more effective than the traditional 170 degree water. Though I haven't experimented personally with this, my understanding is that for decoction mash brewers like Jack (I think? correct me if I'm wrong) that probably won't cause any problems because the mash has been boiled already, and starch clumps will mostly have been broken up. For infusion brewers, however, it seems to me that there might be increased risk of rinsing unconverted starches into the wort. I've done many mashes of both types, and a consistent trend is that the decoction worts are clearer, and the mash in the lauter much thicker (there's a lot of broken-down proteins; a sort of proto-hot break).

Another issue is the effect on polyphenol extraction. Jack: Do you test the pH of the last runnings out of your lauter tun? Do you taste it? My general rule is that I quit sparging when the runoff starts tasting like tea. That seems to be about the time the pH goes above about 5.6.

Subject: Porter

(Sorry if this comes in twice)

I recently brewed some porter using 9 1/2 lbs of Dark LME (a pouring accident). With it I used some specialty grains, the usual amount of hops, and Wyeast liquid Ale yeast (Irish).

After it appeared to be through fermenting, I racked to a secondary and let it sit for a few days. When I came back to check it I noticed that there were tiny little islands of foam floating on top. While the hydrometer reading was too high, I didn't taste yeast - it was just very sweet.

My question(s) - is this wort not done fermenting yet? Should I re-pitch another package of Irish Ale Yeast?

I haven't seen the fermentation lock bubble, but there is a small amount of pressure (maybe my wort is acting as a barometer :) in the carboy.

I'm planning on bottling soon, but if anyone thinks I should add more yeast, then I'd love to hear from you.

Cheers,

- --gk

From: oconnor@ccwf.cc.utexas.edu (donald oconnor)
Subject: 2-row usually not Klages

It is common to see homebrew catalogs and, as a result homebrewers, refer to 2-row Klages malt. This is at best only partially correct. Most 2-row malt used by homebrewers is not Klages. It may contain some Klages but also one or several of many other varieties of 2-row barley such as Harrington ... the name Klages carries some positive PR with it, so shops continue to refer to the 2-row as such even though the malters explicitly state that it may or may not be Klages.

From: johnf@persoft.com (John Freeborg)
Subject: Help a first batch?

Well, after reading everything I could get my hands on for a couple of weeks, I did my first batch on March 14. It is supposed to be kind of an amber ale:

2/3 lb. Crystal Malt (20 lv)
3.3 lb. Yellow Dog Amber Unhopped Extract
(Yellow Dog is a mix of 87% 2-row, 12% wheat, 1% chocolate by the Home Brewery shop out of Missouri)
3.3 lb. Bries Amber Unhopped Extract
2 pkgs Munton & Fison Ale Yeast (14 grams) (Levure deBrassage on package)
2 oz. Fuggles Hops (pellets) (5.9% alpha)
1/2 oz. Hallertauer Hops (pellets) (3.9% alpha)
1 tsp. Irish Moss
1 tsp. Gypsum

Put crystal malt in muslin bag and added 1.5 gallons of water. Brought to boil. Removed crystal malt at 200 degrees. Removed from heat, added malt extracts, stirred well for 5 minutes. Added 1 tsp. of Gypsum. Added 1.5 ounces of Fuggles at beginning of boil. Added .5 ounce of Fuggles 30 minutes into boil. Removed 2 cups of wort - added to cold water and cooled to 80 degrees for yeast starter. Added 1 tsp. of Irish Moss 50 minutes into boil. Added .5 ounce of Hallertauer 55 minutes into boil. Force cooled wort in kitchen sink with ice and water.

Then I made a *terrible* choice of strainers (way to small and fine) and it took forever to get the wort into the primary plastic fermenter. The wort also got extremely aerated at this point as it dripped into the primary fermenter. Since then, I have heard straining out the hops at that point isn't that critical (?).

Added yeast starter at 78 degrees. Primary fermentation was 1.5 days at 68 degrees. Not very much head foam - or at least not as much as I was expecting (1/2 inch). The head fell back *quickly* and lots of fruity ester smell too.

It is now in the carboy and I've got very slow fermentation going - one bubble every 5 minutes at the best. If I shake the beer around in the carboy a bit (gently) I get a lot more bubbling action which stops soon after I stop moving the beer. I think the wort got way too aerated going into primary with that little strainer. I suspected a stuck fermentation because there is no sign of head on top of the 2nd carboy (at all) and the bubbling is so slow when everything I read says it should be bubbling every 20-30 seconds at least. There was a 1/3 inch of milky white sediment (yeast I presume) already on the bottom of the carboy.

So, I worried (don't have any homebrew yet) and sanitized a racking tube

and gave the wort 8 or so really good stirs to get the yeast off the bottom and hopefully working better. Checking it this morning (4th day) the stirring had no effect and everything has collected back on the bottom with no new signs of fermentation.

Any ideas to help resurrect this batch? Should I add another packet of yeast to try to salvage it? There isn't any signs of infections yet and it still smells ok (although a little fruity).

Thanks!

Subject: Re: using starter with Wyeast

Hello,

My first posting and my second batch!. Well I noticed in todays posting by J.S. (arf?) The question of why not cut open the Wyeast packet and make your own starter?

Well I just got back from my local homebrew shop (Fermentation Settlement), and with all packets of Wyeast they are selling they are distributing instructions on just how to do that. In fact they are warning consumers not to try to pop the inner packet due to seam failures recently. The instruction sheets they are distributing appear to have originated from Wyeast.

Hope this is of interest to someone, and thanks for all the help over the past few months!

Subject: Re: Honeymoon (OED attribution)

Okay, I'll jump into the fray.

Although the Oxford English Dictionary is an impressive source to cite (It's so big! So expensive!) I don't think OED looked far enough back for its etymology. Notice that Papazian attributes it to a period that by far predates the quotes by 16th century English authors. The quotes themselves seem to follow the style of the "University Wits", a loose group of university-educated writers of the period who were fiends for play-on-words. True, these attributions helped to popularize the word, but "honeymoon" very likely is of nordic origin, as is a lot of the English language.

.

You get the idea.

I'd type in the Introduction, but I'm short on time. Let it be noted, however, that he addresses the fact - until now unacknowledged in these ivy-covered halls of digitized knowledge - that stocks mutate, and that there is No Good Way to keep this from happening, except to keep refreshing your stock.

His method is to take one liquid culture of known goodness - presumably, fresh from a manufacturer - and making cultures out of it. (I suppose that the legal mind that would copyright roses' genetic patterns would also take umbrage at this illicit cultivation of a copyrighted slimemold - and if this is not an issue now, it will be soon. Take note, brew clubbers ...) He admits to cultivating multiple generations of yeasts hard to get, such as those harvested from the bottoms of beer bottles, but even so, warns against the inevitable mutation.

It seems to me that, given the speed with which yeasts propagate, and the speed with which the generations pass, that evolution is a tangible force in the brewing world, and cannot be stopped or countered. The best one can do is to try to keep known good cultures on hand, ruthlessly discard those that go bad (optionally killing everything in the flask first, if you're really interested in influencing evolution, :-), and keep a steady flow of new genetic strains moving through your beer, accepting the inevitability of your beer's changing as the yeasts mutate in response to environmental stresses and influences. Keep the yeasts pure and don't fret about the breed, exactly, because it's changing even as you watch it ...

This problem even effects the big brewers. I don't know how they do it .
..
maybe they have cloned yeast cells frozen in vast amounts against future mutations in their breeding stocks. But you can't stop Nature ...

I'm rather enthusiastic about breeding yeasts and trading them with friends, as a local member of the Yeastie Beastie Preservation Society - which doesn't exist, but may soon. (-:

Put them in a bag. If your homebrew supply store doesn't stock
ready-made bags (they look like socks) you can use cheesecloth. Hops
floating around loose would be a real bugger to deal with. You may
want to start with a smaller amount--say 1/2 ounce. Cascades are very
aromatic and I've found this quantity to be more than adequate (and I'm
a hop freak). Notice Mal Card's problem with bitterness; it's possible
that the addition of 1 ounce of hops pushed the beer over some sort of
bitterness threshold. In spite of what is generally said about hops
requiring boiling to produce bitterness, Dr. Lewis has established that
the simple addition of dry-hops and no bittering hops is enough to add
some bitterness to the beer.

I've found that 1056/SNA yeast works very well at 65F, although WYeast

claims that it works well at much cooler temperatures. I think your sample may prove otherwise, although the pitching rates seem to be quite different. If the British yeast came from a recently fermenting batch of beer, they were likely much more active, as well as being in greater quantities. So, in this regard, I don't think the difference in activity is surprising. If you can raise the temperature of the SNA you may improve ferment. On the other hand, as long as the beer ferments out completely there shouldn't be any problem with the flavor, so maybe just relax yadda yadda.

Yo. The answer is yes. And why not, indeed? I use the in-built starter for oomph, but transfer it into a starter culture; there's no reason why you can't skip the initial starter. You might try, however, pitching it into a smaller quantity than 1 quart--say 6 to 8 ounces.

Someone raised the question of poor malt yield. I'm told that some of the local microbreweries have had a problem with inconsistency in their Klages, so it's possible that the problem isn't procedural at all. One suggestion is to slow down your lautering phase. I've taken to monitoring the OG when the kettle is full, to see if some form of artificial adjustment is required (e.g., adding some malt extract ((horrors!)) or boiling to a lower volume--or alternatively if the yield seems to be higher than expected, boiling to a greater volume ()

On the question of the Big Boys and the beer they brew. As far as I can tell, a letter-writing campaign is unlikely to change their approach to the market. They already figure they're making Good Beer and as long as they sell lots of it, what do they care what a few grumpy homebrewers think? A few years ago, Heileman (?) built a new Val Blatz brewery in Wisconsin(?) which was designed to brew high-quality (relatively--anyway, all malt) beers on a smaller scale for draught sales in the Midwest. Within a remarkably short time they closed down; I have no idea whether the brewhouse is sitting idle... quite a thought.

If the continuously-expanding microbrewery market ever puts a dent in the BB's sales, then you might see some changes. Judging by previous activity, however, this will simply mean a change in marketing approach. (Garbage like Miller's Plank Road and, pardon me fans, but Coors Winterfest are good examples.)

What I'm curious about is why anybody gives a rip _what_ AB or Coors or any of the others brew, as long as decent microbrews (and contract brews like Sam Adams) are available--or as long as we can brew at home. People like to eat Cool Whip and Big Macs, too, and it's no skin off my nose as long as no one forces one on me. What concerns me is that AB keeps its grubby paws off the Czech Budwar and Pilsner Urquell. Lord knows what their marketing bozos would do with all that labor-intensive brewing!

From: resch@craycos.com (David Resch)
Subject: Dry Hopping and SNPA yeast

Tom Bower asks about dry hopping and SNPA yeast. I use both for virtually every batch so:

I just toss the loose hops into the secondary fermenter (using a large funnel) and then rack the beer from the primary into the secondary right onto the dry hops. I usually do this after one week of fermentation. I let the secondary fermentation/dry hop conditioning continue for another one to two weeks.

Numerous people have expressed concern with these hops clogging the racking tube when it's time to keg/bottle, but this has never been a problem for me in the 2+ years I've been dry-hopping. My racking tube has a little red nipple that fits on the end to reverse the flow of the liquid (presumably to minimize sucking up the bottom sediment). When the majority of the liquid has been siphoned off, the (now soggy) hops begin to clump around the bottom of the racking tube. However, the beer continues to siphon just fine! The hops actually form sort of a filter and tend to catch a little of the yeast/trub sediment. I can (and do) get virtually every drop of beer out of the carboy leaving just the soggy hops and sediment behind!

Ahh, Sierra Nevada yeast! I love this yeast and use it for almost all of my ales. Through a large amount of experimentation, I have found that this yeast seems to work best at about 65 degree F. When the temperature goes below about 60 degrees, it REALLY slows down. In general, I find that this yeast ferments a bit slower than other varieties, but the clean/neutral aromas and flavors that it produces are well worth the wait!

Jeez Jack, I don't suppose you're talking about *me* are you? I did
review
the bloody thing, and I had a dozen people or so review it. The opinions
of
5 of those were posted right here on the net, by the 3 people (other than
myself) that had access... The opinions of the non posters are in line
with
mine and of the people that did post. Did you want a blow by blow review?
I
feel a *little* guilty for not having posted a personal review, but I
figured you got plenty of feedback from them...

Just for the record: it was our opinion that Jack's video has a place,
tho
it's probably not with the HBD community sice it's geared at the very
beginner. As such, it demonstrates a viable technique for making a beer,
and I would recommend some visual instruction to any beginner. It's a bit
hard to pick up miller cold, and make heads or tails of what he's saying
w/out watching someone do it. On the other hand, don't we all learn this
from sobody else? As was pointed out, people had some difficulty w/ the
brewing area not looking sanitary enough. In reality, that's how many of
us
probably brew. On the other hand, if you're trying to train newbies you'd
better take such things as sanitation to an extreme. The section on
malting
was not necessary, and that guy at Baderbraeu (who can't pronounce the
name
of his own brewery) had better be paying you big bucks for the
advertisement. *grin*

Mike

No strain numbers were used, so I am a little bit confused. Wyeast #1338 is listed as a European Ale yeast (on the package), and it is my understanding that it is a German Alt yeast by looking at the Alternative Beverage catalog.

Maybe, Ted, you had another yeast in mind other than #1338 when you said "European"?

From: ncrcae!brew@devine.ColumbiaSC.NCR.COM (Jim Griggers)
Subject: Color Value Question

I am having trouble understanding some color definitions in "The Essentials of Beer Style" by Fred Eckhardt. This was only brought to my attention when

I compared color values given in "The New Complete Joy of Home Brewing" to values in Eckhardt's book. Fred gives values in a 1-10 color scale and also

in SRM values. Part of his table is:

| Value | SRM |
|------------|----------|
| 1 - 1.51 | 2.5 |
| 1.5 - 22.5 | 3.5 |
| 2 - 3.53 | 5.5 |
| 3.5 - 4.5 | 5.5 - 10 |
| 4.5 - 5.5 | 10 - 18 |

Which is fine, no problem. But under the table, he states the color of Budwiser as $2(1-10)/2.7$ SRM. From the table, color value 2 should equal

3.5 SRM, right? What am I missing? This discrepancy seems to be consistent throughout the book. Some places in his charts he only lists color values, not SRM degrees.

An example that first caused me concern:

Bass Pale Ale (export) 10 degrees SRM from TNCJOHB page 49
Bass Pale Ale (E) 5.5/9.8 (color/SRM) from Essentials page 88

The SRM values match up, but his chart says 5.5 should equal 18, not 10.

Not worrying but confused,

Jim Griggers

From: volkerdi@MHD1.moorhead.msus.edu (volkerding patrick)
Subject: August Schell Ingredients

Well, a number of people have asked about this, so here is the official, vague and incomplete, August Schell beer ingredient list: (tm)

August Schell Pils: 100% Barley malt (?), Hallertau, Cascade hops. 4.2 % alcohol. (all alcohol given is by weight)
"Hops are accented in flavor and aroma over a rich, malty background. Naturally krausened."
Kelly also mentioned to me that the Pils is lagered for 3 months. I'm not sure exactly what kind of malt goes into it though...

August Schell Weizen: 60% Wheat malt, 40% Barley malt.
Hallertau, Cascade hops. 3.5% alcohol.
"Top fermentation provides a refreshing citrus tang . . . naturally krausened."

Schell's Bock: 80% Malt, 20% Corn. Hallertau, Cluster hops. 4.5% alcohol.
"Reddish-copper color, light caramel flavor (hint, hint :^), heady.

Pete's Wicked Ale: Pale, Crystal, Chocolate malt. Cascade, Chinook hops. 4.0% alcohol.

Pete's Gold Coast Lager: Pale malt, Cara-pils malt. Cascade hops. 3.5% alcohol.
"Pleasant balance of malt sweetness with robust hops flavor."

Pete's Pacific Dry: Pale malt, Crystal malt, Wheat malt. Hallertau hops. 3.3% alcohol.

I'm leaving out their lower-priced light American lager style beers because I doubt there's much interest in those. (though they're not bad for the style)

Oh, Kelly also mentioned to me that they use only pellet hops at the Schell brewery. One more hint for those of you trying to brew something similar.

Happy brewing :^)

Patrick

P.S. Just pitched the yeast for batch #3 (all grain batch #1) :^) :^):
^)

Bottled batch #2 four days ago. And, I'm planning to brew another batch this weekend. I figure I don't ever want the homebrew supply to run short ;^)

From: "Justin A. Aborn" <jaborn@BBN.COM>
Subject: Stop Clogging Funnel Strainers

I just figured out a new trick.

The funnel I use to pour wort into my carboy has an integrated strainer that usually gets clogged with hop bits when I transfer wort from boiler to carboy. What a pain.

The last couple of batches I did the following. Towards the end of the boil I put my standard, stainless, kitchen strainer into the boiling wort for 10 minutes to sterilize the strainer.

About one minute before I turn the flame off I start swooshing the strainer through the wort to catch free floating hop bits, and dump whatever I catch into the trash.

Several cycles of this gets 90% of the funnel cloggers out of the wort, and makes the transfer to the carboy much more relaxing.

I use leaf hops without any sort of hop bag for maximum rolling and mixing of the hops and wort. This procedure makes using this hop form a breeze.

From: Ruth Mazo Karras <RKARRAS@PENNSAS.UPENN.EDU>
Subject: Homebrew Digest #846 (March 18, 1992)

Someone suggested that "honeymoon" comes into English from Norse. If so, the derivation probably has nothing to do with honey. Cleasby and Vigfusson's Old Norse dictionary suggests that "honeymoon" is derived from Old Norse "h'y n'ott," (those are acute accents), meaning "wedding nights," the three nights after the wedding. "H'yn'ottar m'anudr" (wedding-night month) could easily become "honeymoon" in English, and the explanations of the word in terms of honey could be back-formations.

From: jim@grunt.asrc.albany.edu (Jim Schlemmer)
Subject: When to dry hop?

Regarding dry hopping,

Jeff Frane says:

>Put them in a bag. If your homebrew supply store doesn't stock
>ready-made bags (they look like socks) you can use cheesecloth.

This is what I did. It was a little tight going through the neck of the carboy with an ounce of hops though.

David Resch says:

>I just toss the loose hops into the secondary fermenter (using a large funnel)
>and then rack the beer from the primary into the secondary right onto the dry
>hops. I usually do this after one week of fermentation. I let the secondary
>fermentation/dry hop conditioning continue for another one to two weeks.

This sounds like a better method if, as Dave goes on to say, the hops don't clog the siphon.

My question, however, is not with the method of introduction but with the timing. I just made a batch last night and put an ounce of cascades in a hop bag and stuffed it into the carboy. Now I read that Dave waits until he racks to secondary and I remember that I've heard that before. Can someone tell me why? Miller has about a paragraph on dry hopping and I don't recall if he suggests a *time* to dry hop, but I know that he doesn't discuss the relative merits of secondary vs. primary hopping. Should I expect anything bad to come of not waiting for initial fermentation to cease? This morning the wort was rolling and tossing but the hop bag was just sort of floating atop the head of foam. Should I make an effort of poking it back down?

Thanks,

Jim

From: smithey@rmtc.Central.Sun.COM (Brian Smithey)
Subject: Fred Eckhardt's beer color values

In hbd #846, Jim Griggers <brew@devine.ColumbiaSC.NCR.COM> expresses his confusion over Fred Eckhardt's 1-10 color scale and the tables relating it to SRM.

I've noticed this too, and tend to believe that Fred assigned his color "values" in a very isolated, subjective fashion, and tacked on the value <--> SRM conversion tables as an afterthought. Note that there are very few beers in the book that have actual SRM values listed with the color value; my feeling is that where SRM values are published, they are from information furnished by the brewery. I tend to give those figures much more weight than Fred's color.

On a similar subject, I'm working up a recipe for a microbrewery style (I)PA, and compared the profiles of several beers to get an idea of gravity, bitterness, and color. I looked at SN Pale Ale and Celebration Ale, Red Tail Ale, Anchor Liberty Ale, and Red Hook Winterhook. None of these listed SRM, but the all had color values in the 4.5 - 6.5 range (sorry, I don't have the book handy). Although I've never compared these beers side-by-side, I do have quite a bit of experience with all of them :-), and feel pretty safe in saying that the SNPA is substantially lighter in color than all but the Red Tail. Looking at Fred's numbers he had the SNPA right up there with the darkest of the bunch -- I think he gave it the same value as the Celebration Ale!

My advice is to look at several examples of a style, get a rough idea, and if SRM is also given, give that value much more weight. Also, as always, keep good notes -- write down your computed/expected SRM value, and when the beer is finished, write down a description of the color, maybe some similar commercial examples. Your notes will eventually become more valuable than Eckhardt's book.

Subject: Re: Sparge question

[Sayeth Crawford.Wbst129@xerox.com :]

I saw your posting in the HBD and I have a problem that maybe you can help with. I am trying to get into all-grain brewing but each time I try it (about 5 times) I get a VERY harsh after taste making the brew un-drinkable.

Hmm... That's never happened to me, but then again I've always been worried about it after reading Dave Miller's book.

I'm thinking that the harshness is polyphenols coming from the husk.

I guess so, but once again I have no experimental evidence to back it up.

1. how much sparge water do you typically use per pound of grain?

I generally brew with about 10 lbs of grain for a nominal 5 gal batch. I mash with about 3 gallons and sparge with at least 5 gallons. I know that's supposed to be a no-no, but I feel that when I carefully monitor the runoff there should be no problem.

2. how do you adjust the PH of the sparge water and to what PH?
You already answered when to stop sparging.

Actually, the last time I brewed I didn't, just as a test. After reading Goerge Fix's book I decided that distilled water (which I always brew with; San Jose water is pretty bad and I don't feel like boiling 10 gal of water the night before I brew) should be about as effective as acidified water in controlling tannin extraction. I do have a jar of USP lactic acid that I have used with success. It's kinda hard to find, but chemical supply shops can get it. It doesn't take much.

3. What is your sparging setup?.

I have a pair of 22 qt rectangular food bins I got at a restaurant supply place. I drilled many many holes in one with a Dremel tool. I installed a spigot near the bottom on the other one. When sparging, I nest the multiply-perforated bucket in the spigotted one and wrap the whole thing in mylar-coated plastic bubble insulation (available at hardware stores). I also put a block of wood under one side to tilt the thing such that the spigot end is lower than the other. Before transferring the mash from the stove to the lauter tun, I bring about a gallon of water to the boil and fill the bottom of the tun. I then transfere the mash and let it sit for about five minutes. I then start draining off the wort, rapidly at first, into a saucepan on a little portable electric burner (to keep the mash temperature up). I recirculate until pretty clear.

I used to do the gradual exchange of sparge water for wort, but on my last batch I tried the seemingly popular technique of draining all of the initial mash liquid before adding any sparge water. When the bucket drained completely, I added the 170-degree sparge water and stirred up the mash. I let it rest a little, then repeated the initial process.

On my last mash I also tried the single-temperature "hot strike"

technique suggested by someone; Russ Pencin? That worked very well. The wort came out as clear as any decoction mash I've done, and it was MUCH less work. The mash was mostly 2-row Klages, and I got a perfect pH with almost no effort (a little calcium chloride in the distilled water is all I added).

Subject: RE: Mistletoe

Jay, are you having trouble with somebody? Mistletoe is poisonous.
Deadly even. A few berries are sufficient to off a small child. There
is the slight chance that the process of fermentation might neutralize
the toxin, but, well I guess I'm not that sort of gambler.
Why do you want to ferment mistletoe anyway? The `aphrodisiac' properties
of mistletoe are not inherent in the plant, they are given to it
by tradition and depend upon placement, not ingestion.

Scary stuff.

Carl

*I find it amusing that Christmas is celebrated by decorating with
poisonous plants, holly, pointsettias, and mistletoe.

From: avalon!jm@siemens.siemens.com (Jeff Mizener)
Subject: Re: Help a first batch? (Aereation & Straining the Wort)

I am fermenting a recipe that's not all that different from John's (an oatmeal porter)* and I had a similar problem straining the wort into the fermenter. I use a mesh boiling bag to boil my grains. When I'm done boiling, while the wort is cooking, I clean and sanitize the bag, then bind it across the top of my fermenting bucket. I ladle (saucepan) the cooled wort through two layers of mesh. I need to scrape the hops and such off the mesh in order to get the wort to go through. In the process I aereate a lot. I pitched one package of Whitbread ale yeast directly into the fermenter and stirred. Then I topped off with cool filtered water to 5 gallons. The fermentation lock started bubbling slowly within 4 hours and was going great guns 12 hours later.

The moral to my story is that his problem probably isn't too much aereation.

The question of straining the boil into the fermenter seems to be a bit of a sticky one. My last batch was two-stage and both in carboys. I strained the boil through a big funnel with a built-in strainer (very fine) into the carboy. What a pain. I ended up cleaning the strainer after each small ladle full. I lost a good bit of beer in the process (why I didn't top-up with water is a question I can't answer...).

Any comments??

*3/4# grains, 6.6# extract, 1.5oz hops boil, 0.5oz hops finish (+ 1# oatmeal boiled 10 min)
If it works, I'll post the recipe.

Relaxing (but not too much, I'm at work...)

From: yoost@judy.indstate.edu

Subject: re Mistletoe

I recently made a batch of pale ale to try to simulate Anchor Steam flavor.

Recipe :

3.3 # light M&F DME
3 # light unhopped M&F ME
1 # Crystal Malt
2 oz Willamette
#1007 Wyeast

1 oz Willamette at start of boil 1 oz at end boiled 1/2 hour sat 1/2 hr strained into primary pitched 2 cup starter 48 hrs previous at 78 deg. in primary for 1 week secondary for 2 weeks. Used 1 cup DME boiled in 2 cups water for primer.

I use "Bottled Drinking water" (the kind out of a machine in grocery store)

. My water has a high concentration of calcium and floating solids no chlorine.

The taste is close to what I want but the beer is cloudy.

Also has a somewhat 'thin' taste.

I want more hop nose so I am going to dry hop with about an oz. of Northern brewer next time and probably use a different bittering hop than willamette.

Any suggestions on the cloudy and thin problems.

I fermented at about 65 degrees.

What about using a lager yeast and fermenting at about 68 deg. ?

Thanks.

Subject: Protecting carbonation with a silver spoon

What an interesting idea, I said, when I read those posts. So I ran downstairs
popped open three bottles of brew, and gave it a whirl.
Bottle 1 was half-drunk (slurred words, gregarious ;-), so the silver spoon rested in the neck but was dry.
Bottle 2 was nearly full, so the silver spoon was wet.
Bottle 3 was open, full, and had no spoon (control beer)

I kept all three in my refrigerator for 24h. The results: no noticeable loss of carbonation in ANY of the three. I'm not ready to throw out the theory, but if you're only talking about a day, there seems to be little efficacy. Ideas...longer wait? Unrefrigerated? Have some friends over and conduct a random test with a whole case? I think I would run out of spoons first.

Subject: hot sparge / stuck ferment

>Jack S. offers advice that boiling sparge water is more effective than
>the traditional 170 degree water.

A freind and I let the sparge water get too hot (180-185F) on a recent batch. The sparge had clumps of protein in it, which would not filter out over time. The result had a somewhat sour, green, almost lambic taste to it.

=====

>Then I made a *terrible* choice of strainers (way to small and fine) and
it
>took forever to get the wort into the primary plastic fermenter. The
wort
>also got extremely aerated at this point as it dripped into the primary
>fermenter. Since then, I have heard straining out the hops at that
point isn't
>that critical (?).

So take your fine strainer, and try to remove as much of the hops and coagulate as possible during the waning minutes of the boil. Then add LEAF finishing hops (if any), cool, and strain into the carboy. I find that hop pellets can really clog up a strainer.

The more aeration of the COOLED wort before and just after pitching the better - you didn't go wrong there. The yeast needs the oxygen during its initial aerobic stage for reproduction. Most all the available oxygen will be used up by the yeast, and will not contribute to oxidation of the wort. On the other hand, hot wort can be oxidized instantly.

>So, I worried (don't have any homebrew yet) and sanitized a racking tube
>and gave the wort 8 or so really good stirs to get the yeast off the
bottom
>and hopefully working better. Checking it this morning (4th day) the
>stirring had no effect and everything has collected back on the bottom
with
>no new signs of fermentation.

Rack it off the sediment, if you wish, and be patient. If you decide to add more yeast, create a very large starter, shake it often so that the yeast has oxygen to grow, and then add it to the wort, stirring gently. Aereating the fermented wort at this point can cause oxidation problems and should be avoided.

From: korz@ihlpl.att.com

Subject: Sparge temp

Many of you will recall Jack's informative post on sparge temperature. This issue seems to have come up again and this got me to thinking. The details of Jack's experiment are available in the archives but for clarity, I will summarize here. Basically, what Jack's experimental data shows, is that a 212F sparge water into a shallow bowl resting on the top of the grain bed results in a significant drop in temperature when measured in the grain bed and in the runoff. I can't find my copy of Jack's post, but suffice it to say that the temp in the grain bed was about 170F and the runoff temp was somewhere around 160F.

Here's what I'm thinking: maybe the 170F sparge water *already accounts* for the drop in temperature. Maybe we *don't* want 170F in the grain bed - -- maybe we want 145F in the grain bed and 130F in the runoff (I'm making these numbers up -- I've never measured)?

It's Mike's post that led me to wonder about what temp we *really* want in the grain bed. Comments?

>From: mcnally@wsl.dec.com
>Subject: Sparge water temperature

>Jack S. offers advice that boiling sparge water is more effective than the traditional 170 degree water. Though I haven't experimented personally with this, my understanding is that for decoction mash brewers like Jack (I think? correct me if I'm wrong)

I am no longer doing decoction.

> For infusion brewers, however, it seems to me that there might be increased risk of rinsing unconverted starches into the wort.

My point is NOT that boiling water is the ideal sparge temp but that no matter what the sparge temp is, the mash itself never sees anything close to what is going in.

Next time you do a sparge, run a thermometer up and down the lauter tun to determine the actual temp profile. With boiling water going in, I get a range of 135F coming out to 155F near the top. Matters can only get worse using water at the "correct" temp.

Bear in mind that I am not dumping in a large volume of boiling sparge water.

I am only running it in at the rate the sweet wort is running out. I maintain about an inch over the grain and the heat loss is what is at issue here, not brewing theory.

>Another issue is the effect on polyphenol extraction. Jack: Do you test the pH of the last runnings out of your lauter tun?

No.

>Do you taste it?

Of course.

>My general rule is that I quit sparging when the runoff starts tasting like tea.

That is a bit subjective.

>That seems to be about the time the pH goes above about 5.6.

According to Noonan, the the issue is change in pH, not the absolute value.

He also contends the SG is a good indication of when to quit and suggests that 1.008 should be the limit. I stop at 1.010 to allow a margin for error.

>From: gummitch@techbook.com (Jeff Frane)

>Yo. The answer is yes. And why not, indeed?

Yes, what and why not what?

Just for the record, the question is: Where is the yeast? In the inner or outer container?

Yes is not very satisfying.

>From: mfetzer@ucsd.edu (The Rider)

>Jack Writes:

>> It's great fun, very rewarding and easy to do in small quantities. I > demonstrate the process and how to make the necessary equipment in my video.

> Perhaps one of the "reviewers" out there, who received a free copy would be

> kind enough to send it on to you.

>Jeez Jack, I don't suppose you're talking about *me* are you? I did review the bloody thing,.....

Thank you but you seem to have missed the point. If you are through with it and it is sitting around collecting dust, why not send it on to someone else who could use it?

>The section on malting was not necessary.....

That is a strange comment, considering that the poster was looking for information on doing his own malting.

> and that guy at Baderbraeu (who can't pronounce the name of his own brewery) had better be paying you big bucks for the advertisement. *grin*

I had to settle for a case of beer.

BTW, I am not sure what he is mis-pronouncing but it is named after his sugar daddy, a Mr Bader.

From: abirenbo@rigel.hac.com (Aaron Birenboim)
Subject: New Belgium Brewery, Ft. Collins, CO

On Tuesday, march 17 th meeting of the Unfermentables brewing club had a speaker. Unfortunately, I do not remember his last name, because he was referred to as "Jeff" ... operator of the New Belgium Brewery, in Ft. Collins CO. He makes several Belgian style ales in his basement, and sells them in liter bottles at several Ft. Collins and Boulder liquor stores.

Jeff's beers all use NO bacteria, but he uses several different yeast strains..... and when I say DIFFERENT, i mean it. Real Belgian style yeasts. Very complex flavors... perhaps even "spicy".

His biggest seller is "Fat Tire Ale". Basicly this is similar to your usual amber-ale wort, all malt, fermented with his pure, single strain yeast. It has a bit of the belgian character, but is mild and smoother. Most acceptable to the usual american pallate. I noted a vinegar aroma, but no noticable vinegar flavor. This beer was dry-hopped with Kent and Williamette.

My favorite was his cherry ale. This wort seemed pretty much like Fat Tire, but with almost no hop character. He mentioned the use of "old, cheesy, hops". However, i do not think he actually ages them. He might just expose them to air for as long as he can, or possible "age" them in the oven, a la Martin Lohdal. (just wanted to give martin a little fame... he's helped me a lot over e-mail.) He uses 1 pound of cherries/gallon in the secondary. Since he could not get the european style black cherries, he uses sweet pie cherries, frozen, from a colorado orchard. The same yeast as fat tire ale was used.

His trappist ale had a "hairspray" aroma, but the flavor was quite a bit smoother than the arome suggests. It may be unfair for me to judge this beer, since i do not like the spicy, complex, trappists. This beer is a bit stronger, going from 1.060 to 1.012. It is fermented form a single pure strain. It uses the "secret" trappist ingredient, candy sugar. He uses demura or turbinado for "candy sugar". I have seen both of these on the shelves of Cub and/or King Soopers groceries in Denver.

In his trippel he uses multiple yeast strains. For consistency, he splits the batch for fermentation, and blends at bottling. Trippel is uisually quite pale, and might have wheat. Both his trippel and the "Brassiere Dupont" trippel that i have had seemed to have wheat. I think by this time i wqas getting a bit loopy, because i have almost no notes on his trippel ;-)
I prefered his trippel to the dupont a friend of mine brought from germany, since his was smoother.

His beer is priced competituvely with other u-breweries, and a great bargain for that price. He plans to remain small so he continue brewing the belgian styles he loves, which have a limited potential market. He has almost never made any sales effort.... All but 2 of the liquor stores he supplies approached him. However, he may leave the basement soon.

Apperently, the only major obstacle for him to go commercial was an odd law on in-home businesses. He had no problem

meeting zoning and health ordinances for an in-home operation. However, there was a specific clause which basically said... "except for breweries. no home breweries." He somehow went to D.C. and the like to get this changed or something. I never really understood how hw got around that obstacle. He said that the health inspector said that he had done everything right, so he obviously knew the laws, so why did he go and do this in his basement? This occurred AFTER the initial investment in SS equipment.

It was a very enjoyable talk that lasted about 90 min. Unfortunately it was getting late, so i missed the bock tasting. dang.

Subject: Mistletoe

Jay Allen asked about mistletoe brewing in HBD 846.

All species of mistletoe are poisonous (the american Phoradendron sp. as well as the european Viscum sp.). They contain vasopressor amines such as tyramine and phenylethylamine, and have been known to kill animals as large as cows.

Furthermore, the major use of mistletoe (besides kissing under it) is to manufacture birdlime, the sticky goo use to catch birds by gluing them to a branch. Would you want glue beer?

> I have some screw on bottles. A few are the Ballantine Pale Ale
>bottles. Can I use these to bottle when I brew my first batch? Or is
>bottling screw on bottles very iffy? Has anyone done this successfully?
?

>Ted

A fair question. A common response is "no no," usually followed by:
"And never use nonreturnable bottles 'cause they're not strong enough."

I took the liberty long ago of disregarding the second piece of advice.
I'd guess that the majority of the bottles I use are nonreturnables--the
glass is visibly thinner than the glass which returnable longneck bottles
us.

As for screw tops, I bottle 2 or 3 screw top bottles several batches ago.
I wanted to see how it would work. I used good old fashioned crown caps
and my double handle capper and a little extra care. I had no problems.
I'll grant that my sample size was small, but I can't come up with a
logical
explanation of why it wouldn't work IF you don't break the bottle while
capping--but that's a concern no matter what sort of bottle you use.

Back to the nonreturnable bottle issue: Over in r.c.b., I asked for
stories from people who've had problems using nonreturnable bottles.
No one has given me any horror stories yet. Let's just think about it
for
a minute: beer, soda pop, champagne--they're all carbonated, so the
bottles
in which they are sold are meant to handle carbonated beverages. Now,
if one takes reasonable care in brewing, the beverage one creates is not
going to be significantly more fizzy than what one buys in a store.
Unless
the glass is weakened by sitting around with commercial beer in it, there
is no problem with using the bottle for homebrew. If you're prone to
glass grenades, I suggest you change your brewing practices. If you are
worried that a batch may go explosive without warning, I see no need to
fear nonreturnable bottles more than returnables.

The only reason I bring all this up is that I've seen complaints that
it's
getting harder and harder to find returnables, and/or people have a lot
of old bottles laying around from those 6-packs of Bass or Pete's or
whatever
and they'd like to put the bottles to use.

Have at it!

Subject: Pellets used by the Pros; Dry Hop Timing

volkerdi@MHD1.moorhead.msus.edu (volkerding patrick) writes:

>Oh, Kelly also mentioned to me that they use only pellet hops at the Schell brewery. One more hint for those of you trying to brew something similar.

I've noticed only pellet hops in all of the brewpubs I've visited (roughly 7 in Colorado). I figured they do this for consistency, so they can get the same hops all year round. Anyone else know more?

jim@grunt.asrc.albany.edu (Jim Schlemmer) writes:

>My question, however, is not with the method of introduction but with the timing. I just made a batch last night and put an ounce of cascades in a hop bag and stuffed it into the carboy. Now I read that Dave waits until he racks to secondary and I remember that I've heard that before. Can someone tell me why? Miller has about a paragraph on dry hopping and I don't recall

It is my understanding that you should wait until secondary fermentation for two reasons: 1) The alcohol content is higher and thus prevents any bacteria (that are riding on the dry hops) from running away, and 2) at least with loose hops, it keeps them from floating on top of the foam and wasting their time. I'm planning on dry hopping my current "Buy American Ale" tonight or tomorrow (when the Krauesen falls) in this manner. I just thought of another reason: The shorter you are (in time) from dry hopping to drinking the brew, the more of that great aroma kick you're going to get.

From: ZLPAJGN%LUCCPUA.bitnet@UICVM.UIC.EDU
Subject: It IS a Monstrosity!!

Dear Brewers

Earlier this week I posted a series of questions regarding a potentially lethal concoction I brewed up over the weekend. My procedures were VERY loosely based on Bravery's recipe for "Super Strong Ale." Things seemed to be going well enough: the fermentation was of such a pace that I was positive the damn thing was about to sprout legs and walk away!!

Today, however, things seem to have gone sour, and I choose that word correctly! Fermentation's all but ceased; the kreauseun (?) has fallen and now there's an odd methane-like odor about the fermentation lock. It's an odor not too unlike very ripe fruit... And there's precipitation on the inside wall of the carboy (remember that this is a 2.5 gal batch using 4 lbs extract and approx. 3 lbs sugar).

Many of you have already E-mailed me personally suggesting that I not worry too much and realize that I am not brewing an ale per se, but a barley wine instead. I received further advise about aging and bottling (that I should rack to a secondary and dilute with a few gals of boiled water, and let stand to age for at least a few months).

The point I'm at now, however, (and I'm afraid I'm guilty of the highest of sins -- I've surpassed worrying and have gone straight to panic!) is to bail out completely and run away bravely! Unless, perhaps this odor is normal (if still offensive) and I can simply rack to a temporary container with two gals of PRIMED water and bottle???

Thanks

John

From: mcnally@wsl.dec.com
Subject: re: grabbing hops with a strainer

You might want to "sparge" your hops after scooping them out of the boiler. There's probably a lot of hop goodness, as well as wort, clinging to the leaves.

From: mcnally@wsl.dec.com
Subject: sparging wort?!?

Your question in HBD about "sparging thick wort" makes no sense to me; are you sure you've got your terminology straight? Sparging refers to the process of rinsing the mash in the lauter tun with hot water to extract sugars still clinging to the grain husks. A wort chiller has nothing to do with that process.

As far as rousing yeast, I suggest stirring the wort in the fermenter with your sanitized racking tube. If you've got a real heavy wort, you might even try racking it and allowing it to aerate a little. (I've never done that; it's a twisted theory of mine I tend to explore the next time I do a really heavy beer.)

From: sherwood@adobe.com

Subject: sparge temp

I also have a question about sparge temp, but the opposite one. I have my first mash waiting patiently for me to keg it. Okay, it was a partial mash (2 cans Munton & Fison amber, 10 lbs barley malt, 10 gallon batch) but I got a high specific gravity (1060) so obviously my extraction rate was good.

My question? I sparged using 130F water directly from my water heater. The leftover husks were light and empty, and as I said above, I got a good specific gravity. I also figure that with water that cool tannin extraction should not be a problem regardless of how long I sparge.

So why all the emphasis on 170F sparging? So you can use maybe a gallon or so less sparge water?? Obviously temp is important during mashing (I mashed at 150F) but by the time you sparge the chemical reactions should be complete and all you are doing is dissolving the malt sugar so it can be drained, true? And hot tap water does a very good job of this (perhaps not quite optimal, but as I said above, I can always use an extra gallon of water and boil it away).

So, am I missing something?

Geoff Sherwood

From: mcnally@wsl.dec.com
Subject: when to dry hop

The advantage of dry-hopping in the settling tank after fermentation is that the aromatic chemicals from the hops won't be carried off into the atmosphere from the CO2 that's erupting from the ferment. See Fix.

Subject: When to dry hop and why

Jim Schlemmer says:

>Now I read that Dave waits until he racks to secondary and I remember
that
>I've heard that before. Can someone tell me why?

I wait to dry hop until the secondary for several reasons, some of which
may
not be "scientifically" valid:

- 1) Adding them to the secondary guarantees that the beer will have a
reasonable
alcohol content and will minimize the risk of infection (however
minimal to
begin with) since I do nothing to sanitize/sterilize the hop flowers.
- 2) If they are added too early in the fermentation, they tend to be
carried up
onto the top of the krausen and many stick to the sides of the
fermenter
so that the "goodies" aren't being absorbed into the beer.
- 3) I have no hard evidence, but it seems that since a lot of the aromatic
components that we are trying to extract via dry hopping are very
volatile,
they would be "scrubbed" out by the CO2 generated during active
fermentation. These aromatics would thus be carried away with the CO2
escaping through the fermentation lock/blowoff tube.
- 4) I've found through experimentation, that for the amount of dry hops
that I
add, the 1 1/2 to 2 weeks of secondary fermentation that I do seems to
give
me the desired amount of hop flavor and aroma I am seeking.

Date: Thu, 19 Mar 92 08:48:03 -0800
From: mcnally@wsl.dec.com
Subject: sparge temperature

You really want 165-170 temperatures in the lauter tun, though mostly to ensure efficient rinsing of the sugars. George Fix's book mentions an experiment---intended to keep runoff pH low---that involved sparging at just above freezing.

>clog the siphon.

I can concur with Dave that the hops don't clog the racking cane -- I have one of those orange caps on the end. I simply dump the hops into the primary as soon as the kraeusen falls. Since I've been making only ales, and they almost always ferment-out in two weeks, I don't use a secondary. If I was to use one (e.g. to experiment with keeping the beer off the trub entirely), I would do just as Dave does: rack onto the hops.

>morning the wort was rolling and tossing but the hop bag was just sort
of
>floating atop the head of foam. Should I make an effort of poking it
back
>down?
>

I suggest loosening the bag. I dryhop as soon as the krausen falls for
the
following reasons:

1. If you dryhop while it is still blowing off or fermenting wildly,
you may a) clog the blowoff tube if you are using one, and b) scrub out
many of the aromatics you are *trying* to add!
2. If you dryhop later, I don't think there is much harm except for maybe
(and this is completely speculative on my part) getting less out of the
hops (my ales are usually done in two weeks, blowoff being the first 3 or
so).

Subject: recipe for trappist-style beer

With the availability of Wyeast "Belgian," you might want to try making a trappist ale in the style of Chimay. If I am remembering correctly, Chimay Red has SG of 1.063. Dave Line, in *Brewing Beers Like Those You Buy*, and Dave Miller, in his book, give some suggestions for how to make a trappist-style beer. So, taking their cue, here's an all-grain recipe.

Trappist Ale

8.5 pounds pale ale malt
1 pound mild malt (or substitute Munich)
0.5 pound crystal malt
1 ounce black patent malt
1 pound dark brown sugar
optional: 0.5 pound honey

2 ounces Hallertauer hops at 60 minutes until end of boil
1 ounce Kent Golding hops at 60 minutes until end of boil

Wyeast Belgian ale yeast or cultured Chimay yeast

Depending on your extract efficiency, this beer might come in at SG in mid-1060s or so. This is not intended to be a 1.100 beer! If you can find it, instead of using dark brown sugar, use 1 pound raw sugar crystals (seen at some gourmet food shops, but somewhat expensive). Note the mixture of continental and English hops. As the beer ought to have some body, use a starch conversion temperature of 155-8 degrees F.

I have brewed a recipe similar to this, but used cultured Chimay yeast, and the resulting beer came out pretty nicely.

For a Corsendonk-like brown ale, instead of the black malt listed above, try 3 ounces of chocolate malt.

Happy brewing!

>From: Alan Mayman <maymanal@scvoting.fvo.osd.mil>

>I tried out my new wort chiller recently and was slightly bummed by how thick and viscous my wort became. How do you veterans handle sparging thick wort?

I think you need to post your process for review as the above indicates either a lack of communicating the problem or understanding of the process.

It would appear, from the above, that you are trying to chill somewhere in the mashing process instead of after the boil.

>Finally, I am ready for a big, all grain size brewpot (10 gal?). I have heard something about brewpots with spigots on the side. Is there some advantage to these other than convenience that I should know about?

I suppose it all boils down to convenience but when you spend a whole day doing something, enhancing the convenience is very convenient.

For one thing, with a spigot and strainer as described in "EASYMASH"* , you can mash, sparge, boil and ferment in the same kettle.

It eliminates using a syphon and all the problems of gunk getting stuck in hoses.

If you have two kettles, you can heat sparge water more conveniently with the one with a spigot. (see below)

* email to arf for EASYMASH. No charge :)

>From: mcnally@wsl.dec.com
>Subject: Re: Sparge question

>I generally brew with about 10 lbs of grain for a nominal 5 gal batch. I mash with about 3 gallons and sparge with at least 5 gallons. I know that's supposed to be a no-no, but I feel that when I carefully monitor the runoff there should be no problem.

In what sense is this a "no-no"? It sounds perfectly "nominal" to me. You could squeeze a lot more out of it using more sparge water or you could waste a lot by using less.

>From: korz@ihlpl.att.com
>Subject: Sparge temp

>Basically, what Jack's experimental data shows, is that a 212F sparge water into a shallow bowl resting on the top of the grain bed results in a significant drop in temperature when measured in the grain bed and in the runoff. I can't find my copy of Jack's post, but suffice it to say that the temp in the grain bed was about 170F and the runoff temp was somewhere around 160F.

It was closer to 135.

>Here's what I'm thinking: maybe the 170F sparge water *already accounts* for the drop in temperature. Maybe we *don't* want 170F in the grain bed

- -- maybe we want 145F in the grain bed and 130F in the runoff (I'm making these numbers up -- I've never measured)?

>It's Mike's post that led me to wonder about what temp we *really* want in the grain bed. Comments?

By coincidence, I adressed most of this, this morning but I just wanted to add some comments as a followup. I think most of the experts agree that the ideal temp for sparging is around 170F. This seems to be based on chemistry, biology and physics and I am not about to yell momily.

I will however, point out that in many cases, homebrewers are victims of scale-down from what works for commercial processes and what works in mega-barrel batches simply does not work on a 5 gal batch.

The heat loss from a small batch is much greater than from a large one. If it is important to sparge at 170F, then I suggest that the sparge water temperature should be determined by measureing the temperature within the mash and not by what is hoped for.

.....

I just completed a new gadget to make brewing more "conveninent" and thought I would share it with yall, before I actually use it on the next batch.

I have been tying up my brew kettle by using it to heat (boil) sparge water while sparging. This means I can not start boiling till all the sparge is in the tun. It also means that I have to anticipate my sparge water demand in advance.

I made a simple continuous boiler that heats hot tap water to the boiling point about as fast as it runs into (and out of) the lauter tun.

It consists of a 6 qt enameled stock pot with a barb fitting near the top that is connected to the water tap.

Near the middle are some fittings that provide about a foot of copper tubing going out, to run into the lauter tun and a couple of inches on the inside to draw water about an inch below the surface (to avoid dross) and an inch above the bottom (to avoid sediment).

When ready to sparge, the mash tun is moved from stove top to a stool and becomes the lauter tun. The boiler is placed on the stove to line up with the tun and fired up. Water is boiling by the time the mash has settled and I have an infinite supply of it.

I can now start boiling the wort as soon as I have a few gallons and have cut several hours off the brew time. I also eliminate having to bring 7 gals of water to a boil while mashing. I doubt that there is any energy savings because I have to keep the burner on full heat for the entire sparge whereas with the big kettle, I could throttle it way down once it came to a boil.

BTW, not the least of the reasons for boiling sparge water is to get rid of the chlorine. I suspect, however, that my continuous boiler is not as effective at this as boiling the whole kettle and keeping it hot for hours.

> matter what the sparge temp is, the mash itself never sees anything
close to
> what is going in.

> Next time you do a sparge, run a thermometer up and down the lauter
tun to
> determine the actual temp profile. With boiling water going in, I get
a
> range of 135F coming out to 155F near the top. Matters can only get
worse
> using water at the "correct" temp.

Jack, what do you sparge in? And do you do a mashout?

Lots of homebrewers use insulated igloo coolers that are very efficient
in
retaining heat. Although I have never probed the actual mash, I find
that
when I mashout at 170 F and my sparge water goes in at 170 F, I get the
sweet
wort out of the lauter tun at 150 F minimum, usually even hotter
depending on
the speed of sparging. In such a setup, boiling water for sparging
probably
isn't desirable.

Also, from: mcnelly@wsl.dec.com

>>My general rule is that I quit sparging when the runoff starts
tasting like tea.

From Jack:
> That is a bit subjective.

Perhaps, but only a bit. It is a very accurate description of what
sparge
water tastes like once the sugars are washed out of the grains.
You'd be surprised at how wort!

Also, >From: gummitch@techbook.com (Jeff Frane)

> >Yo. The answer is yes. And why not, indeed?

From Jack:
>Yes, what and why not what?

The first question was: Is the yeast on the outside in a packet of
Wyeast?
And the second was: Why not just make a starter using the yeast without
breaking the inner packet?

From: joshua.grosse@amail.amdahl.com
Subject: Michigan Brewpub Legislation

This is for Michigan's beer lovers where ever they are:

Representative Curtis Hertel (D-Detroit) has introduced a bill (House Bill 5407) that would allow Brewpubs to exist in the state. A "brewpub" is a restaurant or bar that brews its own beer for serving on the premises.

These very small breweries have made significant contributions to the variety of beers and brewing in the U.S.

The full House is scheduled to take this measure up in the next few weeks.

To support this bill, beer lovers who would like to see brewpubs become reality in Michigan should exercise their civic duties and contact their legislators.

House members should be contacted immediately by phone and mail and encouraged to vote for this bill when it comes to a vote of the full House. Senators should also be encouraged to support this bill once it passes the House.

Rep. Hertel should also be contacted -- offers of support, appreciation, etc., are always welcome. He may also need knowledgeable people in the industry to testify if and when the bill is taken up by the Senate.

When contacting a legislator, there are a few things to keep in mind:

- o They deal with hundreds of bills, so cite the specific bill: 5407.
- o Give your reasons for supporting it in your own words -- form letters and scripts are not nearly as effective as your personally stated opinions.
- o Try to stay positive. (e.g. "Brewpubs would be great in Michigan!" or "Our state's economy would benefit!" but not "It's about time you idiots allowed this!")

Should you wish to go the extra mile, you might suggest meeting with the legislator and sharing a fine commercial beer or a homebrew, so that they can get an idea of what the issue really is -- good beer for Michigan.

Thanks.

From: gschultz@cheetah.llnl.gov (Gene Schultz)
Subject: Salvaging bad beer

I recently made a batch of German-style dark ale (with plenty of Australian dark malt extract, Hallertau hops, Wyeast European Ale Yeast, and a few other amenities). I opened the first bottle about ten days after bottling, and was quite disappointed by a strong acrylic flavor that made this ale almost undrinkable.

I periodically drank a few bottles over a period of a month or so anyway, hoping that the bad taste would start to go away in time. It didn't. Then I remembered an accident with several bottles of a batch of lager with a similar off flavor that I had brewed about a year earlier. While out of cold beer one weekend, I had put several bottles of the ale in the freezer to cool down quickly, and left them there too long--until they were mostly (but not entirely) frozen. When the beers defrosted, the off flavor had disappeared. I froze a few bottles of the German ale, then put them back into the refrigerator to defrost. When I drank a bottle about a day later, the off taste was gone entirely. I then asked a friend to take a blind taste test comparing the regular German ale to the same ale that was frozen then defrosted. He complained about the taste of the former, but reported enjoying the latter.

I'm not claiming that freezing ale or beer will solve any problem related to off tastes. I would like to suggest instead that for acrylic or plastic off flavors, you might try freezing a few bottles and see if this method improves the taste.

Incidentally, in both cases in which my ale had an acrylic off flavor, I failed to rapidly cool down the wort after brewing. I am wondering if freezing the ale afterwards gave me some kind of a badly needed (albeit late) cold break or something? Any ideas?

Subject: Growing Hops

Fellow Brewers,

I just received my first HOP rhizomes in the mail yesterday (3/19). I bought three types; Saaz, Eroica, and Hersbrucker from AGS in IL. (800) 444-2837 in case anyone wants it.

My question is this, What (qty. wise) can I expect to harvest off of these vines in the first season?? Different amounts from each variety ?? I realize that it depends on a multitude of variables, but I don't plan on cultivating genetically engineered hop plants or using Miraclegro fertilizer, just general stuff. BTW I live in the N.East (PA) which has pretty normal weather. I didn't purchase a hop growing book (yet) (I don't read software manuals either) so this is just a 'in your experience' question.

Also, has anyone out there successfully nurtured hop plants in an indoor setting, not a greenhouse but an apt.?? I am not planning on being at my current address for very long and I had in mind a big pot with a trimmed down trellis setup. Any tips??

Thanks in advance for your help.

End of HOMEBREW Digest #848, 03/24/92

Date: Mon, 23 Mar 92 12:49 CST
From: arf@ddswl.mcs.com (Jack Schmidling)
Subject: Yeast Culture

To: Homebrew Digest
Fm: Jack Schmidling

Several readers have asked, both here and on usenet, for info on yeast culturing. No one has responded thus far so, although I know only enough to be dangerous, I will share what I do know.

For openers, I called Yeast Culture Kit as suggested by someone and got nothing but a price list in the mail. I poured through my library and dusted off some glassware and made a few starts to get the feel.

Objective

The objective is to isolate a single cell from a beer or culture that has the characteristics desired and encourage this cell to reproduce enough offspring to start a new batch of beer.

This is easier said than done but with reasonable care, luck and modest investment, can be accomplished by the serious home brewer.

General Program

The general program is to dilute the original culture and spread it over the surface of a growth medium in a petri dish so that individual cells are far enough apart to allow them to grow into visible colonies without touching each other.

A sample from one of these typical colonies is transferred to a test tube containing a growth medium. When this colony is actively growing, it is considered a pure culture and can be refrigerated for later use or started by covering with beer wort. When this starter is actively fermenting, it is poured into a larger amount of wort which, when active, is pitched into the beer.

Basic Assumptions

The procedure makes a number of assumptions which are correct, often enough to allow it to work well enough, to satisfy most requirements.

The first assumption is that one can select the desired strain by looking at colonies on a petri dish. This is more or less true because the overwhelming

majority will be the same, i.e. the dominant strain. Bacteria, molds and many wild yeasts are obvious and recognizable.

The second assumption is that, while still very small, all round colonies are the progeny of single cells.

The third assumption is that all such colonies, at least in the center are mono clonal or at least mono-cultures and otherwise sterile.

To do the job right, one would have to study the original diluted culture under high magnification and do a presort at that level. This is revealing and fun. It also gives an indication of any bacterial contamination in the culture but the rub is marking individual cells and finding them later when they grow into colonies. I currently have no way of doing that. However, neither do I believe that it is really necessary for the home brewer, although a must for the lab selling selected strains.

Details

There are many growth media available for the purpose and no doubt someone can recommend a source or recipe for the ideal but for my experiments, I mixed two packets (16 gr) of Knox gelatin with one cup of wort. After heating and dissolving, this is poured into petri dishes and test tubes and sterilized in a pressure cooker for 15 min at 15 lb.

The petri dishes are turned upside down after solidifying and cultured this way to prevent water of condensation from falling on the medium. The test tubes are cooled on a slant to allow the water to settle on the bottom. They are also stuffed with cotton before going into the pc.

Isolating Cells

The first step is to inoculate the petri dish with as diluted a mixture as possible. The books are full of procedures for doing this but I find the simplest is just as good. Take a copper wire or thin glass rod and heat several inches in a flame to sterilize. Dip this, when cool, into a working beer or yeast culture. Gently drag this across the gelatin in the petri dish, trying not to break the surface. Next, draw the wire across this line at several points, to further dilute the sample. Turn the dish over onto the cover and "incubate" at room temp for several days. Do this on several dishes just for insurance. As gelatin melts just above room temp, any attempts to rush the process by increasing the temp will prove disastrous.

If in a hurry, substitute agar for the gelatin and incubate at 80F.

Pure Culture

The next step is to visually inspect the surface of the petri dish under low magnification to pick out a "typical" colony that appears to have come from a single cell. All colonies should be rejected that are any shape other than perfectly round and differ in any way from the majority.

Flame your wire again and after cooling, remove a small sample from the center of the selected colony and rub this on the surface of the medium in a "slant" test tube. You can do this to several slants, with the same sample, to assure all slants are the same or flame the wire and take a new sample from a different colony. You can make as many slants as you will need for several months and throw away the petri culture.

You now incubate the slants until most of the surface is covered with the pure colony and then refrigerate them till needed.

Starting

When needed for use, cover the slant with sterile wort and pitch when ready, i.e fermenting. For best results, this starter should be used to pitch about a quart of wort, a day or so before brew day.

This process can be used on anything from a packet of Red Star to a bottle of your favorite beer and will produce a pure culture. There is no guarantee however, that the strain will remain the same for ever because of natural mutation. As it is my experience that the most common and objectionable contaminants of dry yeast are bacteria and mold, this process will guarantee at least, to eliminate these most serious problems.

I was intrigued by the recent posting on the quality of beer made from Red Star that was re-cultured. I was also "impressed" by the number of contest winners who use Wyeast and now rise to the challenge of winning the "World's Greatest Brewer" trophy using re-cultured Red Star instead of just joining the Wyeast bandwaggon.

I started out with non-deposit bottles, but after a couple of breakages, I've switched to returnables. (Actually, I'm sick of bottles altogether, but I digress.) My favorite was the perfect stress fracture where the side of the bottle met the bottom. Sure wish I hadn't set *that* case on top of the humidifier! Commercial beers are fermented out and then charged with a precise amount of CO₂. Therefore, the brewery can make the bottle just thick enough to handle that amount of stress and not much more. HB'ers fermenting in the bottle don't have anywhere near that kind of precision (at least, apparently, I don't). Also the no-deposits aren't very rugged. I was worried about a bottle "on the edge" ending up as a handful of glass when someone was trying open it. Since I didn't want to be doing that "w" word, I'm collecting other sorts of bottles.

Champagne bottles are something else again. Decent champagne is fermented in the bottle, and is subjected to higher pressures than beer, thus the bottles make good murder weapons. Many a ship's bow has succumbed to the bottle that was trying to christen it, instead of the other way around! Skip the Andre' bottles, but the others are keepers. I especially like Cordon Negro bottles, because they let no light in. Of course, when you bottle beer in champagne bottles, you are committing yourself to drinking two beers at a sitting, ... but SACRIFICES MUST BE MADE!!! ;-)

From: Joel (J.N.) Avery <JAVERY@BNR.CA>
Subject: Where can I get hop rhizomes from?

I posted an article a couple of weeks ago, asking about rhizome sources in Canada, and advice about growing hops in Canada. Judging from my responses (zero), I'd guess that there are not that many hop growers in my part of the country, and there are no sources of hop rhizomes either.

So, I'll expand my search, and consider hop sources from the US. Do any Canadians know what kind of restrictions there are on bringing rhizomes into the country? And where can I get them in the States?

Our growing season here is usually mid May to late September, with a good amount of rain. Is this what hops require to grow?

I was planning on planting them on the south side of my house where they can grow about 10 or 12 feet high. Is this enough?

I assume that the wild rabbits around my house would eat them in a flash (just like the rest of my garden).

All advice will be appreciated.

Thanks,
Joel

'Tis indeed a pain to talk to those heathen U*X sites. I guess we
can't all attain enlightenment in this world... :^)

Here's how I pulled the CAT2 files from the archive:

- o FTP the .PS.Z.UUE files from the archive. We can't do 'real'
FTP from inside the company, so I used FTPMAIL.
- o Assemble and decode the UUENCODEd files. I think I grabbed
my decoder from DECWRL:="/pub/VMS". I'll send you the C source
code in a following message (it's short).
- o Untar the decoded file using COMPRESS_VMS.EXE, available for
FTP from:

DECWRL:="/pub/VMS/compress_vms.exe"
164 10-MAY-1990 18:58:06.00 (RWED,R,R,R)
- o Massage the resultant PostScript files a bit to get rid of
any 'letter' commands. These cause our LPS20s to barf.

Let me know if you have any trouble grabbing the files from DECWRL. I
believe that the site is available for anonymous ftp from outside DEC.
If it isn't, I'll put together a VMS SHARE kit of COMPRESS_VMS.EXE and
mail it to you.

From: polstra!larryba@uunet.UU.NET (Larry Barello)
Subject: Sparge Water Temp, Dry Hopping

I think that the ideal sparge water temp needs to be determined by experimentation. I use 185f water and my final runoff is around 150-155f. Just for yuks, I stuffed a thermometer into the top of my mash near the end of sparging the last batch. The temp was around 160 or so. Since the idea is to have as hot a water as possible to leach out the sugars but not so hot as to leach out the tannins in the husk. Something between 130-170f seems Ok.

I dry hop by dumping pellets into the secondary. Usually that starts fermentation up again (yeast stick to the hop particles and float around keeping themselves naturally "aroused" (pant pant...)). When all the hops stuff finally sinks to the bottom I *know* that fermentation is completed.
Racking the beer off the hops/sediment is no big deal at that point.

Subject: uncompressing compressed files on VMS

Greetings, fellow VMS users,

The folks at Kitt Peak National Observatory have developed a VMS executable to uncompress compressed UNIX files. You can get it via anonymous FTP from TUCANA.TUC.NOAO.EDU. Log on in the usual manner.

- cd util
- binary
- get compress_vms.exe
- exit

You need to define the following VMS symbol:

```
UNCOMPRESS := $[yourdirectory]COMPRESS_VMS.EXE UNCOMPRESS  
- you need to specify the directory unless you write it into SYSEXE
```

The extension of the file to be uncompresssed should be .ps_z

I do not know any more about the utility, but I have used it successfully.

Subject: Yeast propogating

I read with interest the description of Leistad's book. Could someone give me a better idea of how technical it is before I order it ? I'm basically looking for something which goes beyond the Zymurgy yeast issue and discussions of how to streak out cultures. For example, use of diagnostic media to assess the identity of contaminants. Microscopy. Media for maintenance as opposed to growth. etc.

Subject: Malt Longevity

Hi everyone.

I finished brewing a batch of beer and have a couple cups of malt leftover. How long will this last? Ive got it in the bag it came in. this bag is inside a tupperware type container. The container is in the freezer.

I see several recipes calling for small amounts of fermentables and assume there must be a practical, standard way of keeping ingredients fresh. Just a curious thought.

Subject: Uncompressing in VMS

I found a source for VMS utilities such as ZOO, ARC, UUENCODE, COMPRESS, etc.
You can FTP anonymously to OAK.OAKLAND.EDU and change to the pub/misc/vaxvms directory. The compress/decompress program is called: lzcompress.share. It is a COM file which you then run to unpackage all the parts including the C source. It comes with procedures for compiling and linking the code. If you have any problems, let me know. I had to remove the ",clib/opt" part of the link command. It seems to work OK. I will not be able to respond to any mail until 01APR but my mailbox will still be here. There is a chance I could login Thur. or Fri. this week.

Unfortunately, boiling a few more minutes will probably drive off all
finishing
hops aroma and much of the hops flavor. Just sanitize the strainer ahead
of
time like everything else. The straining spoon we use to stir the wort is
also good for scooping out spent grains and hops leaves.

Subject: Growing hops

About a half dozen digests ago I posted about my hop failures when I ordered hops from the west coast (Oregon). I'm on the east coast. Well, my replacement hops which I received for free from the same place as last year because of their failure to grow arrived last friday and there was a big difference in their condition when I opened the box. Last year the roots were very dry and the package was very light. This year the box was heavier because the moss that the roots (and they roots themselves) was moist still. Temperatures are a lot lower this year than last and I guess last years hops did not survive the trip by truck.

Of course I can't plant them yet because this year we have about 6 inches of snow still on the ground and the ground is frozen so I've got them in the fridge. Should I keep them moist by sprinkling a little water on them every few days? They are wrapped in moss, surrounded by paper, in the shipping box, in the fridge. With the crazy weather we've been having in NJ I don't know when it is going to be safe to plant them.

Subject: Haze

In my last two batches (pale ales) I have had a problem with a haze in the bottle that takes up to 2 months to settle out. This is a recent problem and in the past my beers have become clear within a couple of weeks.

The haze does taste like yeast, and thus gives an off flavor 'til its gone.

SO, I plan to try geletin in my next batch, which is new for my beer. What I don't understand though, is if I add it before botteling, and if it removes yeast and other heavy organic types, will there be enough yeast left around for bottle conditioning? Has anyone tried this before, and how has it worked for them?

Also, if anyone has any other ideas for the source of the haze your input is welcome. For what it matters, the yeast for the cloudy beers has been london ale (wyeast) and I don't recall the other. Both have been all grain, though I have brewed all grain without this haze before. The only conditioning has been a bit 'o irish moss in the boiler. The cloudiness has a combo yeasty, baking soda taste to it.

Thanx
Dave

Subject: Decompressing netlib .z files on VMS.

Any DECUS tape for the past several years, in the [VAX000.work] directory has a set of programs beginning with LZxxx.

Both the executables and sources are there for two forms of the compress and decompress program. I have successfully used the executables directly off the tape to decompress all of the .z files I have copied from the Netlib. (That includes ALL of the archives.)

There are two decompressers, like I said. lzdcmp.exe and lzdcn.exe. I find that the lzdcn.exe works, it did for the Cat-2. The other one errors out.

The sources involve about nine files, so I can't really offer to send them, wish I could. Decus tapes are pretty easy to come by, especially old ones.

I suppose that a beer keg might work. The problem would be cleaning it
after
you have cooked a batch in it. Keep in mind that there will be stuff
cooked to
the inside of it. It seems like the keg would be a pain unless you
modified
it so that it had a lid you could remove and then put back on when you
started
cooking. This would allow for quick filling and emptying and easy
cleaning.

] What is the ideal temp. ?

I'm not clear if you have the book "Lore of Still Building" or if you are
looking for it. If you have the book it gives the boiling point of
alcohol
(around 175 or so degrees fa) keep above this temp but as close to it
as
possible. If you are looking for the book send me your address and I'll
have my
local homebrew shop send you a catalog. He stocks them.

] What about a thump keg or a dry keg ?

A thumper will give you a little higher concentration and may help to
condense out fusil oils before it gets to your final product.

] What should be done to insure the purity of the distillate ?

The distillate may contain concentrations of all of the stuff that was in
the wort. A good rule is not to distill anything that
you would be afraid to drink. Stay away from using lead or solder when
constructing your still. It's best to stick to copper, stainless steel
and
glass. Make sure your copper isn't green. The green stuff is poison.

A kind of yucky trick but a totally functional one is to seal any cracks,
joints, or leaks that your still may have with bread dough. That's
right!

Just take a slice of bread and run a little water on it and mush it up.
Stick this stuff over any joints or cracks (like where your pipe goes in
and
out of your thumper). This stuff will dry and make a seal. It also
gives
you some flexibility. You won't have to solder anything together. And
if you screw up and some pressure builds up someplace the dough will start
leaking instead of your still blowing up!!

Subject: cloudy beer!!!

Hello. i've made 5-6 all-grain beers now, and while they all come out tasting OK, (some even WOW!! 8-)) i have two major problems that may be associated.

1) The mashing process 1-5 hrs. at 68 C almost never (except for the very first time) has gone to complete conversion. i have to usually give up out of sheer exhasution (from drinking too much Homebrew waiting for conversion). i stir every 5-10 minutes and have at least 5 lbs. 2-row Klages with the other grains (Black, Roasted, Crystal, flaked etc..) to ensure a good amount of enzymes. Some times i even ended up adding 2 spoons of amylase, with no effect. i use about 1 quart of water per lb. of grain.

Please let me know of similar experiences or solutions...

2) My beer is often very cloudy untiul bottling and only clears up in the bottle. Bubbling has usually ceased (almost) before bottling.

After mashing i sparge (2 gallons for 6-8 lbs grain) at about 70 -80 C, rerunning the sparge water over the bed 5-6 times..

After 30 mins of boiling i cool and pitch. Fermentation is quite standard, but tends to proceed slowly for a long time (which is not unusual, i think). But even when fermentation is complete (SG 1.01-1.02) the beer does not clear.

3) Thought i could slip in a third one since you are this far...

WHat exactly is the hot break and the cold break. i mean,
/ physically what do you see?

Thank./

Thanks to all who spare a moment to answer.

Subject: wort chiller

I just bought 50 feet of 3/8 in O.D. copper tubing at the hardware store for \$20. I plan to coil it for a wort chiller, but what do I do with the ends? Right now I think I'll put the coil in a bucket of ice water and run the hot wort through it into another bucket.

So what do I do? do I just get some 3/8 in I.D. plastic tubing to put on both ends? If so, how do I start the siphon? If I attached some sort of mini-funnel to the start of the chiller, I could fill the plastic tube with water and stick one end in the boiling wort and one end in the funnel.

Also, do I do anything special before I use it the first time?
Thanks.

Subject: dry hopping alternative

An alternative to dry hopping for aroma is using a hop tea. When you boil your water and priming sugar, remove from heat, add your aromatic hops and let them steep for a few minutes. Use a small gravity strainer to remove the hop matter and bottle/keg as normal. Allowing the hop aromatics to bypass the fermentation stage is another way of ensuring a strong hop aroma without the worry of plugging and stopping of your fermenter. I have used this method quite a few times and have been quite satisfied. There is one catch. You will notice that your beer has become cloudy once in the bottle. Not to worry, the beer will clear up within the usual aging period.

As one who enjoys brewing to the extent that I give most of my stuff away to make room for the next batch, this idea has intrigued me. I can see how one could recover the costs of materials but I can't see any reasonable price that would cover the labor involved, particularly on a wholesale level.

Doesn't one need something like a liquor license to sell beer? They are impossible to get in places like Chicago. How about the liquor tax? How much is he getting for a liter and what is the liquor store selling them for?

>From: "John Cotterill" <johnc@hprpcd.rose.hp.com>
>Does anyone out there have a summary of the non alcohol beer thread from a couple of months ago?

Here is the original article. I will up date it as soon as I hear from Jean Hunter who is running some tests on samples I sent to her.

NON-ALCOHOLIC BEER

Everytime I mention NA beer, people give me funny looks and ask questions like, "why would anyone want to do that to homebrew?"

Having been a victim of my hobby some years ago, I drank nothing but Kingsbury for almost 10 years. The thought of going back to that is all the motivation I need. I have been limiting myself to one 16 oz glass of beer, per day for a couple of years and I no longer consider myself a recovering alcoholic.

However, making beer is so much fun and homebrew tastes so good that rather than cheat, I have been experimenting with making NA homebrew.

Y'all will no doubt remember when I started asking questions about measuring

alcohol in beer. That was about the time I started. I have made six batches and think the process works well enough to publish.

So far, I have only produced one gallon batches but I have 7 gals clearing now that will be my first full scale batch. Here is the process.....

When you have your next batch ready to bottle, syphon off one gallon before priming. Put this in a kettle with (2) tablespoons of sugar and bring the temp up to 170 F with the lid off. Let it cool, uncovered until the temp gets below 150 F. Then cover it and cool it to room temp as quickly as possible. I put it in a sink with running water.

When room temp, add 1/8 tsp Champaign yeast. Let it sit for a while to dissolve and disperse, then stir well with a sanitized spoon.

Pour the brew into you favorite bottles and cap. I always include at least one plastic bottle to monitor cabonation. When the plastic bottle is hard, refrigerate them all. This usually take no more than a few days at room temp. I have no idea how long this stuff will keep in or out of the fridge but time will tell.

What does it taste like? You'll have to try it youself to find out.

Just for drill, I took an early version down to a Chicago Beer Club meeting and had it judged blind. I then gave them a bottle of the beer it was made from as a comparison.

What did the judges have to say:

In general, "lousy beer" but they could not tell the difference and had not the slightest clue that one had no alcohol.

Unfortunately, that batch was the one I have previously described as clovey (they said bananas) and you can't make bad beer, good by taking out the alcohol.

I was toying with the idea of sending NA as my entry in the Usenet Brewoff Challenge just for fun but decided that it was too much trouble for a practical joke.

>From: Jay Hersh <herhsh@expo.lcs.mit.edu>

>Jack said>

>>It is obvious from reading the many and varied responses to my question, that the tastes are highly variable, to the point that ale can be made to taste like lager and vice versa.

>I think I'm missing something, please explain...

I don't know what you are missing other than the rest of the thread and the email I received but someone made the claim that to find out the difference between ale and lager, one should go out and buy a few bottles of each to taste the difference.

The rest of the thread pointed to the fact that there is such variability in each style that the experiment would be useless.

>From: STROUD <STROUD%GAIA@leia.polaroid.com>

>Jack, what do you sparge in?

I sparge in the same kettle that I mash in. A 32 qt enamel canner with a spiggot and screen as described in "EASYMASH". (email to arf for details)

>And do you do a mashout?

Yes. 15 min at 175F.

>Lots of homebrewers use insulated igloo coolers that are very efficient in retaining heat.

I understand but it should be obvious by now that I am on a crusade to abolish plastic breweries.

>From: mccaamljv@ldpfi.dnet.dupont.com

> I just received my first HOP rhizomes in the mail yesterday (3/19). I bought three types; Saaz, Eroica, and Hersbrucker from AGS in IL. (800) 444-2837 in case anyone wants it.

I hope you plan to keep them well separated or you will never know which is which after they start sending out their own rhizomes.

> My question is this, What (qty. wise) can I expect to harvest off of these vines in the first season??

Not much. Enough for one batch if you are real lucky.

> Also, has anyone out there successfully nurtured hop plants in an indoor setting, not a greenhouse but an apt.?? I am not planning on being at my current address for very long and I had in mind a big pot with a trimmed down trellis setup. Any tips??

I bought two plants from the same source and spent the winter turning them into six by rooting cuttings from the plants.

If you mean growing them indoors for flower production, forget it. They need full sunlight and lots of room.

This is a very basic book on culturing. In fact, 90-100% of it can be
found
by looking through the old HBDS. (not the actual text, rather the
technique)
Essentially it covers making media from DME, sterile transfer techniques,
growth on slants/dishes, and the like. All of this one could pick up
in about 15 minutes by asking a friendly bio-lab worker.

> I'm basically
>looking for something which goes beyond the Zymurgy yeast issue and
discussions
>of how to streak out cultures. For example, use of diagnostic media to

>the identity of contaminants. Microscopy. Media for maintenance as
opposed to
>growth. etc.

This is a much more difficult book to find. In fact, I've never found
one
that covers everything. For identification you'll probably want to look
at The Yeast by Lodder & <mumble> Van Rij. Don't expect a little book
though. I also hope you have a professional lab to back you up on this.
(If you need to identify bacteria you should look at Bergies(sp?)
Bacteriology) As for Microscopy, I was just looking at a book published
by Cambridge Press in 1990 called something like Yeasts:Identification
and Classification that had photos of what various yeast look like. It
also has information for identification using selective media. Finally,
as far as media descriptions go, the Diffco catalog (Diffco, Detroit, MI)
is about 1000+ pages and lists more than a few differential and general
media, their uses, their component parts, etc.

Good luck. You may quickly find yourself developing a background in
microbiology -- I did.

My brew buddy and I did the exact same thing for a wort chiller.
However, we put the copper coil into the hot wort (after sterilizing
of course) and run cold water through the inside of the coil. This
way the tough to clean part (i.e. the inside) never touches the wort.
We bought some clear plastic tubing and attached it to the copper
coil at both ends with small hose clamps. We bought a fitting from the
hardware store that fits into the kitchen spigot one one end and into
a standard garden hose connection on the other. The hose side fits
into a garden hose-to-plastic tubing adapter we got from a garden store.
We also took about two feet of coil off from the main coil and made a
small pre-chiller that we submerge in ice water to get the temperature
of the water below tap temperature. We connected the pre-chiller to
the main coil in the same manner using plastic tubing and hose clamps.
You have to be a little careful turning on the faucet so that the
pressure
doesn't buildup too fast and blow the tubing off!

We have had absolutely incredibly good success with this design. We
can usually cool down 5 gallons of hot wort in less than 1/2 hour.
Hope this helps!

From: abirenbo@rigel.hac.com (Aaron Birenboim)
Subject: Wort Chiller, blending, going commercial

Bryan Gross bought 50' of 3/8" copper tubing for \$20, and was thinking of making a wort chiller. Well, for 5 gallon batches, 50' is awful long, I might save 10 or 15' for other purposes. I use copper for racking tubes which can be used in boiling wort for a counterflow chiller.

My first chiller was like Bryan suggested. Rack through a coil immersed in cold water. I would advise running cold tap water into a bucket with a hole in the bottom. This way there is a flow over the coil keeping it at a more constant temperature.

I would also put hose barbs on the ends secured by compression fittings.
Remember to use teflon tape!

My first chiller was 1/4", which is way too small. It took like an hour to chill with it, and it kept getting clogged. For my second chiller i made a double coil of 3/8" where the ends come out of the kettle.
Attach hose barbs, and you have a nice immersion chiller.

I do not think i am experienced enough (yet!) to say how my beer has changed with the new chiller. Other factors out weigh this now. (I still have trouble getting the mash to the temp I want) However, in reading Fix, I am now a proponent of getting trub out. Counterflow chilling will make a better cold break, and hence better trub removal, but with risks. To remove the trub, you must chill, wait for trub to settle, then rack to fermenter and pitch. Too much worry. With immersion chilling, just chill in kettle and rack off trub. You do not want trub around while yeast is in the lag phase. It will eat the trub to re-produce and create compounds which may have off flavors. In retrospect, i think my extrack beers were inferior to my all grain beers because of this trub problem. When i went all grain, i started using a wort chiller, and i think it was just the trub removal which made the beer better.... not the all-grain process at all.

BLENDING:

jmaessen@athena.mit.edu was intrigued by my mension of blending. For the New Belgium Breweries trappist, jeff uses several yeast strains. A measured amount of wort is fermented by each yeast, and blended at bottling. This is done for consistency. Jeff did not mention his yeast types, but I'd imagine that most of the wort might be his *S. Cerevescae* (sp?), some with other strain(s) of *S. cerevescae*, and one or two with some Brett. yeasts. By blending these "pure" brews he si assured that 1 yeast strain will not overwelm another. It is also easier for him to keep several pure cultures than one mixed culture due to the yeast domination phenomenon. In wine and lambic old and newer batches are blended to mix the flavor benefits in each. I know little of wine, but gueuze lambic mixes old lambic for sourness and smoothness, newer lambic for its sharp tang, and fresh lambic (possibly at high krauesen) for carbonation.

GOING COMMERCIAL:

Jack S. was intrigued by going commercial in ones own basement. Well... you need an awful big basement like New Belgium's. I think he has built a 4 barrel brewery, with several fermenters, and bottling equipment. He is still most likeley about the smallest micro in the us. Yes, he had to jump through many hoops. Liquor liscenses, health inspection, zoning ordinances. Going commercial is more than just a career move, its a lifestyle. It takes a lot of capitol, skill, time and energy. I'll probobally make much more money as a computer weenie, so going commercial has never entered my mind. Besides... I have a long way to go just in gaining brewing skill and technique.

give
>me a better idea of how technical it is before I order it ? I'm
basically
>looking for something which goes beyond the Zymurgy yeast issue and
discussions
>of how to streak out cultures.

Leistad's book was very good when it was written, and is still useful for
introducing a beginning brewer to the basics (canning, starters, etc.).

The

Zymurgy Yeast Issue goes way beyond the techniques involved in Rodgers
book.

A good microbiology book is the way to go. Another good source of
technique

and recipes I have found is commercial and home texts on mushroom
cultivation,

they tend to be easier to understand from a laypersons point of view,
stress

sanitation and have practical suggestions (for very expensive lab
counterparts).

Subject: Wyeast (Again!)

I just successfully started my 5th Wyeast packet out of five. Here's my method:

1. Lay the packet flat on a table.
2. Cup the inner packet between your thumb and index finger.
3. Pop with the fist of your other hand.

This keeps the pressure off of the top of the packet where the seal has been known to break (the top seal was in noticably bad shape on this particular package).

Good Luck!

I have only used it on wine, so I can't say from experience if you have
to
repitch.

One thing to remember is that gelatin takes out some tannin, which is
good
if you have an excess. If you don't have enough, however, the gelatin
itself won't settle out, and will contribute to the haze. I think the
stochiometric mix is about half as much tannin powder as gelatin (by
volume).

>What I don't understand though, is if I add it before botteling, and if
it
>removes yeast and other heavy organic types, will there be enough yeast
left
>around for bottle conditioning? Has anyone tried this before, and how
has it
>worked for them?

If you're going to use gelatin finings, use them in secondary
fermentation
prior to bottling. For a five gallon batch, dissolve a teaspoon of
finings
into 10-12 ounces of cool water (dissolves in about 20-30 minutes), then
heat the mixture to about 180F (don't boil) before adding to your
secondary.
Then rack out of secondary to your priming vessel per usual. I have
routinely
used finings for ales in secondary and never had any problems with bottle
conditioning.

Frankly, many argue that the value of finings may be marginal, and that
improved
clarity may be simply due to the use of a secondary fermenter. If you
are not
racking to a secondary fermenter after your week or so of primary, I
can't
recommend it enough. If you are, perhaps your racking technique needs a
minor
adjustment. Make sure that your racking tube is elevated off the bottom
of
your primary fermenter so you don't carry the trub, etc. with you to the
next
container. There's still enough yeast, etc. in suspension that will fall
out
during secondary. Granted, many homebrewers are afraid of multiple
transfers
because of the increased risk of infection, but if your sanitation
techniques
are sound you'll get a much better beer.

There are many reasons why a beer can be hazy. Given your description of
a
temporary condition that clears with no off-flavors, however, I'll stick
with
the above recommendation. If your racking technique is sound and you are
already using a secondary fermenter, then other possibilities can be
examined.

Cheers.

Subject: ale vs. lager

jack said:

>>It is obvious from reading the many and varied responses to my question, that the tastes are highly variable, to the point that ale can be made to taste like lager and vice versa.

i replied

>I think I'm missing something, please explain...

and jack responded:

> I don't know what you are missing other than the rest of the thread and the email I received but someone made the claim that to find out the difference between ale and lager, one should go out and buy a few bottles of each to taste the difference.

I *have* been following this thread. It seemed to me you were implying (still) that there is no difference between an ale and a lager. While you can use lager at Ale temperatures to say that ale can be made to taste like lager is a confusing and meaningless statement, which is why I called for clarification. Rather than receive that I got your typical chastising response.

Do you mean to say that trying to tell the difference between ale characteristics and lager characteristics based on tasting commercial beers is pointless because of stylistic differences (ie the recipes are so different that you won't be able to isolate taste differences due to the yeast)?? If that is what you mean, yes it is difficult, but I could suggest you try a Molson Export (aka Red) which is an Ale, versus a Molson Beer which is a lager. They're very similar recipes. As a matter of fact I believe many of the Canadian breweries brew both Ales and Lagers to similar recipes.

If you are looking for a single recipe isolation of this variable, yes you'll have a hard time, but it seems to me as if you're still using this as a cover to refute the differences in character between Ale and Lager yeasts. And while I agree that you can often not tell, even in a given recipe, I have brewed many a lager beer where the smoothness of the flavor was something that could not be achieved with an Ale yeast.

Are you using the iodine test? Even after complete conversion, the
idoine will still react with husks in the wort and turn dark, but
not as much as before conversion. don't worry about it.

The clarity of the runoff, and your extraction rate are the quality
indicators of your sparging method. If you're having trouble, try
letting the runoff settle, and rack off of the precipitate. everyone
should try this at least once after they think they've got their
sparging method down, just to see how much husk material actually
remains in the wort.

> physically what do you see?

30 minutes is not a long enough boil. try at least 2 hours, add
irish moss, force cool, and you will immediately see a spectacular
amount of precipitate - typically 1" in the bottom of a 5 gal carboy,
more if hop pellets are used. this is the hot break, and you should
definitely rack the wort off of it.

From: pyle@intellistor.com (Norm Pyle)
Subject: More Mash Mumblings

I was reading Dave Line's "Big Book of Brewing" last night and it brought up more mashing questions. He says that the mash is by no means complete when you reach the "Starch End Point", i.e. where the iodine test shows no more starch. He says that, at this point, there are more dextrans than maltose (I believe these terms are correct) and that mashing must continue to convert more of these dextrans to maltose. Dextrans are supposedly less fermentable than maltose, which I suppose is fully fermentable. Anyway, he doesn't offer a way to measure the dextrin/maltose ratio, but he gives some guidelines as to times/temps.

I'm guessing now, but it seems to me that dextrin to maltose conversion continues right up through sparging, at least, judging by the temperatures measured by some of you HBDers out there. This implies that the sparging technique has a real effect on the final product, for this reason, as well as probably many others. What effect? You tell me; I'm the beginner at this mashing thingy.

BTW, Line also mentions mashing overnight while he sleeps. An interesting concept, but if this dextrin/maltose conversion occurs over time, you could end up with a mighty fermentable yet bodyless brew.

I'd appreciate any comments you net.brewing.wizards have on this subject.

From: scott@gordian.com (Scott Murphy)
Subject: apricot beer

I just recently kegged my second batch of beer, and I have noticed a pattern that seems to be kegging related (small sample size.)

the first batch, a lager, tasted and smelled of apricots. I tasted it before I kegged it and don't remember it being apricot beer.

My second batch a bitter definitely did not have any apricot smell or taste whatsoever before kegging. After kegging, however, it both smelled and tasted of apricots. In this case the apricots disappeared after a few minutes.

I don't have anything against apricots, in fact, apricot stout sounds very good, but in this case I am concerned. Could there be something in my kegging procedures that cause this?

For the last batch, I dumped the sterilant (I don't know what brand) out of the keg and added a couple quarts of boiling H2O, sealed the keg and shook it up. After a couple of minutes, I dumped out the water and siphoned (carefully) the beer into it, sealed it, and carbonated.

Any hints?

thanks
scott

Subject: Amusing article

Attention homebrewers! I ran across this article in the March 16
edition
of EE Times magazine:

"Silicon structures too small? Add yeast...

London - Researchers at the Advanced Centre for Biochemical Engineering
at
University College, London, have found a novel method for producing
quantum
semiconductor structures using a yeast, called schizosaccharomyces pombe.
Mixing the yeast with cadmium sulphate, the researchers were able to
produce
crystalline structures 1.8nm in diameter. Developed as part of (a)
project to
produce biosensors, the process can yield uniform structures, making
their
electrical properties more predictable.

The quantum structures have already demonstrated luminescent
properties
that do not exist in bulk cadmium sulphide, a potential applications are
now
being considered, including quantum wires."

Quantum homebrew, what a concept!

People recommend using returnable bottles because the glass is thicker
and more suitable for withstanding the stress of reuse. Have you ever
bent a wire back and forth until it breaks? That's what happens to
bottles (sort of) when you pressurize and depressurize several times: it
weakens the structure of the glass.

You might get away with using disposables a few times but sooner or
later: kaBlewey!!

Subject: Haze

DAVID KLEIN <PAKLEIN@CCIT.ARIZONA.EDU> writes:

Also, if anyone has any other ideas for the source of the haze your input is welcome. For what it matters, the yeast for the cloudy beers has been london ale (wyeast) and I don't recall the other. Both have been all grain, though I have brewed all grain without this haze before. The only conditioning has been a bit 'o irish moss in the boiler. The cloudiness has a combo yeasty, baking soda taste to it.

I've never heard of yeast as the source for haze in beer (other than while it is active -- before it drops out of solution). According to Noonan (if memory serves), haze is the result of large proteins in suspension. It comes from under-modified malt that has not undergone sufficient protein rest.

From: gjfix@utamat.uta.edu (George J Fix)
Subject: Haze
Subject: Our New Book (George and Laurie Fix)

We want to thank Tony Babinec for his kind comments about our book. We also welcome any input from other HBDers about any other aspect of it. They say that critiques from friends is worth its weight in gold!

We did not publish lovibond data on the light and dark crystal malts because we were unable to get hard data. Cosby and Baker was absolutely no help in this regard. We contacted them and their "expert" in this area started by saying that he was a winemaker who did not particularly like beer. Things went downhill from there.

After the book was off to Brewers Publ., Darryl Richman sent me a remarkable new formula for the a priori prediction of wort color. We did some test brews, and directly measured the color with the procedure described in our appendix. Darryl's formula was then used to back out the effective lovibond of the crystal malts. We got the following results.

| | 100mg/l
mash water | 200mg/l
distilled | alkalinity | alkalinity |
|------------------------------|-----------------------|----------------------|------------|------------|
| H+B light
(Great Western) | 12.2 | 14.4 | 15.1 | |
| Irek light
(Cosby+Baker) | 11.9 | 13.6 | 14.7 | |
| Irek dark
(Cosby+Baker) | 59.2 | 65.4 | 76.2 | |

We sure hope Darryl makes his new software available (it includes a new hop bitter estimation scheme as well). We certainly would promptly place an order.

Recently an outstanding article has appeared on color malts by Peter Blenkinsop, an well known expert from England. It was published in the MBAA Tech. Qr. (Vol.28, No.4, 1991, pages 145-149). It includes details on how they are made (those that make color malts at home will love this section), color variability (the rather large variations may possibly surprise you), and related info.

Finally, Siebels is now importing malt from Belgium and will sell to all including homebrewers (which we conjecture may be their biggest market). We hinted at this possibility in our book. Since then we have gotten some, and have made some actual brews. Their Pils malt is absolutely terrific, and so is their color malts. Two row barley from Belgium has historically been rated along with Moravians as the top malting varieties for lager beer. A point of great significance is the color malts are from the noble Belgium barley. Ale brewers will be happy to know that they are also importing Belgium ale malt, and it has a very good reputation. Finally, they are also

importing some way out types of malt (would you believe malted oats!).
Jay
Hersh recently visited us and sampled some of the speciality malts
Siebels
imported from Belgium. Any comments Jay?

From: "Spencer W. Thomas" <Spencer.W.Thomas@med.umich.edu>
Subject: Cat's meow 2 redux

Not wanting to waste paper, I figured out how to print my Cat's Meow 2 on both sides. The procedure I followed was this:

1. Add page numbers to the original .ps file. It needs a line
%%Page: # #
added before the beginning of each page. I.e., before the line
%%PageBoundingBox: (atend)
The token # is replaced with 1, 2, 3, 4, ... for each page in
sequence.
(I did this with an emacs macro.) There are 160 pages, so the last
page starts with
%%Page 160 160
 2. Use the 'psrev' program (part of Adobe's Transcript package) to select
the odd pages. Due to limitations in the program, I did this in 4
passes, selecting 20 pages at a time (first 1,3,5,...,39, then
41,...,79, and so on). Specify the -R flag so the pages come out in
the correct order.
 3. Merge the 4 odd files into one using a text editor: Take the common
prefix (setup) information, followed by all the pages, followed by the
common trailer information.
 4. Use the psrev program to select the even pages in reverse order (don't
specify -R). Again, do this in 4 passes (first 122,124,...,160, then
82,84,...,120, and so on).
 5. As above, merge the 4 even files into one. Note that the even
numbered
pages are in reverse order (start with 160, end with 2).
 6. Print the odd pages. My printer feeds out the printed pages face
down,
in order, so if you take out the stack of paper and turn it face up,
the first page printed is on top, followed by the second page, etc.
 7. Take out the stack of pages, turn it so that (for most printers, at
least) the top edge of the page is pointing "into" the printer,
and put the whole stack back into the paper tray (make sure to
carefully even up the edges all around and "fluff" the stack so that
the pages don't stick together).
- Usually, the printed side should be down. You may want to experiment
by
printing a single page, putting it back in, and printing it again,
until you get it on both sides, both oriented correctly.
8. If the first page is not at the bottom of the stack, you lose, unless
you have psrev (if the first page is at the top of the stack, you want
to print the even pages in forward order, but step 4 generated them in
reverse order). Print the even pages.

You should now have a nice copy of Cat's Meow 2 printed on both sides,
with no wasted paper.

To save you steps 1-5, I have placed my doctored files in the anonymous
FTP directory on hendrix.itn.med.umich.edu (141.214.252.146) in /pub,

cat2-odd.ps.Z and cat2-even.ps.Z.

Happy printing.

Subject: Mashing, Break, Blending

To: Homebrew Digest
Fm: Jack Schmidling

>From: MEHTA01@SWMED.UTEXAS.EDU

> 1) The mashing process 1-5 hrs. at 68 C almost never (except for the very first time) has gone to complete conversion. i have to usually give up out of sheer exhasution (from drinking too much Homebrew waiting for conversion). i stir every 5-10 minutes and have at least 5 lbs. 2-row Klages with the other grains (Black, Roasted, Crystal, flaked etc..) to ensure a good amount of enzymes. Some times i even ended up adding 2 spoons of amylase, with no effect. i use about 1 quart of water per lb. of grain.

As a recently born-again all grain brewer, I suggest that you keep it simple till you get the process under control. If you use 8 lbs of Klages and leave all the other crap out, you will get complete conversion in about 15 minutes.

Once you have a process that works you can add new ingredients (one at a time) and recognize the effect each one has on the beer.

I have found that when using adjuncts such as roasted barley or roasted malt, a complete coversion takes longer and the indication turns negative after mashout, no matter what I try.

The clearing characteristis are totally different from extract beer but then so is the taste and overall quality. It will eventually clear all by itself but if you are in a hurry, a half teaspoon a gelatin in the usual fashion will clear it in 24 hours.

>After mashing i sparge (2 gallons for 6-8 lbs grain) at about 70 -80 C, rerunning the sparge water over the bed 5-6 times..

I can not begin to imagine what that means. First of all, even assuming that you have several gallons in the mash, you need at least 6 more to end up with enough to boil down to 5 gallons.

The sparge water passes through the bed, taking the sugar with it and becomes sweet wort when it runs out. There is no "rerunning the sparge water" involved in the process aside from the first cup or so that runs cloudy.

>After 30 mins of boiling i cool and pitch.

Your boiling time is far too short. You need a minimum of 60 min with hops and two hours is more typical.

BTW, I am mailing to you an unsolicited copy of EASYMASH which should help you understand the process.

> 3) Thought i could slip in a third one since you are this far...
What exactly is the hot break and the cold break. i mean, physically what do you see?

Interesting question and I think one that has no rational answer that I have found yet. My brain finds it most convenient to ignore all comments on the subject and directs me to do the following:

- A. Boil for at least 90 min.
- B. Allow the beer to settle for at least 30 min AFTER immersing the wort chiller and BEFORE turning on the water.

The two inches of fluffy glop that ends up on the bottom has something to do with your question. So does an in-line wort chiller and that is where my brain disconnects.

>From: jmaessen@Athena.MIT.EDU

>I've heard that this blending technique is used for most really good wines; this is the first time I've ever heard of beer being blended, however.

This has little to do with your question but since I switched to keggling, I always end up with a gallon or two left over from each batch. This goes into a carboy until I have 5 gallons and then this gets keggled as a "free" one.

It has produced some of my best beers.

For a year I have been using a purpose made "sparge bag", available from homebrew suppliers here. This is made from heat resistant materials which can stand touching the element of an electric boiler, and so makes an ideal hop bag as well as grain bag. It is large enough to hold up to 10lbs of grain, so dry pockets are not a problem provided you stir the grain well in when adding to the water.

Now *that's* a microbrewery! I wonder if they'll call their recipe book "Schroedinger's Cat's Meow" ? Or maybe Pons and Fleischman will come up with "Cold Fermentation."

The parallels are astounding! How about the "Mass/Flavor Duality Theory," which could resolve the conflict between people who believe beer tastes great and those who believe it's less filling? Or the Homebrew Uncertainty Principle, which states that the more beers you drink, the less likely you are to remember how many you drank?

I'm outta here... I have to watch "Young Einstein" split the Tasmanian beer atom again!

Subject: breaks,mash,blend

Jack, I know when you said to just let the chiller sit in the wort for 30 minutes without turning the water on, you were defining an experiment of sorts. I'd just like to say that in practice, you want to turn the water on immediately to cool the wort as quickly as possible. In fact, the faster you cool, the more fluffy stuff you'll see. That stuff is the cold break. The hot break happens during the boil, when proteins, etc. clump together. I believe the hot break is happening at the time when boilover is most likely, although I've seen it happen before then. The differentiation, as I understand it, is *when (at what temperature)* the break occurs. The material itself is more or less the same.

Blending: I often blend brews after they're bottled (black and tan anyone?) I suggested that to someone who had a too-sweet and a too-bitter brew. He did, it tasted better, but then some odd reaction took place and he got a solid half a glass of precipitate! He posted it to HBD, but got no response. Both brews were ok, nothing to indicate what would happen when mixed. Any ideas on what was going on?

Overnight mash: Isn't this the way the big brewers make "dry" beer, a veeerrrrryyyy loooooonnnnnngggg mash?

Subject: Some Heresies(?!)

Hello fellow brewers,

I had an interesting conversation with a guy I order supplies from often, and he had some unusual (to me) points to make. Some of the things he said went against the conventional wisdom expressed here. I'd like to hear if others share his views, or perhaps get some insight into the basis for his ideas.

First of all, he feels strongly that trub is bad (not an uncommon view) and brewers should be careful to let as much as possible settle out before racking into a fermenter. However, he feels that copper wort chillers are a very bad idea, saying that copper will oxidate the hot wort as much as splashing it around. His recommendation is to gently siphon the hot wort into a plastic bucket and let cool and settle overnight, then rack off the settled trub into the fermenter and pitch.

Does anyone else share the view that copper will oxidize hot wort? He says a stainless steel chiller would do the job nicely. Also, it seems to me that siphoning the hot wort is also likely to oxidize it. Any comments?

His other claim is that racking to and fermenting in a secondary is useless, and in fact harmful. The racking will release lots of good CO2 in suspension in the beer, causing more oxidation and upsetting the yeast(?).

The only time one should rack to a secondary is for a long (> 1 month) cool lagering. Otherwise, a single-stage fermentation is sufficient. Does anyone share this view, or care to dismiss it? Recent discussion about dry-hopping indicate that lots of people regularly use a secondary.

Personally, I'm going to try some of his ideas and see what differences I can detect.

Tom

Subject: my Hunter AirStat

I've been using my Hunter AirStat to run a bizarre substitute for a fermentation refrigerator. I've got a bucket (formerly, before I began using a big glass one, my fermentor) wrapped in insulation. Near the bottom of one side is a hole and a small plastic hose nozzle. Tubing runs from there, to a fountain pump, then through a long length of tubing that sits in an ice chest filled with ice water, and finally back to the bucket. The fermentation carboy sits in the bucket surrounded by water that, under direction of the AirStat, is circulated through the ice water.

This setup seems to work real well. That is, it used to. Last night, when I came home, I noticed that the display read 88 degrees. I of course was gripped by panic, and I immediately shut down the pump thinking that somehow the ice bath had warmed to the point that I was now effectiely using the pump as an inefficient heater. Not so. The water bath was quite cold, and fermentation had slowed quite a bit.

When I first put this together, I sealed the temperature probe pretty thoroughly in silicone sealant. I'm not sure how I could have done a much better job of that, but I'm also convinced that the probe failed because of corrosion.

Anyway, be warned. The failure happened spontaneously; the thing was working fine yesterday morning.

>From: bgros@sensitivity.berkeley.edu (Bryan Gros)
>Subject: wort chiller

I also built a wort chiller from copper tube, but I don't run wort through it. Rather, I used compression fittings on either end to mate to 3/4" garden hose connections. I then use short sections of hose to connect one end to the faucet, & the other hose goes in the sink. The chiller sits in the wort (after having been sterilized), and cold tap water is run through it. This chills the wort to 80 deg. in about 15 minutes. The short hose sections are replacement hoses for washing machines, from the hardware store.

From: volkerdi@MHD1.moorhead.msus.edu (volkerding patrick)
Subject: Wort Chiller Design

There's been some discussion of wort chillers again, so I thought I'd toss in my \$.02 since I recently built an immersion chiller that works really good. I got it to chill 5 gallons to 60F in about 10 minutes. Of course, the tap water here in Minnesota is super cold, so your mileage may vary.

I used about 25' of 3/8 od copper. On each end of this I put a 3/8 brass compression fitting with a 3/4" threaded socket. I put adaptors on these to convert the 3/4" inch socket to garden hose fittings, one male and one female. The total cost for all the fittings was about \$5. Worth it, IMHO, because I have no leaks (so far), and I don't have to worry about a hose falling off, even with the water at full blast. (The thing almost jumps when you crank it on :^) I used Teflon tape on all the threaded connectors, BTW.

I coiled the copper so that the input leads into an inner coil about 5 inches in diameter. At the bottom, I curved the coil out to about a 10 inch diameter and worked my way back up to the top, forming a dual-coil design. I bent the two loose ends so that they lead up and out of the kettle, and then head back down toward the floor again, just enough so that if there are any leaks on the fittings or connectors the water will drip on to the floor instead of into the kettle.

Handy tip #1: Get some snap-connect type hose adaptors. They make it real easy to connect and disconnect your hoses from the chiller. I used Nelson Snap Connect #2970 (two of them) which I got for about \$1.50 each at a hardware store.

Handy tip #2: Get one of those little plastic ball-valve things and stick it on the end of the source hose, right before the snap connect. Then you can leave the hose on all the time. This works great for me, because I brew in my basement and I can use the hose to wash out carboys or whatever and the water goes down the floor drain. Obviously this may not work as well in your kitchen :^)

Handy tip #3: If possible, put a big hook on the ceiling near your kettle so you can just reach up and hang your chiller up on the ceiling. Then when you

sanitize your chiller, you won't need a sanitized surface to set it down on.

Hope this helps your brewing :^)

Subject: John's Monster

Reply to John's Monstrosity
HBD #848...ZLPAJGN%LUCCPUA.bitnet@UICVM.UIC.EDU

John's singular account of a recent batch of homebrew gone sour struck a chord of familiarity with us. We also have experienced a similar sensation while brewing. Here's our story. About a month ago, we cooked a batch which used 4 lbs pale malt extract and 3 lbs honey (named Honey Logger). We decided to try Wyeast's Bohemian Lager yeast in the original exploding package, which did. We became justifiably concerned about the ruptured yeast package and transferred the contents to a sterilized ziplock baggie, brewed the wort and pitched the yeast the following morning and waited, and waited, and waited. When no sign of fermentation was present 2 days later, we repitched the yeast using a package of dry SuperBrau yeast we just happened to have. Later that day krauesan was blowing out the tube. The following day the fermentation appeared to be subsiding and we removed the blowout tube for use on a batch of Seat-of-Your-Pants ale. The next day, we made a pilgrimage to the fermenting room, which also doubles as a homebrew storage area and furnace room, for a bottle of homebrew and a chat with our yeast and discovered the Honey Logger had become a mini wort volcano, spewing krauesan out through the airlock. We replaced the airlock with a blowout tube and had a homebrew. Shortly thereafter, several friends were over for a 'tour of the brewery'. An Irish friend with a liking for Guinness took one whiff of the Honey Logger airlock and said without hesitation, "I'd say ya named the wrong one the Seat-of-Your-Pants". Our Honey Logger had an aroma that was enough to make a hog farmer blush. We became concerned, had several more homebrews and watched our concoction merrily bubble away. After 3 weeks of gut wrenching fermentation, our precious Honey Logger now has a wonderful mead fragrance and no trace of the 'ode de hog farm'. We bottled it last night and were pleasantly surprised by a very tasty, very dry beer.

In the 'The Complete Joy of Homebrewing', Charlie recommends not using more than 20 percent sugar in homebrew. Interestingly enough, the Honey Logger and your 'Monstrosity' both used over 40 percent honey/sugar. Could this be the reason for the undesirable aromas?

Our advice (for whatever its worth) is this. Be concerned if you really must, but above all relax, have a homebrew and just call this batch 'Monstrosity Ale'. If it turns out to be any good (which I think it will), send the recipe.

Subject: homemade seltzer recipe?

A friend of mine is interested in making his own seltzer... He's thinking about using champagne yeast and corn sugar with ordinary tap water... What sort of problems would he run into? Nutrients, maybe? Ammoniacal nitrogen? What about pitching the yeast at a high enough concentration to get around growth inhibition (due to lack of nutrients) while producing the seltzer quickly enough to make it worthwhile?

Any and all thoughts are welcome on this subject. It seems to have never been discussed on the homebrewer's digest within the last two years (at least according to my archives 8~).

Subject: Re: Cat's meow 2 redux

Howzitgoin Brewdudes!

I just thought I'd put in my two cents. Regarding Spencer W. Thomas' article (Cat's meow 2 redux) in HBD #850, I've found an easier way to print documents (eg. The Cat's Meow) double-sided.

It's not necessary to edit the source file in any way!

1. Send the file to the printer.
2. Re-stack the output by taking TWO pages at a time (from the top, writing facing up), and place them (also face up) in a new pile. You will end up with pages in the order (from the bottom up) 2, 1, 4, 3, 6, 5, ..
.
3. Turn the new stack over and place in the printer's paper hopper.
4. Send the file to the printer again. You will end up with a stack with the page numbers (front/back): 1/2, 2/1, 3/4, 4/3, 5/6, 6/5, ...
5. Separate alternating pages into two piles (remember to turn over the pages going into the first pile).
6. You now have two copies, double-sided. Share one copy with your nearest brewing-pal (they should share a homebrew in return).

Later Brewfolks,

From: stevie@spss.com

>Frankly, many argue that the value of finings may be marginal, and that improved clarity may be simply due to the use of a secondary fermenter.

They can argue all they want but gelatin works like magic. I have never made a batch without secondary fermentation and I never had a clearing problem till I turned to all grain.

After sitting in secondary for several weeks, the clearing process seems to reach a level beyond which I have not the patience to wait. 24 hours after fining with gelatin, it is crystal clear.

Since I switched to kegs, I quit fining because it settles out in the keg and I would rather not adulterate my beer. It is just one more step removed from BUD.

>jack said:

>>It is obvious from reading the many and varied responses to my question, that the tastes are highly variable, to the point that ale can be made to taste like lager and vice versa.

>I *have* been following this thread. It seemed to me you were implying (still) that there is no difference between an ale and a lager.

I neither implied nor intended any such meaning, "still" or ever.

>Do you mean to say that trying to tell the difference between ale characteristics and lager characteristics based on tasting commercial beers is pointless because of stylistic differences (ie the recipes are so different that you won't be able to isolate taste differences due to the yeast)??

No. I said not a word about yeast. This is not a discussion about yeast.

It is a discussion about the difference between the taste of ale and lager.

How the producer achieves the difference is irrelevant.

I was told to go buy a few bottles of commercial ale and lager to determine the difference myself.

The technical comments lead one to the conclusion that there is enough variability in technique and recipes that it would be very difficult for an unsophisticated taster to learn anything in that way.

When all of the opinions are sorted out we are left with nothing more than "a cleaner taste" and a lack of certain esoteric esterish remnants. Even the almost universally agreed to "fruitiness" of ale leaves me in the cold.

The only fruit I have ever tasted in my ale was bananas and apples resulting from contaminated yeast and the use of sugar.

From: Conn Copas <C.V.Copas@loughborough.ac.uk>
Subject: Blended beers

One of my favourite blended brews is Greene King's Suffolk Strong Ale. It has a gravity of around 60, a clear ebony colour, and a very distinctive port characteristic. Dave Line gives a recipe which basically involves blending 2 gallons of a mature barley wine with 3 gallons of new pale ale. I can't say that I've tried it, but I am dubious of obtaining the port note by his method, as most barley wine does not possess this characteristic. The bottle label states that wood aging is employed, and I am wondering whether GK use discarded port casks. Either that or the yeast could be special. Ideas anyone ?

EASY MASH 4

(Another Sequel)

This was originally posted leaving out a lot of details, some of which were filled in by the Sequel. This edition further simplifies the process and leaves out unnecessary steps.

.....

As I intend to produce a new video on all grain brewing, I would appreciate any and all CONSTRUCTIVE comments.

My intent was to develop an all grain process that reduces the cost and effort to the minimum while producing a high quality beer.

As I have the same aversion to plastic as I do to aluminum and to keep within the budget of most hobbieists, I decided to base the system around the old enameled 8 gal kettle that grandma used for canning.

The same kettle is used for mashing, sparging and again after dumping the spent grains, for the boil. It is never lifted full so the problem of handles falling off is not an issue.

A few simple mods are required to make it fit the process. A small brass spigot is fitted to the bottom with a short piece of pipe extending several inches toward the center on the inside.

A small piece of window screen is rolled several times around the pipe and secured with a hose clamp or twisted copper wire. The screen roll extends several inches past the end of the pipe and the last inch is bent over itself to prevent anything from entering the spigot that has not passed through several layers of screen. This simple expedient eliminates the need for the traditionl "false bottom" with a zillion holes and seems to prove that simple is frequently better.

Mashing is begun by "doughing in" 3 gals of hot tap water to 8 lbs of milled (2 row/6 row) malt. When thoroughly mixed, apply heat to the kettle and bring the temperature up to

155F. Stir regularly to prevent scorching and to distribute the heat. When the "strike" temp is reached, reduce the heat and stir occasionally and maintain 155F for 60 min.

After 60 mins at 155, crank up the heat and continue stirring until 175 degrees is reached. Hold this temp for 15 mins, then turn off the heat and let it rest while heating water on another burner. If you have control over the hot water heater, you can get it almost hot enough out of the tap.

The level of wort in the kettle should be about an inch above the grain when it settles. Lay a small bowl on top of the grain to distribute the sparging water and minimize the disturbance of the grain. The edge of the bowl must be kept below the water level.

Open the spigot just a trickle and run the wort into a cup or jug till it runs clear. This typically takes less than one cup. Pour the turbid runoff back into the kettle (bowl).

The object of sparging is to extract as much sugar from the grain as possible. The longer it takes, the more efficient the extraction. Adjust the outflow so that it takes about 20 min to obtain one gallon. Add the boiling water as necessary whenever the level drops near the rim of the bowl.

The first runoff should be about 1.080 and you quit when it gets below 1.010. The total blend will produce 6 to 7 gallons at about 1.030 which, after boiling will yield 5 to 6 gals at 1.040.

The seven gallons of wort will just fit into the kettle for the boil but it is best to start with about five and add the rest as evaporation makes more room available. A minimal one hour boil will evaporate about a gallon so you can play with the volumes in various ways. You can increase the gravity by more boiling or boil less and have more beer.

Add half of your hops as soon as boiling begins. Save one forth for the end and the remainder at regular intervals during the boil.

After the boil, it is tapped into the primary after cooling, either overnight or with a wort chiller if you have one. I actually draw it off a gallon at a time so that I can shake it vigorously and "glug " it into the primary to oxygenate it prior to pitching yeast.

The rest of the process is just like extract beer. The only difference is that it will take longer for the beer to clear.

The kettle seems to be universally available for about \$35 and the rest of the stuff can be had for less than \$5, making it a pretty inexpensive system.

For those afraid to try all grain, I can simply say that (for me), the quality of my beer has made a quantum leap forward and it was like falling off a log.

I do not doubt that some people can make good beer with extracts but I can now honestly say, I don't think I ever

did. All grain brewing takes a bit more time and effort but the satisfaction is immense and dollar-a-gallon beer is also no small part of the compensation.

Subject: haze

In HBD 851, Jack Schmidling writes:

They can argue all they want but gelatin works like magic. I have never made a batch without secondary fermentation and I never had a clearing problem till I turned to all grain.

Perhaps there IS a problem with your sparge technique, Jack. I always brew all-grain, and I've never had a haze problem (except for the one time I used Irish Moss, ironically). You might, just in the interest of science, try lowering your sparge water temperature on a batch and see if that helps the clarity. Much of the haze could be unconverted starches that will settle only reluctantly.

I could be wrong, of course, but I do know about my own beers. I've never used sparge water hotter than 170 degrees.

veeerrrrryyyy loooooonnnnnngggg mash?

I just recently read an article about dry beers in "All About Beer"
magazine.
The article stated that dry beer was invented in the early part of this
century in the U.S. The process involved removing the barley husks
before
the mash, a very expensive process. The Japanese picked up this process
a
few short years ago and made it profitable (it's like deja vu all over
again). Anyway, the concept caught on again in the U.S., but I'm quite
sure
that the big U.S. brewers don't remove the husks from all the barley
before
brewing (the Japanese probably don't remove it all either). Anyone have
any
more details about the "dry beer" phenomenon?

From: Dennis.Henderson@Eng.Sun.COM (Dennis Henderson)
Subject: Chiller-less cooling

All this talk about fancy wort chillers has got me wondering (but still relaxing) if my chilling method is too casual.

After the boil (malt extract and separate hops) I have ~2.5 gallons of wort. I put the stainless steel kettle in the sink in the garage. I fill the sink up to the wort level and add six ice trays of ice cubes. I stir the ice water every five minutes. After 15 minutes I dump the water and repeat.

After less than 30 minutes the wort is down to 100 degrees F. I combine with 2.5 gallon of off-the-shelf "purified water" that has been in the deep freeze for the brew session (~2 hours). The mixture is then very close to 70 degrees F so I pitch. I don't use the blowoff method and rack to a secondary after 2 to 5 days BTW.

My concerns:

1. The garage sink is not very clean. I do keep the lid on the kettle at all times except when measuring the temperature.
2. Perhaps I should add the hot wort and cold water to the plastic primary fermenter and pitch the next day when the mixture is down to the correct temperature. Wouldn't this give more time for infection to get into the beer before fermenting takes over.
3. An immersion chiller would take another large pot for sterilizing. Or do folks pour the wort into the primary and boil the chiller in the wort cook pot.

How silly am I being with my methods? I'm on my ~seventh batch and am almost able to make a reasonable tasting beer everytime. I'm concentrating on getting a good process and experimenting with various recipes sold at the local brew store before moving to more complicated methods.

I was in Poland last summer, and drank a fairly large amount of beer. I believe almost all the beer sold in Poland is of the style Dave Miller calls "Northern European Pilsner". They frequently will have a local beer for cheap, and charge a premium for an imported German beer. (Beck's is common.) The one place I did A-B comparisons, the German beer was draft, and had noticeable hop aroma; the local beer was in a bottle and had about the same hop bitterness, and I would guess Original Gravity, but no hop bitterness.

None of the relatives I visited was a brewer, but they did discuss (but not demonstrate) some post-brew "recipes" involving adding honey and hot water.

One of the older relatives that I didn't have a chance to talk with used to make various distilled liquors (we called them "Uncle Kazik's hooch") using various fruit and honey as fermentable material. I'm not aware that he ever made beer. My Grandmother had made fruit wine's in her adolescence on a Polish Farm, without using fermentation locks or commercial yeast, or any of the "modern" technology we take for granted.

There is also a kitchen tradition of making things with fermented rye bread. My Cousin Barbara (the best cook I visited) made a dish which combined the fermented rye bread with some kind of organ meat (I don't remember the details) in a casserole. Of course it was baked, so it didn't end up being alcoholic. There has been a recent thread here of kvas recipes, which you might want to look at.

>settled trub into the fermenter and pitch.

I'm not a chemist (in fact, barely passed Chem in college), but I can't see how a copper tube can add anything but copper to your wort. You should cool your wort as fast as possible for two reasons: 1) the sooner you get to pitching temperature, the sooner you can pitch the less time wild yeasts and bacteria have to take hold in your wort, and 2) while the wort is dropping from 212F to 140F, DMS is being produced (DMS will give your beer a "cooked corn" taste).

>Does anyone else share the view that copper will oxidize hot wort? He says
>a stainless steel chiller would do the job nicely. Also, it seems to me
>that siphoning the hot wort is also likely to oxidize it. Any comments?

SS is good also, but I don't think there's any problem with using copper and a *lot* cheaper than SS.

>His other claim is that racking to and fermenting in a secondary is
>useless, and in fact harmful. The racking will release lots of good CO2 in
>suspension in the beer,

Big deal -- releasing CO2 is not an issue.

>causing more oxidation and upsetting the yeast(?).

Another no-op. The yeast doesn't care. Transfer of beer will, indeed, introduce some oxygen -- I agree.

>The only time one should rack to a secondary is for a long (> 1 month)
>cool lagering. Otherwise, a single-stage fermentation is sufficient.

Yes. I agree here also. I have been using single-stage for virtually all my ales for the last few years. I am considering going to two-stage to see if it makes a difference. My plan is to compare:

1. single-stage + no blowoff
2. single-stage + blowoff
3. two-stage + no blowoff
4. two-stage + blowoff

The reason I plan to use the two-stage is to get the beer off the trub. Even though I use a chiller and lately have been waiting for an hour after bringing the wort down to 70F to transfer to the primary, I still

get a lot of trub after a day or two.

If you are lagering, or if the ferment is being done at a very low temp (i.e. you will have a long ferment) you should rack the beer off the trub and dead yeast before autolysis sets in.

>Does anyone share this view, or care to dismiss it? Recent discussion about

>dry-hopping indicate that lots of people regularly use a secondary.

Not necessarily. I simply dump my dryhops into the primary after the krausen falls - after a day or two, I swirl the carboy to wet all the hops.

From: Fred Condo <CONDOF@CGSVAX.CLAREMONT.EDU>
Subject: Phil's Mash System; Filtering your water

Recently, someone posted asking if anyone had had any experience with the "Phil's Mashing System" lately advertised in _Zymurgy_ by the Listermann Mfg. Co. I recently bought one of these for about \$35 from The Home Brewery in San Bernardino, Calif.

The bulk of the system consists of a pair of food-grade plastic buckets, each with a quarter-inch hole drilled into the side at the bottom. Other components include a pair of PVC hoses with hose clamps; a drilled, formed plastic plate for a false bottom; and a very clever brass sparging apparatus mounted on a rigid PVC frame.

To set the system up, you put your brew kettle on the floor, the lauter bucket on a chair or other low support, and the other bucket (for sparge water) up on a counter or other high support. You set the sparge apparatus atop the lauter bucket, and connect the hose from the water bucket to it. When you open the hose clamp, the sparge arm spins, sprinkling the sparge water gently over the grain. The other hose clamp controls the outflow of sweet extract into your kettle.

The only problem I had was using the two hose clamps to control the inflow and outflow. The effective range of the clamps is only wide-open to two stops. Closing the clamps any more effectively halts the flow. Also, I need to set the water supply atop a case of bottles to have sufficient water pressure to drive the sparge arm after half the water is used.

This was my first attempt at all-grain brewing. All the books say you need at least 8 to 10 gallons of boiling capacity, but I am limited to my 6-gallon kettle. So, I just compensated by using extra grain. From 10 pounds of Klages malt, I got about 5 1/2 gallons of 1050 wort.

To those extract brewers who are scared of all-grain brewing (as I was), I say: FEAR NOT! It is *MUCH* easier than I thought it would be, and it adds only a couple of hours to the brewing process. I have two batches of all-grain pale ale in the other room happily fermenting away. I can hardly wait to taste and compare with my extract brews!

Someone was asking about the iodine test. The iodine-starch reaction is very fast, almost instantaneous. If you don't get a blue-black result within 1 second, that's a negative test. If you let the test sit around for a few minutes, you will get some small black particles. With Klages malt, I got conversion after a half hour.

It was an almost magical feeling to see and taste the mash turn from bland and starchy to golden and sweet.

=====

Brian Davis asked about filtering water. I always filter my water with one of those small Water Pik filters to get rid of the chlorine. I've never brewed with unfiltered water, so I can't make a comparison, but it definitely improves coffee.

Subject: hop vines: vertical or horizontal?

Hello fellow Brewpeoples.

David Van Iderstine mentioned in HBD #851 that hops should be trained sideways, and not up. This has raised a good question. It seems to be conventional wisdom that they should be trained straight up--about 20 feet up in fact. Maybe the big-time hop farmers only do this to save space and grow more hops per acre. Maybe they would indeed grow better if they were trained horizontally. Maybe it doesn't matter, as long as they get plenty of sun.

Enter the HOMEBREW digest, a wealth of experience.

First, has anyone tried growing hops BOTH ways, and found one way produces a higher yield? (Hmm, I thought not.) OK, does anyone know of a friend (in the same general geographic location) who grows it differently than you do? How does your yield compare with your friends'?

I've just planted my hops, and am NOT looking forward to (read: dreading) buying a BIG ladder; buying 20' poles; standing them in the ground; stringing cable and twine; and trying to harvest hops that are growing straight up 16 feet or so.

The idea of sending them up 6 feet or so and then over to the eaves on my roof sounds MUCH easier. And, it would provide a wonderful shade for my back yard. It would probably look pretty cool too. Does anyone grow them in this way? How big is your yield (or is that a personal question)?

I would appreciate any informed comments or stories from experience (please, no speculation--we have enough of that in this forum).

Thanks a heap,
-Alan L. Edwards

Subject: Ale vs. Lager

Jack writes:

>When all of the opinions are sorted out we are left with nothing more
that "a
>cleaner taste" and a lack of certain esoteric esterish remnants. Even
the
>almost universally agreed to "fruitiness" of ale leaves me in the cold.

Personally, I'm not sure if I could tell the difference in a blind
tasting
of Ales versus Lagers. I'm also not sure if many "experts" could. As in
the rest of nature, there is no clear dividing line between the flavor of
Ales and the flavor of Lagers -- all beers are somewhere on the fruitiness
continuum. Another "stick-in-the-spokes" of this issue is something like
Samuel Adams Boston Lager, which is so highly dryhopped so as to make it
difficult to perceive esters, that I don't think even Michael Jackson
would be able to tell if it was a Lager or an Ale in a blind tasting.

>The only fruit I have ever tasted in my ale was bananas and apples
resulting
>from contaminated yeast and the use of sugar.

As I've noted in a previous post, my Chemistry skills are pretty poor,
therefore, for the sake of discussion, I would like to present my
understanding and would greatly appreciate concurrence/correction from
experts. Here goes:

It is my understanding that esters are the product of alcohols and
organic acids. The well-known "banana" ester is isoamyl acetate, which
I assume is the product of isoamyl alcohol and acetic acid. I also
assume that the yeast does more than create the alcohol, rather the
reaction between the alcohol and the acid takes place in the yeast cell
(George? Help?). In any event (I digress) I don't think Jack should
immediately blame contamination for esters -- many yeasts are "chosen"
for their ester production (try St. Louis Gueuze for the fruitiest beer
I've ever tasted, that did not have fruit added).

The bottom line is that all beers have some esters, and IMHO while there
may be a theoretical division between Ale and Lager, there is no *real*
division (it depends on the sensitivity of the taster, among other
things).

On the other hand, I don't think it's wrong for a judge to taste a beer
entered in the Pilsener category and to say "too estery for style." A
judge should have pretty-much tuned his/her senses to conform to the
AHA/HWBTA style definitions and should be aware of their taste/smell
(hyper)sensitivities.

Subject: Racking for clarification

I saw some interesting instructions for racking on a beer kit recently. The advice was to rack from the secondary fermenter, wait a day, then rack into the bottle. No explanation was given, and it at first seemed to me that the second racking might not achieve much in the way of clarification. It then got me thinking about the behaviour of some of my wines, and I have noticed that if I rack a quite mature wine, it can often throw an unexpected deposit the next day. Maybe some equilibrium principle operates with yeast/trub, ie, a constant proportion of the absolute amount present tends to remain in suspension. Alternatively, racking is also sometimes recommended as a means of inhibiting any residual ferment, the idea being that one can reduce the amount of viable yeast below some threshold by this method. It would be interesting to know whether any of this applies to brewing.

>Jack, I know when you said to just let the chiller sit in the wort for 30 minutes without turning the water on, you were defining an experiment of sorts. I'd just like to say that in practice, you want to turn the water on immediately to cool the wort as quickly as possible.

I understand but the longer it sits, the more time it has to settle out. My thinking is that if it sits after chilling, it is subject to infection and without mucking up the lid, the kettle can not be covered properly while the chiller is inside. One obviously does not want to remove the chiller after the wort is chilled. If it sits for 30 minutes hot it can not get infected and is not much different from an additional 30 min boil for a chemistry stand point but it gets an extra 30 settling time.

My poke at in-line chillers was to point out that they are inferior in this respect unless an additional settling step is added after chilling. This is just another step, with all the attendant sanitizing and clean up details that make brewing too much like work.

> In fact, the faster you cool, the more fluffy stuff you'll see. That stuff is the cold break.

>The hot break happens during the boil, when proteins, etc. clump together.

The problem with these terms is that in one instance they indicate a stage in a process and in another/both they indicate physical stuff.

>I believe the hot break is happening at the time when boilover is most likely, although I've seen it happen before then. The differentiation, as

I understand it, is *when (at what temperature)* the break occurs. The break material itself is more or less the same.

In my experience, somewhere well into the boil, stuff starts coagulating into what looks like egg-drop soup. If this point is the "hot break", I accept the definition but let's call the stuff something else.

Similarly, the "cold break" should be some temperature at which this stuff collects and drops to the bottom during chilling. Again, in my experience, it is a very specific point AND much of the stuff clumps together and floats to the top. The wort goes from cloudy and turbid to crystal clear in a period of a minute or two when the correct "break point?" temperature is reached.

I have big troubles understanding how this works or can be as effectively utilized with an in-line chiller.

All this simply defines the phenomenon without suggesting a solution. I offer as a solution to confine the use of the terms hot/cold break to the process stage at which something happens and add your favorite expletive when talking about the stuff. Like.... "hot break stuff".. If STUFF is good enough for Carl Sagan, it's good enough for me.

Subject: homemade seltzer recipe?

>A friend of mine is interested in making his own seltzer... He's thinking about using champagne yeast and corn sugar with ordinary tap water... What sort of problems would he run into?

The only problem you will run into is that you are left with a yeasty taste that is not very pleasant. A dash of lemon or one of the many additives used by commercial bottlers will solve the problem.

Use 1/8 tsp yeast and 2 tbs sugar for one gallon and bottle in one litre plastic bottles. Refrigerate when hard.

Subject: Bottle test

I have a friend who loans me a digital scale from time to time so I can weigh my hops out to the nearest .01 g :) While I was doing this, I happened to glance over at the ol' bottle collection and decided to throw a few samples on the scale to see if I could maybe figure out which bottles have more glass, and presumably, would be less likely to fail with repeated refillings.

Now granted, there are other variables involved here, for instance, the shape of the bottle could account for more difference in strength than the amount of glass, but I thought you people might find the results interesting. Here they are:

337g The Winner! :) The heaviest bottle I could find: Cerveza Pacifico.

318g Returnable longlecks from most major breweries. (tested: Bud, Leinenkugel's, Huber. All were within 2g of this weight)

292g Celebrator Dopplebock
276g Bass
274g Young's
263g Samuel Adams
262g Pinkus Homebrew (11.2 oz. bottle)
259g Any Pete's or Schell no-refill but not twist-off
256g Watney's Red Barrel and Cream Stout
255g Red Tail Ale twist-off
218g Anchor
215g IBC Root Beer
213g Any Pete's, Schell, James Page, twist-off longneck
211g Heineken Dark
203g Guinness Extra Stout (the lightest 12 oz. bottle in the collection)

take care,
-- Pat

Subject: Crystal malt and hop skimming.

Hello all,

I have noticed several references to different kinds of Crystal Malt. I have only seen plain 'ole crystal. What's the difference in all the 'flavors' ?

Secondly, I tried using hop pellets in my last batch for the first time. As the green slimy foam came to the top of my brew kettle, i skimmed it off. Was this bad? I used 2oz for boiling and 1/2 oz for finishing. My beer has a slight hoppy flavor. Would leaving the scum to boil increased this?

Thanks a bunch,

Cu

This reminds me of a couple of things that I was going to ask
this august body :) when I got time, which I now seem to . . . While
visiting my brother in Key West recently, we held a fish fry (with
plenty of homebrew too, o'course). I had never done a large-scale
outdoor fish fry before, but my brother pointed out that the deep fat
frier setup would be perfect for boiling wort. I immediately
concurred.

For those of you who haven't seen one of these beauties, it
consists of a big metal tripod with a large propane burner and a pot
platform on top. I assume you'd want to use a regular brewpot instead
of the frier on top, but it seemed like the unit itself would need no
modification. It could also probably be easily modded to run off
natural gas, but since the great wilderness of central Maine (and Key
West, for that matter) uses propane for everything, I see no such
need.

For those of you who have seen one of these beauties, has
any of you ever tried one for boiling wort? I don't recall if I
heard how much it cost, but it seems at least worth looking into. Any
experience, or am I going to have to rush out and buy one of these
myself? Purely in the name of research, of course. :)

One other thing. While in Key West I saw a number of
salt-water aquariums, and a common piece of equipment for them was a
combination thermometer/hydrometer. Didn't measure in degrees Balling
or potential alcohol %age, of course - just specific gravity - but
that's good enough for me. The convenience of both hydrometer and
thermometer in one handy package is quite enticing; this is
something I think I'll go out and buy as soon as I have a chance to
scour the pet stores, but I'd like to ask the HBD again: has anyone
used one before?

A couple of things. I *do* pull out my chiller after it's done its job. I
then pitch the yeast, stir the wort into a vortex, and let settle for an
hour
or 2 before transferring to a carboy.

> In my experience, somewhere well into the boil, stuff starts

That's it. Unfortunately, like "trub", it's a term that probably won't go
away.

> Similarly, the "cold break" should be some temperature at which this
stuff
> collects and drops to the bottom during chilling. Again, in my
experience,

floats

Actually it is a range of temperatures. I seem to remember a Zymurgy
article
that spelled out what precipitates out at what temperature.

I don't really see why Hot/Cold break "stuff" is better than just Hot/
Cold
break. Discussions of break time deal only with the stuff produced at
that
time. There's little room for confusion.

Now I've got a question for you. In your easymash setup, have you ever
had
any problems with the window screen drain/spigot setup getting clogged
with
hops/trub when you transfer off to the carboy?

On a similar note, could someone who's using a hopback explain their
setup/
procedure please?

Subject: Training Hops and Munich Bierstubes

Where does one go to drink beer in Munich? Anywhere one wants....
Think of it as heaven, beer heaven, and take your sweet eternal time to
explore the many different beers available on tap (vom fass).

Hops: my 3 varieties are up, with the 2 Cascades being 2 feet high
already.

Last year I tried training the Hallertauers to go horizontally, sort of
helping out every time they were ready for the next string. It took more
time and care but the harvest was easier, although not much.

The pros go vertical primarily because of space and the nature of the
vines
to head that way. A mechanized picker does the dirty work later.
Obviously
they can't worry about each and every pole.

On my Cascades and Herzbruchers I use a trellis which is 9 feet off the
ground. After making the climb up to the top, the vines meander over and
through the cross-hatched twine. Harvest is easy as I just cut the twine
until it all falls down.

Finally, I have found that twine is easiest for the hops to cling to and
climb up. The wood poles were too thick and caused some hop vines to get
knocked off by wind or rain.

From: tony@spss.com (Tony Babinec)
Subject: crystal malt color and amount (semi-long)

This posting summarizes the recent thread on crystal malts and colors.

Crystal malt is malt steeped and kilned in such a way that it becomes a dollop of sweetness and body to add to your brew. For the extract or grain brewer, crystal malt gives some body and luscious flavor to what might otherwise be a thin brew. In using crystal malt, color is also an issue.

As shown in the AHA beer style guidelines, or in Fred Eckhardt's "Essentials of Beer Style," beer styles have acceptable color ranges. If you are making a beer "to style," you'll want to take the guidelines into account, and then use knowledge of the color property of malt to get your beer in the right ballpark.

First, here is a table that attaches some useful descriptives to numeric color ratings:

| numeric | description | | |
|-----------|-----------------|-------|--|
| 0 - 2.5 | yellow | light | |
| 2.5 - 3.5 | pale | | |
| 3.5 - 5.5 | deep straw/gold | | |
| 5.5 - 8 | amber | light | |
| 8 - 10 | medium | | |
| 10 - 14 | deep | | |
| 14 - 18 | darkbrown/black | | |
| 18+ | black | | |

Source: appendix of George and Laurie Fix's "Vienna," although Fred Eckhardt has a similar table. Eckhardt's book also employs a second rating scale on a 1-10 range.

Second, here is a table showing the color ratings and contributions of crystal malts:

| malt | l#/1g | 1#/5g | |
|--------------|-------|-------|--|
| cara-pils | 1.50 | .3 | |
| crystal 10L | 10.02 | .0 | |
| crystal 20L | 20.04 | .0 | |
| crystal 30L | 30.06 | .0 | |
| crystal 40L | 40.08 | .0 | |
| crystal 60L | 60.0 | 12.0 | |
| crystal 80L | 80.0 | 16.0 | |
| crystal 90L | 90.0 | 18.0 | |
| crystal 120L | 120.0 | 24.0 | |

Notice that cara-pils malt is lumped in with the crystal malts. Think of cara-pils as adding those dextrans you want for sweetness and body while making only a minimal color contribution. This makes cara-pils malt a nice addition to the grain bill of any German-style lager, and especially the light-colored ones. See Noonan's "Brewing Lager Beer" or Miller's "Continental Pilsner" for some recipes.

Notice also that the Lovibond rating is the color contribution of 1 pound of the crystal malt in 1 gallon of water. Dividing by 5, we get the color contribution of 1 pound of each malt in the typical 5 gallon batch. Thus, taken by itself, 1 pound of 120L crystal malt should approximately result in 5 gallons of wort of color 24, which would make the wort dark by the first table's indication. As for SG, depending on your extraction efficiency, you should get 4-5 points (1.004 to 1.005) of gravity per pound of malt.

Crystal malts have different national origins. There are U.S., British, and German crystal malts available. Some of the best crystal malt includes Maris Otter crystal malt, as well as Ireks "light" German crystal malt and "dark" crystal malt. George Fix's recent HBD append showed that "light" is probably 10L and "dark" is probably 60L. Homebrewers should press their suppliers to provide crystal malt with Lovibond ratings. U.S. crystal malts from Briess Malting typically have a color rating.

Use of inferior crystal malt, or too great a quantity of crystal malt, will result in "coarse" flavors in the beer. In practice, homebrewers have used British crystal malts in a German beer, and vice versa, as the proportion of crystal malt in the recipe is not very large. As for amounts, Terry Foster's pale ale recipes, which use pale ale malt as the base malt, use crystal malt additions in the 4 to 8 ounce range. George and Laurie Fix's basic Vienna recipe, which uses pilsner malt as the base malt, employs 6 ounces each of 10L, 60L, and 120L crystal malt to produce an amber beer. So, don't over-do the percentage of crystal malt in your recipes. Instead, make judicious use of darker crystals and other dark malts.

Finally, George Fix's HBD posting also showed that the color contribution of color malt to your wort is contingent on water hardness. Other HBD postings have mentioned the wort-darkening effect of splashing hot wort. In an appendix to "Vienna," George and Laurie Fix make the point that the "color arithmetic" wherein homebrewers take into account grain volume and color rating to "predict" the expected color of the resulting wort is roughly additive for light-colored beers but not strictly additive for amber beers.

From: korz@ihlpl.att.com
Subject: Re: EASYMASH

Three comments on EASYMASH:

1. The "screen-around-the-pipe" lauter tun is indeed simple, but I want to again point out that the advantage of a more elaborate system would be better extraction (drawing all the runoff from the center of the tun reduces the amount of sugar you extract from the grains at the sides of the tun). This is not a big deal for beginners, but you may want to mention the trade-offs that you make going with a simple system. It validates why your system is so much simpler -- some are sceptical when you offer "something for nothing."

2. You should point out that this is a single-step infusion mash and thus requires well-modified malt (Pale malt). Using less-modified malt (such as Lager malt) would require a protein rest.

3. "Strike" temperature, is not the temperature of the mash, rather, the temperature of the "hot liquor" (water) before mixing with the milled grains. If you correctly calculate the strike temperature (based upon the mass of the water you will use, mass of the grain you will use and the initial temperature you want your mast to be), upon mashing-in, your mash will be at the correct, pre-calculated, initial temperature and you won't have to add heat unless it is a very long rest or if your mash tun is uninsulated. I think what you meant was: "When the 'saccharification' temperature is reached, reduce the heat and stir occassionally..."

From: ZLPAJGN%LUCCPUA.bitnet@UICVM.UIC.EDU
Subject: Dry Hops and Green Sludge

Dear Brewers,

After freeing up my carboy from the monstrosity I was brewing (BTW, thanks for the advise, all!), I decided to try something a bit more challenging than simple extract-syrup brewing, and brewed up my first lager, following the recipe (as closely as possible, this time :-)) in Papezian for "Propensity Lager."

Of course this was a learning experience in every respect, and I'm sure this particular experience isn't over yet. And, just as one discovery spurrs twenty more questions (at least that's what they're teaching at the graduate level these days), this particular learning process has generated quite a few questions...

First of all, I used crystal malt; I cracked it, then added it to the boil-pot (w/ 1.5 gal. water) and strained just after the boil began. But, instead of fishing around in the boiling brew with my strainer, I simply poured it through a strainer into a temporary, second (aluminum) pot, and then back into the original pot. I then added the 5 lbs of dry light maly extract all at once, and it all seemed to "clump" together, mostly dissolving but some marble-sized beads remaining and later strained out. I also added the Saaz hop pellets straight into the boil. This I also did with the finishing and flavoring hops. The only sugar called for was 2.5 lbs of clover honey. I let this calderon boil moderately (not vigorously) for 45 min, as per the recipe, then cooled it - without straining the wort yet - by setting the pot in a tub of cold water for about an hour or so. When it was cool enough, I strained out as much on the hops as I could (Pap.'s recipe calls for straining or sparging the hops straight after the boil :-?), and that proved to be a long and tedious process. I had thought, given the nature of pelletized hops, that I'd have to use a COFFEE strainer, but the kitchen strainer proved to be enough og a trial!! I had to pour a bit, spoon through the strainer to let the wort pass, spoon out the spent hops, then start again. The whole process took about half an hour!!

When I finished, the wort in the fermenter looked like thick, milky caramel! I then topped off the fermenter with water to fill it to the neck. I pitched two packets of dry lager yeast (wort temp = approx. 65F) and fitted a blow-off hose to the top of the carboy, emptying into a pitcher filled with about an inch of water acting as a lock. Fermentation began vigorously within 24 hrs and is continuing still, though not so vigorously now.

OK, now the questions:

1) The wort is STILL a milky-caramel in color! Is this normal? Will it clear eventually? If not, do I need to rack to a secondary? I'd like to keep it in a closed container, so, in the event of racking can I simply rack to a temporary (pail-like) container, clean out the carboy, and reurn it? I'm not that comfortable with this idea. If I don't need to rack, what are the possibilities that the beer will clear as it lagers in the bottle?

2) The kreausen is rising, but not enough (yet?) to pass through the blow-off hose. Will it in time (it's been brewing sinse Sat.)? If not, will I have to scoop it off? There's still a green sludge (hops) at the top, and I'm concerned that, if the fermentation does continue

to the point where my blow-off hose is actually useful, will this
sludge clog the tubes? Again, I guess it boils down to a question
of racking...

Any directions?

Not Worrying (a first, for me :-)

>very close to 70 degrees F so I pitch.

This sounds just fine to me. I wouldn't change a thing, unless you want to. This is what I also did for my first dozen batches or so. The primary reason I made an immersion wort chiller was that I was tired of buying bags of ice cubes, and the hassle of having to siphon out the sink periodically to keep it from overflowing. It's true the chiller does take another pot, or bucket, to sterilize in. I use a plastic foot basin. As with everything else, I use a couple oz.'s of Clorox per gallon to at least rinse with or immerse in, then a tap-water light rinse. I don't get overly concerned about sterilizing the copper. I even forget to some times.

The big deal, as I understand it, is to reach the "cold break" as quickly as possible. Someone else could certainly give better technical details than I as to the particulars of this break; it affects final clarity. Anyway, quicker is better. However, I think your 30 minutes is fine. What concerns me is folks who leave it overnight to chill.

I would clean the garage sink, though. Cold, unfermented wort is about the best bacteria food you could have there. The lids helps, but hey, how tough is it to splash some clorox around in the sink first?

- - -

Regarding the thread about secondary racking for non-lagers, I was taught this was important, if for no other reason, than to get the beer off the trub (as korz@ihlpl.att.com also mentioned). I was told to leave beer in the primary no less than 2-3 days, no more than 5-7. No less, so "bad" sediment has a chance to precipitate, no longer so it's not re-absorbed having precipitated. Let's not forget that most micros and all professionals take the trub off the bottom of their fermenters as it forms, so they can get away without racking from the primary. I've yet to see a glass carboy or plastic bucket up to the same trick. BTW, I always use a blow-off tube during primary, as I was taught the foam coming off was undesirable.

- - -

About hop heights: The guy at Freshops that I just spoke to after having purchased some Cascades rhizomes recommended a trellis height of 10' to 12', with sideways running strings. I asked about 6' height, and he said that was absolute minimum; 10'->12' was better, 18' was unnecessary. Training would be required though, as well as selective pruning. He indicated the vigorous side shoots would begin at 6' or so; Papazian in CJOHB recommends removing leaves below 6' to inhibit upward

spread of lift wilt. Sounds like an overhead trellis canopy might be ideal; I can think of little nicer environment than a beer garden with canopy of flowering hops just overhead!

Incidentally, Freshops dried hops prices are INCREDIBLE!

Yes. Not only that, but pouring hot wort (over 80F) will oxidize the wort -- at the least darkening the beer, at worst giving you sherry-like or cardboardy flavors. [On a related note, while brewing a Chimay-clone last weekend, my cousin and I were tasting 750ml bottles of "Red" and Grand Reserve. I felt that both (only 3 months old) had a sherry-like nose, whereas my cousin said they remind him of the "smell of a liquor store." He read from Jackson's pocket guide that the 750ml bottles age differently than the capped (330ml) bottles. I said "yes -- it's probably due to the porosity of the cork which causes some oxidation... sherry-like or wet-cardboard aromas." At this, he replied: "THAT'S IT! It smells like the damp cardboard boxes in some liquor stores!" I checked again, and identified the smell myself, but felt the sherry-like smell was dominant.]

>3. An immersion chiller would take another large pot for sterilizing.
>Or do folks pour the wort into the primary and boil the chiller in the
>wort cook pot.

Not necessarily. I simply use the boiling wort to sanitize my immersion chiller. Again, you want to avoid transferring hot wort -- any aeration will cause oxidation.

Subject: Training Hops - Up Or Out ?

"Date: Fri, 27 Mar 92 14:14:50 PST
From: rush@xanadu.llnl.gov (Alan Edwards)
Subject: hop vines: vertical or horizontal?"

"David Van Iderstine mentioned in HBD #851 that hops should be trained sideways, and not up. This has raised a good question. It seems to be conventional wisdom that they should be trained straight up--about 20 feet up in fact. Maybe the big-time hop farmers only do this to save space and grow more hops per acre. Maybe they would indeed grow better if they were trained horizontally. Maybe it doesn't matter, as long as they get plenty of sun."

The conventional wisdom - and this applies to tomatoes and other plants, also - is that a trellis guiding shoots laterally gives easier access to the resulting fruit, as well as increasing exposure to light on a per-flower basis, since you don't have lower fruits shadowed by those above.

From: mcnally@wsl.dec.com

Subject: using your yeast cake

If, like me, you don't always have the time and energy to brew up a batch of wort just in time to pitch over a yeast cake from a previous batch, here's an idea I've been trying. Go to your local "natural foods" store (or Trader Joe's) and buy 5 gallons of unfiltered unpreserved apple juice. Chill at least a couple of the bottles, then pour it all over your yeast cake after racking off some just-finished beer. Add some honey dissolved in real hot (like just boiled) water and let it go. Your yeast will be ECSTATIC, and you'll end up with an acceptable hard cider ready for those whiners who show up and don't want to drink your homebrew; the cider will surprise them both with its taste and its sneaky strength.

Just a thought!

Hmmm...I'd missed David's note or I certainly would have countered it.
Hops want to grow UP. "Training" them really involves giving them some-
thing to hold on to as they climb, since they're going to *try* very hard
to grow upward.

The commercial hops I've seen were trained along mostly-upward diagonals.

> First, has anyone tried growing hops BOTH ways, and found one way
produces
> a higher yield? (Hmm, I thought not.)...

I tried to train hops to go horizontally. We got into a big argument
over
it. It wasn't a matter of yield; it was a matter of the hops not being
willing to go horizontal...

Me: OK, gals, you're set up to climb these trellis-things here 'til
you

get to the deck. Then there's cord strung up to get you as far as
the deck railing...

Hops: Great! That will take care of us for a month, maybe a little
more. Then what?

Me: Well, then I've got more cord to take you horizontally alongside
the deck rail.

Hops: WHAT??? We don't do "horizontal" We won't take this lying
down!

Me: Why not?? Look, what am I supposed to do--set it up so you can
climb all the way up to the roofline?

Hops: You got it, buster. Oh, and you might want to figure out where
we're going after we get to the roof.

I had some of the vines headed mostly-vertical and tried to get others to
go horizontal. They simply didn't want to do it...I'd go out and find
that

the vine wasn't winding around the cord. With persistence you can go out
every day and wrap the vine around...but forget about doing it for a day
or

two and you've got this anorexic green dragon waving its head in the air,
looking in the window and saying "Give me something to CLIMB, dammit!!"
The ones I forced to go horizontal didn't do well at all.

> I've just planted my hops, and am NOT looking forward to (read:
dreading)

> buying a BIG ladder; buying 20' poles; standing them in the ground;
> stringing cable and twine; and trying to harvest hops that are growing
> straight up 16 feet or so.

Just get a pole and forget the ladder. Arrange it so that you can drop
the pole down to the ground--for example, pivot it at the bottom and
arrange to anchor it (to the house or garage) part-way up. (I saw some
antenna-mounting hardware used for this.) Run several heavy cords from

the top of the pole out at angles to the plants.

> The idea of sending them up 6 feet or so and then over to the eaves on
my
> roof sounds MUCH easier...

Yeah, but six feet is barely a start. Are they close enough to the house
that you can mount a pole by the house and train them along cord up to
the
pole (diagonally upward)?

>...And, it would provide a wonderful shade for my
> back yard. It would probably look pretty cool too. Does anyone grow
> them in this way?...

Yes...the lower part of my plants provides seasonal shade for my office.
Nice feature--they fill in just as the weather gets hot. They drop their
leaves around when the days get short, the weather gets cool, and you'd
like more sunshine.

You'll get shade by letting them spread out just a bit as they grow
upward;
you don't need to run them horizontally. They really do want to climb.

>...How big is your yield (or is that a personal question)?

(It is, but the yield of my hops plants isn't quite so personal.) It
depends a lot on the age of the plants. Where I am--dry climate, erratic
weather--it took several years for them to get established. The first
year
they really grew, I got maybe the equivalent of an ounce dried. Now I
get
a good-sized basket of hops from each plant.

Why not? I chill my wort with an immersion chiller, and when it is at
70F,

I simply pull out the chiller, cover the pot and let it sit for an hour
to
settle.

>If it sits for 30 minutes hot it can not get infected

>and is not much different from an additional 30 min boil for a chemistry
>stand point but it gets an extra 30 settling time.

Oh yes it is different. When the wort is boiling, it is boiling off the
DMS that is produced, whereas when the boil stops, DMS keeps being
produced until the wort drops below 140F, which unfortunately is in the
bacteria-friendly range. You are correct in saying that keeping the wort
hot will kill bacteria that happen to slip into your kettle, but
incorrect

in saying that it's okay to delay cooling.

>> In fact, the faster you cool, the more fluffy stuff you'll see. That

>The problem with these terms is that in one instance they indicate a
stage in

>a process and in another/both they indicate physical stuff.

Yes it is a problem, but the meaning, "stage" or "stuff" can be
determined by
context.

>In my experience, somewhere well into the boil, stuff starts coagulating
into

>what looks like egg-drop soup. If this point is the "hot break", I
accept

>the definition but let's call the stuff something else.

I'm afraid we're stuck with the terminology -- it's been used for years and the HBD can't change the whole homebrewing community.

>Similarly, the "cold break"...

Similarly, we can't change the meanings of cold break. If you must, I suggest "hot break trub" and "cold break trub." All due respect to Carl Sagan, but have you tried his IPA? Not nearly enough hops for the style :^).

>I have big troubles understanding how this works or can be as effectively
>utilized with an in-line chiller.

As you mentioned earlier, it requires you to siphon or pump into an intermediate vessel and then siphon or pump into the fermenter. The advantage of a counterflow chiller is that the wort cools much more suddenly which, as Russ mentioned, will give you a better cold break (the stage).

Subject: Haze info from Micah Millspaw

Since there has been a lot of discussion about haze I'll tell what I know. This is a paragraph from a paper I'm working on about a related topic, this info may be somewhat confusing and hopefully thought provoking.

It is known that oxidation plays an important part in the formation of protein haze and that melanoidins function as anti-oxidants and prevent the oxidation of protein. Oxidation also plays an important part in the production of colloidal haze, hence the name "oxidation haze", first coined by Helm. Moreover, the formation of chill haze is also considerably increased by oxidation. Oxidation of melanoidins and reductones will result in a lower content of stable colloids. Unstable colloids promote chill haze and permanent haze in beer. Stable colloids prevent chill haze. Permanent haze is the end product of chill haze. If you get chill haze permanent haze will follow in time . The stability of beer colloids is the result of a very complex equilibrium, and the whole problem of colloidal haze formation is difficult. A better understanding the problem will show it possible to take some steps to limit its effects in the finished beer.

Also I've read George Fix's new book Vienna. I like it because it has vindicated my attempts at the style, when I get the authentic ingredients suggested by Fix (already ordered) I hope to have these beers nailed down. One bad thing though, the book is full of typos, a failing common to all Brewers Publications books and Zymurgy and New Brewer.

Subject: re: John's Monster, brewing w/sugar

Fellow Brewers--

In digest 851 Frank Willis suggests a correlation between the outgassing of foul odors during fermentation and the use of sugar.

I am presently brewing a batch which contains 70% pale malt, 20% dark brown sugar, 10% British crystal, Wyeast 1098, Centennial for the boil and finish. With the exception of the brown sugar this is a routine recipe for me. I've too have heard the caveats regarding the use of sugar but I'm experimenting and I know that it's widely used in English breweries. During the early ferment it smelled strongly of rotten eggs, which I figure is hydrogen sulfide. I've read too many digest to stress and worry, but I must admit the thought of an infection did cross my mind. After seven days in fermentation the beer looks and smells fine. There is a slight residual sulfide smell, but it's definitely tapered off.

So I'm left with the strong impression that this sulfur phenomenon is associated with the brown sugar, since it's the only thing I changed. Comments?

Cheers,
John

Subject: wort chiller, lager/ale

First of all, thank you to the hordes who sent responses to my wort chiller questionnaire. It was definitely a poor idea to post that and go away for three days! So I will post some concrete responses after I get back from going away again. A number of people provided very long and helpful responses, including some specifics about construction. Thanks particularly for those.

The one obvious comment that can be made from scanning quickly through the responses is that immersion coolers are favored overwhelmingly by the HBD and rcb crowd, mostly because of convenience, cost and concern over sanitizing counterflow chillers. I was also pleasantly surprised to see that a number of people were using wort chillers even though they weren't doing all-grain beers. I was also pleased (intimidated) to see how many people were planning on showing up in Milwaukee and will no doubt heckle my talk/demonstration. Oh boy.

Now without getting into too much friction, let me suggest that

there seems to be some stubbornness here. First of all, it's not possible to talk about the difference between ale and lager without discussing yeast. "How the producer achieves the difference" is the yeast, and the way the fermentation is controlled.

I was probably the person who suggested you try drinking ale and lager side by side; I reiterate and continue to protest that that's the only way to learn the distinction. But I'm admittedly stymied by the fact that you don't taste the fruitiness in ales. I guess the real solution is to deal with what you refer to as the "unsophisticated taster" by doing some reading on taste profiles and terminology (the material from the Beer Judge Certification Program is very helpful) and perhaps by attending a beer tasting "class" either at an AHA conference or held by your local club. Beer descriptors aren't necessarily to be taken literally; they are merely the closest means of defining something that is necessarily different in everyone's mouth. The idea of training in a class is to develop a common understanding of when those terms apply.

I also believe it's relatively simple to see the difference with a side-by-side brewing test. Make a very simple beer, all malt and lightly hopped. Pitch a pure ale yeast in half and ferment at 65F; pitch a pure lager yeast in the other half, ferment at 45F, lager for 4 weeks and taste side by side.

From: jpr@gene.com (Jerome Rainey - consult)
Subject: Anderson Valley brewpub visit

I visited the Anderson Valley Brewery in Booneville, California, this Sunday (3/29/92). Here is a review and a description of their brewing process, as described on a tour of the brewery.

The brewpub is excellent, serving their beers (natch) and terrific food. They had all the ingredients for their brews posted on the wall next to the bar. I can provide a list for anyone who's interested.

They store their 2-row pale malt in the 25 K-gal tank out front, and funnel it in for brewing as needed. A batch is either 310 or 620 gallons. Their brew kettles and fermentation vessels are 400 and 900 gallons, for single and double batches, respectively.

They begin mashing at 5 PM, and allow the mash to sit at temperature all night. The next morning, the brewer begins the drain/sparge, which takes about 90 minutes. The sweet wort is transferred to the brew kettle, where it takes about 30 minutes to bring 310 gallons of wort to a boil, using a propane burner that provides 880 KBTU per hour. The hops are added every 30 minutes, and the boil itself lasts 90 minutes. They filter off the whole hops as the wort comes out of the kettle. The wort is cooled with a fancy counter-current heat exchanger and oxygenated with bottled oxygen.

They use Whitbread ale yeast to ferment all their beers. They buy it in 1-kg foil-wrapped blocks, use it for 15-17 generations (5 batches per generation), then buy fresh again. Fermentation takes place in a cool room with freon-jacketed fermenters. They are roughly cylindrical, with cone-shaped bases and a valve at the bottom to drain off the trub/yeast sediment. Primary fermentation is at 65F, then the sediment is drained and a 55F secondary begins. They use blow-off tubes which lead to 5-gallon buckets of bleach water. All four fermenters were going full blast while we were shown around, and one even had thick brown foam surging all over the floor from the blow-off bucket. After the secondary, the beer is chilled to 2F and run through a horizontal-plate diatomaceous earth filter to reduce chill haze. The tour

guide stressed that they do not sterile-filter, which they feel would remove too much color and flavor.

The filtered beer is transferred to a refrigerated room into conditioning and maturation tanks, where it is carbonated under pressure with CO2 tanks. They use a neat device called a "Zahm-meter" (sp?) to test for proper carbonation level. It's a little canister with a pressure gauge on the side that you fill up with beer and then shake for 5 minutes. You check the thermometer and the pressure and compare the readings to a chart to see how well-carbonated the beer is.

The beer for the pub is fed directly from the cold room to the taps upstairs. They bottle using a 1946 vintage 12-head counter-pressure filler, which one of the owners picked up while visiting Milwaukee for a brewing convention. He saw it sitting outside one of the big breweries and bought it for a song. It has allowed them to go from bottling 56 cases per day to a max of 215 cases per day, although they still use a hand labeler, so to label 215 cases takes two more days .

Their beer is distributed to most of CA, and also NC, RI, VA, NH, NY, DC and recently, CO, NV, and WA. They just shipped their first 750 cases to Colorado in a refrigerated truck from...Coors! It had just dropped off a load of Silver Bullet in the Bay Area and took back 26 pallets of Anderson Valley brew. Hmm, I think Colorado got the better deal, somehow.

The gift shop sells t-shirts and stuff, but also a couple of books on brewpubs: "On Tap: The guide to US brewpubs," by Steve Johnson (WBR Publications, Clemson) and "Brewery Adventures in the Wild West," by Jack Erickson (Redbrick Press, Reston, VA). You can also get a copy of "Boontling: An American lingo," by Charles C. Addams (U. of Texas Press). This book will help you figure out what the weird names of AV brews mean. "Boontling" is a peculiar local jargon which the locals have used in the past to confuse outsiders and now use as tourist material. For example, their "Barney Flats" oatmeal stout refers to the Hendy Woods Redwood state park nearby, and "Poleeko Gold" pale ale is named after Philo, the next town down the road ("Poleeko" == Philo in "Boont").

>In HBD 851, Jack Schmidling writes:

>>They can argue all they want but gelatine works like magic. I have never made a batch without secondary fermentation and I never had a clearing problem till I turned to all grain.

>Perhaps there IS a problem with your sparge technique, Jack. I always brew all-grain, and I've never had a haze problem (except for the one time I used Irish Moss, ironically).

You will note that I said nothing about "haze". I said a clearing problem.

Simply put, it takes longer to clear all-grain beer than extract beer. Extract beer clears within a few days in the secondary and all-grain takes up to a month.

> You might, just in the interest of science, try lowering your sparge water temperature on a batch and see if that helps the clarity.

I am not opposed to trying anything, particularly if it makes life easier.

However, from my previous posting it would be suspected that if I lowered the sprage water temp to the recommended 170F, the grain would be only luke warm and it is hard to see how this would help.

>From: kjohnson@argon.berkeley.edu (Ken Johnson)

>I just hooked up the old tap to the keg and beer line to the faucet. After pressurizing the keg, I noticed that my faucet leaks. Does anyone know how to fix a leaky faucet (standard industrial beer dispenser (brass))?

If you are referring to Hoff Stevens, they are easy to take apart and clean or replace the faulty part. It is just a ball in socket affair that is pretty obvious. I had a leaker recently and sadly it was the old brass one.

The newer ones have plastic parts inside and probably never leak.

>From: Fred Condo <CONDOF@CGSVAX.CLAREMONT.EDU>

>This was my first attempt at all-grain brewing. All the books say you need at least 8 to 10 gallons of boiling capacity, but I am limited to my 6-gallon kettle. So, I just compensated by using extra grain. From 10 pounds of Klages malt, I got about 5 1/2 gallons of 1050 wort.

There is no law that says you have to boil it all at once. You can keep adding wort as it boils down and boil a zillion gallons in a 6 gal kettle.

If you boil for the minimum recommended time, you evaporate at least a gallon of liquid. If you don't evaporate any liquid, you are not boiling long enough to extract the hops and do all the other chemistry required of the brew.

>To those extract brewers who are scared of all-grain brewing (as I was), I say: FEAR NOT! It is *MUCH* easier than I thought it would be, and it adds only a couple of hours to the brewing process. I have two batches of all-grain pale ale in the other room happily fermenting away. I can hardly wait to taste and compare with my extract brews!

Congratulations! Welcome to the club of real homebrewers. Let us know how they compare. I suspect you will never go back again. It's a one way street.

>It was an almost magical feeling to see and taste the mash turn from bland and starchy to golden and sweet.

>From: mfetzer@ucsd.edu (The Rider)

> >The section on malting was not necessary.....

>

> That is a strange comment, considering that the poster was looking for > information on doing his own malting.

<I'm speaking of the video in general, as an intro to homebrewing for newbies. Generally, people don't want to start by malting. And since there's no discussion of mashing, there's no point in showing people how to malt.

The intent is not to show people how to do it but to explain what malt is.

By actually making some, what it is, becomes very clear. I have run into a great many brewers who have no idea what is in a can of malt.

>From: korz@ihlpl.att.com

>Personally, I'm not sure if I could tell the difference in a blind tasting of Ales versus Lagers. I'm also not sure if many "experts" could....I don't think even Michael Jackson would be able to tell if it was a Lager or an Ale in a blind tasting.

Thank you. Just for a refresher, although this thread turned into a sales pitch for Wyeast, my original intent was to understand why commercial brewers, who are so terribly cost conscious, would spend so much money to

produce lager when their typical customer could not possibly tell the difference.

The only reasonable answer I picked out of the mess was that refrigerating the process makes it less likely that something will go wrong or change. The rest is pure hype.

>From: UNDERWOOD@INTEL7.intel.com

> Secondly, I tried using hop pellets in my last batch for the first time. As the green slimy foam came to the top of my brew kettle, i skimmed it off. Was this bad?

I suspect you skimmed off most the hops you just put in.

>
> Any chance that these will be made available for public consumption,
> Darryl? Those of us who write our own software or (shudder) calculate
> by hand can use all the help we can get.

George was far more generous with the credit than necessary. I was rereading his article in the Fall 88 Zymurgy about measuring beer color. In that article, there is a graph presented showing the color of a Michelob Dark (MD) as it is gradually diluted with distilled water. MD is known to be 17 SRM. The idea in George's article is that by diluting MD until it matches the color of your beer, you can determine your beer's actual color. Sort of a homemade set of Lovibond cells.

Also, in the article, George comments on the common color prediction algorithm of beer color = grain color * pounds of grain / gallons of beer. He says that this works for very pale beers in the 2-4 SRM range, but becomes dramatically incorrect as the color gets darker.

My approach is to take the grist and determine how big a batch would be required to produce a beer with 2 SRM. Then, take the difference from this volume and the actual batch size and use that to move back on the curve and predict a color.

I ran this on several batches of beer from my logs and it seemed reasonable. Until, however, the beer is darker than MD. A stout that I had made, which was very dark but not completely opaque, came up at about 600 SRM. The fault here is entirely my own since I naively extrapolated the curve in a straight line. Obviously, the curve flattens out dramatically somewhere above 17 SRM. I haven't had the opportunity to look at the data beyond 17 SRM, so I can only advise: Beware the dark side of the curve, Luke.

Subject: Liquid crystal thermometers

I am looking for a source for "stick-on" liquid crystal thermometers for my fermenters (carboys). I have found some aquarium thermometers that cover 70-90 (good to determine when to pitch), but I'd like one that goes lower (down into the lager fermentation range). Has anyone seen such a thing? (At a reasonable price? My aquarium thermometers cost less than \$2 each. I don't really expect to find a wider range for that price, but \$20 would certainly be out of the question.

The normal range of specific gravities for marine aquaria is about 1.
020
to 1.024, so I doubt the hydrometer you saw will have a range useful
for
brewing. I also don't think the thermometer would have a range much
more than 65 to 95 degrees fahrenheit (typical fish-keeping temps).

Subject: Rehydrating Yeast

To: Homebrew Digest
Fm: Jack Schmidling

Another MOMILY bites the dust?

I had routinely rehydrated yeast with a small amount of wort for years but recently switched to water on the advice of "experts". Not one to take advice without a pinch of salt, I tried it and was so impressed with the vigorous foaming of EDME in water that I assumed that the dried product must contain a nutrient and henceforth, rehydrated in water.

In my current life as a yeast culturing microbiologist, I noted that when I started a culture of EDME in water, the cells in a water solution showed no signs of reproduction even 24 hours later, in spite of the successful growth on the petri medium and slant.

I then started a culture in wort and found that at least 50% of the cells were in bud 24 hours later. It was now 48 hrs for the water culture and I was able to find only a few random cells that looked like they might be budding.

I do not know what the logic or reason is for rehydrating in water but it is clear that the time spent in this condition is not producing new yeast and it is hard to believe that yeast treated in this way is somehow capable of producing better beer than yeast that is encouraged to actively reproduce. It's sort of like drinking tea and singing hymns at a bachelor party.

From: Frank Tutzauer <COMFRANK@ubvmsb.cc.buffalo.edu>
Subject: VMS conversion of UNIX files--summary

Well, thanks to everyone who responded to my post about vms conversion of unix files in general and the Cat's Meow II in particular. There were far too many helpful responses for me to respond individually, but I really do appreciate everyone's helpfulness. Just so we'll have it written down in one place, and also because I've noticed a few more people asking how, I'll post this summary of the responses I received.

First, it is possible to get plain ASCII files and uncompressed postscript files. Many kind souls offered to send them to me, but they are also available via ftp from NETLIB@MTHVAX.CS.MIAMI.EDU and from GARBO.UWASA.FI (128.214.87.1). I haven't tried GARBO, but NETLIB has an upper limit on what they'll send you and I must have exceeded it because it chokes when I try to get CAT II (which, afterall, is a pretty big file). I got CAT I a long time ago (in pieces).

Second, some VMS's will recognize a thing called DECOMP which will decompress UNIX files straight away or will put them in a form that they can be UUDECODED. I couldn't get my system to recognize the command (but it's probably my fault).

Third, there is a utility called LZCOMPRESS.SHARE available from OAK.OAKLAND.EDU in the pub/misc/vaxvms directory. There are other vms goodies there too. Also, a range of LZxx utilities are hanging around on DECUS tapes, whatever they are.

Fourth, for Mac users, you can get MacCompress and UUdecode from SUMEX-AIM.STANFORD.EDU.

Finally, COMPRESS_VMS.EXE is available from TUCANA.TUC.NOAO.EDU and from DECWRL. I lost (never had?) the internet for DECWRL, but I think it's something like DECWRL.ENET.DEC.COM. Anyway, COMPRESS_VMS.EXE is the route I went, and I got it from TUCANA. Worked like a charm. Just make sure you set up the symbol:

```
UNCOMPRESS := ${your dir}compress_vms.exe uncompress
```

and make sure that the file you are uncompressing has the extension xx_z, where xx is, I believe, anything as long as it doesn't make the extension illegal. The important part is the _z, or uncompress won't recognize the file.

Again thanks to everyone for making it easier for a VMS user to get along in a UNIX world.

First, let me say I like the idea of the burner setup.

Second, I don't think the fish thermometer/hydrometer will be able to do what you need. Of all the ones I've seen, the temperature scale does not go high enough. I think the highest I've seen is ~ 95 degrees F. Hell, it doesn't need to be any higher, unless you want to have a fish fry without the nice burner apparatus!-)

>enough of a trial!! I had to pour a bit, spoon
>through the strainer to let the wort pass, spoon out the
>spent hops, then start again. The whole process took about
>half an hour!!

Yep, from my experience that's about par for the course for straining hops. As you no doubt noticed, pellet hops break up into myriad hop leaves and powder that clog like nobody's business. Look around for a hop bag--I use a nylon bag in my beers, it keeps the hops all in one place, removes the need for filtering, and despite the fact they don't get to swim through the wort, seems to give me all the bitterness and aroma I want.

>When I finished, the wort in the fermenter looked like
>thick, milky caramel!

This seems perhaps a little odd; I'd never describe any of my wort as "thick, milky caramel." However, you might just be seeing the effect of trub--hot and cold break material that might not have been terribly well filtered given your necessary multiple-step filtration technique. In general, unless you've been given foul, spoiled extract, there's almost nothing you can do wrong in the boiling stage that you'll be able to actually see that soon, so I would advise not worrying.

>Fermentation began vigorously within 24 hrs and is
>continuing still...The wort is STILL a milky-caramel in
>color! Is this normal? Will it clear eventually? If not,
>do I need to rack to a secondary?

Milky colors in fermentation are normal--you've got billions of little living specks of yeast tearing through your wort sugars, and their population can make the beer look kinda milky. I expect it'll clear on you. Racking to a secondary is a good idea if you're concerned about clarity--I always get a decent amount of "extra" yeast to fall out in a secondary--but since your post suggests you'd have to use the same container for secondary and the transfer would make you worry, I'd suggest not bothering. Drink the stuff out of a porcelain mug if clarity bothers you! Let us know how it looks in a week or so; if it still looks like milky caramel (geez, I'm gonna have to go buy a candy bar after this post!), you might want to try racking just to see what

it would do.

Hmm.. Brown sugar? Sulfur smell?

There might be something here.

(In the US at least) Brown sugar is made by adding some molasses back
into
refined white sugar. Lots of molasses has some sulfur compound or other
in
it leftover from the refining process (if it doesn't say `unsulfured'...
).

Perhaps making your own `brown sugar' with what you know to be unsulfured
molasses would ease the stink?

Subject: wort chilling

I asked last week on how to make a wort chiller and got many useful replies. Thanks a lot.

Here is what I did. It took a couple of hours on Saturday, mostly sitting there and thinking too much before I actually decided to bend the copper.

I had 50' of tubing, and used a plant pot to coil it into about a ten inch coil. The coiling went well, and I coiled about three quarters of the copper. I decided to make a smaller, inner coil with the remaining tubing, since the big coil so far was pretty tall. I then realized that I shoulda made the small coil first. Oh well. I used a wine bottle to make the inner coil, and left the bare ends rising out of the pot. The outer coil flexes a lot, like a slinky, but the inner coil is pretty rigid.

I decided I didn't want hose fitting on my kitchen sink, and since the plastic racking tube I had was 3/8" I.D., it fit right on the copper ends. I went to the hardware store and put about four fitting together to go from a sink to a 3/8" hose fitting (\$6), I got two clamps to keep the plastic on the copper(\$1.50), and a short piece of tougher plastic tubing (\$1.40) for the hot outflow. I used it to cool 3.5 gallons of boiling water and it was down to 25C in ten minutes.

So how do I use it on wort? I cool the wort after boiling, and let the cold break settle, right? So do I pitch the yeast starter, wait an hour or so for the settling, and then rack to the carboy? Do I just wait and don't pitch till the wort is in the carboy?

Subject: no-alcohol beer factoids

Some tidbits gleaned from an article on no-alcohol brews in the Monday, March 30, Wall Street Journal, written by Marj Charlier:

- Brewers don't pay federal excise tax on no-alcohol beer, which boosts profit margins by \$18 per barrel.
- The California Highway Patrol recently instructed its officers not to arrest anyone for drinking no-alcohol beers while driving. This, despite language in the state Vehicle Code that says a beverage with any amount of alcohol is considered alcoholic and therefore isn't compatible with driving motor vehicles.
- Domestic no-alcohol brews have 65 to 76 calories.
- The Big 3 employ different processes. Miller cooks Sharp's at a low temperature, thereby avoiding production of alcohol. Anheuser-Busch makes a regular beer and then removes the alcohol. Coors uses a special yeast and brewing process that together produce less alcohol.

Oh, Chris, Chris, Chris, I'm crying... for one, they may give you an exam
before they let you enter the country, and that'll be to spell it.
Deutschland. But worse than that, you'll be sorely disappointed when you
hit that obvious place, the Hofbr*aeu*haus. You'll find no Germans
inside.
Mostly American and Japanese tourists, by the busload, and Italian,
Turkish, what have you waiters. Can you say *touristtrap*?

My recommendation is to hit small pubs in small towns. Sample the local
breweries, you can get Paulaner in all of southern Germany, so try
something local. Be aware that northern German beers are hoppy, bitter.
Southern German malty, sweet. Tons of small breweries in towns are still
independent and brew according to local styles. Try a 'Radler' sometime.
:)

Subject: What kind of hops do I want?

First of all, I want to thank everyone who sent me information about where I can get hop rhizomes from. It turns out a store right here in Ottawa is ordering rhizomes from Washington, and is doing all of the paperwork importing them. So all I need to do now is select a couple of kinds. I figure (being stupid) that I'll only order two - one for bittering, and one for aroma. I use extract kits exclusively (because of time), and I mostly make dark beer (pale ale, bitters, and browns) - is two kinds of hops enough to get by?

What I would like the net to do for me now is help me select the kind of hops I should order. I can get the Alpha acid content and stability of some of the hops from Papazian, but not all, and he does not mention the yield from the different types. I know that the net contains all of this information.

The kinds of rhizomes available are: cascade, centennial, chinook hallertauer, herzbrucker, mount hood, nuggett, perle, tettnanger, williamette, bullion, kent goldings, and northern brewer.

Thanks in advance,
Joel

Subject: What kind of hops do I want?

Subject: Jack's Grain Mill (George Fix)

I have been meaning to do a review of Jack's mill for some time, but have been putting off doing it. It seems that every time I would start the review, Jack would send a post to HBD insulting someone I liked and respected. That plus a heavy workload made procrastination easy. In recent weeks the tone has greatly improved, and in fact his experiments with NA formulations have been quite interesting. Thus I decided to make the time to do the review.

To get to the main point, Jack has built a first rate mill that is worth every penny he is asking for it. The metal work, the heart of any mill, is extremely impressive. When the mill first arrived, the first thing we did was to compare the quality of the crush with that obtained from the commercial mill at the Dallas Brewing. For the record the latter cost between \$5000 and \$6000. There was absolutely no difference between the two.

Shortly after getting the mill, I joined the staff at the Brewers Research and Development Co. (BRD) as a senior consultant. This firm makes brewing equipment and provides technical services for brewpubs and micros. With that job came a 1/2 bbl. BRD prototype to be used as a part of our customer service. Out went my old system including Jack's mill. The new owner of this system bought it primarily to get the mill, and is very happy with it. He promised a review which I will communicate to HBD.

Two very small additional points. Jack has gone overboard with respect to safety. He seems to be very worried he will be sued. (Folks, we have flamed him too often in the past!) This has lead to features in the mill which hurt its throughput, but not the very high quality of the crush. First, as noted in an earlier review, it is underpowered especially considering the quality of the rollers. This is of course easy to fix, and a motor which works in the 900-1200 rpm range seems well suited. Also by stepping up to 1/2 hp, one could start the mill with grains in the hopper. One can not do this with the motor Jack has on the mill.

Second, the pulley driving the rollers is not rigidly attached to the rollers, but rather to a slip disc on the roller shaft. Jack did this obviously with safety in mind. We took the mill to a local machine shop and they extended the screw hole in the pulley through the slip disc, and then threaded it. With this change the pulley could be rigidly attached to the rollers with a hex nut. The throughput went up by a factor of ten after this was done.

Congratulations Jack. You have every right to be proud of your mill.

From:Korz@ihlpl.att.com

>I also assume that the yeast does more than create the alcohol,
>rather the reaction between the alcohol and acid takes in the
>yeast cell wall (George? Help?)

Al, you need very little help from me. Your comments about esters
seemed both accurate and informative. I presented data from HPLC
studies a few years ago in a AHA national meeting which confirms
your comments. This data was published in Vol. 7 of BEER and BREWING.

Micah is right about the typos in the book with my wife. Fortunately
the numerical entries in the recipes are ok, as are the hop calculations.
There is one major screamer in Chapter 3. It occurs at the bottom of page
45.

It reads

$$\frac{6 \frac{1}{3}}{2} = 3 \frac{1}{3} \text{ barrels}$$

It should read

$$\frac{6 \frac{2}{3}}{2} = 3 \frac{1}{3} \text{ gallons}$$

There are a number of mangled words. Contrary to what is seen on page
vii,
Laurie does not execute people for a living. There will be a second
printing
so we would be grateful for any comments and corrections.

From: adw3345@ultb.isc.rit.edu (A.D. Williams)
Subject: Bottle Fermenting Temps

Last Saturday a friend and I brewed some beer, and it's fermenting away in a bucket in the kitchen. Next Saturday we will bottle it and let it ferment some more. Since this is my second batch of beer (everyone say 'ooooh'! :-)) I've still got a few questions:

- 1) What temperature should I store the bottles when the beer is fermenting in them? Last time I put some in the fridge, some in a closet (room temperature). The ones in the fridge tasted better, but on the other hand I made quite a few mistakes with the last batch (boiled for only 15 minutes, put way too much corn sugar in it - 1 and 1/2 cups), so perhaps putting it in the fridge gave it some saving grace.
- 2) Since this was the first time I boiled the mixture for a whole hour, I noticed that at the last fifteen minutes or so, the mixture changed composition and foamed up a bit. Is this the usual thing to happen?

My recipe was simple, 1 can of amber light extract, 3 pounds - 1 cup of light malt extract, and 1/2 ounce of fuggles at 60, 15, and 5 minutes of boil time. I plan to use the 1 cup of malt extract for priming.

Thanks all for any help. This newsgroup is the best thing that happened to my new found hobby!

Derrick

excessive
> trub, nothing.

Being a lazy slug, I usually opt for something which maximizes the
quality/effort ratio. I've almost always done single-step mashes
(cooler with false bottom) and none have had hazes or excessive trub.
I've used pale (English and US), Klages, Wheat, etc... My brew club
seems to think highly of my beers, as do my thirsty neighbors :-)

My brew-partner, steve@asylum.gsfc.nasa.gov, claims to get better
extract efficiency and a quicker clearing of the sparge by doing a
stove-top step-mash, then dumping into the slotted cooler to settle
and sparge. I haven't run the numbers on my own procedure to compare.

I too have been confused and intimidated by the books and the repeated
insistence on step-mashes, but the Simple Mash (TM :-) works well for
me. Just another data point....

> Turkish, what have you waiters. Can you say *touristtrap*?

I stopped in to try the recently opened Mai Bock when I was last
there. An *excellent* beer (I'm a big fan of bocks). My drinking
companion purposefully sat us next to a couple of Bavarians, despite
the empty tables, and we had a fine time. I suppose there were the
usual groups of tourists, but we didn't pay any attention -- talking to
the locals was more fun.

So, relax, don't worry, have a Hofbrau. You're not going to Muenchen
to see the tourists, you're going there to *drink*!

Prost!

I wonder about the durability of these kettles. I bought one
a few months ago. After being used for 4 extract batches,
the finish on the bottom is wearing off and it's starting
to rust. It was washed and dried immediately after use.
I hate to think of what it will look like after a dozen
batches.

Subject: Mash-Tun from hell -- Alpha test

Hi,

Yesterday witnessed both the beginning & end of two eras. First, after 175K miles I took my '76 Capri to the junkyard. This prompted the opening of the MTFH era (after all, I was kind'a bummed out about the Capri & I couldn't go anywhere -- why not brew the blues away?). Yes, yesterday was the alpha test of the mash-tun from hell.

For those of you who haven't been paying attention, the MTFH is a 27.5gal stainless vessel (half a stainless drum) fitted with a 30% open false bottom.

The false bottom was cut from an 18gauge sheet of 1/8" offset perf stainless.

It rests on a big X made of 1/2x1/2x1/8 stainless angle which attaches to the sides of the vessel via four little angle iron 'feet'.

The MTFH is heated by a 4500watt tube heater constructed out of various bits of pipe and an electric water heater element. Mash recirculation is accomplished by a 15gal/min procom pump (like the carbonator pumps Foxx sells). There is a rather impressive bank of valves that allow wort to move in all sorts of different directions. At the moment there isn't much to do with all of those valves, but once the sparge water tank and the boiler are constructed (30gal and 50gal respectively), they will allow the system to be set in place permanently w/o the need for moving hoses, etc.

All in all, the MTFH is sort of a RIMS on steroids with a few extras for convenience.

Yesterday's alpha test recipe was fairly generic (a shock to many who know me!):

- 30lb 6-row pale
- 5lb 40L crystal
- 20oz Hallertau for 60min boil
- 2.5oz Hallertau for 10min
- MeV English Ale & any pediococcus & Brettanomyces from the cask. (I usually make pseudo-lambics in it)

I started with all of the grain and ~10-12gal of water at 110F. In one hour and 10min it was at ~155F (~.6F/min) The temp was held for one hour (a trivial task with that much thermal mass). Sparging took about 1/2 hour and I collected about 18 gal of wort. I probably could have done better but near the end I'd run out of sparge water & was just using hot water. The sparge went *wonderfully* BTW. I probably could have done it a lot quicker if I hadn't kept running out of sparge water.

The gravity wound up being ~1.050. That's about 70% efficiency according to my 'Amazing Wheel of Beer'. Not great, but given the sparge, not bad either. I expect this will improve dramatically on the next run. (read: I'll have my sh*t together next time)

FWIW, I could have fit another 20-30lbs of grain in the MTFH. I don't ever plan on running anything like that but I was having all sorts of really evil pale barley wine ideas... Lets see,

first runnings from 50lbs of pale...

After the sparge I filled everything that didn't leak with wort. I then started a 1hour boil in a bruheat, 5gal pot & 3 gal pot. I wound up running the bruheat and the 5 gal pot once more each to finish off the boil. Each of the boils got a portion of the hops. Upon completion of the boil I put everything in my oak primary. (It was the only thing big enough, besides I didn't want to have a completely normal recipe)

While cleaning the MTFH I noted some scorching on the heating element, but not so much as to discourage future runs. (I don't make really pale ales/lagers anyway) Also, you wouldn't believe the amount of trub that a batch this size produces!

So what possessed me to build such a large brewery? No, I'm not trying to die of scirossis of the liver. In fact, I don't really drink that much (relative) at all. A few pints a week. However, when playing with lambics I need to fill a 15gal cask for each batch. That means I need to **yield** more than 15 gallons. Hence the MTFH was born.

--Mike

Subject: Leinenkugel tours

From: rjj@tngstar.cray.com
Subject: Leinenkugel's tours

Greg Roody wants to know about tours at Leinenkugel's in Chippewa Falls, WI.

First, Greg, notice the spellings of both Leinenkugel's and Chippewa. I know something about them since I work for Cray Research in Eagan, MN and often go to Chippewa Falls where the supercomputers are manufactured. I'm guessing you're with DEC and will be at Cray for the month.

Leinenkugel's is a German name and Chippewa is a bastardized spelling and pronunciation of the Ojibwa Indian tribe.

I took my homebrew group from Red Wing, MN on a tour of the brewery a few years ago and I recall that tours don't start until May. They do, however, have a little hospitality shop there with shirts, etc., but no samples, unfortunately. Call directory assistance for their number (AC 715).

If you get to tour, it is sort of interesting, because, even though they are now part of Miller, they are still kept SMALL. The brewmaster was funny and very charming. I remember crawling over hoses and up steep steps. We saw the whole thing and when done sampled fresh, unpasteurized beers he had put in his office freezer before we toured. Everyone that works in the brewery seems to be happy, short, stout and has a big belly.

Chippewa Falls is NOT cosmopolitan, so don't expect big city thrills. Residents there enjoy the outdoors (hunting, fishing, etc.). There is an interesting park across from the brewery you might like to see. And of course, every bar in town serves Leinie's (reg., light, and Limited).

Oh, and watch out for the one-way streets - they're killers. For more excitement, go to Eau Claire or watch TV.

> producing better beer than yeast that is encouraged to actively reproduce.

> It's sort of like drinking tea and singing hymns at a bachelor party.

maybe some of us bachelors enjoy drinking tea and singing hymns!

i rehydrate my dry yeast in a little bit of warm water in a coffee mug, and stir the thing up with a fork till there's no clumps left. then i dump it into the carboy. total time for process: 2-3 minutes.

i figure it's done to prevent the yeast from clumping up (and not having some of it work).

you might be trying to start your yeast, rather than merely hydrate it!

From: Michael J. Gerard <mjgerard@eng.auburn.edu>
Subject: Mash Water
Full-Name: Michael J. Gerard

I'm brewing my first all grain recipe in a few weeks. We have about 11 pounds of grain (9 of those are pale ale). We are also mashing on an electric stove. One of the books I have suggests that you use at least 2 quarts of water per pound of grist on an electric stove. That comes out to $11 * 0.5 = 5.5$ gallons of water. I usually try to have 7 gallons of wort at the start of the boil (which seems to come out to 5 gallons of beer after boiling and settling, etc.)

My question is will 1.5 gallons of sparge water be enough. I'm used to using something like 3-4 gallons with much less grain.

Any help would be appreciated.

Thanks,

Mike Gerard

From: P_LABRIE@UNHH.UNH.EDU (Paul LaBrie)
Subject: re: U.S. brown sugar and molasses

I was interested in Carl West's comment on U.S. brown sugar -- specifically that some (most?) of it is manufactured by adding molasses back to refined white sugar. This might explain the taste of the last bitter that I had made.

I based an all-grain bitter on some of the recipes from one of Dave Line's books. Not wanting to spend the money for demerara sugar, I went with common brown sugar. The recipe also called for 1/8 of a cup of unsulphured molasses for a 5 gallon batch (I do understand that molasses should be used sparingly) Anyway, the brew came out rather nicely (IMHO) but tasters did observe that it had a distinctive molasses note -- not objectionable but definitely there. The brew did NOT have any sulfur odors or tastes.

S-O-O-O, the question is: Does anyone have any further detail on the composition of U.S. brown sugar? I could obviously just eliminate or reduce the molasses addition, BUT it sure would be nice to know...

Thanks

Subject: clearing problems

You will note that I said nothing about "haze". I said a clearing problem. Simply put, it takes longer to clear all-grain beer than extract beer. Extract beer clears within a few days in the secondary and all-grain takes up to a month.

Your all-grain beer takes up to a month to clear, Jack. Mine takes about a week. And believe it or not, your "clearing problems" are the result of haze. The solution to the clearing problem is to wait for the haze to precipitate out.

>slant.

OK, Jack, let me add my two cents worth. Of course water is not  
a good medium for yeast growth. The only reason I know of for  
rehydrating dried yeast cells in water is that the difference in  
osmotic pressure on the yeast cell walls is kept down, allowing  
more of the cells to rehydrate without bursting (than if you  
rehydrated them in wort). This process may take about 5 or 10  
minutes. Then you immediately put them in a growth medium, such  
as wort.

It is sort of like eating some food and taking some aspirin and  
vitamins before going to the bachelor party. <grin>

From: jpr@gene.com (Jerome Rainey - consult)  
Subject: Anderson Valley brew list - ingredients

Ok, here's the list of Anderson Valley brews and their ingredients as printed on the wall by the bar at the AV brewpub in Booneville, California.

Brew Malts Hops

Poleeko Gold 2-row pale, eroica, nugget, northern  
Light Ale 40L crystal brewer, cascade

Extra Special 2-row pale, 40L nugget, eroica, northern  
Bitter (ESB) crystal, Munich brewer, tettnanger

High Rollers 2-row pale (60%), northern brewer, mount hood  
Wheat Beer Wheat (40%)

Boont Amber 2-row pale, 40L eroica, northern brewer,  
Ale and 80L crystal willamette

Centennial 2-row pale, 40L nugget, eroica, northern brewer  
(Batch #500) and 80L crystal, mount hood  
20L Munich

Deep Enders 2-row pale, 40L nugget, northern brewer,  
Dark Porter and 80L crystal, willamette  
chocolate

Barney Flats 2-row pale, 40L eroica, northern brewer,  
Oatmeal Stout and 80L crystal, cascades  
Munich, chocolate,  
wheat, roasted  
barley, oats

I have tried the Boont amber in bottles (very good!) and the ESB, centennial and oatmeal stout at the pub. So far, I have nothing to complain about. Their beers are clean and malty, and the stout is so good I can hardly believe it. As a matter of fact, I had better try it again to make sure I'm not imagining things.

Cheers,

Subject: hops in nj (sort of)

A friend of mine brought me an article on hops from a magazine called "The Herb Companion." The article is great, but it's too long to post, sorry. Anyway, listed at the end are sources for hop seeds, vines, and cuttings (rhizomes). There's a place in Port Murray, New Jersey listed called the Well-Sweep Herb Farm. I was pretty psyched since I live about a 1/2 hour away from there. I gave them a call and spoke with a very nice but clueless woman who said that they do carry rhizomes for \$6 ea. When I asked what kind they carry she said "the kind that grow in New Jersey." Hmmm. I asked if they were used for brewing and cooking (as opposed to decoration or something) and she said they're excellent for beer. I also asked if she could give me a hint as to what variety they're close to, but she said she didn't know hops (I had figured that part out already).

Does anyone know what types of hops are indigenous to NJ? They sound interesting but are a little (actually a lot) pricey. If you're interested and want to call yourself, the place is:

The missing text "...." specifically mentions Samuel Adams (whose Lager and Ale are both very highly dryhopped) as a \*specific\* example which would be difficult to identify as lager or ale by MJ, due to the high hop nose.

> Thank you. Just for a refresher, although this thread...

> The only reasonable answer I picked out of the mess was that  
refrigerating  
> the process makes it less likely that something will go wrong or  
change. The  
> rest is pure hype.

That and the fact that the industrial brewers appear to go to great lengths to avoid the introduction of flavor in their products. Witness Eckhardt's book that gives the IBU for 1986 Budweiser and (I guess) 1989 Budweiser. A-B lowered it to 12 IBU, which according to Eckhardt, is \*at\* the threshold of human sensitivity to hop bitterness! At this rate they'll be bottling seltzer water by the year 2000 :^).

>I \*do\* pull out my chiller after it's done its job. I then pitch the yeast, stir the wort into a vortex, and let settle for an hour or 2 before transferring to a carboy.

That is an interesting alternative but I do not see the advantage of resuspending the trub by churning it up when you take out the chiller. Somehow I doubt that you will have the same amount of trub after one hour.

>I don't really see why Hot/Cold break "stuff" is better than just Hot/Cold break. Discussions of break time deal only with the stuff produced at that time.

Because there needs to be a distinction between the process state and the trub.

>There's little room for confusion.

Tell me, when does the hot break become the cold break? Clearly, the cold break stuff contains hot break stuff.

>Now I've got a question for you. In your easymash setup, have you ever had any problems with the window screen drain/spigot setup getting clogged with hops/trub when you transfer off to the carboy?

Never! If the mash doesn't get stuck, why on earth would a little hops?

>From: korz@ihlpl.att.com

>Three comments on EASYMASH:

>1. The "screen-around-the-pipe" lauter tun is indeed simple, but I want to again point out that the advantage of a more elaborate system would be better extraction (drawing all the runoff from the center of the tun reduces the amount of sugar you extract from the grains at the sides of the tun). This is not a big deal for beginners, but you may want to mention the trade-offs that you make going with a simple system. It validates why your system is so much simpler -- some are sceptical when you offer "something for nothing."

I am skeptical about your assumption that simple is necessarily less efficient. Visualize the following:

A kettle with 5 inches of mashed grain and six inches of liquid. The grain is totally saturated with the liquid and it does not make any difference at what point the liquid is removed as long as the mash remains submerged in the liquid. Osmotic pressure will always attempt to maintain a balance by diluting the sugar no matter where it is in the kettle.

Just to test my theory, I have thouroughly stirred the spent grain and upon settling again and re-establishing the proper temp, there is no increase in the SG of the runoff. This would indicate that the extraction is homogeneous throughout the mash.

I suspect the reason people believe what you are suggesting is because, again, the experience of a commercial brewery does not extrapolate to the home brewery. Most commercial operations sparge by spraying water on the top of the mash not by covering with water. Spraying seems far less efficient to me than submerging in water and would require capturing the trickle down over the entire bottom area.

>3. "Strike" temperature, is not the temperature of the mash, rather, the temperature of the "hot liquor" (water) before mixing with the milled grains. If you correctly calculate the strike temperature (based upon the mass of the water you will use, mass of the grain you will use and the initial temperature you want your mast to be), upon mashing-in, your mash will be at the correct, pre-calculated, initial temperature and you won't have to add heat unless it is a very long rest or if your mash tun is uninsulated. I think what you meant was: "When the 'saccharification' temperature is reached, reduce the heat and stir occassionally..."

All of the above is totally irrelevant to my process and sounds more like rocket science than EASYMASH. Why on earth would anyone want to or need to go through all that, when he/she can simply heat the mash to any temp desired?

The answer is obviously that you are ignroing the fact that I am mashing in a kettle and you are dumping your stuff in a bucket.

Subject: Rotten Egg Smell

The only times I've ever gotten a rotten egg smell is when I've fermented with more than 75% wheat malt. Once with Red Star Lager (agast!) and once with Wyeast German Ale yeast. The Red Star when on for days this way, finally died out and no trace was left in the bottles. After a couple of months in the bottle this beer to second in best of show out of about 120 enteries. The German Ale yeast had the sulfur smell for about a day and then its gone. Two weeks in the bottle and this beer is smooth clean and wonderful, better than the RS batch.

Just a data point,  
Walter

From: whg@tellab5.tellabs.com (Walter H. Gude)  
Subject: Re: Rehydrating Yeast

In Digest #854, JS comments that after rehydrating his EDME yeast in water he sees no budding in 24 hrs, however in wort he sees budding. I think that the rational for rehydrating in water runs along the following lines.

The yeast after happily growing in their normal aqueous state, are rudely dried into hard little balls. By first rehydrating the yeast in water it allows them to return to a watery state, before being thrown to work in the wort. Its a kinder gentler rehydration, sinse the high gravity wort will compress the bee-jeebers of of the little guys. Sort of the opposite of divers comming up from deep sea diving, they must go through a graudual decompression to keep from getting the bends. Here, the yeast go into relatively low pressure water, and then into the higher pressure wort, in the hopes that more of the little guys will survive the transition unscathed. Momily or not? It's absolutely no more trouble to put it in water for a few minutes so what the h\*ll.

My two cents,  
Walter Gude

From: Frank Tutzauer <COMFRANK@ubvmsb.cc.buffalo.edu>  
Subject: Head color in stouts and porters

As a brewer, I would place myself somewhere in between advanced beginner and beginning intermediate (batch #15 is in the fermenter). Of these 15 batches, I have only brewed 4 stout/porters. Actually, 3 dry stouts and 1 dry porter. Of these 4 brews, 2 had a very creamy white head and two had a dark brown head. Although all of the beers were quite tasty, I am curious as to what causes the difference in the colors of the heads. Since I am currently an extract brewer, I understand that I am somewhat at the mercy of the companies that manufacture my malt extract. Nonetheless, I would like to know what determines the color of my beer's head in stouts and porters, and what I can do to influence that color.

Under the assumption that the head color is determined by ingredients and not process, I looked back over my notes for the 4 beers in question and compiled the following data:

Ingredient	Stout 1	Porter	Stout 2	Stout 3
Extract Syrup	A	--B	C	
Dark DME	3lb	5lb	1lb	--
Flaked Barley	1c	1c	--1c	
Roasted Barley	1lb	--1/2lb	1/2c	
Crystal	--4oz	1/2lb	1/2c	
Black Patent	--1c	1/2lb	1/2c	
Chocolate Malt		-----1/2c		
Quaker Oats		-----3/2c		
Yeast	M&F dry	1084	1084	1084
Priming	3/4c dex	1c amber	1c amber	5/4 c light
Head Color	white	white	brown	brown

Note: DME = dried malt extract (not diastatic malt blah blah blah)--all DME is M&F DME; A = 4lb Muntons Export Stout (hopped); B = 6.6 lbs John Bull dark (unhopped); C = 8 lb Mountmellick Stout (hopped); dex = dextrose; amber = amber DME; light = light DME.

I really don't think that the specialty grains would markedly influence the head color, but still I figured I should consider the possibility. And, looking at the above table, it seems I'm probably correct that they don't: Flaked barley, chocolate malt, and oats all went into one brown beer, but not the other; roasted barley and crystal both went into one white beer, but not the other (and similarly for the yeast and the priming sugar). I suppose

there might be some kind of synergistic effect (e.g., crystal in the presence of roasted barley leads to brown heads but otherwise the head is white), but somehow that seems unlikely to me. So really, the only thing left that might account for the difference is the extract: Mountmellick and John Bull giving brown heads, and Muntons syrup and DME without syrup giving white heads. Is this correct? If so, what in the extracts accounts for the differences? I would really like to know.

And now, on another subject: Looking at the table, you have a pretty good idea of how I've brewed my stouts and porters (ok, you don't know about hops or procedures, but still....). If you have any suggestions, let me know. I'm on a quest to duplicate the many pints of Guinness I had in Dublin a few years ago. It's probably an impossible task, but trying, I'm sure, will make me a better person.

From: Peter Glen Berger <pb1p+@andrew.cmu.edu>  
Subject: Recipe: Mo' Better Bitter

Here's a recipe for a good to great bitter.

3 lbs. M&F Dry light malt extract  
3 lbs. M&F Dry amber  
1.5 lbs. Laaglander dry light  
.5 lbs cracked toasted 2-row malt.  
SMALL SMALL SMALL SMALL SMALL handful of roasted barley.  
1 oz. Galena hops (8% alpha, so 8 HBU) for boil  
1 oz. Fuggles (4% alpha, 4 HBU) for boil  
1/2 oz. Fuggles, finishing  
Wyeast irish ale yeast.

Substitute boiling hops at will, as long as you end up with 12 HBU.  
The roasted barley is to add a hint of "red" color and just a touch of  
flavor; if you despise the taste of roasted barley use chocolate malt  
instead. The toasted barley is essential.

I used Wyeast Irish, but London ale would probably be even better.  
I wish I had dry hopped this batch with an extra 1/2 oz. of Fuggles.

This is assertive and full-bodied, but drinkable by all. Keep the  
fermentation temperature relatively high, around 68-70 degrees  
fahrenheit, as a nice dicetyl is necessary to round this out.

From: Peter Glen Berger <pblp+@andrew.cmu.edu>  
Subject: RECIPE: Goldenflower Ale

This may be the best beer I've ever brewed. It is without question the lightest.

3.5 lbs. Laaglander Dry extra light malt.  
1 lb. really good fragrant clover honey.  
8 grams Galena hops (8% alpha, for boil).  
1/2 oz. Fuggles, DRY HOP ONLY.  
Wyeast American Ale yeast

Boil water, malt, honey, and galena hops. Cool, transfer to fermenter, preferably with blow-off tube, and add started yeast. After krausen subsides, rack to carboy with Fuggles in it, ferment until hydrometer readings stabilize, about 5 days, probably. Bottle. Drink young.

Primary fermentation should be around 68-71 degrees fahrenheit. Secondary should be closer to 61-63.

This is an extremely estery beer ... heavy on the pear and raspberry. If you want to understand the difference between ale and lager, brew this one. It is the epitome of "fruity". The slight hop aroma and very mild bitterness, tied with the lightness of the beer, really allow the esters to shine through; I suspect the honey aided them strongly.

This is the easiest drinking beer I've ever made. Low alcohol, too. make it make it make it make it make it.

Subject: Re: Mail order prices

[Brian Gross' list of mailorder prices deleted]

I'd like to add one place to Bryan's list of suppliers; St. Patrick's of Texas @ (512) 832-9045. I recently started doing business with them and I am now a very satisfied customer. Their prices plugged into Bryan's chart look like this:

Place	Cascade pellets	2-row malt extr.	bulk pale (1 #)	sugar(5#)	wyeast	choc. malt	corn
StPat's	2.80 (3 oz)	.80	1.25/6lb	3.90	1.05	2.70 (3#)	
	6.00 (9 oz) DME	-	8.25/3lb				

St. Pat's packs their 3 oz. hops in airtight plastic containers with screw tops and graduations on the side. This makes it easy to measure partial amounts as well as reseal and store them. Their bulk liquid extract is stored under CO2 and drawn fresh when ordered. It comes in nice clear P.E.T. jars with screw top lids which are quite handy when empty. I recommend adding their catalog to your collection.

From: rossini%biosun2@harvard.harvard.edu (Anthony Rossini)  
Subject: raspberry ale

Does anyone have suggestions for an extract-based raspberry ale (amounts of raspberries, hops, adjunct grains, even a recipe?)? I'm thinking about something like:

5 lbs amber malt syrup  
1-2 pkgs frozen raspberries  
2 oz Cascade hops (boiling)  
1 oz ?? (finishing)  
1/2 lb crystal malt...

for a 5 gallon batch. The primary goal is something like a bitter with raspberry flavor, and maybe even a red-ish tinge.

If I don't care about clearing (the taste is the main important point with me) , is there any problems with pectin in the beer (or should I not add the crushed berries until the wort starts to cool on general principle?)

Advice, ideas welcome, flames (seems like there is still too much intolerance on here -- USE PERSONAL EMAIL, FOLKS! I read the same stuff as the rest of you HBD'ers, and if you are hot under the collar because someone sounds arrogant or annoying, don't tell me, since I don't care) send 'em to /dev/null...

And keep them there.

But about those raspberries... No stout recipes, please. As much as I'm interested in trying CP's Cherries in the Snow or his Rasp Stout, I've got anxious roommates to please (taste-bud and time-wise)...

thanks,  
-tony

Subject: chiller

Something I'd like to add about using an immersion wort chiller: the water that exits the chiller is *\*extremely\** hot. I use it to rinse off my already sanitized stainless spoon, which I then use to gently stir the cooling wort into a vortex.

Someone was confused about the order of chilling/pitching steps. Here's what I do.

- (1) Chill (and stir, as above)
  - (2) Remove chiller when wort is cooled
  - (3) Pitch yeast
  - (4) Stir into vortex again (make sure the spoon (and your arm) is sanitized!
- This is the step most likely to introduce bacteria/mold/etc.)
- (5) Let sit for 1-2 hours
  - (6) Transfer to carboy

Subject: Leinenkugel Tours

I have been on the tour, and the brewery is truly a museum piece - with twisty passages, the aforementioned steep stairways, climbing over pipes and hoses, and wonderful classic huge mysterious pieces of America's Industrial Past going "hiss hiss hiss" as levers move up and down and whirlygigs whirl. Bring your camera, especially if you're into industrial history.

However, the best part of Chippewa Falls must be its bars. All small, friendly, places that treat tourists same as locals, and proudly sell a 10 oz glass of the local product for \$.25. At happy hour it's \$.20! And it is, of course, VERY fresh, so while Leinenkugel's is not exactly a four-star beer, it is one of the better representatives of the American Pale Pilsner Style, so despite my beer-geekdom, I found fresh Leinenkugel's very enjoyable on a hot July afternoon after all those stairs on the brewery tour.

Whoda' thought such an environment would give birth to the world's fastest computers.

Subject: Re: Can Liquid Yeast Pkgs Explode? YES!!!

After several years of reliable performance from Wyeast's packaging, they changed something early in 1992, and a number of people have reported bursting packages. Not only is this a waste of very good yeast, it is a mess. Wyeast's quality control people are said to be VERY concerned, and we all hope they fix this problem soon.

What to do since you can't brew right away: Make a starter, as per the instructions on the Wyeast package or in many books. The Wyeast package is itself a starter, and so you're simply enlarging the starter. This is a good idea even without the fear of bursting, since the quantity of wort in the package gives just barely a high enough pitching rate to insure rapid commencement of fermentation and the protection from infection and worry which that will give you.

Subject: Negative Pressure in the Blow Off

Dear Brewers

First, I want to thank all who responded to my post re: "milky-caramel" appearance to my wort. I'd like to thank in particular Steve Hamburg and Mark Easter for their insights and experience. Thanks all... I'm not worrying... At least I wasn't until this morning...

When I got up this morning to check on how well my wort was clearing - it had progressed to about half way into the wort - I noticed that the blowoff tube had filled with clear water, obviously sucked in from the catch recepticle! (Maybe *\*that's\** why Pap. suggests replacing the blow off tube with a fermentation lock!!)

I suspect that, because of the temperature drop last night - I've got the carboy out on the back porch - the wort condensed a bit and the negative pressure sucked up the chlorinated water in the recepticle. Now, the tube is quite long (about 6' or so), so I suspect that if any of the water did get into the wort, it was minimal.

Still, I replaced the tube with a lock, but now I've got yet another set of questions for the Illuminati:

- 1) Will the small amount of HCl-ated water that was sucked into the wort do any damage?
- 2) Will the exposure to the air (when I switched from the blowoff tube to the lock) effect the wort?
- 3) Is there now a possibility that, having replaced the blowoff with a lock, any further fluxuation in temperature/pressure will suck in (contaminating) air through the lock?

Thanks for the responses

John

Subject: brown sugar & molasses

> ... brown sugar == molasses & cane sugar

well, I for one can taste the difference between beers made with brown sugar and those made with molasses, and beleive me, brown sugar is prefereable, being quite appropriate in an english ale. molasses leaves a much more distinctive taste, very sweet, and objectionable in excess. I've used 2 lbs of brown sugar in a 1.075 OG, 1.020 FG ale before and it was yummy. My brewing partner used 1/4 cup molasses in 4 separate batches - It was quite at home in the english ales, budefinitely a different flavor from brown sugar. It was not at home in a lager. After the 4th batch, we're both sick of molasses. I've also used an entire 16 oz. bottle of molasses before in a 1.088 OG 1.033 FG dark cherry ale, and it worked wonderfully - the residual sweetness balanced the acidic cherries nicely. I was thinking about adding some molasses to make a sweet cherry mead, but I'll stick with brown sugar for the most part, from now on.

Subject: Only nose knows

I read the ongoing thread about ales vs lagers and can't help but wonder how many brewers that have difficulty differentiating subtle aromatic and taste differences in beers are smokers? Most smokers would be hard pressed to identify gross differences in smells between ANY two items (I'm really trying to be nice and general here) much less the subtle differences in beer aromas.

I remember the Mr. Wizard test where he closes a kids eyes and holds thier nose and ask them what they are biting into. When they bite into an onion they think they are biting into an apple. Once he lets the kid smell, the kid immediately knows its an onion. I would suggest a smoker has a partial nose clip on at all times :-).

Subject: forced carbonation

Hello All...

I have a few questions regarding Forced Carbonation. I have gone through past HBD and have downloaded the CO2 chart from the archives so I think I've got somewhat of an idea of the general process. But, there are still a few grey areas...

What I've got so far is this:

Rack to the keg; pressurize to about 30psi and shake real well; lower pressure to that specified on the CO2 chart based on temperature and desired carbonation level.

Now for the questions:

First of all, does the above pretty well describe the process or am I all wet from the get-go?

Is it necessary to chill the beer down as much as possible to aid the CO2 going into solution? If yes, what are the effects when the beer is warmed back up to serving temperature?

After initial pressurization to 30psi, how long is it recommended to keep the beer at that pressure before lowering it to the chart pressure?

Is it sufficient to pressurize the keg and then remove the gas, or should the gas be left on for the entire rest.

After the 30psi pressurization I assume the keg must be vented and then re-pressurized to the chart pressure. After which, how long is the recommended chart pressure rest?

Should the chart pressure rest be done at serving temperature or as cold as possible?

Lastly, (whew!) do you all think that there would be any benefit in connecting the gas line to the \*output\* of the keg so that the gas would have to actually bubble through the beer while pressurizing?

Thanks in advance for any light you all may be able shed on the above...

From: Jacob Galley <gal2@midway.uchicago.edu>  
Subject: Stinks & a question

Walter Gude adds:

>The only times I've ever gotten a rotten egg smell is when I've  
fermented with  
>more than 75% wheat malt. [ . . . ] The German Ale  
>yeast had the sulfur smell for about a day and then its gone. Two weeks  
in the  
>bottle and this beer is smooth clean and wonderful, better than the RS  
batch.

I currently have a Koelsch-esque brew fermenting with a rather stinky  
air about it. That's roughly 15% wheat and German Ale Wyeast. I  
mustered up the courage to taste it, nose held, and it's seems fine.  
I'm not worried. I also used the slurry from the Koelsch for my Fine  
Line Barleywine (aka Sleepout Imperative Stout), and this brew smells  
fine -- good, even.

That reminds me . . .

Said barleywine is based on the Empirical Stout recipe in Meow I  
(sorry, but I don't remember the creator off-hand). This recipe calls  
for a primary ferment using some Ale Wyeast or other, and then, when  
this yeast has passed on (so to speak), a secondary ferment using  
champagne yeast. Does anyone have any comments on this technique? How  
would it work on a mead?

Cheers,  
Jake.

Subject: Using Pale Extracts in Stouts

From: Frank Tutzauer <COMFRANK@ubvmsb.cc.buffalo.edu>

>Since I am currently an  
>extract brewer, I understand that I am somewhat at the mercy of the  
>companies  
>that manufacture my malt extract. Nonetheless, I would like to know  
>what  
>determines the color of my beer's head in stouts and porters, and what I  
>can  
>do to influence that color.

Before I made the move to all grain, I too wanted to have more influence over my beers. Not just head color, but in every respect possible. Short going all grain, there are things one can do.

Try using the palest extract available, regardless of whether you're making a light lager or a stout. Starting from this point, you can then adjust the color and malt character by adding specialty malts (crystal, chocolate, etc.) as desired. Especially in darker brews, the color and flavor contributions of the extract become less significant, giving the extract brewer greater control over the outcome.

From: Kathleen T Moore <ktmg8824@uxa.cso.uiuc.edu>  
Subject: Thermo/Hydro/Micro

Someone wanted to know about a combination thermometer-hydrometer. Well, I use one sold by Crosby & Baker, catalog # 3103. It has a thermometer range of approx. 0-215F and a standard 3-scale hydrometer.

I don't know if C & B sells retail. (I buy the hydrometers for my brewery!)

The price in their wholesale catalog is \$8.10, so you might expect to pay \$15.00 for it at a homebrew shop. Their address is:

Crosby & Baker  
999 Main Road  
P.O. Box 3409  
Westport, Massachusetts 02790

(800) 992-0141  
(508) 636-5154

(Insert standard disclaimer here.)

Since I recieved only one or two responses to my question about brewing microbiology, I will restate it more specifically:

Where can I find, or who can provide me with specific info on detection and identification of beer spoiling organisms? Specifically, I'm interested in preparing selective and differential media for the culture of :

1. *Obesumbacterium proteus*
2. *Escherichia* spp.
3. *Lactobacillus* spp.
4. *Pediococcus* spp.
5. *Acetobacter* spp.
6. *Acetomonas* spp.
7. *Zymomonas* spp.
8. *Aerobacter* spp.

Of course, I am particularly interested with techniques commonly employed by breweries. I have access to incubators and autoclaves, and I also have basic streaking-plating-culturing experience.

Perhaps someone who has attended the Siebel Institute's Course on Microbiology could point me in the right direction or even sell me a copy of their notebooks.

Also, related yeast handling techniques would be appreciated.

Does anyone know the cost of a Difco Manual?

Finally, what exactly is the difference between Hallertau mittelfreuh and

Hallertau hersbrucker? I know the mittelfreuh is regarded as the nobler of the two, but what else? Are mittelfreuchs available to homebrewers in the U.S.? Can we get mittelfreuh rhizomes? Do the suppliers know the difference? Etc.

Perhaps Dr. Farnsworth could help me with my microbio question as I know that he at one time sold culturing equipment to homebrewers.

I'm open to suggestions. I live in a city apartment so I don't need  
compost & I don't own any animals that would normally eat the spent  
grain.

(at least my cat didn't seem interested at the time)

> From: Kathleen T Moore <ktmg8824@uxa.cso.uiuc.edu>  
> Where can I find, or who can provide me with specific info  
> on detection and identification of beer spoiling organisms?  
> Specifically, I'm interested in preparing selective and  
> differential media for the culture of :

.....

two sources come to mind. Bergie's (sp?) Bacteriology and The Yeasts  
by Lodder & Van Rij, or a trained microbiologist. I'd suggest the  
later route if you don't have any training. These texts are not easy  
bed-time reading and are far from a how-to. (as far as I can tell  
an easy how-to doesn't exist)

There are also a number of different kinds of identification kits that  
one can get from places like Roche (sorry, no adress). They are  
essentially tubes of many different media. You take a sample and  
streak it across all of the different media & then observe growth/no  
growth.

You then compare the results to a big chart & hopefully find out what  
you've got. (of course if what your testing is a mixed cultured of stuff  
then you'll probably go crazy trying to match the result up.

> Does anyone know the cost of a Difco Manual?  
Its \$25 from Fischer Scientific. I don't know if the price is better  
(or even if it is available) directly from Difco. I assume it  
must at least be available from Difco. Don't expect this to be a  
how-to of identification. (or even a pointer to a how-to)

>It seems that every time I would start the review, Jack would send a post to HBD insulting someone I liked and respected.

What goes around, comes around. I appreciate your tolerance.

>Jack has gone overboard with respect to safety....

>Also by stepping up to 1/2 hp, one could start the mill with grains in the hopper.

I have been told that as little as 1/6 hp will do the trick. I put the 1/2 hp motor from my belt sander on one and it scared the hell out of me.

>Second, the pulley driving the rollers is not rigidly attached to the rollers, but rather to a slip disc on the roller shaft. Jack did this obviously with safety in mind.

Actually, I did it because I am unable to get the pulley with a 3/8" bore and use a 1/2 to 3/8 bushing. I should have drilled it out but it did not slip when I checked it out. I will in the future drill it out so the set screw seats on the flat ground on the end of the shaft.

>Congratulations Jack. You have every right to be proud of your mill.

I am even more proud when the kudos come from someone as highly esteemed as you.

For the record, I am just about out of the surplus rollers that started this whole business. I have found a vendor willing to make a look alike for a reasonable price. The good news is the MALTMILL is here to stay, the bad news is the price will go up. Not quite sure how much but I will hold the price till May.

From: Bob Hettmansperger <Bob\_Hettmansperger@klondike.bellcore.com>

Subject: Strike two

Strike two

Alas, I have not had much luck with my last two batches (both Pale Ales)

. At the most recent homebrewing club tasting, it was suggested to me that my problems might be due to DMS and/or/from(?) high fermentation temperature.

According to Miller, high fermentation temps (and excess trub) can lead to fusals, and DMS can be caused by infection.

The infection part, I can address by being more anal - looks like it might be back to the bottle scrubber instead of the dishwasher next time.

The temperature part is tougher. Even though I think my apartment stays about 68 degrees, I live above a pizza shop, and when they fire up the ovens during the day, the temperature in my apartment probably rises (free heat, but at what price...). So, until I begin my search for a new place to live that has a nice, cool basement, does anyone have any suggestions about what I might be able to do? Does anyone have experience with yeasts that work well at higher temperatures?

Also, does anyone have any good descriptions for what fusals and DMS taste like?  
Thanks,

-Bob Hettmansperger

From: PEPKE@SCRI1.SCRI.FSU.EDU (Eric Pepke)  
Subject: Re: Raspberry Ale

Anthony Rossini asks about raspberry ale and proposes this recipe:

5 lbs amber malt syrup  
1-2 pkgs frozen raspberries  
2 oz Cascade hops (boiling)  
1 oz ?? (finishing)  
1/2 lb crystal malt...

It seems to me that the amount of raspberries is much too small. I find that, when making raspberry wheat beers, you need to add at least the equivalent of four pounds of fresh raspberries to get a slight raspberry aroma and need to add something like six to eight pounds to get any real raspberry flavor. That's without much hops to compete with.

In re. pectin, a more important reason not to add the raspberries to the hot wort is that the heat tends to extract bitterness from the seeds. I always put the raspberry pulp in at the secondary fermentation. Even then you do get some bitterness from the seeds.

The other thing is that my raspberry beers have all REALLY REALLY benefited from cold conditioning for a period of time. Some bottles I even stuck in the freezer and let become slushy!

From: michael@frank.polymer.uakron.edu (Micheal Yandrasits)  
Subject: re:raspberry ale

Here's my 2 cents on Tony Rossini's query about raspberry ale. I just recently made such a beer. First, 1-2 pkgs of frozen raspberries will not be enough.

I used about 8 lbs (11 12oz pkgs) and it turned out wonderfully, not at all overly raspberry-like. I blended them with just enough water to make a slurry and added it to the cooled wort (seeds, skins and all). I also added 2 camden tablets to ward off infection. It seems to have worked. No pectin haze at all. I racked into a secondary and left most of the raspberry sludge behind. Here's the rest of the recipe:

2 Cans Alexanders pale malt extract  
2lbs rice syrup extract  
1 oz Cascades  
8 lbs Frozen Raspberries  
Edme ale yeast

This beer has a very nice mild raspberry flavor, aroma, and color but the beer character is not lost either. Sounds like what your looking for.

From: eisen@kopf.HQ.Ileaf.COM (Carl West)  
Subject: mead honey recommendation

I don't know about specific honeys but as a general rule:

You should use honey that you want your mead to taste like.  
If you like the taste of orange blossom honey, you'll probably  
like the taste of mead made from it.

(helpful huh?)

Another general rule:

The darker the honey, the longer it will take an aged mead to  
mature. (short meads are a whole n'other animal)

Date: Fri, 03 Apr 92 10:09:50 PST  
From: bryan@tekgen.bv.tek.com  
Subject: Raspberry Ale

>>Does anyone have suggestions for an extract-based raspberry ale  
(amounts of  
>>raspberries, hops, adjunct grains, even a recipe?)? I'm thinking about  
>>something like:  
>> 5 lbs amber malt syrup  
>> 1-2 pkgs frozen raspberries

I use a minimum of 2# of raspberries. To maximize the raspberry taste I  
do not  
put them in the boil. Leave 1/2 gallon or so of space in the carboy, then  
after the fermentation has started, maybe 1 to 3 days, simmer the  
raspberries  
in some water to sanitize, let it cool some and add it to the fermenting  
wort.  
Usually the simmering does some boiling, but I don't worry.

Date: Fri, 3 Apr 92 13:41:07 EST  
From: sterling@bilbo.umcs.maine.edu (Sterling Udell)  
Subject: AHA Conference Get-together, thermo/hydrometers

I think getting the HBD attendees together during the AHA conference in June is a great idea. The first place that comes to mind is the Water Street Brewery, Milwaukee's only brewpub (to the best of my knowledge). That might be pretty crowded the days of the conference, though. Another possibility might be a bar called Zirkrone's (sp?), on the south side - it's a very German place, with an excellent selection of bottled beers and a copy of the Reinheitsgebot posted on the wall. Obviously, there are other bars in the city that would be enjoyable for homebrewers as well.

There is some appeal to finding a non-bar location as well, but that would probably depend on a local volunteering his domicile. Any Milwaukee residents on the digest here? Whaddaya think?

Also, a quick followup to the thermo/hydrometer thread . . . Some respondents have pointed out that the temperature range for aquariums is not the same as that for brewing, and hence the thermo/hydrometer would not be terribly useful. I maintain that the temperatures where I care about a hydrometer reading (in the 60-80 degF range) would probably be covered by the thermometer, so I think one of these might be convenient anyway. If I buy one, I'll give a report on its use. I've never seen them in the Crosby & Baker catalog, though.

From: adiron!Scott.Barrett@uunet.UU.NET (adiron!scott@uunet.uu.net)  
Subject: Mead advice (sought)

Dear HBD Brewers,

After a dozen extract-based batches of various beer styles, I find myself tempted to try my hand at mead making. Rather than being straightforward about

it and making a 5 gallon batch, I would like to split the batch after primary fermentation into a mead, a metheglin, and a fruit mead (hyppocras?).

My hope/plan is to begin a 5 gallon batch of mead, perform primary fermentation in a carboy, and then rack into gallon bottles containing appropriate infusions of herbs and/or pasteurized fruit for secondary fermentation.

I've read a couple of articles on mead making in Zymurgy and TCJOHB and another small book on mead. But I still have several questions for this august group.

1) Are there pitfalls (other than sanitation) associated with adding fermentables (in the fruit case) at the time I rack to the secondary fermenter?

2) Any suggestions on herbs or spices (and appropriate quantities) that may make for an interesting metheglin? Should I prepare an infusion (like making tea) or use a dry-hopping approach?

3) What are recommended types of yeast for mead making? Any tips on adjusting the amount of honey (to achieve a medium sweetness) when using champagne vs. ale (or other) yeast?

4) Am I totally crazy with this batch-splitting plan?

Any and all enlightenment will be greatly appreciated.

Yours in brewing,  
Scott Barrett

From: NCDSTEST@NSSDCA.GSFC.NASA.GOV

Subject: big chillers, line constrictions

A question for the larger brewers out there (1BBL brewlength). What size is the outlet grant on your kettle. How long does the chilling require? I ask because I intend to take a 1" or larger outlet and divide it into several 3/8" copper lines to chill in parallel (Mike Zenters idea, thanks Mike). Any experience as to geometries and sizing of the manifolds would be appreciated. One thing to remember is that a 1" outlet with ball valve only gives about 1/2 to 3/4" effective throughput due to ball valve construction. If anyone is chilling in parallel, how long are the runs and what is the diameter of the chilling lines. Thanks in advance.

I've used my enameled canning kettle for about 10 batches so far. I got it from a flea market so I'm sure it has seen much more use than that. There were a few chipped places in the enamel when I got it but it has not gotten worse. My only complaint is that the handles are too weak to lift the full kettle. I usually siphon stuff in and out so it's not a big concern.

Subject: Re: Y'all come from Micah Millspaw

Well, Micah's suggestion prompts me to drop an idea I've been wondering about, but haven't had the chance to think through yet. One great pastime in Milwaukee is the tailgate party, an event often raised to an art form by many of its participants. During the summer it's a fun way to start off an evening at the ballpark, while offering a pleasant opportunity to be outside (albeit surrounded by asphalt), enjoy bratwurst in beer sauce, and of course sip some homebrew. And what visit to Milwaukee would be complete without a chance to watch some famous Brewers?

So my idea is to have a tailgate party get-together one evening of the AHA conference. The Brewers are in town the evenings of June 9th and 10th against Oakland. Since the evening of the 10th is the opening reception of the conference, I think the 9th would be better. Beer consumption is allowed in the County Stadium parking lots (though the best you'll see inside the park is Leinenkugel's).

Tailgate parties often continue long past the start of the game, so folks who are not baseball fans should not be shy about coming - you don't have to actually attend the game to enjoy yourself. And of course many good parties have enough momentum to resume right where they left off once the game has ended...

Consider this a proposal I'm sending out to gauge interest in such an event. If enough folks would enjoy this type of outing, I'd be happy to head up an effort to put it together (I live in the Milwaukee area). Of course, if most people would rather not meet at the ballgame, but still want to meet somewhere else, I could probably help arrange that instead.

Let me know!

Tom

From: Conn Copas <C.V.Copas@loughborough.ac.uk>  
Subject: Brown sugar vs molasses

A small point, but important perhaps. If your brown sugar flows freely, then it is probably white sugar with caramel colouring added. Pick the sticky stuff - I use 1 lb dark muscovado to add interest to old ales without thinning the brew out too much. Molasses or treacle are useful sources of unfermentables, but I have trouble finding a place for that sort of taste sensation in any brew. I can only presume that dark sugars are a step along the refinement continuum.

The usual answer, from my reading on the subject, is that it is  
much easier to make lagers with no taste and no aftertaste than  
it is ales. This was certainly true some years ago, and whether  
it is true any more, with newer techniques, I can not say.

From: "ACAD3A::FTHAT" <FTHAT%ALASKA.BITNET@CORNELLC.cit.cornell.edu>

**Subject: Priming with Molasses**

Last week I bottled an Imperial Stout. I primed with 2/3 to 3/4 of a cup of black-strap molasses. I opened a bottle last night to see how it was coming. It was the most highly carbonated beer I have ever opened. Now I'm beginning to wonder if the wimpy bottles I used will explode. (Not worrying -- yet.) The batch was 6 gallons and should qualify as a barley wine. I used 12 lbs of liquid malt extract, 1 lb of dry malt extract, and about 1.5 lb partial mash of specialty grains. Being lazy I did not measure initial and terminal specific gravity. I used an attenuative yeast for 1 week primary @ 70 degrees F and 1 week secondary @ 64 degrees F. Fermentation appeared to be over. The beer tastes strong and immature but not sweet.

Does anyone have experience/advice regarding priming with molasses?

Heidi

Fm: Jack Schmidling

The following exchange indicates that I seem to have forgotten to put on  
my  
dancing shoes again....

>From: matth@bedford.progress.COM

> Fred Condo Sez:

> That he just switched to all grain from extract and felt it was a  
painless process

>In reply to this, Arf Sez:

> "Congratulations! Welcome to the club of real homebrewers."

> To This I say:

> Jack, your attitude bit is stuck. Just because someone doesn't do  
all  
grain doesn't mean they aren't "real" homebrewers.

I received several similar letters from readers and don't know whether  
to  
laugh or cry. For the record, I did not intend to insult anyone but if  
congratulating someone constitutes an insult, there is little hope for  
any  
meaningful dialog.

> It's like a 'C' programmer telling an ADA programmer 'You're not a  
real  
programmer because you don't use C'.

Not even close. It is more like the difference between baking with cake  
mixes and baking from scratch. Women/cooks accept the difference, why  
can't  
homebrewers?

>Many people don't have the time, money, or desire to go all grain.  
(Right  
now I don't have the time, and it \*is\* more time consuming).

> Enough said.

Not enough at all. Vote the county dry and move out of town?

You can not negate the value and effort of people who DO devote "the  
time,  
money or desire to go all grain" simply by declaring that YOU don't have  
the  
time, anymore than my statement reduces the value of what you are doing.

Although the definition of a "real homebrewer" might be subject to debate, I don't think there can be much debate about the fact that making extract beer is NOT really brewing. That's not to say it isn't fun, rewarding and great beer, just that mashing is a fundamental step in the brewing process, without which, one is simply making beer.

>From: Bob Jones <BJONES@NOVA.llnl.gov>

From: darrylri@microsoft.com  
Subject: re: Why Lager?

Although a number of folks have advanced the idea that lagering was created as a means to a watery, tasteless beer, that is putting the cart before the horse. Lagering was discovered at least a thousand years ago, as a means of providing beer during the summer months when it was just too warm to make any drinkable beer. These beers were crisper and cleaner in character, and although it took a lot longer to make them, they were held in high esteem.

As you'll find out in much greater detail in the Fix's book "Vienna", big time lagering came into being in the 1840s, and quickly spread around the world. (After all, it was the brewers' dogged determination to make a lager in warm San Francisco in the 1850s that gave us Ste ...uh, California Common beer.)

The neat thing about these beers is that they had a shelf life. They could be transported great distances, to other markets, and the brewery could expand its range beyond the distance a dray cart could move in a day. In reading "Breweries of the Pacific Northwest" I was struck by how the big breweries in the area (Blitz-Weinhard, Olympia, and Rainier) pretty much started out exporting down the coast and even to Asia and Central America. Look at Will Anderson's "From Beer to Eternity" and notice the old ads, which guarantee the beer not to sour. This was the boon of lagering. It is what allowed a single brewer to produce essentially one style of beer and market it all over the world.

So, although there are fruity lagers and clean ales available, it is the period of storage that allows the beer to become a completely stable product that makes it worthwhile to the big brewers. There is a large pull in this, making it economically better for the brewery with designs to brew it.

Subject: Extract Brewing

<Warning: This is a bit long.>

In the last HBD, Jack "Controversial- me?" Schmidling said:

You can not negate the value and effort of people who DO devote "the time, money or desire to go all grain" simply by declaring that YOU don't have the time, anymore than my statement reduces the value of what you are doing.

Although the definition of a "real homebrewer" might be subject to debate, I don't think there can be much debate about the fact that making extract beer is NOT really brewing. That's not to say it isn't fun, rewarding and great beer, just that mashing is a fundamental step in the brewing process, without which, one is simply making beer.

As there is no formal definition of "homebrewer" that I know of that gets into the complexities of the style, I would say that there can be debate on the issue until our fingers turn blue.

I would say that extract homebrewing IS real homebrewing. You might be removing a step, but your comparison (not quoted above) between mash/extract brewing and scratch/box baking is not valid. When I extract, I experiment with a variety of specialty grains, adjuncts, and other bits and pieces that show I am not altering a preset recipe (unlike someone who cooks from a box).

Then again, the above-quoted statement contradicts itself. At one point it is saying that you cannot be a homebrewer unless you mash. Then he turns around and says that if one does not mash, then "one is simply making beer."

Excuse me? If you are making beer then aren't you a "homebrewer?"

But Jack's basic premise rests on "work." He has this ill-conceived notion that the more steps you add in your process, the more of a homebrewer you are.

Well, let's take this to its logical conclusion. Jack, do you grow all your own hops? Your grain? Do you culture all your yeast? Do you process all the water that you use? After all, you'll be in direct control of all

the factors that determine the quality of the ingredients as well as their ultimate taste. How can you be a homebrewer unless you can control all of these factors as well?

And what if one adds adjuncts? Since a mash is just a step in getting the sugars, then is one not a "real" homebrewer if he/she does not grow the corn/cane/beet sugar his/herself? The same is with honey or any other type of sugar.

Are you then "less" of a homebrewer if you do not bottle but switch to kegging?

This kind of reasoning does not cut it. If you use this method of determination then you must take it to its logical conclusion or else you risk being a hypocrite yourself. Obviously it is flawed in its simplicity as it ignores the fact that there are people who do not go through these steps, yet brew their own beer (hence "homebrewer.")

Is there a dividing line? I met someone on the Brew Free or Die trip that takes cans of hopped extract, boils it, and adds yeast later. He is not working as hard as I am, but he is learning. And he is a homebrewer. Maybe, to please people like Jack, we need to say that there is a level of "apprentice" brewers, "journeymen" brewers (extract/grains) and "master" brewers (mash). While this ignores some steps, it might be a better solution.

Thing of it is, though, is that there is an arrogance about Jack's statements.

Jack's statements indicate that he has achieved "satori" so to speak and that he is on the uppermost level possible so far as homebrewing is concerned (at least in his eyes). Now Jack, it seems safe to say that you are older than I and that you have considerably more experience than I do at homebrewing. That, to me, means that you are a homebrewer who has more experience and is most likely much better than I.

But you cannot justifiably belittle my efforts. I use extract and I learn. I experiment and make beer. Fact of the matter is that I spend considerable amounts of time and effort at home making my own beer. To me, that is enough to get on my feet and say "I am a homebrewer, as real as real can be."

From: Mark J. Easter <eastern@ccmail.orst.edu>  
Subject: Raspberry beer, plus 'Beer King' article

I've been interested in making a raspberry beer as well, but was thinking about substituting a couple of cans of frozen concentrated raspberry juice rather than the 6-8 lbs of fruit that most recipes call for. Has anybody tried it? Several companies market the stuff, most prominently Welch's. After checking out the prices for frozen raspberries, this seemed to offer a good cost savings.

And now for something completely different...pardon me if this has already been posted however I read an interesting article in "Outside" magazine (April, 1992) about Alan Eames (a.k.a. the beer king) and his travels around the world investigating indigenous beer styles. It is pretty interesting and fairly well written although they make a few technical boo-boo's (such as describing beer made of "roasted hops and barley").

Cheers,

Subject: Grain disposal

Date: Fri, 3 Apr 92 14:39:57 MST  
From: Eric Mintz <ericm@bach.ftcollinsco.NCR.COM>  
Subject: spent grain disposal

Eric Mintz asks:

> I haven't had the huevos to try this myself yet but... has anyone  
dumped  
> their spent grains in a kitchen sink garbage disposal?

Dumping spent grains (or anything organic for that matter) down the disposal is ecologically unsound if your waste water ends up in body of water which is not in the best of health (in my case, the Chesapeake Bay). What happens is that the waste that gets into the water introduces an overabundance of nutrients. That might not sound so bad, but the nutrients are ground so fine that they are usable only by microscopic organisms, which reproduce more than they should and leech out much of the dissolved oxygen in the water. Big critters like fish, oysters, and crabs suffer as a result.

Besides, you don't really feel like forcing ten pounds of grain into such a small opening, do you? Sounds messier than bags.

> Any other  
> creative ways to dump spent grains without a mess?

I compost my excess grains and/or mulch with them; it works well, but not everybody has a backyard to use for this. A very "creative" idea for getting rid of the grains was suggested by Jack S. and others: make beer bread! There was a thread on that topic recently; Jack can probably give you details.

Good luck,  
Jim Buchman

>  
> 1) Are there pitfalls (other than sanitation) associated with adding >fermentables (in the fruit case) at the time I rack to the secondary fermenter?

No, I did not have any problems at all.

> 2) Any suggestions on herbs or spices (and appropriate quantities) >that may make for an interesting metheglin? Should I prepare an infusion (like  
>making tea) or use a dry-hopping approach?

I used cranberries and really liked the results alot. Also tried hops and misc. spices and was not too thrilled with that (but that's me). My preference is to sparkling fruit meads.

> 3) What are recommended types of yeast for mead making? Any tips on >adjusting the amount of honey (to achieve a medium sweetness) when using >champagne vs. ale (or other) yeast?

Stick with champagne to start with. You'd need a good ale yeast to expect it to tolerate the alcohol levels that mead is supposed to have (if you go by classic definitions). I guess it would not be mead then but I don't know what you would call it (mead cooler?). Off track but isn't beer with the alcohol removed just a malt beverage and no longer beer? How are companies advertising their non-alcoholic brews?

> 4) Am I totally crazy with this batch-splitting plan?

\*I\* don't think you are, but maybe I'm crazy! :-)

1) Will the small amount of HCl-ated water that was sucked into the wort do any damage?

Eh, how much bleach did you have in that water? If it was a normal disinfecting strength solution you've got nothing to worry about...

2) Will the exposure to the air (when I switched from the blowoff tube to the lock) effect the wort?

Not at all.

3) Is there now a possibility that, having replaced the blowoff with a lock, any further fluxuation in temperature/pressure will suck in (contaminating) air through the lock?

If you're very worried about that, or if you have large temperature fluctuations, put Vodka or better yet grain alcohol into the air lock. If it gets sucked in, you get a bit of extra kick in the beer. \*grin\* But, I don't really think it's a good idea to keep the stuff where the temp. fluctuates too much. I've no idea what max/min temps you're talking about, but beware that ale yeast goes to sleep around 60-65F, and at 80F you're making fruit punch and not beer any more. I suggest a nice insulation wrap, cut off jacket for a water heater works great and is cheap.

From: Dances with Workstations <buchman@marva1.ENET.dec.com>  
Subject: RE: Homebrew Digest #857 (April 06, 1992)

Hi Jack,

I would like to respectfully differ with your definition of a "brewer" as (necessarily) one who mashes the grain rather than using extracts.

> It is more like the difference between baking with cake  
> mixes and baking from scratch. Women/cooks accept the difference, why  
can't  
> homebrewers?

This is a very good analogy, since both involve producing a food product from grain; but I would propose that the person baking a cake from "scratch" is much more like an extract brewer. Malt extract is our "flour". Whole grain brewers are people who grind their own flour before beginning to bake. Both of these people are obviously baking. My extract beers are brewed by following fairly complex procedures to control parameters for bitterness, strength, flavor, color, aroma, and other factors; it is much more complex a process than baking a cake from mix. And some of my recipes include a pound or two of specialty grains.

A cake mix person would be like the brewer who buys one of those gizmos where all you do is add the appropriate amount of water, put it in a dark place, and drink your beer three weeks later. Such kits were described in the digest last year, though I've never seen one. Even this person is "brewing".

> Although the definition of a "real homebrewer" might be subject to  
debate, I  
> don't think there can be much debate about the fact that making extract  
beer  
> is NOT really brewing.

There can be plenty of debate. What is "brewing", after all? It is producing beer, an alcoholic beverage, from fermentable ingredients in a controlled fashion. The first half of Papazian's book discusses brewing from extract. It ain't called The Complete Joy of Home Beer-Making.

> That's not to say it isn't fun, rewarding and great  
> beer, just that mashing is a fundamental step in the brewing process,  
without  
> which, one is simply making beer.

Why draw the line at mashing? Granted that it gives you control of more factors and is greatly rewarding, and I'm looking forward to my first full mash brew. But malting is even more fundamental to the brewing process. Shouldn't real brewers also malt?

And what about keggering? It can be argued that you're not really brewing in the traditional sense if you then condition your product in bottles. I've heard it said on the digest that "it isn't really Guinness unless it's on draft [in Ireland]" (that was before Guinness Draught in cans).

You can draw the line in a lot of places; but what I've always liked about this digest is that people seldom do. We all brew, and we all love to talk about it. It's great to be able to exchange views with the likes of George Fix and Charlie P. in this kind of forum.

(but this does open the possibility of a deluge of slogans along the "REAL men" or "REAL" programmers line. e.g., "REAL brewers don't use starters. If the yeast doesn't like my beer, it doesn't deserve it." "REAL brewers don't use hops pellets. How can you tell it from turtle food?)

From: Rob Nelson <70206.1316@compuserve.com>  
Subject: Malt in Garbage Disposal

There was a question recently about putting spent grain down the garbage disposal. I've done it several times without any trouble. I just dump them into a pile in the sink, turn on the cold water until the sink is almost full. Then I direct a forceful stream of water from the sprayer down the hole. It takes about a minute to grind it up.

Do NOT try this with spent hop flowers. I jammed up the old In-Sink-erater but good once. Had to use the little wrench thingy and a broom handle to free the blades. Then, I had to scoop out the goo. Not a pretty sight.

Subject: Re: Meeting in Milwaukee

Hi brewers,

I'm from Milwaukee. First to answer a couple of questions. There is more than one brewpub in Milwaukee, i believe. I will try (when I'm at hoem) to get some addresses for you and post them. you may want to tour two of our local micros as well, I'll post them also for convienience.

On the Brewers idea, I'm not a fan of baseball, but i could show up for the tailgate part (is there a cost to simply get into the parking lot?).

I would like to meet you all, but my friends and I cannot afford to pay the price of the conference (poor grad. students).

Now for the real point of the post. A place to meet. Although the beer selection is limited (Hacker Schorr (sp?) Culmbacher are about the best) the college union is sure to be a low key atmosphere. you can pretty much rest assured we'd find each other. The low key atmosphere and ability to hold conversation over the noise level is the only reason i suggest it.

Barry's Waterstreet Pump is also pretty low key and has a better beer selection. Von Trier has the best german beer collection I know of. These may be easier to find. Von Trier is sure to be crowded and noisy howver.

Maybe some Milwaukee brewers can E-mail me, we can toss a few selections around and some ideas and post a place since we know where the bars are and what they serve. Please, write to me, There a couple of other brewers here with me and we can get quite a debate going over E-mail to decide. This way, everyone who has never been to Milwaukee won't have to shuffle through the debate.

Also, any requests in terms of, well any requests, send 'em. Not trying to exclude, just trying to get the ball rolling!

Subject: Urubamba/Chicha beer

In the most recent issue of ALL ABOUT BEER (May 1992), there was an article called "The Brewsters of Urubamba" by Alan D. Eames. The article focused on a beer called "Chicha". Is there anyone out there who can supply more info about the beer, particularly what type of corn was used, what type of yeast is employed and anything else about extra ingredients? Please do not repeat the article. I am looking for more info about this beer OTHER than what appeared in the article. Please send any responses by private email. Thanks ahead of time.

Subject: raspberry ale

Thanks to everyone for the suggestions, recipes, and comments. You all know

who you are! I was going to post the recipe I'm going to use in brewing tomorrow, but I think I'll wait until I taste the result. Plans include 24oz

raspberries right after the boil, and 24oz in the secondary. The one question I have is how should I prepare the raspberries for the secondary?

Granted, there is a bit less chance of infection at this point, but still...

Do people just risk the infection and dump in the fruit, or do they steam the fruit first? (I'd assume this might kill off nasties without creating too much jelly...).

If anyone is interested in the information I got, email me and I'll compile the lot and send them; since some have been posted here, I see no need to waste bandwidth...

thanks again,  
-tony

Subject: smoking/beer-tasting

Bob Jones asks about being a smoker and a beer taster.

I used to smoke (quit in sept 90 after 16 years). One of the reasons I quit was that I entered a beer in the `88 nationals and got terrible reviews. After receiving the judging forms, I pulled out a refridgerated bottle of the same beer and tried to identify the flavors/smells etc. I couldn't. At the time, I figured that it could be the fact that was a smoker. In retrospect, I think it was 60% smoke and 40% inexperience. I am still learning a lot (who says "when I stop learning, bury me?") but quitting smoking has made tasting a much more enjoyable and intense experience.

Subject: Re: Meeting in Milwaukee

Since those of us attending the AHA conference will be at the Mark Plaza, Downtown, I'd suggest the Water Street Brewpub as a HBD meeting place. It's not far out of the way from the Mark Plaza, and it's also not too far from Marquette University's environs. Furthermore, its easy to find even by strangers to Milwaukee. Best of all, it's an actual brewpub, (albeit extract) which like all good brewpubs has hits and misses, but their hits can be excellent. Food is great, and not terribly costly.

Subject: re:view on brewing

I almost hate to stoop to flaming Jack S, but ...

Brewing (according to Funk & Wagnalls) is the process of making fermented undistilled liquids, as beer or ale.

It is the fermentation process which determines if you are brewing, not the process up to the point of fermentation. In fact, one may argue that producing NA beer may not be brewing. As I read the laws in Canada, they relate to alcoholic beverages - which dictate what I can or can not do with my product. Non-Alcoholic beverages fall under different legislation which are much more relaxed than for alcoholic beverages.

As for the mashing, etc. Jack should maybe talk to the Wine Industry and inform them that they are not "BREWING."

Keep your hops on straight!

Date: Tue, 7 Apr 1992 11:12:43 -0500 (CDT)  
From: ISENHOUR@LAMBIC.FNAL.GOV (John L. Isenhour)  
Subject: Yeast Biology

Yeast biology article digested from

journal = Science, 20 Mar 92 (origin - Cell, 20 Mar 92)  
author = Michelle Hoffman (Science)  
title = Yeast Biology enters a suprising new phase,  
page = 1510  
source = Gerald Fink, et al (@ Whitehead Institute) and MIT  
keyword (s) = Saccharomyces cerevisiae / captive behavior  
              filimentous phase / domestication / starvation

The old Field vrs Laboratory observation style philosophies recently took a turn for the interesting in the yeast arena.

It seemed to be commonly accepted by the majority of Saccharomyces researchers that although most of its relatives (other similar molds) went through a filamentous phase and that Saccharomyces had been so domesticated over the years that it either never had the ability or had lost it. Now researchers have reason so suspect their assumptions.

Fink first suspected a contaminant because it did not resemble the normally observed structure, but Carlos Gimeno (grad. stu.) pointed out that the alien could have successful sex with Saccharomyces.

The missing phase seems to be caused by the fact that, in the lab, the ingredients for growth are all provided for. The filamentious phase seems to be activated by starvation.

Fink claims that given free reign the yeast would ...

"If you let just one cell divide at its maximal rate, it would form a layer around the earth 10 feet deep after just 2 weeks."  
(ed. everybody "pitch" in and LETS TRY IT!)

The new structure seems to be invoked by reduced environmental nitrogen levels, which causes buds not to not seperate. A bud does not break away and that daughter bud does not breakaway. This "chaining" activity allows the yeast to penetrate agar media, and has been hypothesised to be a foraging mechanism. The yeast penetration effect seems to be regulated by nitrogen levels.

From: Chris Quint <quint@hpindqj.cup.hp.com>  
Subject: Hey Darryl - Lager question.

Hey Darryl,

I read your interesting post on Lager beers and it seems to make sense, but I'm puzzled by one thing. You said Lagering provided a way to produce beers in the warm summer months. But I thought Lagers fermented at temperatures COLDER than normal - thats why people make Lagers in their refridgerators. Am I mistaken? Or did you mean that in the summer the beer WAS made in an icehouse or something? Along those same lines, I thought a Steam beer was a Lager made at Ale temperatures (i.e. normal San Franciso temperatures - especially in the summer!). And how could SF's temp.s be warmer than anyone else's unless it was someone else's icebox?

Thanks,  
Chris

> West coast.

Thanks for posting the list! I did a similar (although not so thorough) comparison last fall (and didn't post results :-()). What I found, is that for items like bulk grain and bulk DME, the shipping cost becomes a significant portion of the final bill. As a result, I went looking for the closest supplier rather than the cheapest. The Brewhaus in Knoxville, Tennessee did well for me on both counts. Bulk pale malt from Great Western Malting costs about \$1.00 per # by the time it gets to my door, whereas pale malt from the Brewhaus (\$35 for 55lb) costs about \$0.82. For hops shipping costs probably aren't that big a deal.

It's just something to consider.

> Also, buying in bulk will lower these prices.

I've noticed that the people who have the best prices for bulk don't have the best prices for small quantities (sometimes not even close) and the reverse.

Subject: re re: Why Lager?

Since you've brought the subject up---would you care to guess how it got warm enough in San Francisco to make steam beer a necessity? I used to spend an occasional weekend at conventions in Oakland or San Jose, so I never believed Mark Twain's "The coldest winter I ever spent was a summer in San Francisco." Then I arrived in SF proper in mid-July, driving down 101

with the fog flooding through the gaps in the coastal hills and virtually covering the Golden Gate, and nearly froze downtown; and now a physicist friend who taught in Sacramento for two years says that's standard (due to rising air in the central valley sucking cold wet air off the ocean?).

So how did it happen that ]room-temperature[ lagers were necessary? Were

they really brewing across the bay? Or is a daytime high of 50 not cold enough even for the older styles of lagers? Or (global warming on the east

coast to the contrary---the Charles almost never freezes hard enough to walk across any more) was it actually warmer in SF in the last century?

For that matter, how/when did lagers spread compared to mechanical refrigeration? 1840 is well before compressors, and somewhere around the start of ice-block refrigerator cars for cattle carcasses. The word means "cave", I'm told because that's where the beer was stored to stay cool; were there no caves or cool cellars available in SF? Or wasn't there enough

ice inland from SF in the winter (considering that there's skiing within easy reach of LA) that summer brewing should have been possible?

Subject: Baker's retort

Jack-

As a professional baker and chef, I find your analogy of using extracts to be rather infuriating. I use extracts in my work every day. Am I less of a baker because I don't soak vanilla beans in alcohol to extract the essence? Am I less of a baker because I use mixes instead of gathering together flour, leavening agents, sugar, etc., which is what a mix is made of in the first place?

In the future, I suggest that you refer yourself to a cook before making such a weak argument, thus setting up a straw man to be knocked down.

I also find your "women/cooks" to be a fundamentally insulting phrase. Not all women are cooks, nor are all cooks women, and I would estimate that neither party agrees with your conjectures.

Hmmm, I didn't express myself well, did I? Lagering was a means  
to being able to consume beer in the warm summer months, not  
produce it in that season. It required brewing a full year's  
worth of beer in the cold winter and finding some cache that  
stayed cold during the summer, like caves in the hills.

San Francisco never gets down to the necessary lagering temps  
due to the strong moderating effect of the ocean. Before  
widespread mechanical refrigeration (a product from the 1880s,  
well after Steam beer was created for the benefit of the  
'49ers), there was no way to make a lager beer in SF, regardless  
of season. Any attempt to do so would produce a more estery  
beer that fermented explosively.

Well, anecdotal evidence aside, it is usually quite pleasant in SF  
(ignoring the rain) from spring through fall, and even a 50s high is  
warmer than most traditional lager primary temperatures. For example,  
Pilsner Urquell never lets their beer rise above 48F, and during  
most of the time it is in the neighborhood of 40F. Of course,  
that's only the primary; during secondary, the temperature is 34F.  
This is not a common occurrence in Baghdad by the Bay. However, 50F  
is warm enough to give most lager yeasts a real kick.

> start of ice-block refrigerator cars for cattle carcasses. The word  
means  
> "cave", I'm told because that's where the beer was stored to stay cool;  
> were there no caves or cool cellars available in SF? Or wasn't there  
enough  
> ice inland from SF in the winter (considering that there's skiing  
within  
> easy reach of LA) that summer brewing should have been possible?

I believe that the pioneering work of Dreher (Brauerei Schweicat  
in Vienna) and Seydlmayer (Spaten in Munich) with respect to  
refrigeration occurred in the late 1880s. Fix has the date in  
his "Vienna". The lager revolution required a number of events,  
but it began with the understanding of how to culture pure yeast  
strains en masse. Cheap glass also helped. But until mechanical  
refrigeration, the beer generally couldn't be made in the summer.

The word "lager" is from the German word "lagern" which means  
"to store". I'm not aware of any caves in the SF area that would  
have been local enough to keep the cold temperatures throughout  
a summer.

And, of course, you look at distances with a jaundiced, modern eye, as do I. But remember, 140 years ago, 20 miles was a great distance and required most of a day. Consider that it took a week to transport the mirror up to Mt. Hamilton in the San Jose area at the turn of the century, and it was only about 25 miles away. The skiing in LA is in Wrightwood, a solid 75 miles from downtown, along a modern, highly engineered road. To get to an ice field in LA during the winter, using horse drawn wagons would be well nigh impossible.

From: polstra!norm@uunet.UU.NET (Norm Hardy)  
Subject: Lager vs Ale

Darryl Richman said some very good things about the comment 4/7 and I would

like to add a couple more:

[1] In Germany the ales (alts/kolsch's and I think weizens) are conditioned

(lagered) near freezing for up to a month to make for a smoother taste.

I remember an alt in Duesseldorf with a label that said "top fermented

lagered beer" (in German of course).

[2] There is no such thing as an isipid bland lager beer in Germany (unless

you happen upon an American Bud in who knows I don't know where place).

Most homebrewers that return from Europe have a better idea of how good a lager beer can really be. That is the challenge; to do it at home.

Subject: Wyeast Belgian (first batch)

I bottled my first batch of ale using the Wyeast Belgian last night. I used my generic 6.6 lbs of amber malt extract recipe, just to get a bracket on where the beasties would take the sugar. When I opened the carboy for syphoning, a wonderful aroma filled the basement. After bottling, I took a taste from the bottom of the pickle bucket I use as a bottler and was again impressed. I got kind of a liquorice/herbal taste with a Styrian goldings note. I'm not sure what to expect from this yeast but I like how it's behaving so far.

My next batch will have much more malt in it.  
(An observation: Jack S. seems to put his 2 cents (and more) into any group he gets involved with. For thoes of you with usenet access, he holds forth quite prominently on misc.headlines) \*NOT A FLAME\*

From: chrisbpj@ldpfi.dnet.dupont.com  
Subject: Red Hickory Lager

Red Hickory Lager (Ingredients for 5 gallons)

1 Can (3.3 lbs) Munton & Fison Amber malt extract  
1 Can (3.3 lbs) Munton & Fison Light malt extract

1 oz Saaz hops (boil - 60 minutes)

2-3 pinches Irish moss

1 oz Bullion pellets (Boil - 1 minute)  
1 oz Fuggles hops (boil - 1 minute)  
1 oz Willamette (boil - 1 minute)

Whitbread lager yeast

3/4 cup corn sugar to prime

NOTES:

I made this batch after taking quite a while brewing a wheat beer. I pulled a couple of bags of hops out of my freezer, grabbed two cans of malt, and threw together a quick-n-easy brew. The Bullion, Fuggles, and Willamette all smelled so good, I couldn't decide between them, and figured since they were only going in for a minute, why not try all three! Well, it turned out so good, I'll be making quite a bit more!

COMMENTS:

I'll probably try this as an ale next. It was quite clean as a lager, though with a good hoppy aroma (not too much hops flavor...). Might try Whitbread ale yeast, or a clean-finishing Wyeast with some fruit subtleties. Also, might boil some of the finishing hops a bit longer to try to get some hops flavor. Good quenching Summer beer!

From: ml4051@mwvm.mitre.org (John DeCarlo)  
Subject: Re: Steam Beer at Anchor Brewing

When I went on a tour of Anchor Brewing, the guide showed us where primary fermentation takes place. These are wide, flat containers kept shallow and cooled by San Francisco air. My memory tells me that they keep the temperature fairly stable at 50 or 55 in there by a judicious combination of insulation and only bringing in cool air from outside. Of course, these temps are fairly easy to maintain in SF, but not cold enough to lager with.

Corrections requested, of course.

Subject: Re: Makkoli

This is what I have been able to find out so far about "Makkoli" the Korean beverage (it is not much). There *\*IS\** barley in it and it does come out milky looking. I may be able to get a recipe this weekend, if so I will post it. I think there was more than one person interested in this, I lost the email addresses for the individuals and did not feel like looking through the old digests. I'm still working on it!

BTW, "Makkoli" is really supposed to be three words. I'll get that detail straightened out also.

Subject: Scottish Ales

Fellow Brewers,

I had the opportunity to try a BELHAVEN SCOTTISH ALE the other night. I was wondering if this is a good commercial example of the style or, if there are other brands available to us here in the 'colonies'??

IMHO, I found this brand to be a very well balanced good tasting ale with a creamy hint to the aftertaste. Any other opinions ??

Recipes for Scottish ale style brews would also be appreciated, there is only one in the cats meow 2.

Thanks in advance,

From: bgros@sensitivity.berkeley.edu (Bryan Gros)  
Subject: brewing definition

I've been wondering about something for a while, and with the "arguing" over the definition of brewing posted..

Why is making tea usually called "brewing"? no fermentation involved.

And while we're at it, making wine (and mead i guess) should also be referred to as brewing.

From: BSABLTHR%EKU.BITNET@uga.cc.uga.edu  
Subject: Overflow

Fellow Homebrewers,

Ran into a problem this morning with the Stout I boiled last night.  
The

recipe that I had, called for about a six U.S. gallon mixture. I've  
only got a

7 1/2 gallon fermentor. Right now, I've got one big mess. The foam has  
come up  
through the bubbler on to the top of the fermentor. I've also cleaned it  
up  
several times and reinserted the bubbler valve. It still foams up! The  
only  
thing I could think of was to pull the bubbler off and cover the hole  
with a  
cheese cloth. Are there any other suggestions? Help!

-Date: 29 Sep 89 17:36:00 EDT  
-From: "FEINSTEIN" <crf@pine.circa.ufl.edu>  
-Subject: Meads & mead-making

Hello, all!

I noted 's recent request for mead-making info, but haven't had time to respond until now.

Below you will find my basic recipe for making mead. First, however, some basic tips and information.

Meads come in several basic types: meads, metheglins (spiced meads), and melomels (meads made with fruit and/or fruit juices added). Many of these, especially the melomels, are "species specific" (as it were). For example, a cyser is by definition a mead made with apples or apple juice.

Use unblended honey when making mead, and raw honey if at all possible. Thus, unless there is someone with an apiary in your neighborhood, the best place to get honey is at a health food store or roadside stand. If the honey has bits of wax, or other particulate matter in it, that can be strained out before cooking. Do NOT, under *any* circumstances, use "blended to death" honeys, like "SueBee". Remember: the taste and character of the honey you use will be the principal determinants of the taste and character of your mead.

Please note that meads don't need any malt added, for *any* reason. Apart from altering the flavor and character, there are quite enough fermentables present already, thank you! :-)

Use a white wine yeast in brewing mead; "Montrechet" is recommended. \*Don't\* use ale or lager yeast; the end result will most likely be exploding bottles!

Most mead recipes call for the addition of some citrus juice or tea (tannin).

This is important, as it balances the sweetness, preventing it from becoming cloying. This is the same reason caffeine is added to many sodas.

The molecular structures of the sugars involved in meads are different from those found in brews. Thus, meads can take anywhere from a few weeks or months to several years to age properly. And, they won't taste very good if one isn't patient; the time is necessary.

When adding honey to hot or boiling water, STIR CONSTANTLY!! Otherwise, the honey will go straight to the bottom of the pot, where it will caramelize, scorch, and otherwise ruin the whole thing. KEEP STIRRING, until the honey is \*completely\* dissolved.

You will notice, in mead recipes, instructions to skim off any scum that forms as the mead heats up. This is very important, as that scum is the equivalent of the krausen in beer. Apart from the nasties in it that can contribute to hangovers, there are nasties in the scum that can adversely affect the flavor and appearance of the finished mead.

The length of time mead is allowed to ferment is the other principal factor in determining not only the final alcoholic content, but how dry \_vs.\_ how sweet your mead will be. Remember: mead is not necessarily a sweet drink! Also, meads can be sparkling, or still. It's all a matter of individual preference.

A word of warning about mead hangovers: they are the stuff of legend-- and rightly so! The combination of high alcohol content (relatively speaking) and high sugar content are perfect for the induction of the Ultimate Hangover.

One author I've read on meads, in an attempt to convey to the reader the potential severity of a mead hangover, referred to the Biblical story of Judith and the Holofernes. The author pointed out that Judith saw to it that the Holofernes got thoroughly drunk on mead, waited until they had slept awhile, and then had the Hebrew army attack-- beating on their shields! As the author put it: "What else could the Holofernes do but throw down their arms and accept slaughter with gratitude?"

Personally, I consider this description of mead hangovers to be both apt and astute. :-)

Anyone with questions about mead-making can contact me at the addresses below. The recipe for basic mead follows.

Yours in Carbonation,

Cher Feinstein

#### BASIC SMALL MEAD

NOTE: All equipment mentioned below is assumed to be either well-cleaned or sterilized, as needed.

In a 1 gallon enamel pot, simmer the following until the infusion is done to taste: 2-3 whole cloves, lightly cracked; 2 sticks of cinnamon, broken up; 2 thin slices peeled fresh ginger root. Add 2-4 tsp. orange peel (how much depends on the honey-- with orange blossom honey use less, for example) and simmer a little longer.

Add enough water to bring the volume up to 3 quarts. Bring back up to a simmer. Add 2 lbs honey, stirring constantly. Some of the warm water can be ladled back into the honey container to rinse it.

DO NOT BOIL! Continue to simmer at a moderate rate, skimming off any white scum that forms on the top. If the scum is yellow, the heat is too high. Once no more scum forms, turn off the heat, place the lid on the pot, and leave overnight.

The next day, strain out as many of the spice particles as practicable. Pitch the yeast. Replace the pot lid; the condensation on it will form a seal.

Twelve hours later, rack the mead into a gallon jug, leaving the dregs of the yeast. After racking, top off the jug if needed, filling it to the base of the neck. Take a piece of clean paper towel, fold it into quarters, and put it over the mouth of the jug. Secure with a rubber band. Allow to ferment 36 hours. If the paper towel becomes fouled during this period, replace it with another.

After 36 hours, taste the mead. If it is still too sweet for your taste, ferment longer. Repeat this as necessary, until a desirable level of sweetness/dryness is achieved.

Place mead in refrigerator for 8-12 hours, then rack into a fresh gallon jug. Seal new jug tightly, and place in refrigerator to carbonate for 12 hours.

Once the mead is nicely carbonated, add 1/4 cup of vodka or grain alcohol to the jug to kill off the yeast. Rack into a fresh jug again, seal tightly, and place in refrigerator for 3-4 days.

The mead may then be bottled; Grolsch bottles work extremely well for this purpose.

This is a "quickie" mead, drinkable in 2 weeks. However, it does improve considerably with age, and letting it age for at least a couple of months before drinking is recommended. This mead is excellent chilled.

-From: Kevin Karplus <karplus@ararat.ucsc.edu>  
-Subject: Mead recipe

Several people have been asking about mead recipes lately. Here is one I've used for years. Incidentally, the meads I like best are strong dessert wines, with take over 5lbs of honey per gallon of water. They take months to ferment and years to mature, but they're great for sipping.

Mead  
(a fermented drink made from honey)  
Generic Recipe

The basic ingredients of mead are honey, water, and yeast. The proportions of the honey and water determine the final strength and sweetness of the drink, also how long it takes to make. The ratio ranges from 1 lb. honey per gallon of water for a very light "soft-drink" to 5 lbs. per gallon for a sweet dessert wine. The less honey, the lighter the mead, and the quicker it can be made. I've successfully made a 1 lb/gallon mead in as little as three weeks, while my strongest mead (5 lb/gallon) was not bottled for six months, and could have stood another few months before bottling. Elizabethan recipes varied considerably in strength, but 3 or 4 pounds of honey per gallon was common.

The mead I make is spiced, so is sometimes referred to as "metheglin." Elizabethan meads used large numbers of different spices and herbs, but not always in large quantities. Kenelm Digby, after giving the recipe obtained from "Master Webbe, who maketh the Kings Meathe," has this to say:

The Proportion of Herbs and Spices is this; That there be so much as to drown the luscious sweetness of the Honey; but not so much as to taste of herbs or spice, when you drink the Meathe. But that the sweetness of the honey may kill their taste: And so the Meathe have a pleasant taste, but not of herbs, nor spice, nor honey. And therefore you put more or less according to the time you will drink it in. For a great deal will be mellowed away in a year, that would be ungratefully strong in three months. And the honey that will make it keep a year or two, will require a triple propotion of spice and herbs.

[The Closet of the Eminently Learned Sir Kenelm Digby Knight Opened, 1669]

Here is a partial list of flavoring agents (mainly herbs and spices) mentioned for meads by Digby: agrimony, angelica root, avens, baulme

leaves, bay leaves, bettony, blew-button, borage, cinnamon, clove-gilly flowers, cloves, dock, eglantine, elecampane, eringo roots, fennel, fruit juice (cherries, raspes, Morrello cherries), ginger, harts-tongue, hopps, juniper berries, limon-pill, liver-worth, mace, minth, nutmeg, orris root, parsley roots, raisins, red sage, rosemary, saxifrage, scabious, sorrel, strawberry leaves, sweet marjoram, sweet-briar leaves, thyme, violet leaves, wild marjoram, wild sage, wild thyme, and winter savory.

In my own brewing, I use mainly "sweet" spices (cinnamon, ginger, nutmeg). The main herb I use is tea. Tea is an important addition to the mead. It provides tannic acid, to give the drink a bit of bite. It is particularly important for sweet meads, which can otherwise have a rather syrupy taste (like Mogen David wines). Any sort of tea will do--I've used genmai cha (a very light Japanese green tea), lapsang souchong (a smokey Chinese tea), China Rose (a black tea with rose petals), jasmine, oolong, and others. If you want to use Lipton's, that should work as well. I have not seen any period recipes that use tea in mead, but all my batches that omitted tea were not as good. I am more interested in producing good flavor than in strick authenticity, so continue to use tea.

Other ingredients I use include small amounts of orange or lemon juice, fruit, cloves, and other spices. I've used bay leaves, cloves, rosemary, anise, and galingale, in addition to the spices listed above. Be careful not to over-spice the mead! It is probably safer to use less of fewer spices, until you've had some experience.

As examples, here are the quantities for two of my mead batches:

Batch: M4  
Type: Quick Mead

3 gallons water  
5 lbs honey (Wild Mountain)  
1/3 cup jasmine tea  
1/2 tsp ground ginger  
2 tsp cinnamon  
1/2 tsp ground allspice  
1/2 tsp ground cloves  
1/2 tsp ground nutmeg  
ale yeast

Started: 1 July 1979  
Yeast added: 2 July 1979  
skimmed: 12 July 1979  
racked: 15 July 1979  
bottled: 28 July 1979

yield: 3.1 gallons  
clarity: excellent  
sweetness: fairly sweet  
sediment: slight  
carbonation: variable (some popped corks)  
color: light gold  
An excellent batch

-----  
Batch: M7  
Type: Sack Mead

3 gallons Water  
16 lbs honey  
1/4 cup keemun tea

1/4 cup oolong tea  
2 tsp cinnamon  
1/2 tsp whole aniseeed  
18 cardamum seed clusters crushed (about 1 tsp)  
20 whole allspice slightly crushed (about 3/4 tsp)  
about 1 inch galingale root crushed (about 2 1/4 tsp)

(Finning agent: 1 pkg unflavored gelatin in 1 cup of water)

Started: 26 Dec 1981  
Wine Yeast added: 27 Dec 1981  
1 rack: 10 Jan 1982 (vat -> carboy)  
2 rack: 31 Jan 1982 (carboy -> carboy)  
3 rack: 30 April 1982 (carboy->carboy)  
gelatin added: 23 May 1982  
bottled: 3 July 1982  
Yield: 3.7 gallons

Comments:

sweet, smooth, potent. A dessert wine.  
This is perhaps the best of my 20 or more batches of mead.

-----

I use tap water for brewing, but if your tap water has off-flavors, then you might want to get a bottle of clear spring water. Recently I've switched to filtered tap water, to remove some of the rather grassy flavor that our water gets in summer.

The honey may be almost any cheap honey. Strongly flavored honeys (orange blossom, buckwheat, wild flower (in some areas)) generally work best. Clover honey works well, but very light honeys (like alfalfa) generally lack flavor. If making a true mead (without spices), the flavor of the honey is more important, and only strongly flavored honeys should be used.

The yeast is important. Baking yeast is bred for fast carbon dioxide production, and is not at all suitable for brewing. Some home cider makers may be used to just letting the sweet cider stand a few days to ferment on its own. This technique relies on the wild yeasts present in the air, on the cider press, and on the skins of the apples. It doesn't work for mead. The wild yeasts result in off-flavors, which the honey is not strong enough to mask. For strong, still meads (3 lbs honey/gallon or more) I use a white wine yeast, while for a lighter beverage I use ale yeast. A beer yeast should work as well as an ale yeast, but I find top-fermenting ale yeasts more fun to work with. WARNING: the "brewer's yeast" sold in health-food stores is dead yeast, it will not be usable for brewing.

The equipment you need is a large pot (I use a 20 quart canning pot), a 5 foot plastic tube to use as a siphon, and strong bottles. In addition, a 5 gallon water bottle with a stopper and fermentation lock is a very useful piece of equipment. Everything you use should be sterilized to prevent the growth of vinegar-forming bacteria. There are chemical sterilizing agents available from wine-making supply stores, but I prefer to sterilize everything in boiling water. I'll mention sterilizing over and over. It is the single most important part of brewing mead rather than vinegar.

If making a still, wine-type mead, any sort of bottle will do for the final bottling. However, this recipe is for a fizzy "ale-type" mead, so strong bottles are essential. Champagne bottles and returnable pop bottles are usable, disposable bottles of any sort are not. I once had an apple juice bottle explode in my room, embedding shrapnel in my pillow from 9 feet away. Don't make the same mistake--use strong

bottles!!

Steps to making the mead:

1. Boil the water, adding the tea and spices.
2. Remove water from heat and stir in honey. (Note, stirring implement should be sterilized!) Some mead brewers boil the honey in the water, skimming the scum as it forms. This removes some of the proteins from the honey, making it easier for the mead to clarify. However, I don't mind a bit of cloudiness, and prefer the taste of unboiled honey. If you are making a wine mead, you can avoid the cloudiness simply by waiting an extra month or two for the mead to clarify. If you're buying a clear honey from a supermarket, it may already have been cooked a bit to remove pollen and sugar crystals, in which case, a bit more cooking probably won't change the flavor much. Digby's recipes do call for boiling the honey.
3. Cover the boiled water, and set it aside to cool (to blood temperature or cooler). This usually takes a long time, so I overlap it with the next step.
4. Make a yeast starter solution by boiling a cup of water and a tablespoon of honey (or sugar). Let it cool to blood heat (or all the way to room temperature) and add the yeast. Cover it and let it ferment overnight. The yeast should form a "bloom" on the surface of the liquid. (Of course, the cooling and fermenting should be done in the pan or other sterilized vessel.)
5. Add the yeast starter to the cooled liquid. Cover and let ferment. After a few days, it is useful to siphon the mead into another container, leaving the sediment behind. Here's where the 5 gallon bottle comes in handy. A fermentation lock provides a way to close the bottle so carbon dioxide can get out, but vinegar-forming bacteria and oxygen cannot get in. Remember to sterilize the bottle and the siphon first!
6. Ferment for a few weeks in a warm, dry place. When a lot of sediment has collected on the bottom of the bottle, siphon off the liquid (without disturbing the sediment). This process is known as "racking," and helps produce a clear, sediment-free mead. Again, make sure all your equipment is sterilized. A wine mead may need to be racked three or four times before the final bottling.
7. For a fizzy mead, siphon into strong (sterilized) bottles a bit before fermentation stops. With the strength given here 4 weeks is about right. The exact time depends a lot on the temperature, the yeast, the honey, ... . I use plastic champagne corks to seal the bottles (sterilized, of course!). Crown caps are also good. Real corks should only be used for still beverages, since the amount of carbonation is unpredictable. Too much carbonation and you'll pop the corks, too little, and corks are hard to remove from champagne bottles. Don't wire on the corks, unless you're willing to risk an occasional broken champagne bottle. Still meads should not be bottled until fermentation has completely stopped. I generally wait until the fermentation has stopped, and the mead has cleared. This can take more than six months for a strong wine mead.
8. Age the mead in a cool place. Note: ferment warm, and age cool. I sometimes keep the champagne bottles upright in the cardboard box they came in. That way, if a cork pops, there is something to absorb the overflow, and if, despite my care, a bottle breaks, it won't set off a chain reaction.

9. Drink and Enjoy! The light quick meads should be served chilled (like beer), while the wine types are better at room temperature or only slightly chilled.

From: polstra!norm@uunet.UU.NET (Norm Hardy)  
Subject: Mashers vs Extractors

What a great subject to heat up the net!

When I started brewing in 1985 I joined the Brews Brothers club in Seattle, and eager to meet the members I introduced myself to one saying I was making beers using extracts. This member (now in AA I hear) said: "SH\*T, when are you going to make REAL beer!". Later, another member said "Making extract beer is like making Swiss Miss chocolate to drink."

So, when an all extract (powder I think) ale won the top score at a club tasting in the summer of 85 I was vindicated and some oldsters were educated.

Having said all that, I have to say that I spent a year making extracts and then extract/small mashes until I got comfortable with all grain. Through the club the malt is 50 cents or less per pound. There is a big difference in the quality of taste, mainly in the BODY or mouth feel of the beer. There is also more control available to me.

Finally, having stated that, remember that Wyeast (the company) was not around in 1985-86 and the liquid cultures REALLY picked up the quality of the beer.

Subject: Makkoli/South Korea

Fellow Brewers,

'Makkoli', boy does that word take me back. I had the pleasure of being stationed in the Republic of South Korea for a year while I was in the Army (85').

I tried Makkoli -ONCE- and my recollections are as follows. It was VERY milky in appearance and texture, I remember thinking it was a rice based beverage because I seem to recall grains of rice floating around in the stuff (I saw lots of rice patties, no barley fields). It had a very high alcohol content and the men folk used to drink it like water (read: Makkoli is to Koreans what beer is to Americans -- personal observation). I am sure like many things in the ROK, this drink is very regional i.e. it may be made different in various parts of the country. I did not like the stuff very much, but of course that is my opinion (I remember thinking it was like curdled milk with a kick). Yes, my one taste left me with this much of an impression.

The ROK does have its own brands of beer O.B (Oriental Brewery) and CROWN. Both lagers, BudMichMiller taste alike (more hops maybe). They also (O.B.) brew(ed) Heineken under contract/license. I have seen O.B. beer on the left coast but not here on the right, although, I bet there is a specialty store in NYC that carries it.

The really good indigenous drink is called SOJU, but this is a distilled liquer, a really potent knock you on your as\* beverage. I remember the true native made type you had to blow the formaldehyde off the top before you could drink it.

Well this turned into quite a lengthy post, so enough for now. Su ga sayo (phonetic spelling of see you later in Hongul(Korean))

Subject: BRFTWARE.EXE in the archives at mthvax.cs.miami.edu

Just a note to let you all know that Chris Campanelli's shareware program entitled Beer Recipe Formulator (BRF), which runs on DOS-compatible PCs, is now available in the archives in Miami. For those who missed it, the availability of this shareware program was announced about a month ago. Please send e-mail regarding BRF directly to the author: akcs.chrisc@vpnet.chi.il.us.

Anonymous ftp access is to: mthvax.cs.miami.edu

It's in the homebrew directory:

```
-rw-r--r--  1 288 system 76912 Apr  1 13:53 brftware.exe  
-rw-r--r--  1 288 system106000 Apr  1 13:54 brftware.exe.UUE
```

brftware.exe is a self-extracting zip file (make sure you set BINARY mode in your ftp transfer!); brftware.exe.UUE is a uuencoded version of brftware.exe. Sorry, I didn't shar it for e-mailing - I haven't figured out how to do that yet...

Thanks to Chris for providing this program, and many, many thanks(!!!) to the archives administrator aem@mthvax.cs.miami.edu for providing this useful service to the homebrewing community!

Subject: reuse yeast

I couldn't get this through directly to the person who wanted it, so here it is, shortened.

I get 2 batches out of each package of Wyeast. For the first one, I make a starter and use that. When the first batch is ready for transfer

to the secondary carboy (usually the next weekend), I brew another batch.

When the 2nd batch is cool and ready to be yeasted, I rack the first batch into the secondary, and rack the second batch directly onto the slurry

from the first batch. It usually starts fermenting in 2 hours! and finishes

in a couple of days.

You can do this for many batches, but since I do all-grain, I don't mind

spending the \$4 for 2 batches worth of yeast I can count on to treat my wort nicely. 10 gallons of beer also lasts me a while ;-)

You can also pitch onto the slurry from the secondary. This can be a better approach if the primary is longer than a week, as the trub and dead yeast in the primary slurry can start to impart off flavors after that time. There is less slurry in the secondary, however, so you may not get the 2 hour starting time. Also, as racking to secondary is another place for bacteria, etc. to get introduced into the beer, the secondary slurry may not be as "clean" as the primary.

From: gummitch@techbook.com (Jeff Frane)  
Subject: Wow! A Lot on Mead!

The most recent Homebrew Digest had a LOT about mead. If there's this much interest perhaps someone could take the effort to put together a mead digest (isn't there already a cider digest?). Generally speaking, I think this digest ought to be reserved for discussion of brewing -- you know, making beer?

As far as definitions (and someone asked about tea), Webster's offers an explanation: 1: to prepare (as beer or ale) by steeping, boiling, and fermentation or by infusion and fermentation 2 a: to bring about : FOMENT b: CONTRIVE, PLOT 3: to prepare by infusion in hot water

I thought the recent comments about "real" brewing were quite cogent. As a judge, for example, I've tasted some extraordinarily good beers that were brewed from extracts/grains and some piss-poor ones brewed from all-grain. I remain, frankly, more impressed by people who are able to brew exceptional beers from an extract base than those doing good or mediocre beers from whole grains. What you get out of beer is what you put in of yourself, the gift of the craftsman. Science without art is sterile (and not in the sense of clean, but barren).

Subject: Homebrew does not cause beer bellies.

Read on. Appeared in the 4/9/92 NJ Star Ledger.

-A Dietz  
Bellcore, Morristown

-----  
Boston (AP) - At last, science has found an explanation for one of the obvious effects of drinking too much - the beer belly.

Swiss Researchers report that when people drink alcohol, their bodies burn up fat much more slowly than usual. And any fat that isn't burned is stored in the paunch, the thighs or other places where people tend to put on weight.

The study suggests it isn't just the calories in alcohol that make it fattening. It's the way alcohol throws off the body's normal disposal of fat in the diet.

"This is one good explanation of why people get fat drinking alcohol," commented Dr. Clifton Bogardus of the National Institutes of Health.

The study was based on an experiment in which people were put on a diet that included about 3 ounces of pure alcohol a day. This much alcohol - about six shots of whiskey or six beers [or 1 cup of mead ;-)] - reduced their bodies' burning of fat by about one-third.

The study, directed by Dr. Paolo M. Suter of the U of Zurich, was published in today's New England Journal of Medicine.

The research is one more piece of a larger idea to emerge from recent investigation of how people get fat or stay thin. It seems that fat is what makes people fat.

When people eat extra carbohydrates - sugar or starch - they tend to burn most of it, adding little to their girth. But the body burns extra fat sparingly and instead saves it away.

Of course, not everyone who drinks gets a spare tire. It depends on what they eat. Beer guzzlers and whiskey drinkers who subsist on hamburgers and potato chips will almost certainly put on pounds, while vegetarian wine sippers do not.

The Swiss study found that alcohol suppresses the body's already-stingy disposal of fat. Just why this happens is unclear. The body may simply prefer to burn alcohol first, or alcohol may have some other effect on metabolic processes in the liver.

The finding "points to the fact that energy balance over the long term has a lot more to do with fat balance than anything else we eat," said Bogardus. "The main way to stay thin is not to eat fat."

The study was conducted on 8 healthy men during two sessions. In one, alcohol made up 25 percent of their calories, but their total daily calories did not change. In the other, they drank enough alcohol to increase their daily calories by 25 percent.

On both diets, the men's bodies burned about one-third fewer fat

calories when they drank alcohol.

The study reached one modestly positive conclusion: People who substituted alcohol for other food but did not increase their daily calories burned up more calories over all than when not drinking. The reason appears to be that alcohol boosts the metabolism.

This finding provides a strategy for drinking without putting on flab. "If somebody wants to drink socially and avoid gaining weight, he should have a substitute strategy - substitute fat calories for alcohol." said Suter.

However, this is hard to do. And Bogardus noted that people doing this might still put on extra fat, even if they actually weigh less.

"You'd end up with a slightly different body composition," he said. The study found that while on the alcohol substitution diet, people burned up 875 fat calories, instead of their normal 1,291 fat calories. They also burned slightly less carbohydrate, a bit more protein and all of the 680 alcohol calories they consumed each day.

From: tix!roman@uunet.UU.NET (Daniel Roman)  
Subject: Re: Extract Brewing

Definition: (from American Heritage)

Brew (brewed, brewing, brewer)- 1. To make (ale or beer) from malt and hops by infusion, boiling, and fermentation. 2. To make (a beverage) by boiling, steeping, \*or\* mixing various ingredients.

Beer- A fermented alcoholic beverage brewed from malt and flavored with hops.

(asterisks are my additions for emphasis)

>From the above definitions I contend that extract brewers can refer to themselves as brewers and so can somebody who puts a tea bag into a cup of hot water. The AHA refers to extract brewers as "brewers", that's more important to me than a dictionary definition. According to the dictionary, if you take the alcohol out of beer, it's no longer beer! If you extract brew and want to be dictionary legit, just add some hop pellets and then you pass the "infusion" or "steep" requirement. After all, you WILL be extracting flavor from the hops and that'll satisfy the dictionary (if you care).

Just wanted to point out that the dictionary is too narrow minded (?). I extract brew and all-grain brew. Extract brewing is commonly referred to as "extract brewing" even by Jack on this thread. If you are brewing you are a brewer. Even the dictionary lumps these terms brewing and brewer together in the same definition.

Relax, don't worry, have a homebrew and proudly call yourself a brewer, \*I\* consider you one.

From: tony@spss.com (Tony Babinec)  
Subject: kudos to HBD appends/burners

Recent postings on mead, yeast technology, Wisconsin breweries, and recipes have all been great!

Paul Sherrill asks about burners. Alternative Beverage of Charlotte, North Carolina, carries a propane cooker with baffle. Full tilt, it produces 125K BTUs of heat. It'll bring the collected sparged wort to a boil in 10 minutes, at which point you have to turn it down to control the boil. But, talk about getting a rolling boil! The cooker includes 6 feet of gas hose and a high pressure regulator and needle valve. The list price in the current catalog is \$59.95, and shipping weight is 13 pounds. You'll also need a propane tank, like you see in people's back yards or on their campers. Tanks go for \$20-30. Propane refills cost around \$7-8, and last for numbers of boils. ABs phone number is 1-800-365-BREW. For safety, among other reasons, I recommend using this setup outdoors.

I've noticed that Service Merchandise carries "back yard" propane gas grills. One of the least pricy ones had 4 legs and stood like a table, and was priced around \$80.

Subject: Disposing of 10 pounds of spent grain

In HOMEBREW Digest #861 Jask S. States:

In the interests of insulting no one in particular, I have eliminated citing the source of this particular insanity. HOWEVER, the idea of dumping 10 pounds of spent grain into a garbage disposal is an act of personal irresponsibility that staggers me. I find it hard to put my outrage into words. Instead of just being outraged, let me suggest a few alternatives.

Put it in your garbage can.

Find a friend with a garden.

Find an empty lot.

Make lots of beer bread.

Go back to extract brewing.

I'd like to make a personal observation here

While putting the garins into the disposal might seem like a bad idea, in *most* places it's not a bad idea. The drain pipe from the sink goes to the same place as the rest of the house, meaning a treatment plant. It's far better for the environment (since that appears to be the issue here) to have it go there than to:

1) Put it in a garbage can  
Where it will most likely end up in a landfill where it could take years to decompose. Going through the treatment plant will take days, not years.

2) Find a friend with a garden.  
I like this idea, but 10 pounds is an awful lot when you consider that it should be mixed with other stuff (grass cuttings, peat moss)... You get a fairly large pile. But, This is *my* favorite anyway. Composting

3) Find an empty lot.  
I'm going to just pretend this isn't on the list

4) Make lots of beer bread.  
A good idea for some, but not for others.

5) Go back to extract brewing.  
But is this *really* brewing? !-) !-) !-) !-)

From: akcs.chrisc@vpnet.chi.il.us (chris campanelli)  
Subject: outdoor burners

I'm aware of three types of portable propane burners currently on the market, although I'm sure there are more:

Metal Fusion, Inc.  
623 Maria St.  
Kenner, LA 70062  
(504) 469-6431

- This company makes a burner that is best described as a rocked engine in disguise. It is a 125,000 BTU monster that I once saw bring 6 gallons of wort to a boil in under 10 minutes! I have seen this burner listed in Alternative Beverage's (of North Carolina) catalog for \$59.95. Their price includes a regulator with a six foot hose. This burner was also the subject of the product review article in the Zymurgy Summer 1991 issue and appears on the cover of same.

Superb Gas Products Co.  
423 S. Church St.  
PO Box 99  
Belleville, IL 62222  
(618) 234-6169

- This company makes a wide variety of outdoor burners and cookers. I have purchased two burners from them. The burners in question are Model 16-20E. This type is 35,000 BTU and they sell for \$59.95. The price includes a regulator with a four foot hose and shipping & handling. They mail free brochures.

Great Fermentations of Santa Rosa  
PO Box 428  
Fulton, CA 95439  
1-800-544-1867

- This homebrewing supply store does not make burners but sells a 31,000 BTU burner. The burner is pictured in their catalog and sells for \$64.95. The price includes a regulator with a five foot hose. They mail free catalogs as well.

With all types listed above, you will need a fuel source. Some people like to tap into their existing natural gas line, others prefer the "Weber Grill" type of tanks. I will not get into the pros or cons of which is better. Ask around and judge for yourself. I will say that the tanks can be purchased at places like Sears, Kmart, etc. for around \$20.00.

I have been using my burners in the basement without any problems regarding fumes or vapors. As my house is rather old and drafty, this may or may not be the reason. I will point out that water vapor will be a BIG problem and the resulting condensation on the walls, doors, floors and windows gets to be a real mop up job.

From: "Olzenak,Craig" <OLZENAK@AC.GRIN.EDU>  
Subject: Vienna

Greetings All!

Many thanks to Laurie Fix for the recent list of corrections to their fantastic book. I remember well George's AHA Nationals talk in Denver back in June '87. Now there's someone EXCITED about beer! I happened to be judging the Vienna style that year and (as many of you know), we awarded 1st place to - you guessed it! - George. A marvelous beer!

One quick question to yo two, as I didn't see it listed on the errata posting - What jumped out at me as possible errors were the L. listing of the English caramel malt on pages 56 and 57. In the previous recipes you list 120 L. (I'm very fond of dark crystal malt!). Do you really mean 20 L. for the Modern Viennese Mild and Traditional Oktoberfest/Maerzan?

Many thanks!

And, looking forward to Milwaukee!

From: dab@dasher.cc.bellcore.com (dave ballard)  
Subject: using sourdough culture in brew

Okay, someone tell me if this is sick or something. A friend of mine (actually, the great Oz of the exploding carboy) has a sourdough culture that he's had in the fridge for about 4 years. He just scoops out what he needs whenever he wants to do a loaf of sourdough bread. The stuff is pretty scary looking, in fact if you stare at it long enough it starts to breathe. Anyway, I was thinking about doing a small batch (~1g) of ale and throwing in a handful of the sourdough stuff to try to make some sort of bizarre lambic.

So what do you think? Should I have my brewing toys taken away from me? Am I onto something great? Will it grow hair on my tongue? Will it make me a REAL HOMEBREWER? I saw someone on r.c.b mention the idea today, so at least I'm not alone...

Date: Fri, 10 Apr 1992 11:37:39 -0700  
From: Michael.Burgeson@Eng.Sun.COM (J. Michael Burgeson)  
Subject: Grain mill

I just received my Marcato grain mill, and thought I would review it for the HBD.

First a description: The mill is about 8" high, and 7" wide. It has 3 rollers arranged in an inverted triangle. The rollers are about 1" in diameter, and have diagonal grooves from grabbing the grain. There is an adjustment knob on one side which moves one of the top rollers (roller "B" in picture) in a circular pattern, which allows semi-independent adjustment of the distance from the other two rollers. The unit comes with a hand crank, a small hopper, and a catching container.

For making flour, "B" is moved close to "C", and far from "A"; "AB" will crack the grain, and "BC" will grind it to flour. For our purposes, "B" is moved far from both "A" and "C"; "AB" will crack the grain, and "BC" will do nothing.

I ran some Munich malt through the Marcato, and compared the results to malt crushed with Jack's MALTMILL, and the Corona mill. Crush and throughput on a scale of 1-10. All comments are IMHBBHO (in my highly biased but humble opinion).

Marcato: The malt looked "squished", with very few small husk particles.

Left no uncrushed grains.

Overall, a very good crush: 8.

Throughput: 4.

Disadvantages: Hopper is too small. Kinda slow.

Disclaimer: Did not test with electric motor, or high RPM.

MALTMILL: The crush was mostly half-husks with some grain appearing intact,

but they would crumble between your fingers.

A very good crush: 9.

Throughput (with 1/2" electric drill): 8.

Disadvantages: Did not hold up under excessive RPM. Adjustment of roller distance is only at one end.

Corona: Lots of small husk particles. Powdered husk material. Lots (~10%) grain uncrushed.

OK crush: 5.  
Throughput: 2.  
Disadvantages: Too many small husk particles. Too slow.

Now the important part; The Marcato Grain Mill cost me \$73.50. I ordered it through a local (Redwood City, CA) kitchen supply warehouse (look in the yellow pages under "Cooking Utensils").

IMHBBHO, I consider the Marcato mill an excellent alternative to the MALTMILL, as long as you are not overly concerned with throughput. I am very impressed with the crush, and the price isn't too bad.

I am not associated with any of the products mentioned in this article in any way, except for being a satisfied owner of a Marcato grain mill.

Michael Burgeson

From: Jacob Galley <gal2@midway.uchicago.edu>  
Subject: Re: reusing yeast

Davis McPherson wonders:

> i interesting in learning about reusing yeast now that i'm brewing  
> with liquid yeast...i have heard that its possible to rack a new  
> batch of wort onto the yeast cake from a previous batch...anyone  
> with information on procedures for doing this please e-mail...

I have recently been reading over Father Barleywine's posts from last September, where I believe he introduces the "yeast cake" concept. (He does however cite his earlier posts during a spat circa HBD 600, which I have not had time to sift through yet.) I just want to get something straight: the term "cake" brings to mind a rather dry, hard object. I am just assuming that this is not a state which I want to preserve yeast in. The Father is simply talking about reusing (uncaked) slurry, which has lots of live yeast in it -- isn't he?

As for Davis's specific question, the method Father Barleywine preaches is to start your next batch as soon as you bottle the last one, without removing the slurry [my interpretation, see above] or cleaning the carboy at all. This way, you keep lots of the yeast from the last batch, and if you're really quick, you can start your next batch before hoards of nasty infections plague your fermenting container.

Jake.

Date: Fri, 10 Apr 92 14:10:35 CDT  
From: Jacob Galley <gal2@midway.uchicago.edu>  
Subject: Killer head!

Another question:

Have noticed a tendency for my beers to produce a rediculous amount of foam as they mature. My latest example is a light ginger lager which I bottled about three months ago. At this point, if I pour it (out of the fridge) into a glass at room temperature, \*ALL\* of it turns to foam! Into a chilled glass, and I get less than an inch of beer and the rest is foam. I resorted to drinking out of the bottle, but as soon as it hits my palate it turns to FOAM. The CO2 flies out of solution so fast I can barely hold it in my mouth! Also, if I simply wait patiently for beer to collect underneath the foam in the glass, it is quite flat. And this used to be my best batch!

So let me describe my technique. I am still a lowly extract brewer. In all my beers so far I have added a third of a stick of brewer's licorice (30 minute boil or so). I boil about two gallons of wort for a five gallon batch, and pour it into a carboy with two gallons of cold water, and then fill it to the top with cold water. I let the trub fall out over night, rack, and pitch.

I know there's lots of room for improvement in my procedure, and when I have the time, energy and money all at once, I will improve. Until then I am asking you-all out there "Are there any specific adjustments I can make that will prevent this weird heading behavior?"

Thanks,  
Jake.

From: Subhash Chandra Roy <roy@mcnc.org>  
Subject: Steam Beer Reciepee

Here's a recipe for a steam beer, That has finally lagered long enough to taste.

6.6 American Classic Light Malt Extract

1/2 lbs 10L Crystal Malt

1/2 lbs 20L Crystal Malt

1 1/2 oz Tettnanger hops (60 min)

1/4 oz Tettnanger hops (30 min)

3/4 oz Hallertauer hops (30 min)

1/4 oz Tettnanger hops (10 min)

1/4 oz Hattertaufer hops (10 min)

1 oz Kent Golding hops (dry hop)

1 teaspoon salt

1 1/2 teaspoons Gypsum

1/2 cup of honey (priming)

Wyeast Steam Beer yeast

Original Gravity 1.049

Terminal Gravity 1.009

Two stage fermentation

1st stage -- 10 days @ 72F

2nd stage -- 26 days @ 50F

Crack the crystal malt and add to 1 gallon of water and bring to a boil then strain off the wort. Add the extract and return to a boil. Add the hops @ the given times. Cool wort and pitch yeast.

Subject: BREWING, SPENT GRAIN

To: Homebrew Digest  
Fm: Jack Schmidling

>From: bgros@sensitivity.berkeley.edu (Bryan Gros)  
>Subject: brewing definition

>Why is making tea usually called "brewing"? no fermentation involved.

Fundamental to the brewing process is STEEPING and that is how tea is prepared and how mashing extracts sugar from malt.

Fermentation is NOT integral to brewing, it is an optional additional step.

>And while we're at it, making wine (and mead i guess) should also be referred to as brewing.

Not unless you steep (yuck) the grapes.

.....

In my never ending quest for new uses for spent grain and to KEEP IT OUT OF GARBAGE DISPOSALS, it gives me great pleasure to announce that MEALS WORMS like spent grain.

I have been raising meal worms for a number of years to supply food for my menagerie ranging from toads to bats. Two months ago I started a colony on spent grain. I started the colony with 10 pupae so that they would have to change into adult beetles, mature, have sex, lay eggs and hatch with no other source of food than spent grain.

Well, this morning I found a zillion little worms which seems to prove that there is no end to what one can do with this stuff. The only problem is that most of the moisture must be removed so it doesn't rot but that is easy enough to do.

So don't be surprised if your local brew pub starts to offer meal worms along with it's beer and beer bread. Watch for some really creative marketing. Something along the lines of:

"Yuppie Micro-brats, go great with our micro beer, eat 'em by the hundreds and never get that stuffed feeling".

Then, I really get excited thinking about McMicro-brats.....

Over one million sold, every minute, in fact, on every bun. To hell  
with  
malt mills and videos, my future is in worms..

From: Rob Nelson <70206.1316@compuserve.com>  
Subject: I'm Dirt!

A few posts ago, I mentioned that I was able to jam 10 lbs of spent grain down the garbage disposal. This brought about some discussion about the environmental soundness of this practice. I checked with our local sewage treatment plant and was saddened to learn that my practice of flushing 50 pounds a month was responsible for the extinction of the Pacific Sockeye Salmon run. Additionally, several of the local dairies have reported three headed calves. Elementary IQ test averages have dropped to 41. Acid rain has been reported in the Cascades. I'M DIRT! I DON'T DESERVE TO LIVE! KILL ME NOW BEFORE I FLUSH AGAIN!.

Seriously, I deeply and sincerely thank those who straightend me out. My spent grains will now be adding dietary fiber to some local hogs.

On the subject of REAL HOMEBREWING, let me add my own \$0,000.02. I've developed a system that has won many regional contests that involves neither extract or mashing. The tools are ammonia, a bottle capper and a magic marker. I soak some fine commercial beer bottles in an ammonia solution, scrape off the label, re-cap the bottle with a generic cap and write a cryptic code on the cap. I'm improving the technique by super-chilling those beers that come in easily recognized bottles so that I may decant them into standard long necks. I sent a McEwans, an Anchor Steam, a Budweiser and a Sierra Nevada Stout to the AHA nationals this year. I'll see you in the winner's circle.

Rob Nelson, Seattle Brews Brothers.

Date: Monday, 13 Apr 1992 09:30:32 EDT  
From: ml4051@mwvm.mitre.org (John DeCarlo)  
Subject: Extract vs. All-Grain

Well, I usually compare cooking and brewing using something like the following:

Extract brewing can be anywhere from using a cake mix to which you add water and bake (simple kits or brewbags) to buying the flour, eggs, etc. separately and mixing them up to bake (using unhopped extracts of specific types to which you add hops and all the other ingredients you need).

All-grain brewing can be anywhere from simply grinding your own flour to growing and making your own flour and raising your own eggs, etc.

In essence, the usual "making a cake from scratch" is still more like extract brewing than all-grain, if your "scratch" is store-bought flour, eggs, butter, etc.

Oh, and BTW, those interested in the environment and in growing plants, but live in apartments, can get indoor composters that don't smell for composting your grains.

From: wiley@wiley.b11.ingr.com (Dave Wiley)  
Subject: Homegrow hops vs quality control

A little philosophical math for you:

growing my own hops for the first time (Yay!)  
+ an article by Quentin B. Smith - "Matching Hops with Beer Styles"  
+ a temporary shortage of homebrew  
-----  
= an epiphany

One passage in the article read as follows:

"All suppliers should provide this [alpha acid % of hops] to you as as a standard practice. You cannot consistently brew duplicate or award-winning beers without it."

For the record, I agree, but this particular passage left me with a dilemma. I am growing my own hops to improve the flavor of my beer, but by doing so I am drastically limitting my ability to finely control hopping levels. Of what value is better beer if I shall never see my name in lights above the AHA?

I needed to think. I needed a homebrew. I had none. My gaze wandered over to where four entries for The National Homebrew competition lay securely trussed for shipment. Hmmm. Ah, what the hell. I ripped open the "Club Porter" and commenced to drink it on the spot. This was satisfaction. Pure black manna. Isn't this why I brew? Do I really care to match what someone else's opinion on what perfect porterness is?

The answer is astonishingly simple. Yes and no. Yes, I would like to be able to approximate the canonical beer styles. Yes, I appreciate having a nomenclature so that we can discuss flavor somewhat objectively, and so I have an idea of what to expect before I open a beer. Yes, I enjoy and appreciate the fine feedback I've gotten from judges over the years. In the final analysis, however, I would much rather concentrate on making beers that taste good rather nailing particular styles consistently. If choosing to grow my own hops means diminishing my chances for national accolades, so be it. On this occasion I choose to relax.

Whee! I'm free!

I think I'll celebrate by buying some oak chips. :-)

Subject: Disposing of spent grains

Last friday I had the exquisite pleasure of touring the D.L. Geary Brewing Company in Portland (Maine, not the other one :), producers of such nectars as Geary's Pale Ale and Hampshire Ale. I don't have time today for a complete review, but one will be following shortly.

Anyway, to get to the nub of my gist: they brew almost every day and each brew uses 1000 lbs of 2-row barley (I'm getting goosebumps just thinking about it :). I asked the guide/ass't brewmaster what they did with all their spent grains. He said that a local farmer comes by every brewing day in his pickup truck and takes it home to his cattle.

Just adding a data point.

Subject: Stuck (no start) fermentation

Dear Homebrewers,

First of all, thanks to all for their experience and advise regarding my latest batch of "Propensity Lager." I bottled the batch last Thurs. and all went relatively well. Many suggested that, because I was using honey (as called for in the recipe) I might wait the full 2 weeks before bottling, if not a little longer. But I just couldn't wait, so I bottled... And, to make a long story short, my impatience got the best of me again on Sunday and I snuck a peek! Peoples, let me tell y'all it was great! Beautiful, even! The head was delicate and golden, with persistant retention. Yes it was a bit premature and not quite cleared, but if what I tasted was any indication greater things to come... Well, suffice to say I may never buy commercial beer again... Well, OK, maybe a rare import now and again... Once or twice a week... Three times at most... on the weekends... or on an odd Thursday... But never at dusk!

Anyway, onto the subject at hand.

I brewed up another batch the day after bottling the Lager (Hey! I don't want to be caught empty handed). I forgot to bring in the recipe, but it's something like this:

- 1 lb pale malt extract (dry)
- 1 lb corn sugar
- 2 oz freshly grated ginger root
- 1 oz spruce essence (approx.)
- 1 Tbs lemon juice
- 1/4 oz Tett. hops (boil) (they were leftovers)
- 1/4 oz Tett. hops (finishing)

I boiled first three ingredients with Tett hops for 1/2 hour, added the spruce, lemon, and finishing hops for the last 2 mins. Cooled and then strained into carboy and pitched 1 pkg dry Doric Lager yeast. Oh, yeah, the total volumn of this brew is approx. 2 1/2 gals., and it's been sitting in my pantry since Friday. And, herein lies the problem: it's just sitting there! There's been NO activity whatsoever - no kreausen, no bubbles through the lock... All's quiet on the yeastern front, so to speak. Well, almost. This morning (Mon.) there was slooowww activity through the lock, but no Kreausen forming, nor bubbles in the wort.

Now, when I pitched, I had just cooled the wort, and strained it into the carboy. There was a LOT of splashing, and a subsequent foam at the surface. I pitched on top of the foam, then carefully swirrlled the brew to distribute the yeast, but I think this is where the problem is. Also the temperature's been a constant 65 F, and I've sinse \*gently\* agitated the wort a few times to wake up the yeast. This seemed to work, if the activity this morning (if it can be called this) is any indication.

So, knowledgible illuminati, PLEASE help!! I'm as stuck for direction as my fermentation is. Plus, it's going on three days, with only MINIMAL fermentation. As time is of the essence, please e-mail me directly, or even call me at home [(312) 275-5929]; I'm nearing panic! (Then again, maybe it's time for another sneak preview of the Propensity Lager and not worry :-)

Thanks,

John

From: Matthias Blumrich <mb@Princeton.EDU>  
Subject: Stuck ferment?

I brewed a pale ale using M&F extra light extract and Whitbread ale yeast Saturday night and have it in a 7 gallon plastic primary with a blowoff tube. By last night the ferment appeared to be stuck because there was no more bubbling in the blowoff. When I opened it this morning there was about a 1 inch head of krausen (sp?) on top. A few minutes after closing it, I heard the plastic lid flex and then it started bubbling away again for a few minutes before stopping. Could it be that the pressure flexes the lid and breaks the seal, and the CO2 is escaping from the sides? Note that there is a lot of pressure inside because if I just press down lightly anywhere I get bubbles. Could it be that I didn't aerate it enough? If so, what can I do? Any help is appreciated.

Subject: Propane Burners...

The 125K BTU "rocket" burner described by Tony Babinec (he and I ordered them from Alternative Beverage at the same time) and Chris Campanelli is also known commercially as a "Cajun Cooker." If you've ever seen this name used, now you know they are one and the same.

As Tony mentioned, this burner really produces a fast, rolling boil. It has easily cut at least an hour off my brewing time. Some use it strictly for the boil, but I have had great results using it during mashing as well. You have to make sure to use the baffle and be careful about the intensity of the flame, or you risk some burning and caramelizing. A vigorous mixing of the mash to spread the heat seems to prevent this, however.

Also, for some reason, the burner is painted black. I recommend that you try to burn off much of the paint before using it, or else you'll have a very messy clean-up, even with stainless.

Subject: Kegging the inexpensive way.

I just got my catalog from St. Patrick's of Texas and saw their keggling system was only \$155. I called to make sure it wasn't a misprint and found out that not only was it correct, but if I would settle for a reconditioned regulator, it was only \$140!

This is outrageous. I'm saying goodbye to my bottles, right now! (Anyone want six dozen Grolsch bottles, not quite free?)

I notice St. Patrick's other prices are very good, too. This one, however, was too good not to share. They're at 512 532-9045.

I'm not going to join the stampede to make sure you realize I'm not connected with them. It doesn't make any difference. The deal is real and mentioning is of benefit to all. So what if I get \$175 for each system they sell. [grin]

Subject: Pale Ale

Greetings...

A friend and I have recently started brewing again (yesterday, in fact!); we haven't done a batch since college. (In our case, that's only a couple of years, but that's beside the point...)

Anyway, we were wondering if anyone had a good recipe for a Pale Ale, such as Bass. We have the "Complete Joy of Homebrewing," which includes a recipe for "India Pale Ale," but have never tried it. Has anyone had any success with this? Is there anything better out there?

Keep in mind that we are still at the novice stage... most of our brews have been made from a combination of canned and dry malt extract, adding some grain now and then with some success.

Please respond directly, if possible; I'll post a summary to the list later.

Regards,

From: "Ken Schrinier" <KENS@saturn.uark.edu>  
Subject: Boulevard Beer

I spent Friday in Kansas City, Kansas. I had visited boulevard brewery several years ago when the only beer they made was the pale ale, and only in kegs. They are now up to at least four different types. (That's how many the liquor store I was in had.) I of course bought a six pack of each. For the low price of \$5.79 a six pack.

The six packs were actually little boxes that completely enclosed the six dark brown bottles. They are using screwtop caps. Boxes to keep out the light, brown bottles for the same, screwtop caps. Are they trying to make me like this beer before I even open it?

Pale Ale. Just like I remember it. A little fruity. Three types of hops. Cascade for aroma. Can't remember the other two. Good maltiness and good mouth feel. Was great with shrimp. Dark golden color. Very nice.

Irish Ale. Fruitier. Tangier. Darker (a little.) It seemed like a variation of the Pale Ale. I wouldn't give this to non-home brew friends, its taste is a little farther from their palatte path than they be willing to accept, or appreciate. Was great after a pale ale. A little drier than the pale ale.

Wheat Beer. Why does every brewery in Kansas feel compelled to brew a wheat beer? Unlike Free State Brewing in Lawrence KS., boulevard brew actually has an enjoyable wheat brew. Very clear, very light. Less carbonated than either of the ales. The six-box said it is brewed with 25% soft red winter wheat grown locally. Also mentioned that it used two types of yeast in the fermenting process. Do they do things right or what?

Bully Porter. Stupid name, but another great beer. A little light colored for a porter (I thought). It was light brown to amber in color. Very smooth. could easily taste the chocolate malt written about on the six box. The taste was not overpowering though. Great with a few peanuts. It had a strong enough hop nose to balance the stronger malt taste. Overall, it was great also.

All of the above are shipped with a label that has Best If Consumed By:. The lady at the liquor store said that they wouldn't let them have the beer past the date either. What a class brewing establishment. \$5.79 a sixer? That seems a ridiculously low price for such quality beer.

Are there other folks out there from the KC area that have experience with Boulevard Beer?

From: korz@ihlpl.att.com  
Subject: Re: Killer head!

Jake asks about a beer which overcarbonates after a while.

There are three common causes for beer to overcarbonate:

1. bottling too soon,
2. infection, and
3. too much priming sugar.

If the beer is only correctly carbonated during weeks 2, 3 and 4 after bottling, then I suspect either reason #1 or #3. I wait till my airlock bubbles less than once every 3 minutes before I bottle. [Note that there are many additional variables such as stuck fermentation due to big, sudden temperature changes, etc., but I won't address them here.] If you are using corn sugar for priming, you should probably not use more than 1 cup.

If the beer is correctly carbonated two weeks after bottling and not overcarbonated for three months, but then begins to overcarbonate, then it's probably reason #2. Reassess all your sanitation.

Al.

Dave,

I can't get you the reference on this since it's in a cookbook at my ex-wife's (Yaaaaaah!), but apparently the Alaskan goldminers (sourdoughs) use to take great care of their cultures, keeping them in their shirts on really cold nights. They also occasionally used them to make beer (?) although I don't know what they used for malt (syrup?. At any rate, even the miners rated this stuff pretty low; one anecdote had a bunch brewing some sourdough beer up in a barrel and drinking it out of the same barrel. One fellow toppled in while trying to dipper out the last bit; his buddies were too befuddled to haul him out and he died. Better stick to small batches! Seems to me sourdough culture includes one or more yeasts and an array of bacteria; if it made good beer then you could achieve "lambics" in places like Alaska, San Francisco and Poland, where the sourdough combination exists in the atmosphere.

>  
The one thing you don't talk about is your fermentation and bottling  
procedure, and this is probably where the problem lies. Sounds to me  
like your beer is simply overcarbonated from (a) too much priming sugar;  
or (b) bottling too soon. Trying racking the beer when the primary  
fermentation is done and letting it clear somewhat in the secondary  
before bottling. When I was having trouble with overcarbonation, this  
latter step helped tremendously and also resulted in a lot less sediment  
in the bottle.

The problem might have something to do with the brewer's licorice you're  
adding as well, but never having used it I don't know for sure. Why do  
you add this? Quite frankly, I don't know any brewers, amateur or  
professional who use licorice. You might try leaving it out entirely.

>  
>  
> without boiling & had no problems or dissapointments. Has anyone done  
a side

Well, one of the marvelous things about the English language is the way  
we can bend it. It's pretty clear from the complete definition given in  
Webster's that it all depends on which part you choose: "to prepare (as  
beer or ale) by steeping, boiling and fermentation or by infusion and  
fermentation." It's clear that here the common denominator is  
fermentation, not steeping. The fact that the same word is used to  
describe the process of makin tea doesn't mean that "steeping" is the  
root of brewing. Let's not scramble around trying to find the  
connection, for instance, between "posting" a letter, "posting" a new  
lieutenant, and "posting" on a horse.

>From: matth@bedford.progress.COM  
>Subject: Disposing of 10 pounds of spent grain

>While putting the grains into the disposal might seem like a bad idea,  
in  
\*most\* places it's not a bad idea. The drain pipe from the sink goes to  
the  
same place as the rest of the house, meaning a treatment plant. It's  
far better  
for the environment (since that appears to be the issue here) to have it  
go  
there than to:

Keep in mind that treatment plants are just that. They are an effort  
at  
best to remove some of the waste but a good deal still gets through.  
Furthermore, they are very expensive to operate and you are asking  
others to  
pay for your irresponsibility.

Finally, in many cities and Chicago in particular, whenever there is a  
heavy  
rainfall, the whole system is bypassed and the garbage disposals go  
directly  
into the river system.

>> 1) Put it in a garbage can

> Where it will most likely end up in a landfill where it could take  
years  
to decompose.

All the landfill does is raise the elevation of the landscape. It does  
not  
matter from a pollution point of view if the grain never decomposes if  
it is  
in a landfill.

>Going through the treatment plant will take days, not years.

That's only because it is a compromise. If it goes through the sewer  
system,  
some of it WILL end up in the water system.

>> 2) Find a friend with a garden.

> I like this idea, but 10 pounds is an awful lot when you consider  
that  
it should be mixed with other stuff (grass cuttings, peat moss)... You  
get  
a fairly large pile.

It does not have to be mixed with anything. If simply dumped on a pile, it will disappear within a few months in warm weather.

>> 3) Find an empty lot.

> I'm going to just pretend this isn't on the list

Considering #2 above, this is far more benign than the garbage disposal.

>From: Rob Nelson <70206.1316@compuserve.com>

>Seriously, I deeply and sincerely thank those who straightend me out.  
My spent grains will now be adding dietary fiber to some local hogs.

I find it most telling, that you, the admitted villian, took the advice in the proper spirit but the hate mail keeps flooding in from the lurkers.

>I soak some fine commercial beer bottles in an ammonia solution, scrape off the label, re-cap the bottle with a generic cap and write a cryptic code on the cap..... I sent a McEwans, an Anchor Steam, a Budweiser and a Sierra Nevada Stout to the AHA nationals this year. I'll see you in the winner's circle.

This is quite funny BUT I have often wondered how many people have actually done just that and won. What is to prevent it?

From: Dale Veeneman <dev1@gte.com>

**Subject: Question for Evening Brewers, Morning Rackers**

For all you who brew in the evening, then let things settle out overnight before racking in the morning: when do you pitch - in the evening after things are cooled or in the morning after racking? Since the idea is to get the trub away from the fermenting yeast, morning would be better(?); but is evening pitched yeast at a stage after 8-10 hours that the fermentation is harmed by the presence of trub? The wort temperature would be, say, 60 degrees and have approximately 24 hour lag time.

Thanks,  
Dale

From: ZLPAJGN%LUCCPUA.bitnet@UICVM.UIC.EDU  
Subject: Better Late Than Never?

Dear Brewers,

I suppose it's better to learn a lesson later rather than not at all! The question now is whether or not it's better to have a fermentation start later than not at all - which is the present case with my latest batch of spruce / ginger lager:

(From yesterday's post) "... And, herein lies the problem: it's just sitting there! There's been NO activity whatsoever - no krausen, no bubbles through the lock... All's quiet on the yeastern front, so to speak. Well, almost. This morning (Mon.) there was slooowww activity through the lock, but no Krausen forming, nor bubbles in the wort."

I guess I spoke too soon, 'cuz the fermentation was in full swing by yesterday afternoon! If the lock had a whistle in it, it'd've been whistling Dixie three octaves too high! The krausen's risen to about 1 1/2 inch, and all seems to be taking off well enough!

I guess in this field it's more accurate to say that I've got foam on my face (rather than egg :-) ), but I'll look at this as a learning experience. I suspect that beginners all too often see their yeast as that magic "stuff" which just gets the ball rolling, unaware of, or even neglecting the fact that yeasts are living organisms - maybe even with their own "personalities." At the very least, now I know that each pitching will behave differently; that each wort will brew in a unique way.

Maybe THIS is what being a "real homebrewer" is all about?

Not worrying,

John

ps - I hear the the popularity of "high-water" pants has made a recent comeback here in Chicago!! ;-)

Date: Tue, 14 Apr 92 10:29:05 CDT  
From: tony@spss.com (Tony Babinec)  
Subject: extract pale ale recipes

Steve Davis is looking for pale ale recipes.

The first beer I brewed was a pale ale, and every 4 or 5 beers I brewed since then was probably a pale ale! It's a great style.

Here are two recipes, assuming that you are an extract brewer and have access to good ingredients. After all, good recipe + good ingredients + good process = good beer! The English Pale Ale will be somewhat in the style of Bass Ale, while the American Pale Ale will be somewhat in the style of Sierra Nevada Pale Ale or Anchor Liberty Ale.

#### English Pale Ale

4.5 pounds unhopped light dry malt extract  
0.5 pounds dark crystal malt  
0.5 pounds dark brown sugar

1 ounce English Kent Goldings 60 minutes before end of boil  
0.5 ounces Fuggles 60 minutes before end of boil  
0.5 ounces Fuggles 30 minutes before end of boil  
0.5 ounces English Kent Goldings 10 minutes before end of boil  
0.5 ounces English Kent Goldings 2 minutes before end of boil

dry Whitbred Ale or Munton-Fison ale yeast or  
"Brewer's Choice" Wyeast "London" or "British" or "Irish" ale

1 teaspoon gypsum or "Burton Salts" added to boil water

Notice that the recipe calls for unhopped, light, dry malt extract. Use unhopped extract because you're going to add your own hops. Use light-colored extract because you're going to get some color from the crystal malt. Use dry malt because you can measure it out, unlike syrups. The crystal malt should be "cracked." Your homebrew supply store can do that for you. Steep the crystal malt for 30 minutes in your water at 150 degrees F. Then strain the husks out, bring the water to boil, add the gypsum or salt, and add the dry malt. After the wort has been boiling for 10 minutes, add the first hops and follow the hop schedule indicated above. Hops are English hops. Brown sugar can be added as soon as the boil starts. If you use dry packaged yeast, use the above brands. Others are lousy! Or, if you have access to Wyeast, use any of the above yeasts. If you like the recipe, vary only the yeast, and you get a somewhat different beer next time! Whitbred dry yeast and Wyeast "British" ale are the same yeast.

#### American Pale Ale

5 pounds unhopped light dry malt extract  
0.5 pounds dark crystal malt

1 ounce Cascade hops 60 minutes before end of boil  
0.5 ounces Cascade hops 30 minutes before end of boil  
0.5 ounces Cascade hops 10 minutes before end of boil  
0.5 - 1 ounces Cascade hops "dry hopped"

Wyeast "American" Ale (this is Sierra Nevada's yeast!)

"Dry hopping" consists of adding hops not to the boil but after boil and especially after fermentation. When your beer is done fermenting, you must rack it into a second sanitized vessel, preferably a glass carboy for which you have a fermentation lock. The beer and the hops are both added to that second vessel, and the beer is left from 1 to 3 weeks in the vessel. It isn't fermenting, but it's picking up flavors from the hops. If you don't want to do this, then instead of dry-hopping, add that last hop addition 2 minutes until end of boil. When you turn the flame off, let the beer sit with the lid on for 20 minutes before chilling it and racking it into the fermenter. But, I recommend that you try dry hopping sooner or later, as it adds flavor and aroma that is just right for this beer! English Pale Ale also benefits from dry hopping.

Happy brewing!

Subject: The Beer Game

Are you thinking of opening a brewery? Think again. This is the sobering advice from Professor John Sterman of MIT, who has created the Beer game. The game is designed to illustrate how and why managers invariably go wrong in making decisions in the corporate world. Excerpts follow from a brief mention in the April 1992 OR/MS today:

The result of scientific analyses of thousands of real firms by MIT computers, the Beer game mimics the way companies operate based on a simulated example, in this case a beer factory, distributor and retailer. A member of TIMS (The Institute of Management Science), Sterman and the Beer game were featured in the lead story of the Jan. 18, 1992 business section of The Atlanta Journal and Constitution.

The game can be played as a board game or on a computer. An analysis of thousands of games indicates that all "players" tend to overreact at approximately the same time, either by ordering too much or too little inventory.

"People who run businesses--whether geniuses or morons--tend to make the same kinds of mistakes when faced with similar decisions in similar circumstances. Put another way, of the 85,000-odd firms that went belly-up last year, even a guru like Lee Iacocca probably couldn't have saved very many"

"Many businesses, perhaps all, are all but predestined to fail. This is why the average life span of a big corporation is only 40 years, why one-third of 1970's Fortune 500 companies weren't on the list in 1983, and why three times as many companies as go bankrupt just close up because owners don't make enough profits."

Quotes are credited to the AJC writer, whose name is listed as Hendrick.

Subject: Re: Locusts for Brewing in Illinois

Here in Illinois, the large swarms of locusts come only once every 17 years, and last year was their year. Although I did not try any myself, I understand they were quite tasty deep fried and served with a light creamy dill sauce - similar to a smaller size softshell crab. Best when accompanied by a nice hoppy pale ale. But \*IN\* the beer?!?!?!? ;] ;] ;]

From: "DRCV06::GRAHAM" <graham@drcv06.decnat@drcvax.af.mil>  
Subject: **Comparitive prices for keg systems.**

Here are some comparative prices for keggng systems I did after my post about St. Patrick's of Texas. All systems include a five gallon Stainless soda keg, (reconditioned unless otherwise noted), a five pound co2 tank, two gauge regulator with check valve and gas line. Liquid line with hand held faucet and quick disconnects on all lines.

St. Patrick's of Texas, (with reconditioned regulator), \$140.

Alternative Beverage, \$200.

Beer & Wine Hobby, \$229.

Great Fermentations of Marin, (used keg), \$183.75.

Great Fermentations of Santa Rosa, (New keg, no co2 tank), \$155.

Henessee Homebrew, (new keg), \$250.

The Brewery, (5 gal. Beer Ball, plastic), \$210.

The Homebrewery, \$200.

The Modern Brewer, (1 gauge reg.), \$180.

American Brewmaster, \$177.

Jaspers Homebrew Supply, \$182.

F.H. Steinbert & Co., (new keg), \$202.75.

Williams, \$249. (Maybe less, it's hard to tell from the catalog.)

Well, those are all of the places I could call for free, or nearly so. Looks like there is a great difference between systems, makes it pay to shop around.

Subject: Whoops, double Whoops!

The correct phone number for St. Patrick's of Texas is 512 832-9045, NOT 532. My apologies, both to you and the poor lady who got some pho ne calls.

Now, the second whoops. I said in my post about the very inexpensive kegging system from St. Patrick's that I'm going to get rid of my Grolsch bottles. I have received a flood of responses. I'm so sorry, I'm blind and can't really deal with shipping. Making beer is hard enough! I'll gladly sell them, (cheap) to someone here in New England who can come to pick them up. I already have one New England response, whom I'll make the offer to directly. Other N.E. interests, mail me and if you're the lucky one, (read: if this other gentlepersion isn't interested), I'll contact you directly.

Sorry for the confusion.

Dan

In Homebrew Digest #863, Al (korz@ihlpl.att.com) writes:

>Jake asks about a beer which overcarbonates after a while.  
>There are three common causes for beer to overcarbonate:

- >1. bottling too soon,
- >2. infection, and
- >3. too much priming sugar.

I agree. Regarding point #3, you go on to say:  
> [...] If you are using corn sugar for  
>priming, you should probably not use more than 1 cup.

In my experience, 1 cup of corn sugar to prime a 5 gallon batch is far too much. When I used 1 cup priming sugar I got no gushers but significant amounts of foam. In fact, I routinely had to pour a 12 oz. bottle into a half-gallon glass pitcher which would be foam right to the top. Several minutes later the foam subsides, and the beer can be poured off. As an experiment once, by carefully and slowly pouring the bottle down the side of the glass, I could pour the entire bottle without causing a foam up. I do not like my beer highly carbonated, and resorted to (carefully) stirring the beer with a spoon until the carbonation level dropped to (what I considered) a drinkable level.

I've since cut back to 1/2 - 3/4 cup of corn sugar (depending on the style) or (recently) gyle leftover from the start of the batch. After racking into my primary fermenter, I run the "dregs" through a strainer into another container. I let this settle out, and pour the gyle into quart jars which I "can" in a water bath canner. I use 1 - 1 1/2 quarts of the canned gyle in place of corn sugar solution for priming when it comes time to bottle.

I've also heard tell that the use of dry yeast also tends to produce overcarbonation, but I have no interest in trying an experiment to find out.

You've got leaks around the edges. I have the same problem and  
have solved it by putting Saran wrap around the edge before putting  
the lid on. Works like a charm.

Subject: Pale Ale Request... Followup

I'm making a Romulan Ale. Unfortunately I am forced to use some less than authentic ingredients. It seems the Rihannsu make their drink from a mixture of distilled ale blended with regular ale, the grain base is their version of wheat (grown on ch'Havran) and its blue. My effort is a low hopped wheat wine. The question I have is the blue colour. I have made in the past a blue cream soda using blue food colouring. This tended to cause the drinker to have a blue mouth and also to discolour the lines in my draft system and it left a flavour residue in the lines. Anyone know of a source of blue colour that safe to drink in doesn't exhibit the above mentioned problems. Thanks

From: Bruce Mueller <mueller@sdd.hp.com>  
Subject: Cambridge Brewing Co. review

Well, a couple weeks ago I was in Boston. I'd read the previous reviews of the Cambridge and Commonwealth breweries. I only had time to visit the former. It is located in Kendall Sq., at the corner of Hampshire and Portland, next to a Thai restaurant.

I tried the Tall Tale Pale Ale, which was good and fresh, well hopped (at least flavored--I had a cold, couldn't smell anything) and the Amber, which was OK. The food is quite good. I had grilled chicken, with rojo and negro salsas (the former milder), black beans, rice, tomato/cucumber salad and corn-bread. The last was fair--dry. For those who don't live near indigenous Mexican populations (I'm in San Diego), this is GOOD Mexican food.

The Back Bay Hilton has a decent beer bar, with many micros in bottles and maybe four on tap. Low key.

Adios!

From: florianb@chip.cna.tek.com  
Subject: grain vs. extract

A few HBD's back, some submitters were discussing all-grain vs. extract brewing and commented on the amount of work involved.

I, like many others, started out with extract brewing while renting an apartment in Bend, Oregon. Using extract was very convenient since we had a small kitchen. However, I was continually disappointed with the reproducibility and the lack of variety (not to mention cost) of the brews I produced. For a long time I was hesitant to go "all-grain" since I thought it would be more work and require lots of expensive equipment. I was wrong on both accounts.

I started all-grain brewing after sampling some home brew made by my brother-in-law, who had begun home brewing about 15 years ago and has never brewed using extracts. I was so impressed by the flavor of the beer that I determined to go all-grain as soon as possible. I asked my wife for a larger boiler for my birthday, then began assembling the other things I needed based on what my brother-in-law showed me.

It is not expensive to go all-grain. It only takes a larger boiler (I use a big porcelain pot), a picnic cooler, some length of 1/2" copper tubing, a smaller pot for stovetop mashing, and that's it.

It is not much more time consuming. I start at about 2pm on Sunday, and I'm done by 7 pm on Sunday. Last week, I started a batch of wheat beer at 2 pm and was done by 6 pm. Most of the time during that period was spent standing around waiting. So I played with my kids, worked on the deck, drank coffee, and watched Star Trek. Big deal.

If you find that all-grain takes more time for some reasons, then there are ways to reduce other parts of the brewing process. Like start kegging instead of bottling. Use a wort chiller. Make a starter culture so there is little lag time. And the time required in mashing and sparging can itself be reduced. I have written about this before in the HBD. Maybe I should write a book on improved mashing techniques. Now that's and idea!

Quality? Even the reduced-time techniques I use will yield high-quality brew. Maybe I'm prejudiced, but I enjoy my beers better than practically anything I can buy. Many of my friends have said the same thing. Although this may have more to do with kegging than anything else!

So if you have been hesitating to go all-grain because you are worried about more work, then you are worrying too much! Get bold! Do it! If it doesn't agree with your lifestyle for some reason, you can always go back to extracts. But if you have my experience, you never will.

Florian

I must confess that I'm interested in this thread as well. I still use plastic primaries, and a number of times recently I've had an obviously active fermentation confound me by blowing no bubbles through the f-lock. Fortunately, when using a secondary as well it makes little difference to me; I just rack it when the krauesen's fallen.

I just assumed that I was getting a little leakage at the border of the bucket and lid, but this didn't seem entirely right either, as I could make the f-lock bubble by pressing down in the middle of the lid. In true homebrewer style, though, I relaxed and didn't worry about it. I'm still curious about it, however. Has anyone else seen this before?

Specifically to Matt: Your fermentation probably isn't stuck, especially if you have krauesen. If you're using a secondary, rack when the krauesen goes down as usual. If not, wait'll the foam goes away, take a gravity reading, and gauge bottling time accordingly.

> - Matt -

I used to see this when I was using the 7 gallon plastic primary buckets supplied with so many starter kits. What I found was that I did have active fermentation occurring (as evident by the krausen) but that the seal of the top to the fermenter was faulty. I never tried to use a blowoff with these however (I have used blowoff technique exclusively with glass carboys). I always seemed to have problems maintaining a good seal, plastic is also a pain in the wort to clean and sanitize. Anyways, my two cents would be to chuck the plastic fermenter and switch to glass carboys using the blowoff method. Just a thought.

From: rfozard@slipknot.pyramid.com (Bob Fozard)  
Subject: Simpler mashing system?

I'm interested in simplifying my brewery. I wanna use my sparging bucket to mash in. It's a spigoted 6 gallon plastic bucket with a false bottom (from the bottom of a 5 gallon plastic bucket, with stainless bolts for legs, and a bunch of 3/8" holes drilled in it). I use a hand-made grain bag as an insert, with canvas for the sides and a nylon mesh for the bottom. I made an insulation blanket from a hot water heater blanket. What I would like to do is simply add grains and hot water to this, stir, let rest, and sparge. Also, for a step mash, why not start out with a stiff protein rest, then add boiling water to bring it to conversion temp, rest, and sparge? Or for a decoction, remove portions for boiling then dump them back in. It seems to me that this can easily be used for any type of mash. Anybody else doing things similar, perhaps you picnic cooler guys? I've thought about building a copper-tubing-in-picnic-cooler setup, but I get good results with this bucket, and I wouldn't have to build anything to use it as described. Do you see any problems with this?

Subject: fermenters and seals

A number of people have sent in saying they had problems with sealing plastic buckets. Is it possible they're not locking the lid all the way down? The plastic buckets I've seen have a /very/ /strong/ locking rim (this may be a legal requirement for so-called "food grade" buckets, but some supply shops may be selling something else); prying it off carelessly is a good way to lose a fingernail. I also wouldn't automatically endorse the sealing properties of carboys. I have several 3-gallon carboys (I've been doing tweaking on half batches) with the standard orange soft-plastic caps and have found most cap/carboy combinations don't seal tightly enough to force exhaust CO2 through the fermentation lock; I've used various gimmicks, including props, string around the outside, and plastic washers (made from the seals on 5-gallon water jugs) inside to make a tighter seal, but haven't figured out whether I've run into a bad line of caps or the neck of the 3-gallon carboy is just a hair smaller/shorter.

From: djt2@po.CWRU.Edu (Dennis J. Templeton)  
Subject: Romulan Ale

Micah asks about coloring for Romulan Ale. What comes to mind is Blueberries. Sometimes Blueberries turn red in food, and sometimes stay bluish purple (not as blue as in the movies) I think it's a pH thing. Try it and let us know, it sounds fun. BTW is Romulan ale hopped?

There is a commercial beer that is made with blueberries that I had in Seattle. It was quite good but not enough to make me remember the name. As I recall the color was not very dramatic, and my host told me that they use \*green\* berries. The flavor was nice, and not overpowering.

From: m14051@mwvm.mitre.org (John DeCarlo)  
Subject: Can CO2 be Useful?

Radical question #1: Are air-locks really useful?

Is there any harm in having CO2 in solution, carbonating the fermenting beer? Why not keep all the CO2 in the fermenter, instead of wastefully letting it out in the environment?

Disadvantages: 1) You could exceed the pressure holding capability of the fermenter, causing an explosion or other catastrophic failure. 2) Increased pressure could affect the fermentation adversely. 3) No more listening to "glub, glub".

Advantages: The more CO2 in solution, the less likelihood of oxidizing the liquid when racking (to secondary, bottling bucket, bottles).

So, does any of this make any sense? As background, I use an S-shaped air lock, that came with a little red cap. When I started, I jammed the cap on tight, thinking that was what it was for. But no "glub, glub", so I stopped doing that. But maybe it would be useful after all?

Subject: Kegging Equipment Prices

Kegging Equipment Prices  
Just got a new Superior Products sale catalog today. Here are the prices of a few kegging equipment items that may be relative to the recent discussion on the same topic.

Twing Gauge Regulator	\$34.00
Single Gauge Regulator	\$28.00
Single Valve Tap	\$21.90
Hoff-Stevens 2-Probe Tap	\$13.90
2.5lb cap. Aluminum C02 Cylinder	\$43.00
5lb cap. Aluminum C02 Cylinder	\$49.00
10lb cap. Aluminum C02 Cylinder	\$64.00
20lb cap. Aluminum C02 Cylinder	\$90.00

Superior Products is a national wholeseller of resturant/bar equipment who will sell directly to the public and accepts credit cards for payment. They can be reached at 1-800-328-9800. Standard discaimers apply (i.e. I don't have anything to do with them and don't give a rat's ass whether you do business with them or not.)

On an other note, thanks to all how gave me advice on where to go for beer in and around Munich. I'll write up a beer related summary of the trip and post it soon.

From: Dale Veeneman <dev1@gte.com>

**Subject: Re: Evening Brewing, Morning Racking - When to pitch?**

I received three mailed responses (thanks guys) to the above question. One said pitch after cooling (evening), one said after racking (morning), and one quoted both Miller (pitch in the evening - the trub's oxygen is good for the yeast), and Fix (pitch in the morning after racking off the trub - yes the yeast will use the trub's oxygen, but you won't like what's left over). So the score is 1.5 to 1.5.

I'm off for a week and a half, so I won't be able to follow this until after I'm back, but I've seen arguments both ways and I'm wondering if a consensus is possible (assuming infection is not an issue - which, of course, it can be).

From: Eileen Anderson <EANDERS2%ALB9370%SED.bitnet@CUNYVM.CUNY.EDU>  
Subject: Irish Red Ale

I have two questions: Is there such a thing as an Irish Red Ale beer style?  
Secondly, if there is can anyone give me a good recipe for one? I had an excellent one at the Vermont Pub and Brewery, but I'm beginning to lose faith.  
Whenever I ask the owners of the local Homebrew stores they just give me a blank look and talk about how to achieve the color. I know that there has to be more to it than that, but then again if it doesn't really exist per se....I did peek into Michael Jackson's beer guide and saw Irish Red Ale on his family tree of beers so I'm not quite willing to give up yet. Am I missing something I should knowabout? If you do have a recipe for me, please keep in mind that I'm still brewing with extracts. Thanks for any help you can give me.

Subject: Re: irish moss

Wanpus asks about irish moss and clarity.

I'd like to point out that if your beer is cloudy, it does not necessarily mean protein-tannin (chill) haze or yeast haze. Finings will take out either the protein or the tannin (depending on the type of finings) and chilling for a week will usually help drop out the yeast. If you're using finings and chilling your beer in advance of drinking it (or waiting for gravity to drop the yeast out) and still are drinking cloudy beer, then either you've added a ton of protein (e.g. wheat malt has a lot, so does unmalted barley) or you've got an infection. That's right, certain wild yeasts will never come out of suspension and a bacterial infection can also make your beer cloudy. Check your sanitation.

**Subject: Evening brewers, morning rackers**

In response to Dale Veeneman's post, I've been doing this (letting the cold break stuff settle out, then racking to primary) for the last couple of batches. I have a strong feeling, backed up by two no-ferments, that if you pitch the yeast before settling and racking, you may be throwing away much of the yeast when you rack. It's tempting to want to get that yeast in as soon as possible, but for the best pitching rate I think you want to pitch after you rack to the primary. The risk of infection in the meantime can be reduced if you can chill the wort way down before the settling period.

From: homebrew@tso.uc.EDU (Ed Westemeier)  
Subject: Hops as food

The hops I planted last Spring did OK for their first year, but now they are sending up lots of new shoots, and I can see that the second year will be a fantastic increase in yield over the first.

I went out this evening and culled all but the three strongest shoots from each rhizome, took the culms (all between one and four inches long) in the house and sauteed them gently in a little butter, just barely long enough so they were completely wilted and beginning to soften (I like my pasta al dente, too).

Took them out of the pan, blotted the excess butter with a paper towel, put them on a plate and dug in. WOW!!! All the stories are true! Absolutely DELICIOUS! I would describe the flavor as slightly sweet, slightly salty, definitely nutty. Slightly reminiscent of asparagus, but far superior.

I didn't notice any difference between the blanched ones that had been covered with mulch, and the deep green ones that have been in full sun, so I'm a bit skeptical of the value of "mounding" them.

In short, if you have any room to grow hops around your house, this Springtime treat alone could make it worth your while. Well, no, actually it's probably a much bigger thrill (at least for this brewer) just to be able to say you used your own hops in a particular batch. My experience last year indicated that the ones that got the most sunlight produced the best yields, but that could also be coincidence -- we'll see this year.

>water heater blanket. What I would like to do is simply add grains and  
>hot water to this, stir, let rest, and sparge. Also, for a step mash,  
>why not start out with a stiff protein rest, then add boiling water to  
>bring it to conversion temp, rest, and sparge?

I do that when I use a pretten rest (I only rest when I use adjuncts or  
wheat malt). For example: 8lbs grain; mis with 1 1/4 gal of water at  
135degF; hold at 124 for 30min; add 1 gal for boiling water stabalize at  
152; hold for 1hr sparge. (determining these temps required some  
expairmentation with my system -- I have a water cooler with copper  
tubing-false bottom; you will no doubt need to expairment to determin  
temps  
for your system.)

>Or for a decoction,  
>remove portions for boiling then dump them back in. It seems to me  
>that this can easily be used for any type of mash.

Indeed I have used decoction when my temps from above are off the mark or  
I  
want to mash out.

From: Tom Dimock <RGG@CORNELLC.cit.cornell.edu>  
Subject: Rack/Pitch vs. Pitch/Rack

I can't claim to have tested alternatives, but what I'm doing works for me. After the boil, I counterflow cool the wort and let it settle for two to four hours. I then rack half the wort to my primary (all of this is happening in glass carboys - a 6 gallon for the settle, a 5 gallon for the primary), shake it vigorously to aerate it, add my starter, and then rack in the rest of the wort. I'm a little dubious about leaving un-pitched wort around for much more than a few hours - that was a characteristic of my one contaminated batch. Maybe if you cooled it waaay down.....

Chip> figured out whether I've run into a bad line of caps or the neck  
Chip> of the 3-gallon carboy is just a hair smaller/shorter.

I have a 25 liter acid carboy which I have fitted with one of  
the orange carboy caps that Chip refers to, as well as 5 gallon  
and 3 gallon carboys that take a drilled rubber "cork" (#7 I think).  
I've noticed that with the orange cap, I get a good seal probably  
about 1/2 the time; on the occasions when it doesn't seal I don't see  
any bubbling out of the airlock. I do primary fermentation in the  
big carboy, so I don't worry too much about the imperfect seal,  
but on the smaller carboys (my secondary fermenters) I always get  
a good bubbling seal with the rubber stoppers. Chip, you might  
want to find drilled rubber stoppers for your 3 gallon carboys.  
My small carboy was made in Italy, and imported by Crosby & Baker;  
if yours is similar, it probably takes a #7.

Subject: Re: Irish Red Ale

Eileen Anderson asked about Irish red ale. I do not have Eckhard's book, or Jackson's, but I'll take a shot at defining Irish Red. I think it is a VERY WELL BALANCED ale made with some crystal. Quite easy to make from extracts. The problem is that it takes a lot of work to make a truly balanced beer, so I too would like to see a recipe posted. Please use IBU or HBU if possible, and include precise details on boil times.

Subject: Re: Can CO2 be Useful?

Some have misunderstood my posting. My basic question is:

Are air-locks just wasteful pressure-release mechanisms, or is there a benefit to removing CO2 (say, to keep beer at a certain pressure during fermentation)? Should I keep the plastic cap \*on\* my airlock and forgo the aurally satisfying "glub, glub" to get much more carbonated fermenting wort?

From: mcnally@wsl.dec.com  
Subject: CO2

If you sealed your fermentor, it would either explode or else sustain a pressure high enough to stop fermentation.

Remember that most oxygen is consumed while the yeast is reproducing in the initial stages of fermentation. Thereafter, the constant positive pressure caused by CO2 exhalation keeps any outside free oxygen from entering.

The red cap on the airlock has little spacers inside of it. Unless you pound it on with a mallet, you probably can't seal it. If you did, it would blow off, the airlock would pop out, the stopper would pop out, or your fermentor would burst.

5 lbs of munich malt will turn any light beer a beautiful red,  
but you'll have to mash it. Go for a medium gravity (1.040-1.060),  
no dark grains, easy on the crystal malt, no brown sugar, use  
english hops - fuggles or northern brewer. For an extract version,  
try 2 cans amber malt X, steep 1/4 lb crystal malt,  
1 oz fuggles 60 min, 1 oz fuggles 30 min. .5 oz hallertau finishing  
hops optional (I wouldn't, personaly). whitbread ale yeast should  
work just fine.

Subject: Belgian Ale?

tmsocha@vela.acs.oakland.edu (Tom Socha) writes:

> I recently masde a batch of ale. Using a the best of two recipes, one  
bock  
>and the other trappist ale. Then adding yeast culture from a bottle of  
Chimay  
> Can I enter this under AHA rules as a belgian ale?

You can enter this beer in any AHA category you think is appropriate.  
Many of  
us have brewed targeting one style and ended out with a beer that was  
closer  
to another. While AHA rules prohibit multiple entries in the same  
category/  
subcategory in a competition, there's nothing to prohibit you from  
entering  
the same beer in two completely different categories. In the above  
example,  
you could submit the same beer as a bock and a trappist ale (dubbel, I'd  
imagine), or anything else, for that matter. The Chimay yeast will  
definitely  
produce one weird "bock," but if that's what you want to submit it as,  
there's  
nothing stopping you. Just be prepared for the judges' reactions!

Remember that Belgian Ales come in plenty of varieties (dubbel, tripel,  
saison,  
wit, Flanders Brown, lambic, faro, etc.), so make sure to be more  
specific when  
entering such a beer in any competition. For more info on style  
descriptions,  
the recent "zymurgy" special issue on styles can be helpful, as are  
Jackson's  
books, and Fred Eckhardt's "Essentials of Beer Styles," among others. Of  
course, you can always send me a bottle...

Date: Thu, 16 Apr 1992 13:04:01 -0400 (EDT)  
From: COLE@IRENE.MIT.EDU  
Subject: Assorted

Though I am a novice homebrewer (3 batches) I thought I would put in my comments to a couple of threads from the last couple of digests if only to help other novices like myself.

Regarding the note concerning the clarity of Pale Ale:

I brewed a batch of Pale Ale in my second attempt. It came out quite nicely, but I was unhappy with the clarity, until I poured a bottle of it myself and found it to be crystal clear. The first couple of times my wife joined me and actually poured the beer herself, pouring until the head foamed up too much, then tilting the bottle back to wait for the head to settle and so on. To make a long story short, if I poured carefully so that none of the yeast in the bottle reached my glass, my beer was perfectly clear. This without using any Irish moss, gelatin, or any other clarifier. The recipe was pretty basic, 3# extract syrup, 3# dried extract, pellet hops. The ferment was single-stage with no rack off the trub, though I filtered the wort to remove hops, trub, break stuff etc...

Regarding a note about priming using malt extract:

I have done all three of my batches with extract instead of corn sugar. Having not done it with corn sugar I can't compare the end result but I am happy with the end carbonation except that I find it takes 2.5 to 3 weeks to develop the appropriate level of carbonation. My local supplier said that he found extract to take longer when carbonating and also claimed that with extract the amount of carbonation obtained was extremely temperature dependent. I don't have enough experience to verify his claim, does anybody else ?

A question about dry-hopping:

I have noticed lately that many of the subscribers to this digest extoll the virtues of dry-hopping. What are the relative advantages/disadvantages of dry-hopping vs. adding flavor hops late in the boil ? On my batch of pale ale I used Hallertau hops (unusual I know) for both bitterness, flavor, and aroma at various stages in the boil. I was quite pleased with the results and am somewhat unwilling to switch to dry-hopping without a good reason.

Sorry for the long post and thanks to all of the experts who have provided me with useful info.

P.S. I am an extract brewer who plans to switch to mashing at some point in the future. I will switch over when I feel that I have a handle on the multitude of variables which can be influenced using various extracts, hops, yeasts, specialty grains etc... In spite of the lack of control over the extract there are many other ways to influence the quality of beer.

MINI FLAME: It's interesting how Jack's comments about extract/grain brewing mirror those of Jeff's

about brewing with liquid/dry yeast ...

Yes, I'm back to germany again. Just in case I didn't tell you, my job in Austin was just a holiday jobs to get some more cash in ... (poor student and so ...).

>Yes I have been brewing my own Beer for about a year now I am trying to reproduce

>

>2 famous american beers:

>

> Samuel Adams <- No comments it is famous regardless of how it is - John

> &

> Anchor Steam

>

>Have you ever had either ?

Well, I know both of them. 'Samuel Adams' is said to be the best local beer in Boston (althought it's not from MA ;-)) And Anchor Steam was the only beer

I drank way back in Texas that had an acceptable acohol precentage ;-)) A friend of mine brought it with him from milwalky.

>what is the QUOTE in German at the end of your e-mail ?

>

>Translation ?

That's very funny. It's about the best commercial I ever saw for the most discusting product I ever drunk. It's about a commercial (series) for an alcohol free beer (Clausthaler). The history of these commercials is so funny. Their first spot was like this:

"Clausthaler, all a beer needs"

Nobody thought this was cool. Nobody was really intrested in alcohol free stuff. So they changed their commercials to a new text:

" always ? ... no, not always ... but more often "  
(and then the wellknownline from above)

Well, this was quite good now, but not good enough. The spots were to boaring. Only these cool guys (in suits etc). So they changed it again but

this time did a new spot with the old text:

First you'll see a reporter in a bar, asking a guy standing there and drinking (kind of family father, everyday guy).

Reporter: "Why are you drinking Clausthaler ?"

Man: "It does the right thing."

Reporter: "What ?" (has no idea what the man meant)

Man: (looking down to his dog on the floor)

"He now follows my commands"

Reporter: (a little bit astonished)

Man: (talks to his dog)

"Lie down !"

Dog: (just sits around, and tries to look in the opposite direction)  
Reporter: "Always ?"  
Man: (little bit sad)  
"No, not always ..."  
Dog: (looks up to his master and lies down)  
Man: "... but more often"  
Reporter: (looking to his audience)  
"Clausthaler, all a beer needs"

The last few lines of this conversation are taken for my signature. It's a kind of insider joke ;-)

I've made beer with blueberry juice - one quart juice in one gallon  
beer. It did not turn blue, just a slight purplish tint that you  
wouldn't notice if you didn't know it was there. It didn't taste much  
like blueberries either, unless I added a little sugar at drinking  
time.

Under AHA rules you could enter it as an American light lager. It  
wouldn't  
fit the style and would get a terrible score, but you could do it. Heck,  
you  
could enter the same beer in every category they have and hope for the  
best.  
Actually with beers on the fuzzy line between styles, many people enter  
them  
in both.

I feed my spent grain to my fowl (chickens, ducks, geese) and they can't seem to get enough of it. 10 pounds will disappear in under 15 minutes - they actually fight over it! They prefer it over their regular layer pellets and cracked corn. They will also eat spent hops, but do not like them as well as the grain. I think the residual sweetness and the softer texture is why they like it better than regular feed.

Subject: re Can CO2 be Useful?

>Advantages: The more CO2 in solution, the less likelihood of oxidizing the liquid when racking (to secondary, bottling bucket, bottles).

Not clear; in the classical chemical approach, the amount of dissolved CO2 would have no effect on the capacity for O2, and I think that even a quantitatively accurate approach shows little interference. It is possible that having CO2 coming out of solution whenever the beer is moved would keep the O2 away, but I wouldn't bet on it.

Also, keeping all the CO2 in solution could make the wort too acidic even for yeast (which likes a lower pH than most bacteria)---not sure of this.

The fermentation lock certainly isn't going to keep in very much of the CO2; it probably can't take more than a couple of PSI. The carboy is stronger, but I wouldn't care to bet on its being able to take a lot of pressure. Fermentation generates a LOT of CO2; in round numbers, for every 1% v/v alcohol produced, a volume of wort will generate four volumes of CO2. Consider the effect of 80-120 gallons of CO2 in the .5-1 gallon headspace of a typical carboy.... Note that in practice quite a bit of CO2 stays in solution anyway; it's significantly soluble in water.

From: korz@ihlpl.att.com  
Subject: SNPA

Has anyone else noticed a change in the bouquet of Sierra Nevada Pale Ale?

I bought a sealed case in mid March on which the date was "FEB 92" so it could not be old. SNPA was not available in my area (SW suburbs of Chicago)

for a few months and now that it has returned, the bouquet is not as I remember it. The way I remember it was, when you opened the bottle, you could smell fresh Cascade hops and when you poured, the whole room filled with a fresh Cascade smell. The FEB 92 bottles have a stale, wet-cardboard

aroma (not sherrylike as in Chimay Grand Reserve which can be attributed to

the porosity of the cork). Has anyone else notice this change? Could the

beer have been damaged in shipment (freezing more likely than being too hot)?

Could this be attributed to a poor 1991 Cascade harvest? I know that the

Summer of '91 in the midwest was very dry -- maybe the Pacific NW has similar

problems?

To save bandwidth, email to me, and I'll summarize.

From: korz@ihlpl.att.com  
Subject: Pale Ale Recipe

Here's my foolproof Pale Ale extract+crystal recipe.

It has a better nose than Bass, but a little less than SNPA (the one I fondly remember). The Wyeast #1028 "London Ale" imparts a bit of a woody flavor. It has had various names throughout it's various re-incarnations, but let's call it: "AL'S PALE ALE."

#### AL'S PALE ALE

5 gallons -- extract+specialty

3.3 lbs. Munton & Fison Old Ale Extract (throw away the yeast!)

3.0 lbs. Laaglander Light Dried Malt Extract

0.5 lb. Crushed Crystal Malt (40 Lovibond)

1.0 oz. Clusters Pellets (60 minute boil)

0.5 oz. Fuggles Pellets (15 minute boil)

1.0 oz. Goldings, Fuggles, Cascades or Willamette Whole Hops (dryhop)

1/3 oz. Wines Inc. Burton Water Salts

5.5 gal. Soft Tap Water or Distilled Water

Wyeast #1028 "London Ale" yeast

5.5 oz. (weight) Laaglander Light Dried Malt Extract for priming.

OG=1046

FG=1014

#### Comments:

Hop rates based upon a \*5.5 GALLON BOIL\* -- if you do a partial boil, you need to increase the boil hops to compensate for the higher boil gravity. See the Zymurgy Special Issue on Hops for the compensation formula. In any event, boil all the water to sanitize it and drive off any chlorine.

Steep the crushed crystal malt in a grain bag in the water as you bring it from cold to 170F, then remove. Don't boil the grains! I use two polyester hop bags, one for each addition, to simplify removing the hops after the boil. The wort must be cooled to 70 or 80F before aeration. I use an immersion chiller, which brings it from 212F to 70F in 15 minutes, and then pour the beer through a large funnel into the fermenter on top of the yeast.

I recommend the blowoff method of fermentation -- non-blowoff versions of this beer have tasted harsh, astringent and too bitter.

Primary fermentation: 3 weeks in glass at 66F. Dryhops added directly into fermenter (no hop bag) after kraeusen falls (about 4-6 days). No secondary. Boil the priming extract in 16 oz of water for 15 minutes to sanitize.

If you don't like the woody taste, try substituting Wyeast #1056 American

Ale yeast, but the FG will be different.

Subject: Cooperative Micros?

I have a question for any of you who have closer ties to micro-breweries than I do.

One of our marketing folks approached me today and said that they are planning a celebration for a particularly successful product of ours and want to get 2000 bottles of beer with our own labels on them. Does any one know of a micro-brewery, that would be interested in putting our labels on 2000 bottles of their beer and then selling it to us?

Our plant is in the Boston area.

I will be invited so I am naturally interested in maximizing the quality of the beer!

Please e-mail any info you have. Thanks!

From: David Suda <suda@barley.Colorado.EDU>  
Subject: Many mead questions

My friend Susanne is writing an article on mead, and she's interested in the personal experiences and anecdotes of HBD readers. She would appreciate

your responses to any or all of the following mead-related questions:

- \* What flavor/aroma/clarity trade-offs have you experienced for boiling vs. not boiling the honey?
- \* What type of honey is best for making a smooth traditional mead? What type of honey is best for making a melomel or metheglin with "character"?
- \* What is the most attenuative yeast? How does the attenuation of various yeasts compare?
- \* Is sugar level tolerance relevant for mead yeast? That is, are some yeasts inhibited by the high OG of meads? Which ones?
- \* What water additives do you use and why? Why add gypsum?
- \* Does using irish moss produce a significantly clearer mead?
- \* What are some good regional honey suppliers?
- \* Tell about any failed experiments. (Yes, we know about unboiled prickly pear mead.)

Thanks for your help!

Please reply to:

> I've noticed that with the orange cap, I get a good  
> seal probably about 1/2 the time.

I have always been told that the standard orange 2-spout carboy cap is made specifically for the 5-gallon carboys marked Made in Mexico. It works well on my three. But I have another one made in Canada, and it doesn't give a good seal. Drilled rubber stoppers definitely seem to be the way to go for anything but the 5-gal Mexicans.

It's not too late to plant hops for this year in northern NJ, but only just.

Plant your rhizomes (order from any decent supplier, such as those who advertise in Zymurgy), but make sure you keep different varieties at least 6-8 feet apart. Those roots really spread out under the surface and before you know it you might not be able to tell which shoots are coming from which variety of root!

Plenty of sun seems to work best.

From: Bob Hettmansperger <Bob\_Hettmansperger@klondike.bellcore.com>

Subject: RE>fermenters and seals

RE>fermenters and seals

I just bought an orange cap for my carboy (I like the idea of having two openings during blow off). I checked the seal by putting it on the carboy and trying to blow as much air as I could into the carboy through one of the holes in the cap. I wasn't able to force any air to leak out the sides, so I'm assuming I can get a decent seal. We'll find out after this weekend...

>#2.

I had a batch with some gushers but no apparent infection. After repeated sampling :- ) I noticed that while some gushed, many others had little or no carbonation. Casting my thoughts back to a frenzied exam-week evening of bottling I came to the conclusion that my priming sugar had probably not been evenly distributed through the beer; some bottles got too much sugar and some got too little.

>>copper tubing, a smaller pot for stovetop mashing, and that's it.  
>  
>What about a scale to weigh the grain? And a grain mill? I live out in  
>the boonies and mail order almost all my ingredients. I would have to  
>get a grain mill. How do you get by without these two pieces of  
>equipment?

I also live out in the boonies. In fact, the area I live in in Central Oregon is called "Boonesborough." It's half-way between Bend and Redmond. The water here comes from a deep well and is perfect for lager.

I found both the balance and the grain mill (Corona) at second hand stores. The balance cost \$7 and the mill \$15. It takes some looking around. Sorry, I should have mentioned these also. Still, even if you have to buy them new, you will win in the long run. A half-case of regular store-bought US beer is about \$7 now. A six of micro is at least \$7. Considering you get over two cases of 12 oz bottles from 5 gallons, home brewing makes up the difference really fast. The equipment cost is trivial compared to six-months worth of buying commercial brew instead of all-grain brewing.

WORLD'S LARGEST HOMEBREW COMPETITION SETS TONE  
FOR 1992 NATIONAL HOMEBREW CONFERENCE

Boulder, Colo.-- The American Homebrewers Association today announced that the National Homebrew Competition, the world's largest competition of its type, broke all previous records for participation.

To accommodate the vast number of entries, more than 2,200 in all and 635 more than last year's 1,565 entries, the National Competition was broken into four regional first round judging sites for beer and one site for sake and cider. The competition was hosted in the West by Anchor Brewing Company in San Francisco, Calif., in the Rockies by Boulder Beer Company in Boulder, Colo., in the Midwest by Goose Island Brewing Company in Chicago, Ill., and in the East by Boston Beer Company in Jamaica Plain, Mass. Sake and cider, both first time categories at the National Competition, were judged at F.H. Steinbart in Portland, Ore. and Boston Beer Company in Jamaica Plain respectively.

"The host breweries make the whole Competition possible," said Karen Barela, AHA vice president. "If the breweries didn't open their doors to us and support homebrewing as much as they do, the size and interest in the National Competition would be much more limited. The really provide an incredible amount of support for homebrewing."

The National Competition provides an opportunity for homebrewers to receive unbiased feedback on the quality of their beers, mead, cider and sake from a panel of trained judges certified in the Beer Judge Certification Program. Beers, meads, sakes, and ciders are judges according to style. In the beer judging alone there are 24 different categories and 57 different subcategories.

With 2,200 beers, meads, ciders and sakes distributed across the country and ready for judging, entrants eagerly await the May 8 announcement of which entries have been selected to go on to the second round. Both the second and final rounds will be judged at the AHA National Homebrewers Conference June 9 to 13 at the Marc Plaza Hotel in Milwaukee, Wis.

National Competition winners as well as the Best of Show (single best beer), Ninkasi Award (brewer who receives the most points) and the Club High Point Award (homebrew club that has entered the most winning entries

throughout the year), will be awarded at the National Homebrewers  
Conference  
Grand banquet and awards ceremony on June 12, 1992.

Subject: Shipping Beer Across America

In HBD 866, bliss@csrd.uiuc.edu (Brian Bliss) mentioned:

>...Beer across america sent this one out last month, and it's been my..

.  
^.....^

I don't know if I dozed off during some earlier mention of these folks on HBD, but I 'accidentally stayed awake for it' this time. Faster than this Vermont weather(\*) changes, I've discovered the following:

- --B.A.A. is (indeed) to beer what BOMC and POMC are to books and lingerie.
- --The monthly cost is \$13.75 plus \$3.xx s/h in Illinois, and \$7.xx s/h to the rest of the USA (oops, forgot to ask about canada, etc).
- --Each month, a six-pack each of two beers show up on your porch via UPS.
- --Their phone number is 800-854-BEER, (854-2337), and yes, they'd gladly send me a brochure.

NOTE!! Twice I've mentioned interstate shipping of beer. Since there seemed to never be a full resolution on that problem here on HBD (or I've missed that text, too), I asked the guy at B.A.A. about how they work with UPS.

They ship via some small-packet airfreight carrier (I forget the name) to the state of the addressee, to a UPS drop point. Then UPS carries it to the door. This way, UPS doesn't cross state borders with beer. While I'm curious about how flying 34000 feet above the stateline succeeds where UPS ground fails, this does suggest alternatives for shipping beer, doesn't it?

- --Darryl the younger ----- D\_Davidson@uvmvax.uvm.edu

Disclaimer: if a disclaimer becomes necessary, I will INSIST this was fiction.

In the interim, I hold no economic interest in B.A.A. or the Women's Christian

Temperance Union.--(\*) we rec'd 2" of snow last night in Burlington :-(

Date: Fri, 17 Apr 92 19:13:11 -0700  
From: Nick Cuccia <cuccia@eris.berkeley.edu>  
Subject: Relaxing, not worrying, and having my first all-grain...

Last month I decided to go for it. Here's my recipe for Blackout Brown Ale  
(named after the storm-related blackout that happened while making it):

5 Gallons

7# Klages Malt  
1/4# Chocolate Malt  
1/4# Patent Malt  
1/2# 80L Crystal  
1 oz Willamette Hops (3.8% alpha) (one hour boil)  
4/5 oz Perle Hops (8.5% alpha) (30 min boil)  
1/2 t Irish Moss (15 min boil)  
1/2 oz Willamette Hops (3.8% alpha) (dry hopped)  
Wyeast English Ale yeast  
3/4 c Corn sugar (priming)

I used Papazian's temperature-controlled mash:

30 min @ 122 F  
90 min @ 155-145 F  
sparge @ 170 F

Total boil time was one hour.

3/22 Cooled; pitched yeast. Initial gravity: 1.042  
3/28 Racked and dry-hopped. Intermediate gravity: 1.012  
4/6 Primed and bottled. Final gravity: 1.008

One word: Mmmm! I was aiming for an English mild, and missed--too dark and too hoppy a nose for style. Nice body, with a good balance between the malt and the hops; the first thing that hits you, however, is the Willamette nose.

Looking back at the process, I'm surprised at how easy it was (even with thunderstorms and blackouts while it was going on--thank your choice of supreme being for gas stoves).

Cheers!  
- --Nick

Subject: CO2 & Yeast Cell Walls

Hi All,

I'm not an experienced enough brewer to do more than speculate, but:

The idea of having all of the pressure build up in the fermentor because the CO2 may be a good thing leads me to ask:

Wouldn't this break the yeast cell walls? I mean the argument for using a hydration step in water rather than in wort is because of cell damage. So, wouldn't the pressure be as bad for the yeasties as tossing them straight into wort for hydration purposes?

. . . Unless its because once in the wort and reproducing they grow stronger - being already hydrated an all . . .

Just a thought,

Dave - bell@convex.csd.uwm.edu

|>the same 'off flavor' you describe. I haven't been able to find liquid  
|>yeast. My local Homebrew supply shop doesn't stock it or sell it. Where  
|>do you get your yeast? If you need to mail order it, could you provide  
|>me with an address I can order from?

I often get my liquid yeast mail order from The Frozen Wort, at P.O. Box 988, Greenfield, MA. 01302. The phone number is (413)773-5920. The guy who runs it is Charlie Olchowski, a very nice guy. He's also head of the Valley Fermenters, the homebrew club for the Connecticut River Valley area (in Mass.). I phone my orders in & he bills me with the shipment. He stocks all the Wyeast varieties.

Another potential source for liquid yeasts is Sierra Nevada beers. Buy a six, pour off all but the bottom into a pitcher, and then pour the bottom slurry from the bottles into a sterilized vessel. Add some pre-sterilized starter wort (say 1 cup extract in 1 qt. water), an air-lock, and let that go for a couple days. Once the bubbling slows down or stops, it can be pitched in your full batch. A friend does this regularly; the Sierra Nevada yeast is actually the same as one of the Wyeast varieties.

Of course, any commercial beer that has yeast on the bottom can be prepared this way.

From: Todd Enders - WD0BCI <enders@plains.NoDak.edu>  
Subject: Alt

Although I can't quite claim that this is an "authentic" altbier recipe (wrong yeast), it *is* good, and it would probably be just as good with Wyeast #1007 (German). Enjoy!

4# US Two Row (Klages/Harrington)  
3.25# 10L Munich  
4 oz. 80L Crystal  
8 oz. Wheat Malt  
1/2 oz. Black Patent(just for color :-)  
1/2 oz. 5.5% alpha Willamette (boil)  
1/2 oz. 6.1% alpha East Kent Goldings (boil)  
1 oz. 2.9% alpha Hallertauer (finish)  
Wyeast #1056 (American Ale aka Sierra Nevada) yeast  
2/3 C. Corn sugar (for priming)

Mash in: 11 qt. water @ 137F pH 5.2  
Protein Rest: 30 mins. @ 131F  
Conversion Rest: 60 mins. @ 155F  
Mash out: 5 mins. @ 168F  
Sparge: 5 gal. @ 170F

Boil: 90 mins.  
Hops: 2 additions, 45 & 10 minutes before end of boil.

OG: 1.047  
FG: 1.012

This is a well balanced brew. To be closer to authentic, you should age it for a month in the fridge after bottling and waiting for the brew to carbonate. It's also quite nice aged at room temperature.

The bittering hops were just what I happened to have on hand (I didn't have enough Willamette :-). If one were to worry about the hops they were using, one could use a heap of Hallertauer for bittering, but I can think of better uses for such a fine hop. Perle would serve nicely for bittering. Of course, for finishing/dry hopping you could go nuts with various combinations of Hallertauer, Tetnanger, Saaz, etc.

From: Nick Cuccia <cuccia@eris.berkeley.edu>  
Subject: RECIPE--Grizzly Peak Pale Ale

My second all-grain batch is a variation on Jackie Brown's Summer Pale Ale  
(Cat's Meow 2, p.1-6, HBD#134):

5 Gallons

8# Klages Malt  
1# 20L Munich Malt  
1 c Cara-Pils Malt  
1.5 T Gypsum  
1/2 t Irish Moss  
3.5 oz Kent Goldings Hops  
3/4 c Corn Sugar (priming)  
Wyeast Chico Ale yeast

Used Papazian's temperature-controlled mash:

30 min @ 130-120F  
120 min @ 155-145F  
Sparge @ 170F

Boiling/Hopping schedule:

0:00: 1 oz Kent Goldings  
0:30: 1 oz Kent Goldings  
0:45: 1 oz Kent Goldings  
Irish Moss  
1:00: Cooled; strained off of trub; pitched yeast. OG: 1.043

Racked after six days; primed and bottled after seven more. FG: 1.008

Heavenly KG aroma; big mouthfeel; nice malt and hop flavors up front,  
with a  
good hop bite going down. Definitely not Lawnmower Brew.

For those who haven't tried mashing: give it a go. It's not hard; in  
fact,  
I'm posting this while mashing a wheat beer.

Time to go stir,

From: bickham@msc2.msc.cornell.edu (Scott Bickham)  
Subject: Jack Schmidling's NA Beer (very long!)

Saturday, Jean Hunter ran a Dr. Beer seminar in which several Ithaca Brewers' Union members were able to taste a standard beer that had been doctored by adding food grade flavors or by fermentation/storage conditions. After we had finished, we had the opportunity to taste Jack Schmidling's NA homebrew, as well as Freeport NA "brew". My analysis of these two NA beers appears below, along with a listing of some of my judging qualifications.

Judging and Brewing experience: I have been a homebrewer for 3 years, primarily of ales due to the temperature stability of my basement at 60F. I am currently doing partial mashes; however I will start doing full mashes with a RIMS unit in the fall. I will not take the AHA Beer Judge Certification Program (BJCP) Exam for another week; however I already have 5 judging points from 3 AHA-sponsored competitions (including 3 from judging the first round of the 1992 AHA Nationals at Boston). Disclaimer: I have no bias towards Jack Schmidling as a result of any so-called "flame wars", and am no way affiliated with him or the brewers of Freeport NA.

Freeport NA: The color is golden to amber, very clear, and conditioning is sufficient to produce a moderate head. The aroma and taste are predominately piney or woody in character, and the finish is very clean. I found the flavor profile to be somewhat short, yet surprisingly complex for a NA brew.

Jack's NA: The beer was in a clear Corona bottle, which enabled us to see a small colony (about 1/4" in diameter) floating on the surface of the liquid. Jean Hunter remarked that the colony was there when she received the bottle in the mail. The color was pale, however it was very cloudy. The bottle had been refrigerated, so it could have been chill haze; however I didn't let the beer warm up to test this hypothesis. The conditioning level was similar to the Freeport. The aroma was faintly herbal, but phenolics were also detectable. The taste was also herbal, with some phenolic astringency in the finish. The flavor profile of this brew lasted longer than the Freeport; however it seemed more like an herbal tea than a beer. As for the alcohol level, Jean has not yet checked this on the chromatograph, so the question of distillation efficiency remains unanswered.

Conclusion: I found both of these brews lacking in the qualities necessary to define them as beers. I haven't tried any other commercial versions of this style and I don't know of any AHA description of this style. However if I assign a 29 out of 50 to Freeport (which puts it at the high end of the good range), then Jack Schmidling's beer would be a 24 (the high end of the drinkable range). Both brews suffer from having one-dimensional flavor profiles, while Jack's loses points in aroma, appearance, flavor, and overall impression.

Jack, I recommend that you be extra careful with sanitation, since more microorganisms can exist at the lower alcohol level (as you are no doubt already aware of). Also, since your brew still contains isomerized-hop

and sulphur compounds, you are taking an unnecessary risk of photochemical damage by using clear bottles. Hopefully the reason you sent this bottle to Jean is because you are trying to get rid of it :-)

Cheers,  
Scott Bickham

Subject: Michael Jackson's book "The Gret Beers of Belgium"

I mentioned this book a while back on HBD and the lambic list, since it was something I was sure many here would be interested in. I picked up a copy in Belgium, and have never seen it here. It was available in both English and Flemish (I didn't see any in Waloon, though I'd expect it to be available in that, too).

A number of people asked for the ISBN and other info. What number, you ask? I don't remember. But here it is:

The Great Beers of Belgium, A Complete Guide and Celebration of a Unique Culture, by Michael Jackson

Edited by: Media Marketing Communications nv  
Frankrijklei 111 - 2000 Antwerp - Belgium

ISBN 90-5373-003-6  
Copyright MJ, 1991

I bought it in Brugge at this shop:

de reyghere boekhandel  
Markt 12 B-8000 Brugge  
tel, 050/33.34.03

Needless to say, it's a fantastic book. 269 pages.

From: tynor@prism.gatech.edu (STEVE TYNOR)  
Subject: New Amsterdam Ale recipe?

Can anyone recommend a recipe (hopefully extract, but I'll take whatever I can get) that will duplicate New Amsterdam Ale (New Amsterdam Brewing Co., Utica NY)? Barring that, can someone at least tell me what style of beer it is?

My relatively uneducated guess is that it is some sort of pale ale. I'm just a lowly extract brewer with only three batches to my name -- my first and only IPA attempt has been (so far) somewhat dissapointing. [Will the oak flavor subside as the beer ages? It's only been a week, but all I can taste is oak! In reviewing Papazian and the Cat's Meow, I see that oak is very optional for IPA's -- next time I'll probably leave it out! But I digress...]

According to the label: "New Amsterdam Ale has a rich malty flavor with a pleasently bitter aftertaste. Whole hop flowers are added after fermentation in a process called `dry hopping' to provide the wonderful spicy and fruity aroma". I'll go along with that. It's the spiciness and fruitiness that distinguishes this ale from others I've tried. Is it simply a matter of taking a common pale ale recipe and dry hopping with the proper variety of hops?

So:

- 1) can someone suggest an extract recipe? all-grain?
- 2) what style does it most closely resemble?
- 3) Even w/out a recipe, can you suggest what sort of hops are used?

Is there a book similar to Dave Line's "Brewing Beers Like Those You Buy" (which I understand deals strictly with british brew), but focusing on US beers?

This is not necessarily true. If some bottles gush and others don't it could very well be improper mixing of the priming sugar.

From: sherwood@adobe.com

Subject: clear bottles

With all the junk I have read about clear bottles here in the HBD over the last couple of years, I finally decided to throw my two cents into the mash.

I keg now, but I bottled for many years. I far preferred clear (Miller) bottles to anything else because they showed off the color of the beer so well. Oh, Heresy!! (quick, repeat the mantra: "clear, bad; brown, good" until

he goes away...:-). Okay, clear bottles plus beer plus light gives problems.

Fine. I was not in the habit of storing my beer either in the sun or under fluorescent lights. When I got the bottles I also got these great light-tight bottle holders (I think they call them "cases" :-)) that the bottles came in.

Once I bottled the beer, I put it into the case (just in case there are some who don't know what I mean, when long-neck beer bottles are sold by the case

they come in heavy cardboard boxes with split tops that fold together to make a nice-stackable unit) to condition and age. Since it is inside the case, the

color of the bottle is irrelevant. When I got ready to drink it, I placed it

into the refrigerator, another notably dark environment. So unless you plan

on placing your beer on grocery store shelves or out in then sun don't worry about the color of the glass. And clear bottles are prettier. So there.

Subject: Epson/LaserJet version of Cat's Meow

I wanted to print out the postscript version of the Cat's Meow but I had a small problem. My postscript printer was down. Since I did have an HP Laserjet handy, I used Ghostscript 2.4 to create a version that would print on the HP. For 'fun', I also made a version that should work with the Epson dot matrix printers. Unfortunately, the laserjet file was very large, but the Epson file came out to be about 10 MBytes, 2.5 MBytes when compressed 3.4 MBytes when uuencoded.

If anyone with an Epson would like to see if this will print out I'll break it up and email it to you.

Cheers,

John

Jason writes:

>Me and a pal brewed a batch of beer 2 weeks ago (today) unfortunately we  
>have not had a chance to bottle it. Now we are wondering if we spoiled  
>the batch. Should we bottle it anyway? Should we dump it? Should we  
>bottle it and then give it as gifts to our enemies? Etc.

By all means bottle it! At the fermentation temperatures I use, 57F to  
68F (depending on where in the basement I put the carboy), my Wyeast-  
powered  
brews take at least a week to ferment-out and some (like my Orval clone)  
take much longer. If you use dry yeast at 80F, it can ferment-out in 24  
hours  
(albeit making all kinds of higher alcohols in the process), but there's  
no  
problem having the finished beer sitting around for a week or two. If  
you  
know it will be sitting around longer than two weeks, you should rack it  
off  
the trub and dead yeast. Even if the finished beer was to sit around for  
four or six weeks, you should bottle it anyway -- the worst thing that  
will  
happen is your beer may develop a slight "yeasty" flavor -- certainly not  
bad enough to dump the batch!

Subject: Microwaves and Mashing

This showed up in rec.crafts.brewing. I thought this was a neat trick and might even be useful for partial mashes for those of us with electric stoves. Reprinted with the author's permission.

---

From: jlmoore@cats.ucsc.edu (Jamie Lewis Moore)  
Newsgroups: rec.crafts.brewing  
Subject: Micro-Mashing

I have been brewing all-grain for about three years now with good results, but my interest in experimenting with new recipes has led me to brewing 3 gallon batches. Needless to say this is a lot of work to go to for such a small batch.

I have come up with a solution that is easy and saves me a lot of worrying (sorry Charlie). So I will pass on this mashing technique to the rest of you for comments and such.

- 1) Cut off the bottom 6 inches off a plastic 5 gallon bucket with a saber saw or hand saw (don't use a shipping knife, too dangerous).
- 2) Make sure it fits into your micro-wave oven!
- 3) Pour in enough water for 5 lbs of cracked malt (about a quart per pound of grain or slightly more).
- 4) Set your micro-wave to 70-80% power setting and set the timer for about 25 minutes (assuming a 600-700 watt oven).
- 5) Stop the oven every 5 minutes and stir the mash well. Also check the temperature rise to estimate the amount of time to reach the first rest point.
- 6) When the temperature hits 118-122 F stop the oven and let sit for 30 minutes in the oven with the door closed. This is a very important step if you want haze free beer that ferments well. Something to do with breaking down long chain proteins and freeing up nutrients for the yeast. I have never experienced chill haze with or without irish moss as long as I do a good protein rest.
- 7) start up the oven again and continue to stop every 5 minutes and stir well.
- 8) when the mash hits 155 F stop the oven, stir well and then let rest for 10 minutes.
- 9) The temperature will have fallen a few degrees so run the oven for another few minutes and let rest for 10 minutes.
- 10) Continue this process for 45 minutes or until the mash passes the iodine test.(I just wait out the time, the iodine test is a little tricky to interpret correctly and makes me worry!)
- 11) Run the oven on full power and stop to stir and check temperature until the 170 F point has been reached. Let rest for 10 minutes. This

step is also very important because the elevated temperature kills off enzyme activity that would shift your sugar to dextrins ratio and give your beer a thin body with a high alcohol content. I forgot this once and my wort fermented over night to completion. Tasted a little bitter due to low dextrin content and was thin. On the positive side the beer was very clean due to the rapid ferment.

12) Sparge as usual and so on ...

Let me know how this works for you, I have used it two times with consistent results.

Jamie Moore

From: korz@ihlpl.att.com  
Subject: AHA subcategories

Steve writes:

>You can enter this beer in any AHA category you think is appropriate.  
Many of  
>us have brewed targeting one style and ended out with a beer that was  
closer  
>to another. While AHA rules prohibit multiple entries in the same  
category/  
>subcategory in a competition, there's nothing to prohibit you from  
entering  
>the same beer in two completely different categories.

I read and re-read the AHA Competition rules a half dozen times (just to be on the safe side) and I've come to the conclusion that you can enter a beer in each subcategory. The reason for my re-reading was because I brewed a stout in January and it was (in my opinion) halfway between a dry and a sweet stout, but very good. So, I entered it in both the Foreign Stout (stronger version of dry stout) and Sweet Stout subcategories.

Since I was a judge at the Midwestern Regional, I had the opportunity to look into my stout's progress. After completing my flight of Traditional German Bocks, I wandered over to the stout tables. Alas, neither of my stouts had made the cut, but both had scored 38.5 (from two \*different\* judging teams -- talk about judging consistency!). I didn't get a chance to see the score sheets, but I suspect one beer got: "a bit too sweet to be a Foreign Stout" and the other: "a bit too dry to be a Sweet Stout."

Oh well, back to the old drawing board.

By the way, since the judging was over, I did get a chance to taste the three Midwestern Stouts heading for the Second Round in Milwaukee. They \*were\* measurably better than mine and deserved the 40+ scores they got. Heavenly!!!

One final note. I am convinced that the quality of \*all\* the beers at the Second Round of the AHA Nationals will be better than 95% of the commercial beers in the world and par with the other 5%. I'm proud to be associated with Homebrewing, as we all should be. Charlie, take a bow.

From: korz@ihlpl.att.com  
Subject: Dry hopping

Brian asks:

I have noticed lately that many of the subscribers to this digest extoll the virtues of dry-hopping. What are the relative advantages/disadvantages of dry-hopping vs. adding flavor hops late in the boil ?

No question in my mind -- the room-filling hop bouquets some beers have are not possible without dryhopping. Dryhopping is much more efficient at adding bouquet than adding hops in the last minute of the boil. Flavor hops are a bit different (in my opinion) than finishing hops. I add flavor hops in the last 15 minutes of the boil. 15 minutes will boil off most of the bouquet, but will add hop flavor. Finishing hops are usually added in the last 1 to 5 minutes of the boil.

The disadvantages to dryhopping are:

1. marginally increased chance of infection,
2. slightly more troublesome racking (leaf hops float -- I suggest using them), and
3. you lose a bit of beer (that which is trapped in the hops) when racking to the priming bucket.

From: SHERRILL\_PAUL@Tandem.COM  
Subject: Time to brew a pepper beer...help

Hi folks,

I plan on brewing a serrano pepper beer this week and I need to know the best way to introduce this into the beer. I had a pepper beer at the last Small Brewers Festival in CA that was excellent. The brewer mentioned using serranos and I think making a tea out of it.

My first guess is to make the tea and pour it in with the finishing hops during the steep. My second thought is to add it upon racking into the secondary or possibly with the bottling sugar at bottle time. Any suggestions?

Send to me at SHERRILL\_PAUL@tandem.com

thanks paul

Date: Mon, 20 Apr 92 12:45 CDT  
From: ZLPAJGN%LUCCPUA.bitnet@UICVM.UIC.EDU  
Subject: odd ingredients

Dear Brewers,

I have a couple of questions (So what else is new, right?!) )

First of all, with all of the advise this network sends, there has been none so valuable as: "What ever happens, never throw out a batch, unless it turns out to be utterly impalitable (which is, of course, up to the individual brewer's tastes). So, my latest lager - that highly gingered and spruced flavored batch of terperntine - is still sitting on my back porch in two 1 gal jugs. However both are acting completely differently from eachother. One, which is filled to the neck, is bubbling and forming a kreausen-like foam (this, after the initial kreausen fell in the primary and I rached into these 1 gal. secondarys). but the lock is not passing bubbles!! (?) There's nothing wrong with the lock, either. Finally, the brew is still a familiar milky white-ish and yeast is still 'swimming' throughout.

The other 1 gal secondary is filled about 3/4 full, but is clearing and seems healthy enough, with bubbles steadily passing through the lock and a normal amount of bubbles collecting at the surface. So, I guess the question I have about this batch (did I mention that the 1 gal. jugs contain the same brew - racked from a primary) is, "What gives?" Why is one the fuller jug sluggish, and the less-full one behaving? Could this result from improper cleaning (although I tend to be maticulous about cleaning, but this one jug was a \*bitch\* to clean!)

Ok, now for the second set of questions..

Has anyone used or know about using hearts of palm as an ingredient in a wort? Now, before y'all laugh yourselves blue, let me try to briefly explain: For about 10 years now my brothers, close friends and I have been getting together in the Everglades every Christmas for an all-night campfire and acoustic jam session (we're all acomplished musicians to various extents). So, what I want to do is try to capture in a beer (preferably a lager, but that may prove difficult during the summer months) that flavor of a campfire in the 'Glades. So I'm thinking about a HINT of spruce (not like what's in my present batch) and a bit of liquid smoke (again, only a hint) and possibly those palm hearts, reminescent of the palmetto palms in the 'Glades. So, if anyone knows anything along these lines, I'd appreciate your experience and advise. E-mail me personally if you don't want to be exposed on the network!!

Thanks!!

John (of "Monstrocitcity Ale" fame!!)

|> >Also by stepping up to 1/2 hp, one could start the mill with  
grains  
in the hopper.

> If the initial load is the problem, and 1/6 hp will sustain operation  
then a capacitor start motor may do the trick. They're designed  
for high torque start up. Perhaps a small one from a dead fridge  
or other suitable donor could be used.

Just so there is no confusion here, the initial load is not a problem on  
just  
about any motor larger than the one supplied with the MALTMILL. The 1/  
30th  
HP motor supplied is INTENDED to stall under a load sufficient to cause  
personal injury. I do not want to lose my house over what started out  
as a  
hobby.

As shipped, it will mill forever if fed grain at the same rate as it  
comes  
out. It beats cranking and is adequate for the home brewer. The high  
volume user might wish to put on a larger motor but that forces HIM to  
assume  
the liability for personal injury.

BTW, there was one very important feature left off of the recent  
comparison  
between three malt processors.

The MALTMILL is the only one made in America by Americans.

The Corona is made in Columbia and the Marcato is made in Italy.

Every MALTMILL purchased, keeps one American employed for one day.  
And that includes not only yours truly, but lumberjacks, machinists,  
screw  
manufacturers, tool factories, box manufacturers, telephone and  
communications workers, UPS and a host of other AMERICANS.

From: keng@ic.MENTORG.COM (Ken Giles)  
Subject: Sierra Nevada Ale yeast

I've seen numerous remarks on culturing the yeast from a bottle of Sierra Nevada Pale Ale under the assumption that it's the same as Wyeast 1056.

When

I toured their brewery, the guide mentioned that they repitch yeast at bottling

time in order to achieve the bottle conditioning. I asked if it was the same as

the brewing yeast. He said that it was a different, more flocculant strain

which stuck well to the bottom of the bottle. Given that their conditioning

temperatures are in the 40s (Farenheit), it would also seem to be a lager yeast (I didn't ask this).

Anybody have information to the contrary?

Subject: Re: Candy sugar

Al replited to russ that "candy sugar" was likely to be cane or sucrose. At a talk i attended from the brewmeister of the "New Belgium Brewery", Ft. Collins, CO... he mentioned that "candy sugar" was the secret ingredient of many trappists. He defined candy sugar at Turbinado or Demura... Both of which are available in the grocery store near me. Look for them tucked away in the bottom shelf of the sugar section. They are not big sellers, and do not get a prominent display space.

The only information I have to the contrary is the information I got when  
I  
took the tour of SN. The guide, when I asked this very same question,  
defferred  
to one of the other workers (who seemed to be intimately involved in the  
brewing  
process but I didn't get a chance to iquire further) who said that they  
used only  
one yeast type (except for the Bigfoot Barley Wine) for primary,  
secondary  
and bottle conditioning.

Just my \$0.02 worth.

Hello:

Just two quick questions... I've certainly enjoyed the Nitrogen heads found on so many Stouts today, I was wondering why this gas give off such a nice head and why it isn't used in other beers?

Secondly, I've noticed over the years that most brewers don't usually provide the amount of mash-in water used. Is there a rule of thumb for gallons of water to grains mashed in? I simply eyeball it until I think the grain/water ratio is not too thick.

Thanks in advance

Yep. It's possible they've changed their procedures in the last 10 months, but at a Sensory Evaluation seminar at UC Davis last June I met a microbiologist from Sierra Nevada who said they condition with yeast from the fermentors, after an acid wash. They don't use the washed yeast for pitching; only for conditioning.

As an aside, I believe it speaks volumes for Sierra Nevada's approach to quality that a brewery that size actually HAS such a job description as "microbiologist".

You mention conditioning temperatures in the 40s; consider this: many ale yeasts that will stay in suspension in the 60s will drop right out in the 40s, providing as tight a yeast cake as one could want. I assume they start the conditioning process at a warmer temperature and then go down to there, unless they also artificially carbonate (which would make sense to me). At those temperatures, they really don't need to maintain a second yeast strain.

I've had my share of ballistic carboy caps--okay, maybe more than my  
share. I  
did several things.

First, I went out and got some tubing with an inner diameter equal to the  
outer  
diameter of the carboy cap's central (larger) opening. This will give  
you  
about double the cross section of the tubing-inside-the-opening  
arrangement.

Second, and more important, I made sure to filter my wort when putting it  
into  
the carboy. Nothing fancy, just passed it through a kitchen strainer and  
into  
a funnel that has a plastic screen in the bottom. This is particularly  
handy  
when whole hops have been used. Even when in a boiling bag, some of the  
bracts  
sneak out with the sole intent of clogging your blowoff tube. It takes a  
little longer to get it into the carboy, but what gets into the carboy  
stays  
there!

The best solution is to do something discussed here recently. Let the  
break  
material settle out a bit and rack the wort off the trub before  
fermentation  
gets going. I did this for a barley wine and left behind a gallon(!) of  
break  
material. I can only imagine the carboy cap fireworks that might have  
ensued  
with that batch!

Since I've taken these steps, I've had no more bottle rockets and no more  
irate  
telephone calls from my wife after finding hops on the ceiling. But I  
probably  
won't be able to replicate that batch of "Calamity Amber". Such is life.

Yours in brewing,  
Scott Barrett

Subject: pepper beer

I would suggest adding the pepper as late in the process as possible.

Long ago I made a hot pepper mead. I put the peppers (crushed red) in the boil at the start. I cooled it and pitched it. Talk about a slow start! There was no krausen for the first 3 or 4 weeks. My theory is that there were only a few yeast cells that could stand up to the anti-biotic properties of the hot peppers and it took them that long to take over the must.

Were I you, I'd roast the peppers and try either dry-peppering in the secondary or the bottles themselves (smile when you drink that beer).

>From: bickham@msc2.msc.cornell.edu (Scott Bickham)  
>Subject: Jack Schmidling's NA Beer (very long!)

>Saturday, Jean Hunter ran a Dr. Beer seminar in which several Ithaca Brewers' Union members were able to taste a standard beer that had been doctored by adding food grade flavors or by fermentation/storage conditions. After we had finished, we had the opportunity to taste Jack Schmidling's NA homebrew, as well as Freeport NA "brew". My analysis of these two NA beers appears below, along with a listing of some of my judging qualifications.

>Jack's NA: The beer was in a clear Corona bottle, which enabled us to see a small colony (about 1/4" in diameter) floating on the surface of the liquid. Jean Hunter remarked that the colony was there when she received the bottle in the mail. The color was pale, however it was very cloudy. The bottle had been refrigerated, so it could have been chill haze; however I didn't let the beer warm up to test this hypothesis. The conditioning level was similar to the Freeport. The aroma was faintly herbal, but phenolics were also detectable. The taste was also herbal, with some phenolic astringency in the finish. The flavor profile of this brew lasted longer than the Freeport; however it seemed more like an herbal tea than a beer. As for the alcohol level, Jean has not yet checked this on the chromatograph, so the question of distillation efficiency remains unanswered.

I am not sure if I should be just irritated or downright outraged at all this.

After being accused of everything bigotry to being a charlatian, I sent Jean some samples to be analyzed for alcoholic content on Mar 16. I also included a complementary copy of "Brew It At Home" as a token of appreciation for her help. I have sent mail to her three times since sending the samples and she has declined to respond and this is the first feedback I have received.

There were four different samples, produced in different ways and none of them were intended to represent anything other than samples for chemical analysis. There was only one that I would even consider drinkable. One was boiled to reduce the volume by 50% another was a blend of 4 different beers, one was in a plastic bottle and none were aged or cleared prior to sending.

In the future, I will have a hard time taking criticism of my articles seriously.

>Jack, I recommend that you be extra careful with sanitation, since more

microorganisms can exist at the lower alcohol level (as you are no doubt already aware of).

As a matter of fact, I was no uninterested in anything but the alcoholic content that I didn't even sanitize the bottles. I just rinsed and filled them. I might have done a lot of things differently had I not been deceived as to the purpose.

>Also, since your brew still contains isomerized-hop and sulphur compounds, you are taking an unnecessary risk of photochemical damage by using clear bottles. Hopefully the reason you sent this bottle to Jean is because you are trying to get rid of it :-)

What you think of as a joke, is precisely why I used the clear bottles. They are from Miller High Life and I only use them when I don't care what the beer tastes like or when I can control the environment.

Now that you have all had your fun, is it asking to much to answer the only question the samples were sent to address.

What is the alcohol content?

Date: Tue, 21 Apr 92 15:09:02 CDT  
From: gjfix@utamat.uta.edu (George J Fix)  
Subject: Itsa Conspiracy  
Subject: Vienna recipes (George Fix)

Laurie and I would like to thank Craig Olzenak for his kind comments about our book. After a initial trimming of potential recipes we decided to go with whatever formulations did the best in sanctioned competitions, independent of our personal preferences. There were no conflicts with the standard Vienna, and it is the formulation that won 1st in the '87 nationals. It also won best of show in the EHA competition in New Orleans of that year. It has also proven to be quite serviceable for the most important use of homebrew, namely as a beer to have on hand for visitors and special social events.

We started to "debug" the festival beer (Marzen/Oktobefest) in '88, and this one caused us considerable grief. The first version, still our favorite, used the recipe on page 57 except 120 degree caramel malt was used instead of the 20 degree. We share Craig's love of the dark malt flavors! However and alas, the version was clobbered in competitions. Typical comments included "way too big for style", "dark malt flavors are overpowering", and in Texas competitions (Dixie Cup) it was criticized for being underhopped. The latter is a predictable regional response, but one with some validity. We tried a lot of different things including different yeast strains and higher hopping rates, but the overall performance was generally poor. In 1990 we started cutting back on the dark malt profile, and in particular started using the 20 degree malt. We also started using English caramel malt exclusively. The effect of these two changes was dramatic. It won 1st place in the 1990 LA Fair, the 1990 Riverside Cal Fair, the 1990 Dixie Cup, and the 1991 Bidal Society Comp. in Wisc. It was also entered in the New England conf., however that one was sharply marked down for being overhopped. The last time it was entered was the 1991 nationals where it won 3rd place. The two beers that came in front of it were in the standard Vienna motif, and it has been our experience that this version (SG=1.050-1.055) will generally do better than the festbier (SG=1.060-1.063). All of the commercial "Oktobefests" available in the US fall into the lower part of the first gravity range, and apparently most judges not to mention basic beer drinkers have grown accustomed to the lower gravity versions, although a SG in the range 1.050-1.055 is hardly a weak beer.

P.S. Those going to the microbrewer's conference next week in Milwaukee should stop by the Brewers Research and Development Co.'s booth and say hello. There will be some exciting new equipment on display. JV Northwest and Pub Systems can be counted on to display some interesting things as well. All of this should give one an indication of the striking technological revolution that has been taking place these last few years vis a vis equipment for small scale brewing.

> What is the alcohol content?

Jack,

This was not made clear to the other participants in the seminar or me,  
so maybe Jean misunderstood the nature of the samples. I got the  
impression  
from your HBD digest postings that you wanted an evaluation of your  
beers, as  
well as an estimate of how effective your distillation process is. In  
either  
aspect, lack of sanitation (albeit intentional) will destroy any accurate  
measurement. For example, depending on the amount of oxygen available,  
lactic  
acid bacteria will either metabolize ethanol or fermentable  
carbohydrates.  
Acetic acid bacteria, which is common in beer dispense lines, uses  
ethanol  
as its source of carbon. Thus the apparent alcohol content may or may  
not be  
representative of the original, sterile beer.

Jean has not been intentionally procrastinating on the HPLC measurement  
of the alcohol content; she is up for tenure at Cornell next month, so  
I'm  
sure she will get back to this matter after that hellish procedure is  
finished.  
And by the way, judging a beer that scored in the low 20's is not my idea  
of  
fun. But thanks for pointing out that the taste and alcohol content was  
not  
representative of your homebrews.

Cheers,  
Scott

From: jal@techbook.com (Jim Larsen)  
Subject: Stainless Steel

Greetings:

I am in recent receipt of a Cornelius kegging system and I have a few questions regarding its care and feeding.

1. How does one ferment in steel? I know of brewers who split the primary into two five-gallon vessels, relieving the pressure at regular intervals, and counter-pressure transfer to a single secondary. Others remove the fittings and tubes and replace them with blowoff tubes for primary and counter-pressure transfer to primary as well.
2. What are the preferred cleaners/sanitizers for stainless? I know of those who swear by between TSP or Iodophor, and one who even uses bleach with minimum exposure.
3. My current Cornelius inventory consists of one five-gallon and one three-gallon. In addition, I have a Firestone I acquired from a generous Coca-Cola driver. Is there a simple means to incorporate this into my system, or should I seek to replace it with another Cornelius?

Thanks,

jal

Date: Wed, 22 Apr 92 10:42:30 PDT  
From: bgros@sensitivity.berkeley.edu (Bryan Gros)  
Subject: Fermenting Steam beer

I'm fermenting a steam beer right now. For various reasons, my primary fermenter is an open plastic bucket. The beer is bubbling away, and in a couple of days I will rack off the trub into my glass carboy. (This is the first time I'm using a secondary fermenter. Too bad I don't have the fridge space to lager).

My question is, since the Wyeast cal. lager yeast is bottom fermenting, and I rack into the carboy leaving the stuff on the bottom behind, will I leave all my yeast behind? Or will I get enough to finish the fermentation? Thanks.

- Bryan

BTW, should I be skimming the foam out of the bucket? Or was this the topic with no consensus?

>time, I'm brewing a Pale Ale with 1028. It's producing CO2 like a  
>banshee but the kreausen is less than 1" high. Is this characteristic  
>of the yeast or my wort (or is it common for the kreausen height to  
>vary)?

I'd say that 1007 is unusually vigorous, not that the others are  
lethargic.

When my brew partner and I first acquired some 7 gallon carboys  
we stopped using a blow-off hose. For most of the yeast strains  
we used- 1028, 1056, 1098- this was no problem. Then we tried  
1007 for the first time. Yeast sludge all over the basement.  
Beer tasted great, though.

used  
> only  
> one yeast type (except for the Bigfoot Barley Wine) for primary,  
secondary  
> and bottle conditioning.

Hmm, I hope we can resolve this issue: I used yeast cultured  
from a bottle of SNPA for my latest pale ale, which is still  
in secondary. The thing I noticed about the yeast was that  
there was very little sediment on the bottom when I racked to  
secondary, and that the cap of foam on top (it never  
collapsed) was very thick and sticky, like peanut butter  
in consistency. That would make sense if I used a specially  
sticky bottling strain to ferment with. Still, the hydrometer  
sample tasted fine.

Let's hear it for Sierra Nevada Pale Ale! Hop hop hooray!

**Subject: Clear bottles**

I agree with Geoff Sherwood. My beer looks a lot better in clear Newcastle Brown Ale bottles than any brown long neck bottles. I also store my bottles in long neck cardboard cases and have never had a problem with light-struck beer. (Of course, the original Newcastle Brown Ale that had been sitting for who knows how long under the fluorescent lights in the liquor store is another story :)

Subject: Low mash pH

I've recently gone all-grain and have a sort of problem.  
All my water is preboiled and cooled to remove chlorine.  
Tuscaloosa, AL water is moderately soft.

I heat my mash water to the correct strike temperature, dump  
in my grains and stir well for 5 minutes. Then I remove a  
sample of the liquid and test the pH. According to my  
battery operated pH meter (properly calibrated), my pH is  
4.8. I have verified this with pH papers too. I've added  
as much as 2 tsp of CaCO<sub>3</sub> to bring the pH up to the recommended  
5.2-5.4 range, but it doesn't budge. I do make sure to stir  
in the CaCO<sub>3</sub> well before taking another reading. My question,  
what is the effect on the mash with a pH that low? Beneficial or not?  
Should I continue to add more CaCO<sub>3</sub>? Should I not worry and  
be happy with a 4.8 pH?

From: Bob Jones <BJONES@NOVA.llnl.gov>  
Subject: Spent grain & Romulan Ale from Micah Millspaw

What to do with spent grains? I brew 15 gallon batches and often end up with 30-40 pounds of spent grain, not to mention used hops covered with clumps of protein from the boil(yuk). I used to trade the grain for eggs with a friend who had chickens. Unfortunately the birds stopped laying (to old) and I can get free eggs anyway. So, one of the guys I ride to work with raises llamas(sp?) and they seem to eat everything, I don't get any thing out of this but it is convenient and my kids like to watch the llamas eat. And the llamas really like the used hops!

Micah Millspaw 4/16/92

The Romulan ale has been brewed! I call it S'harien, it is an all grain wheatwine, 50% wheat, OG 1104 with 65 IBU's. On the colour end of it, I'm going with food colouring but am adding it to the bottles just before I counter-pressure fill them. No draft Romulan ale for me. This stuff should be ready by conference time, I intend to bring some. Thanks for the many suggestions HBDers.

From: bgros@sensitivity.berkeley.edu (Bryan Gros)  
Subject: HBUs and IBUs???

I was designing my recipe for my steam beer (see post above) and bought some Northern Brewer hops. The store said 8.5% AA. I noticed most recipes for an Anchor-type beer said 13 or 14 HBUs. This means about 1.5oz in my 5-gallon batch.

I checked Eckhardt and he said steam beer: 35-40 IBUs. I decided to take the plunge and figure out IBUs. If I use the formula in Papazian or the Zymurgy issue, I get something like 1/2 oz for 60min. (Don't have the formula with me). So how can these two different measurements be off by so much? Is this why all my beers so far have been pretty darn hoppy? Should I just switch to IBU calculations and go by experience? I ended up compromising and using 3/4 oz for 60min, 1/4 oz for 30 min, and 1/3oz for flavoring. I have no idea what it will taste like. (I'm considering dry-hopping slightly, but I'm not sure how much I would add.)

Any advice would be helpful.

sorry about the format of my last post. anyways, about the carboy keggering. i use 19 liter carboys from my lab. they are made of thick pyrex (great for autoclaving), with a wide (57 mm) mouth and large lip. i have only seen them in scientific catalogs (thomas scientific, p.135, 1-800-345-2100), and they are a little pricey (\$113.26). my suggestion is that anyone who has access to some of these suckers, \*use them\*, but they may be a little out of the price range of most homebrewers. anyways, they take a size 12 stopper. so i drilled two holes in a stopper, of appropriate diameter for two glass tubes, one short one for pressure, one for drawing off the bottom. the connections (CO2, tap) were made with sterilizable nalgene tubing held tight with clamps, and sealed with dow/corning high vacuum grease. now, the most important piece: the stopper clamp. this consists of a \*large\* washer-like piece of steel of about 57 mm o.d., 50 mm i.d., which fits over the stopper, and has four equidistant holes drilled in it, each about 3 mm. picture that? ok, these holes are for bolts to go through, which are being held in place under the lip by a pair of hemicircular steel bands, which are in turn screwed together around the neck, tight enough so that the lip cannot pass through. thus, with a few twists with a wing nut, the stopper is absolutely clamped into place. this device was designed for the fermentation of a strictly anaerobic methanogenic bacteria, but it serves my purpose well. anyways, i have used a commercial CO2 regulator and tap mounted in a friend's fridge (keg-o-lator style). i prime in this device, and keep it under 5 psi while it is carbonating. in 2 weeks, it is ready to pull. best of all, it didn't cost any more than bottling. good luck to any i have inspired. i will comment on yeast culturing soon. -brett lindenbach

Subject: Removing blow-off

> - Bryan

>

>BTW, should I be skimming the foam out of the bucket? Or was  
>this the topic with no consensus?

>

People may remember that I proposed an experiment on this issue a while  
back.

The basic idea was to take some blow-off, dehydrate it, then add it back  
to an  
acidified water/ethanol solution and note any effects on colour, taste,  
etc. I

did something like this by taking the blow-off from a 5 gall stout brew  
and

adding it back to 1 gall of acidified water. OK, I didn't check ethanol  
solubility, but I did concentrate the solution by a factor of 5 times  
what

would normally be encountered. The second thing I did was to take the 1/  
2 gall

trub remaining after racking into the primary, and give it the same  
treatment.

As we all know, both blow-off and trub taste foul. The dehydrated trub,  
in

particular, was so intensely bitter that not even 1 litre of homebrew,  
applied

orally, could alleviate the situation :-). The two substances appeared to  
be

chemically different, as the blow-off dissolved with considerable  
effervescence,

whilst the trub did not. Actually, the blow-off didn't dissolve, because  
it

preferred to sit on the bottom, despite all my best stirring efforts.

After two

weeks, it had had negligible impact on colour or taste. Conclusion -  
removing

the blow-off is of questionable utility, unless you subscribe to the view  
that

the yeast may metabolise it into fusel oil during its anaerobic phase,  
which is

doubtful as far as I understand it.

The dried trub contained considerable sugar and gave a rehydrated gravity  
of 6,

with an opaque black colour. The solution tasted pleasantly bitter, which  
led

me to wonder how much hop utilisation is lost by precipitation. On the  
strength

of these observations, I decided to add a pound of sugar, some yeast, and  
ferment away. I deliberately gave the brew no nutrient and pre-boiled it  
to

drive off any oxygen. Thus, in theory, I should be making a headache-  
inducing

brew of fusel oil. At the moment, it is fermenting powerfully and tastes/  
smells

quite pleasant. I'll keep the list posted on further results, provided I  
survive :-)

From: tony@spss.com (Tony Babinec)  
Subject: homebrew "steam" beer and hopping rate

In the last HBD, Bryan Gros described his hopping of a "steam" beer. Is the homebrew "steam" beer adequately hopped? I'd say that if it isn't, he didn't miss by much, so relax...

The formula from the Hops Zymurgy issue is:

gram weight of hops to add =

Wort Volume\*BU\*.001 / (Percent Utilization\*Alpha),

and ounce weight of hops = 0.0353\*gwh.

In this case, filling in the formula:

$gwh = (18.9*40*.001)/(PU*.085).$

Percent utilization is a function of the length of boil. The Hop Zymurgy issue lists percent utilization at 30%, or 0.30, for a one hour boil. However, you might want to downweight that a little bit, to take into account hop age, extent to which you attain a rolling boil, and such. If you assume PU is 0.30, then one hop addition at one hour before end of boil should be 1.05 ounces of your Northern Brewers. If you assume PU is 0.25, then one hop addition at one hour before end of boil should be 1.26 ounces of your Northern Brewers. Since you split your one ounce addition of NBs into 0.75 ounces for 60 minutes and 0.25 ounces for 30 minutes, your bitterness falls a bit short of what it would be if the entire one ounce were added for an hour, as the above shows that 1.05 ounces would be needed assuming 30% utilization.

If you are concerned that your beer will lack a little in bitterness, this is all the more reason to dry hop to compensate. Not that you'd get the same character as if you had boiled, but the character would certainly be appropriate. Try Northern Brewers or even Cascades. Although by all reports Anchor doesn't use Cascades in Steam, I think they're appropriate and it's YOUR beer! Try 1/2 to 1 ounce of Northern Brewers, or 1/2 ounce NB plus 1/2 ounce Cascades.

Doesn't Fred Eckhardt's book show a recent Anchor Steam to be hopped slightly less than an older one--say, IBU equals 35? If so, then your hopping is near-target. Let's hope that Anchor doesn't knock that number down, as Anchor Steam is a world-class beer and just fine as it is!

The percent utilization ambiguity homebrewers face in practice helps explain IBU/HBU conversion. If you assume 30% utilization in a one-hour boil, then

$HBU = IBU/4.5$

while if you assume 25% utilization in a one-hour boil, then

$HBU = IBU/3.8$

Hop additions at less than 60 minutes will have a smaller utilization number. While it appears that hop utilization is not a linear function of time, you probably won't be far off by

assuming PU for a 30-minute hop addition to be around 13-15%.

Finally, the 3.8 factor is useful to remember when reading recipes or the Zymurgy style guidelines. This is not a criticism of what is in many ways a very fine book, but Papazian's suggested HBU additions in one of TNCJOBH style tables in the middle of his book strike me as somewhat high for some of the styles. Now, as our "mileage may vary," these may in fact work well for the homebrewer getting a sort-of boil on the stove. But, if you use fresh hops and get a good boil, then take that into account!

Subject: hopping a steam beer revisited

Yesterday I posted a question about IBUs and HBUs and what to do when the measurements don't line up.

I've got some good responses on how to get the IBUs and convert, and most people said the numbers I reported (.75oz for 60min, .25oz for 30min, .33oz for 2min, 8.5%AA) were a little low, but not bad.

Unfortunately I forgot to say that these numbers were for a three gallon batch. Now I guess maybe I'm a little high, especiall since the OG was 1.044.

But thanks for the responses. We'll see what it tastes like and chalk it up to experience.

> I'm fermenting a steam beer right now. For various reasons,  
> my primary fermenter is an open plastic bucket.

I've probably got a misconception here, but when you say "open bucket" you really mean "plastic bucket with lid, and the lid is on right now, but there's enough headspace in the bucket to simulate a truly 'open' bucket," right?

Otherwise, if the bucket is really just open to the air, and you have it sitting in your bathtub or garage or whatever, you run the risk of some errant piece of dust landing in your wort and inoculating it with God-knows-what kind of yeast, bacterium, or mold.

Anchor ferments its Steam Beer in an open trough, sure, but the trough is in a clean room under positive pressure. "Don't try this at home."

> My question is, since the Wyeast cal. lager yeast is bottom  
> fermenting, and I rack into the carboy leaving the stuff on  
> the bottom behind, will I leave all my yeast behind? Or will  
> I get enough to finish the fermentation? Thanks.

The number of yeast cells in suspension is more than our minds can comprehend. Don't worry.

> BTW, should I be skimming the foam out of the bucket? Or was  
> this the topic with no consensus?

There's no consensus. Note that (a) Anchor doesn't skim their foam, and (b) not skimming foam can be accomplished while sitting in a La-Z-Boy drinking a beer.

I think, from this posting, that Jerome is asking about whether or not SN bottle conditions. This is the case. According to the information I got at the brewery, they inject the finished brew (finishing is a two week process in which the wort is cooled to the low 40's F to precipitate the yeast) with actively fermenting wort (kraeusening) just before bottling/kegging. That's why we can culture their yeast from the dregs of a bottle of SNPA. Again, it's the same yeast (Wyeast American [Chico] Ale yeast - I forget the model number :-). The rich, creamy head at high krausen is characteristic of this yeast strain.

From: "Roger Deschner " <U52983@UICVM.UIC.EDU>  
Subject: Re: Competition Question

eisen@kopf.HQ.Ileaf.COM (Carl West) asks:

What Happens to my Three Bottles when I send them to a competition? Let's pretend we are your bottles.

We arrive via UPS in a securely packed box, at a generous sponsor brewery, restaurant, or brew-pub. (such as Goose Island in Chicago, Anchor in San Francisco, etc.) The nice guys at Goose Island stack our boxes down in the brew-house in a huge pile, where we wait along with a lot of other entries. At least down here it doesn't get too warm, and its chummy with all that other beer around. If we're lucky, we're still right-side-up. Our maker had written a big "UP" arrow on our box, and so we are lucky indeed.

In a day or so, a "competition organizer" arrives at Goose Island. He's a homebrewer just like my maker, and so he draws a pint of Goose Island Porter, to properly prepare himself to deal with us beer bottles. He unpacks my box, places a numbered sticker on each of us and writes the number on my paperwork, and places me in a beer case and leaves me in Goose Island's cooler. The Organizer guy mutters something about "relax, don't worry, have a homebrew" and we start to worry as he continues "...and all this homebrew around and none of it to drink." Another pint of Goose Island Porter settles him down, and makes us feel safer. It's dark and perfect beer temperature in here, so I feel fine while my yeast settles back down after shipping, and my paperwork has taken a trip to the Organizer's home to be entered into a computer.

On competition day, a couple dozen judges gather in Goose Island's banquet room. They sit three to a table, and each table will judge one type of beer. I am a German Bock, and one of my three bottles is brought to their table along with the other German Bocks. The judges open each bottle, pour a bit into a glass, and judge it. (This process is covered at length elsewhere.) The end result of it is \*\*\*WE WIN\*\*\*  
\*\*\*HOORAY!!!!\*\*\*. My maker has made the best German Bock in the competition, and he wins a blue ribbon. (No, not a Pabst product.) Now, one of us is consumed and two of us are left.

Then the winner of each category goes into "Best of Show". The most senior judges gather a second bottle of the winning beer from each category up from the cooler at a large table, and begin. An immediate problem: When opening one of the other beers, a Munich Weissbeer, it gushes all over. The judges figure it must be a bad cap, since the first bottle of that same Weiss was so good, and so they fetch the third bottle for that entry. It is OK. Finally, it's down to just us and a really good British Bitter. Two beers left. The judges, however, have used all the beer in my second bottle already - so out comes my third bottle, and the third bottle of that ESB, which the judges open and compare. \*\*WE WIN\*\*  
My maker's German Bock is the Best of Show, and he gets a nice engraved pewter beer stein.

What happens to the second and third bottles of the beers that didn't win? The assembled judges and organizers have one hum-dinger of a party! They've earned it, because these things are a lot of work to put on. They drink ALL the homebrew, and make a serious dent into a keg of Goose Island Honkers Ale before it all ends. The empty bottles are given to anyone present who wants them for homebrew.

From: bickham@msc2.msc.cornell.edu (Scott Bickham)  
Subject: Nepal Alcoholic Beverage

Grrretings,

One of our german postdocs described an alcoholic beverage he consumed while in Nepal. A large urn partailly filled with millet or similar grain was brought out, and then hot water was poured over the top. It immediately started producing bubbles, and the beverage is supposed to be consumed through straws. He described the taste as mostly hot alcohol, but he doesn't remember much more than that. It was sold as "authentic nepalese beer".

Does anyone know what this concoction is, and is it possible for fermentation to take place that rapidly? It would save me a trip to Nepal if I could get the information here :-)

Date: Thu, 23 Apr 92 11:35:19 PDT  
From: Richard.Stueven@Corp.Sun.COM (Richard Stueven)  
Subject: Shipping Homebrew

The subject of "how can I legally ship my homebrew" comes up time after time in this group. Attached is a letter I sent to Charlie Papazian's Compuserve address on this subject. I didn't receive a response, but then I didn't really expect one, since this isn't necessarily the most appropriate way to contact Charlie the Editor (as opposed to Charlie the Homebrewer-at-Large :-)

Also, upon reading it a month later, there are some hints of a personal attack which I certainly didn't intend. If you're reading this, Charlie, and I've offended you, I apologize.

Anyway, my points are pretty clear in the letter, I think, and I'd like to open the subject up for debate here. Should the AHA get involved in the politics of homebrewing? I say, yes!

From gak Fri Mar 20 16:30:37 1992  
To: 72210.2754@compuserve.com  
Subject: Shipping Homebrew

Charlie,

Writing in the Spring 1992 \_zymurgy\_ regarding the shipping of homebrew, you said:

Doing it interstate is technically not allowed if not for analytical purposes. How are you going to ship your brews to a friend? I don't know how you'll do it and frankly I don't need to be told as long as your friend eventually has the pleasure of enjoying your beer. Shhhh.

Is the official position of the AHA to encourage its members to break the law, stupid as it is, in order to share their hobby? I've always considered the purpose of the AHA to encourage homebrewers to participate in the Art of Brewing and to share their ideas, recipes, procedures (and most importantly, their beer!) and especially to help them along the way. By "help", I mean use the organization to get rid of these idiotic, pointlessly restrictive laws. Let your members know to whom they should write to effect these necessary changes. Make the AHA become more than just a clearinghouse for competitions and recipes.

You know as well as anyone that this country is in a Prohibitionist mood. To turn a blind eye toward activities that can cause legal problems for members, rather than to proactively effect positive changes that will free your members from government interference, could send the Art of Homebrewing back underground. We don't need that.

Thanks for listening.

Richard Stueven

Subject: Reviving Red Tail Ale yeast

Has anybody successfully fermented a batch of homebrew from the yeast dregs in the bottom of Red Tail Ale? I've got a couple of bottles at home, and I'd like to use the yeast if it's viable.

Also, if anybody has used it, I'd appreciate a review of the characteristics of the finished brew.

Thanks,  
Brian

From: Michael J. Gerard <mjgerard@eng.auburn.edu>  
**Subject: RE: Low mash pH**  
Full-Name: Michael J. Gerard

It sounds like you might want to think about using bottled water. I'm at Auburn, AL and the water here stinks (literally). We have some kind of problem (or did) with a cow pasture that was near the water supply. So basically there's ---- in the water.

I've tried three solutions...

- 1) buy bottled drinking or spring water (pH after boiling is around 5.5)
- 2) use a filtering system (pH after boiling is around 5.2)
- 3) boil longer. A long boil with the top off should help raise pH.

If you want to keep your costs down you might be able to use some distilled water (with a high pH) and add it to your tap water. You might get by using two gallons which would only cost you about \$1.20.

Hope that helps,

Mike

Subject: IBU'S TO HBU'S

4.5 if you assume MAX Utilization of 30

/

IBU = HBU's (3.75) --- this assumes a utilization factor of 25

HBU = IBU/ (3.75) --- this assumes a utilization factor of 25

EX: Bass ALE = 20 ibu's = 5.33 HBU's = 5.33 AAU's

or ~ 1oz of goldings

BTW, 25 is the U.F. that terry Miller uses in his Pale Ale book recipes. Eckhart also states that 25 is a good starting point for the homebrewer.

/Mal Card

p.s. I derived this simple formula using Eckhart and Papazian formulas. along with some help from HBD.

p.p.s. I too said "no wonder my brews have been too hoppy".

p.p.s. You may note that your all-grain hop rate may need to be reduced if you are comparing with your old extract recipes.

IE. 12 HBU's in an extract boil, yields a lower utilization than 12HBU's in an all grain recipe.

Date: Thu, 23 Apr 1992 17:28 EST  
From: Frank Tutzauer <COMFRANK@ubvmsb.cc.buffalo.edu>  
Subject: IBUs for a steam beer

Bryan Gros asks about IBUs in steam beers.

Anchor bitters with 33 IBUs for their steam beer. In my own brews of interest (4 extract-based steam beers), I have tried the high 30s and low 40s, and the results were usually a little too bitter (although one of them, with a high finishing gravity, was a little too sweet). Next time I try I'm going to shoot for the low 30s.

As for Bryan's particular numbers, below are the answers I got. I've written a short BASIC program that does the calculations for me. I use the equations in Charlie II. As for the utilization rates, I don't use Charlie's table directly; instead, I use a regression equation given to me by Tom Hettmansperger. The equation explains 99% of the variation in Charlie's table, and allows me to estimate utilizations for non-tabled times and gravities. The assumptions I'm making for Bryan's problem are as follows. First, I'm assuming a 2-3 gallon boil with a gravity of about 1.110. If you do a larger boil (giving a lower gravity), the IBUs you get will be higher, so you'll have to adjust the quantities/times down. Second, I'm assuming a 5 gallon batch. Third, I'm assuming hop pellets; if you use leaf hops, you'll get lower utilizations, so you'll need to increase quantities/times. Finally, I'm assuming Bryan's alpha of 8.5%.

First, Bryan considers 13-14 HBUs, i.e. 1.5 ounces. A sixty minute boil will give almost 46 IBUs. To get the 35-40 IBUs Bryan talks about, you would need to add fewer hops. 1.15 oz. gets 35 IBUs and 1.30 gives 40, assuming a sixty minute boil. When Bryan uses the "formula in Papazian or the Zymurgy issue" he gets 1/2 oz. I'm not sure exactly which formulae he's talking about, but my program shows that 1/2 oz. in a 60 minute boil yields just over 15 IBUs. Finally, Bryan's compromise of 3/4 oz. for 60 min., 1/4 oz for 30 min., and 1/3 oz. flavoring (1 min., say) yields  $23 + 4 + 1 = 28$  IBUs, which is probably ok if the California Lager yeast is attenuative enough.

And then again, remember that a bunch of other stuff--kettle geometry, boil vigor, pH, etc.--affect hop utilization, so these numbers are all approximations anyway. If anyone wants to look at the program, or if anyone wants me to redo the calculations assuming different times, alphas, or

gravities, let me know.

Subject: How a competition works.

\*\*\*\*\* PROFS Note \*\*\*\*\*  
From: NLORSCL --VMSPFHOU Date and time 04/23/92 16:43:43  
To: POSTMAN --NASAMAIL

FROM: LAMB, SEAN C. LOR  
SUBJECT: How a competition works.

In regards to Carl West's question about how a competition works, here's the

quick run-down. There are three types of people involved, the orgnaizers, stewards and judges. Your beer shows up at the orgnaizer's place, where they log your entry, put an entry number on your bottles, and put your bottles with entries from the same category. Hopefully they are stored in the

proverbial cool dry place, out of direct light. Preparation for the judging

includes making up the summary score sheets for each category, and merging

categories if there are too few entries. The night before the competition,

the beer is cooled down, and made ready for transport to the competition site

if it is different from the storage site. At the competition site, the beer

is arranged by category and made ready for the stewards. The stewards are

volunteers who open the beer and pour it for the judges. The judges evaluate

the beer, usually using the AHA 50 point evaluation criteria. If there are not

many entries in a category, the judges may decide to award 1st thru 3rd places

in this first round. If there are many entries and the category is split

between groups of judges, the beers that are not boviously flawed are sent to

a second round. One bottle of beer is used in the 1st round.

During the second round, the stewards once again popen and present the beer to

the judges. 1st 2nd and 3rd places are awarded. The 1st place beer in each

category is then judged for best of show. This is where the 3rd bottle is

used. Best of show is usually judged by 4 qualified judges. There is no

score sheet used, they just go at it to determine which of the beers before

them is really the best. It can take time and lead to arguments.

During the 1st 2 rounds, the score sheets are collected by the stewards and

given to the data slaves for tabulation. Most competitions will send the

individual score sheets back to you.

What happens to the left-over beer? It's up to the discretion of the organizer

s, but usually the vultures get it. I ask the judges of my favorite styles about the quality of the entries, and if I find some people that tell me how tough it was, judging all that good beer, I go for it.

And now it's my turn for a question, where can I get Iodophor? Do you make it at home, or do you buy it? Thanks in advance. Hope that this description helped.

From: whg@tellabf.tellabs.com (Walter H. Gude)  
Subject: Re: HBUs and IBUs???

Funny you should ask. I dredged the collective knowledge of the HBD on this very subject a while ago. Following are my responses.

So with 35 IBUs = 7.8 - 8.9 AA pellets  
(8.2 - 9.5 AA whole leaf) or about 1 oz.

If your not doing a full boil (or if the recipe was formulated that way) you'll have a higher gravity in the boil and utilization will go down. (If you boil 2.5 gallon and the 5gal have a 1.045 G then the boil has a gravity of 1.090. This will cause hop utilization to go down by 20%, and you'll need around 10 AAUs to get 35-40 IBUs) Confused? I know I am? :-)

From: SHERRILL\_PAUL@Tandem.COM  
Subject: Here's the first cut at the pepper beer

Most replies said to attempt to introduce the pepper's into the beer as late as possible. So I am going to just put a slice in a few bottles and see how it goes. This way I don't blow a whole 5 gallons on this little perversion of mine.

Here's the whole recipe:

6 lbs anderson light malt extract  
8 oz light crystal  
1.5 oz cascade (boiling)  
0.5 oz cascade (finishing)  
Wyeast pilsner yeast

Ferment at 50 degrees (primary). Secondary at 45 degrees.  
At bottling place a piece of pepper in a dozen bottles. Some serranos, some jalapenos and a variety of sizes.

That's what I call a lawnmowing beer.

Date: Fri, 24 Apr 92 09:49:44 PDT  
From: johno@sherpa.com ("John Olson")  
Subject: Himalayan homebrew

The Himalayan homebrew we saw a lot in Nepal is called "chang." It looks like milky water, has little white chunkies in it, and tastes like bread yeast smells. It seemed mildly alcoholic, after handicapping it for the altitude.

It was quite enjoyable, however, but mainly because of the surroundings.

The Sherpas brew chang from millet, in large plastic food drums left behind (i.e. dumped along with all the other trash) by departing expeditions. Because so many drums are dumped, production capacity seems quite high along the tourist routes. There was one in the corner of every kitchen we saw.

They do not seem to boil or sanitize anything. In fact, apart from a working knowledge of fermentation, it appears that the concept of microorganisms of any kind has not reached much of Nepal.

A landlady serves her guests room-temperature chang in clear glasses from a pitcher that she fills by dipping into said expedition drum. She comes around with the pitcher once in a while offering refills. The bill is on the order of pennies.

All Western medical advice says don't drink the chang, for the same good reasons you don't drink the water (which reasons are abundantly obvious in Nepal), and most of our group prudently didn't. Two of us with less concern, who had somehow avoided GI problems and were feeling immortal, enjoyed it on several occasions with great pleasure and no ill effects.

Chang is very nice enjoyed while sitting back in a lodge kitchen in the afternoon. The Sherpas on a crew head there after seeing to more safe and sane refreshments for the tourists.

It is best enjoyed, however, later in the evening after the other westerners have crashed. The Nepalese trek crews love to stay up late in the kitchen, singing and dancing and playing a drum, the national instrument, with a little chang.

I haven't looked for recipes, because I prefer Our kind of beer better. If I were to make chang, it would be as a novelty, or for refreshments for the big slide show.

Subject: dandelion wine

Has anyone out ther made dandelion wine? I just picked 21 pints of dandelion flowers to make 5 gallons of wine. I'm up scaling the following 1 gallon recipie:

4 pints dandelion flowers (as little "green" as possible)  
18 oz chopped sultanas (white raisins)  
1 1/2 lbs corn sugar  
3 teaspoons citric acid  
2 camden tablets

The recipie calls for making a "dandelion tea" by steeping the flowers in a warm water for 24 hours. I've done this part and the "tea" is a yellow-brown color with a very grassy smell and taste. Is this what is supposed to happen? I've tasted and smelled the flowers very carefully and quite frankly they don't taste like much at all. Will some "magic" happen durring fermentation and aging (not at all uncommon in this type of endeavor)? I plan to go ahead with the brew since after 8 years of beer and wine making I'm compelled to make the quintessential homemade wine but any suggestions would be greatly appreciated.

Date: Fri, 24 Apr 92 14:41:47 HST  
From: richard@pegasus.com (Richard Foulk)  
Subject: more malting

A little over a month ago I posted asking about malting. Lots of good information has flowed in since then. There's still a lot of experimenting to do, but it seems to be working fairly well.

(Someone sent me a list of kilning temperatures for different styles of malt, which I've misplaced. I'd appreciate it if whoever sent it would please send it again. Or post it, there are a number of others that are interested.)

The real breakthrough came when I switched from an initial soak of two days to two hours. The whole barley from the local feedstore seems to be almost 100% viable using this approach. Without attempts to slow things down the malt goes to full modification in less than three days.

My first brew from home-malted barley is underway now. This was also my first all-grain brew, so lots to learn here. The mash seemed to work as expected, things got nice and sweet as they're supposed to. The wort is quite cloudy, perhaps due to a very poor crush, but looks are the least of my worries at this point.

The wort smells good and the yeast seems to love it.

I have a few unanswered questions that I was hoping someone else in netville might be able to shed some light on. BTW, many of the details of commercial malting operations don't seem to apply to home-malting or feedstore barley.

- \* Is the main purpose of kilning, for light malts, simply to add color and a slightly different flavor to the brew? Or does it play some other important role? I've heard it said that it stops the malting process, but drying seems to do that quite well.
- \* Is there something that I can safely mix with the steep water that will retard bacteria growth (keep the grain from going sour) without adversely affecting the malt? (I currently do a lot of rinsing after the steep, every few hours or so, but this seems to speed up the sprouting process more than is preferable.)
- \* Is there an easy way to remove the roots from the grain? Is it really necessary to bother?

Some have said that feedstore barley has the wrong protein content for making beer. I don't buy this. It may be inappropriate for some styles of beer, or for making light beers. Those issues simply don't matter at this point.

Any and all info and pointers on home malting are most appreciated.

>weekend).

A word of warning, especially since you have just done one batch.  
Don't leave bleach solution standing in stainless for a long time  
(long term storage, or even overnight). It is a strong enough  
oxidizer that even stainless steel will rust.

I left some stuff soaking in my kitchen sink overnight, and found a  
couple of rust spots on edges (like around the drain, or where there  
was a scratch in the sink). They scrubbed off easily, but you wouldn't  
necessarily see them inside the keg, and it would be more severe  
if you left it for a few weeks while waiting for your next batch  
to be ready.

Subject: Wyeast's New Packages

Well, I just picked up a package of Irish Ale Yeast at my local brewing store (Brewmasters in Rockville, MD...a great little place with >200 brands of extract in stock), and the new package struck a very familiar note. I'm in the US Air Force, and have been forced occasionally to subsist on "field rations" once in a while. If you followed the Gulf War human interest stories, you may know the new field rations (since about 1987) are called "MREs", short for Meal, Ready to Eat. These replaced the "C" rations, which had been around since WWII. The main difference is the MRE comes in envelopes, while the C rats came in cans (hence, MREs are far lighter). MREs are also much more palatable, but that's beside the point. The main dish (scaloped potatoes with ham, my personal favorite, or chicken ala king, etc., etc.) is in an olive drab foil pouch. The rest of the meal is in other plastic and foil pouches of similar blend-in-with-trees colors, and the whole thing is in a large plastic bag. Getting back to the point, the Wyeast package is PRECISELY the same as the pouch in which the main dish of an MRE is packed. The same color, the same double notches to tear it open on both sides, the same fabric-like pattern from sealing all around, the same horizontal ridges in the bottom edge.. .the only difference between the packages is the Wyeast label (which is stuck on). So now we all know (or at least suspect) how Wyeast solved their packaging problems...they copied the US military! Now if I can just get over the flashbacks of cold "ham and cheese omelet" for supper. Can anyone at Wyeast verify this? Was it intentional? The new packages work great, but I never had a problem with the old one exploding, either.

Subject: hops

A couple of hops questions:

It is thought to be a good idea to allow just 3 or 4 shoots to grow.  
I've got a plant with 6 very healthy shoots. I was thinking of having 3 lines, with 2 shoots on each line. Good idea? Bad idea?

Does the method of making a plant split into 2 main branches by snipping off the top work for hops?

Subject: TSP/RATC

jal writes:

>2. What are the preferred cleaners/sanitizers for stainless? I  
>know of those who swear by between TSP or Iodophor, and one who  
>even uses bleach with minimum exposure.

It is my understanding (from Charlie's TCJoHB, I believe) that TSP (trisodium phosphate) is a good cleaner (for label removal, I believe), but not a sanitizer. I believe George Fix introduced Iodophor to the HBD and recommends it for SS because Chlorine Bleach reacts with SS.

I purchased a bottle of Iodophor a few months ago, but had been hesitant to use it, not knowing the proper concentration to use. As an experiment, I bottled a batch where half the bottles were sanitized with 200ppm Iodophor and half with 200ppm Chlorine Bleach. After sanitizing (with one of those Italian-made, red-and-white bottle sanitizers) I rinsed with hot tapwater using my Jet bottle washer.

Two weeks later, all the Iodophor bottles have ring-around-the-collar. None of the Bleach bottles do (yet -- see NOTICE).

NOTICE: I had recently developed a ring-around-the-collar problem in my brewery (read, basement). I was using 100-200ppm Chlorine Bleach but was not changing it (I would used the same gallon of sanitizing solution for the entire batch -- bad idea). I had gotten cocky and my sanitation had become lax. I've since become more careful when sanitizing and have not had problems with the ring-around-the-collar (knock on wood). Note, that some bottles had more RATC and some had less. Some brews did not have any. When it did appear, it would show up as pinhead-sized dots at the liquid level, unevenly spaced around the entire circumference. I will check for a correlation with dryhopping tonight.

I just re-read a personal email conversation with George, who said that the Chlorine in my municipal water will (to some degree) counteract the Iodophor. He suggested that I add more Iodophor till a "good color is established." Hmmm. Maybe I should have added more Iodophor? The Iodophor I'm using has an indicator which makes the solution amber when it is working and clear when it should be changed. The solution I used was about the color of American Light Lager. Maybe I should have added Iodophor till the color was like Bass Ale? George? Maybe the problem is in my water (Palos Hills municipal -- purchased from Chicago South branch)?

Has anyone identified the creature(s) responsible for ring-around-the-collar? I assume it's aerobic since it only hangs out at the liquid level. I have not tasted any acidity in any of my RATC brews -- I had assumed, therefore, that it was a mold. In fact, I have not noticed any ill-effects from the RATC other than cosmetic. Comments?

Subject: Light-struck beer

I had read in the HBD, that a week or two in the dark at 50F will "cure" light struck beer. I just finished a six of Newcastle Brown Ale. I recall that the beer was stored at room temp under fluorescent lights in the store. The first bottle (1 day of chilling at 50F) smelled skunky. Subsequent bottles (after a week or so at 50F) did not have a skunky smell. Anyone else notice this phenomenon?

> I ended up comprimising and using 3/4 oz for 60min, 1/4 oz for  
>30 min, and 1/3oz for flavoring. I have no idea what it will taste  
>like.

You goofed in your calculations somewhere. According to the Zymurgy  
Hop Special Issue (I use this issue so much I should buy another one ;^)

'Steam'-clones should have 40 IBU. According to the calculations in  
the Hop Special Issue, if you are making 5 gallons with a boiling gravity  
under 1050 and want 40 IBU using a 60 minute boil of 8.5%AA hops, you  
should use 1.051077 ounces of hops. I suggest rounding to 1 oz.

I don't have my copy here at work so I cannot accurately calculate the  
actual IBU you used (you didn't post the boil gravity anyway), but  
a thumbnail calculation would indicate you got somewhere around 32 IBU.

DON'T DISCOUNT BOIL GRAVITY -- I DID ONCE ON A 1084 BOIL AND WILL NEVER  
FORGET TO DO IT AGAIN! The IPA I made would go well on pancakes.

Well we are finally finished here in San Francisco. We concluded our  
judging  
of 761 entries this past Saturday. With the exception of having a few  
larger  
flights than we'd have liked, everything went pretty much as we planned.

I'd like to say "Thanks!" to all who participated. We had a great  
turnout of  
judges, stewards, and volunteers.

Special "Thanks!" to Bruce Joseph and Anchor for allowing us to disrupt  
the  
brewery for the month of April.

Now on to Milwaukee!

> rinsing after the steep, every few hours or so, but this seems to  
> speed up the sprouting process more than is preferable.)

> \* Is there an easy way to remove the roots from the grain? Is it  
really  
> necessary to bother?

1. Kilning is important because it begins the destruction of the  
enzymes,  
which is continued into the mash process. Ordinary drying will not  
do  
this. Kilning the malts also changes the color of malts by producing  
melanoidins via the Maillard reaction. DMS is also destroyed in the  
strong kilning that pale ale malts undergo.

2. Alkaline steep waters can check microbial growth and steep phenolic  
materials from the grain. Non-Reinheitsgebot maltsters sometimes use  
gibberic acid or potassium bromate to reduce malting losses. A  
decent reference on this is "Malting and Brewing Science", ed. by  
D.E. Briggs et.al., London; New York: Chapman and Hall (1981-82). I  
don't know if you can find this book, but it is kept on reserve here  
at one of the Cornell libraries.

3. I remember reading that if the malt is dried correctly, then the  
roots  
fall off very easily. They actually have a high nutritional value  
for  
livestock, so maltsters go through great efforts to recover and sell  
the roots.

Keep us posted - this is something I'm interested in trying someday.

Scott

Subject: Pepper experience

Sorry I'm lagging a bit on my response, but I did want to put in my 2" worth. A while back, my brother decided to try making some stir-fry dish from scratch. The recipe called for roasted red peppers (the HOT kind...). My mom and I just just happened to be in the house at the time he decided to roast the peppers...

He put them in a small skillet and started dry-roasting them on the stove. After a few seconds, they started giving off a light smoke. All of a sudden, my brother started coughing like he couldn't stop, then ran outside with the skillet. I went into the kitchen to see if he was alright, and I started coughing too. I had to run outside and join him, where we both just stood there coughing. After about 10 minutes, we were finally able to go back into the kitchen. We ended up opening all the doors just to get rid of the fumes. When we'd finally thought the house was pretty much free of fumes, we heard this endless coughing coming from upstairs - turns out the fumes had drifted up there too!

Anyway, the moral of this story is, if you're planning on roasting red peppers (for beer, or whatever), do it outside on the barbecue and wear a bandana - the fumes are unbearable! BTW, the peppers tasted great!

From: Jon Binkley <binkley@beagle.Colorado.EDU>  
Subject: Pilsner from 1-step Infusion?

Ok, I finally ordered a refrigerator thermostat and I hope to make my first lager this weekend, a pilsner.

I know that these are traditionally made from less modified malts which require a protein rest, but I plan to use fully modified British pale malt and do a single stage infusion in a picnic cooler, unless someone here can successfully talk me out of it.

Are there any \*REAL\* problems with making a pilsner from British malt, such as serious off flavors? I know the color should be okay, since I've made very pale beers from the same malt.

Thanks for your consideration,  
Jon Binkley

>On competition day, a couple dozen judges gather in Goose Island's  
>banquet room. They sit three to a table, and each table will judge one  
>type of beer. I am a German Bock, and one of my three bottles is brought

Not exactly. Under the new system, only one beer is required for the first round. "Winners" of the first round (three beers in each category) are notified (by May 8th this year, I believe) and asked to send another two bottles for the second round judging. I don't know exactly what happens to the extra bottles if brewers send three instead of one to the first round.

>to their table along with the other German Bocks. The judges open each  
>bottle, pour a bit into a glass, and judge it.

>Then the winner of each category goes into "Best of Show". The most

>My maker's German Bock is the Best of Show, and he gets a nice engraved  
>pewter beer stein.

Not quite. The brewer's are asked to send a second and third bottle for the second round. One of these bottles will be used for the second round judging. The other will be used if the beer wins first place in the category and goes on to the "Best of Show" judging.

Subject: Kegs and Propane

Richard Stern <rstern@col.hp.com> asks, in reference to converting a keg and using a propane cooker:

- >a) Are kegs stainless?
- >b) Do I need a lid? Or do I just brew without one?
- >c) Any concerns about brewing in my garage or back yard?
- >d) Where can I find a large propane cooker??

Simply put: a) yes; b) no; c) no problem in your backyard; propane cookers are not recommended for indoor use, but you can get away with it if your area is VERY WELL ventilated (open windows, doors); d) many sources -- Alternative Beverage in NC sells the simple and effective Cajun Cooker, as do others.

I've used a propane burner for over a year now, and definitely recommend one as a fairly inexpensive alternative to slow, stove top boiling. If you thought you had a good rolling boil before, think again. You'll also easily cut an hour off your brewing schedule by reaching that boil substantially faster. Go for it!

From: PHILLIPSA@LARS.AFRC.AC.UK  
Subject: Fining without cruelty

Dear HBD,

I usually fine my beer, a day or two before moving from secondary to barrel, with either gelatin or ininglass. This works fine, and I get crytal-clear beer after 4-5 days in barrel (of course, it may clear OK without fining, but I've never tried it). The problem is, my partner is a vegetarian, and objects to my putting animal products in the beer she drinks. Up to now, I've managed to convince her that all the fining agent drops out of the final product, but I'm not sure that's too convincing. My question is: is there a fining agent which I can use with a clear conscience?

I brew mainly ales with the occasional Pilsner (the latter brews tend to be significantly cloudier, probably protein haze due to my inefficient decoction mash technique).

P.S. Can someone send me an address/phone/FAX number for Zymurgy so that I can get an overseas subscription?

Subject: Dandelion Wine

To: Homebrew Digest  
Fm: Jack Schmidling

>From: michael@frank.polymer.uakron.edu (Micheal Yandrasits)

>Has anyone out ther made dandelion wine?

Great minds travel the same roads. My wife and I were poring over my collection of winemaking books trying to integrate all the recipes and procedure into one that makes sense. Talk about contradictions and momilies...

Steep one day... steep seven days.  
Remove all the green calixes.. don't bother.  
Steep in boiling water... never boil.  
Don't steep at all, just ferment the whole mess.

My wife spotted a vacant factory with about an acre of yellow but you just know the day we go to pick, the lawn mowers will be pulling away.

I am pure culturing Red Star champaign yeast for this project so I can't start till the yeast is ready and we are shooting for this weekend.

>I'm up scaling the following 1 gallon recipie:

4 pints dandelion flowers (as little "green" as possible)  
18 oz chopped sultanas (white raisins)

Thank you.... we were wondering what sultanas were... My wife suggested sultans' wives.

1 1/2 lbs corn sugar  
3 teaspoons citric acid  
2 camden tablets

Here is what we came up with:

4 gallons dandelions  
4 gallons water  
8 lemmons  
4 lb raisins  
10 lb sugar

Bring water to boil. Dump in the stuff and pitch when cool.

>The recipie calls for making a "dandelion tea" by steeping the flowers in a warm water for 24 hours. I've done this part and the "tea" is a yellow-brown color with a very grassy smell and taste. Is this what is supposed to happen? I've tasted and smelled the flowers very carefully and quite frankly

they don't taste like much at all. Will some "magic" happen durring  
fementation  
and aging (not at all uncommon in this type of endeavor)?

I think the whole thing is a conspiracy. It seems like dandelion wine  
is to  
wine what Bud is to beer. I made some years ago but have no  
recollection of  
how or what it tasted like but like you, I was itching to give it a  
whirl.

Keep us posted.

>From: richard@pegasus.com (Richard Foulk)

> \* Is the main purpose of kilning, for light malts, simply to add color  
and a slightly different flavor to the brew? Or does it play some  
other important role? I've heard it said that it stops the malting  
process, but drying seems to do that quite well.

All of those sound pretty important to me. One you missed is that it  
would  
rot during the 4 to six week curing period if the water content was not  
reduced to very low levels.

The most obvious and important probably is the taste. It just does not  
taste  
like malt if just dried. The kilining brings out the sweet malty  
flavor.

> \* Is there something that I can safely mix with the steep water that  
will retard bacteria growth (keep the grain from going sour)  
without adversely affecting the malt? (I currently do a lot of  
rinsing after the steep, every few hours or so, but this seems to  
speed up the sprouting process more than is preferrable.)

Rinsing three or four times a day should keep the bacteria to  
undetectable  
levels and is just good hygiene. Anything you mix with the grain will be  
absorbed and get into the beer. Stick with water.

> \* Is there an easy way to remove the roots from the grain? Is it  
really  
necessary to bother?

By the time it is ready to kiln, they sort of take care of themselves. I  
just reverse the drying fan and they just blow away.

>Some have said that feedstore barley has the wrong protein content for  
making beer. I don't buy this. It may be inappropriate for some  
styles of beer, or for making light beers.

The only problem I have had with feedstore barley is a 50% viability  
which  
means that 50% of my malt is rotting barley. As I had no other source,  
I  
gave up.

BTW, congratualtions on taking home brewing one step further. No one  
will  
accuse you of being a cake mix brewer.

From: sdavis@laforge.ksc.nasa.gov (Steve Davis)  
Subject: Sterilizing Solutions

Greetings...

A local brew shop carries a bag of white crystalline powder that is simply labeled "Sterilizing Solution Mix". Supposedly, you just mix a few teaspoons per gallon of water, and you can sterilize anything instantly. We tried this stuff with our last batch, which has just passed the bottling stage. The wort tasted normal at this point, so there doesn't seem to be any contamination yet.

Does anyone have any experience with this stuff, or know what it might be? We've been using bleach and water up until now, but that required soaking for a day or more for proper sterilization. Other than speed, what are the advantages/disadvantages of the two?

Date: Thu, 30 Apr 92 09:15:02 MDT  
From: haney@soul.ampex.com (Kenneth Haney)  
Subject: First time keggng.

Hi all,

Well it's me again with another question for the more experienced.

I've got everything I need to start keggng in Cornelius kegs, and want to try carbonating with CO2 instead of priming. How much pressure do I need to put on the keg and how long do I need to leave it on the keg? Once carbonated can I remove the CO2 setup and let the keg set on it's own until I'm ready to tap it? How much pressure do I use to dispense the beer? If need be can I unhook everything and tap another keg before the first one is done?

Well thanks in advance for any and all replies, I haven't had a chance to check into any of these things and want to keg the batch that is in the fermentor.

By the way, don't discount garage sales and flea markets to pick up your keggng supplies. I got my CO2 cylinder, three 5 gal. soda kegs, one 2.5 gal soda keg, regulator, lines and quick disconnects all for \$19.75. This is why I want keg so bad and don't have any info on it, I couldn't pass up all great deals and would like to try it.

Thanks again,  
Ken

From: korz@ihlpl.att.com  
Subject: Non-animal-based finings

Andy asks for non-animal-based finings.

Polyclar is a trade name for a fining made from (I believe) polyethylene. It is to be used just like geletin or isinglass. Another alternative may be to use Irish Moss, which is made from a type of seaweed, and is added to the last 15 minutes of the boil. On the other hand, if your boil is good and long (at least an hour) and you let it clear in the keg for a two weeks (like I do), you shouldn't need finings. If you still get cloudy beer from your Pilsener, maybe your protein rest is at the wrong temperature or not long enough.  
Al.

P.S. The AHA can be reached at 303-447-0816. They publish Zymurgy.

Jack Schmidling says:

>> I think the whole thing is a conspiracy. It seems like dandelion wine  
is to  
>> wine what Bud is to beer.

What I've always guessed is that it's like the nail soup. Obviously  
you can make wine by adding enough raisins and sugar. The  
dandelions probably don't have much to do with it.

Microbiology for the Home: A Primer on Yeast Culturing

by: Brett Lindenbach  
(brett\_lindenbach.microbiology@qms1.life.uiuc.edu)

After quaffing a good yeasty beer I thought to myself, "Why throw away the yeast that's stuck to the bottom of the bottle, especially when I have to pay four bucks for a Wyeast culture?" And so, with this do-it myself attitude, and some training in microbiology, I set out to construct my own library of yeast strains. Let me tell you how I did it.

**A WORD ON SANITATION** First of all, to have success in manipulating microorganisms, you must have an appreciation of sterile technique. It is one thing to pitch an active culture into fresh wort, and quite another to revive a yeast that has been sitting happily in alcoholic dormancy for months: the chance for contamination are at least ten-fold. A good thing to bear in mind at all times is that microbes are everywhere: on your hands, in the air, your countertop, you name it. I am amazed at my roommate's brewing technique (he's an engineer). He will sanitize something by swishing it around in our bucket-o-bleach water, and promptly set it in the kitchen sink! So, when dealing with sanitary/sterile things it is important to work quickly, but to not get sloppy. Soak things in bleach water at least 5 minutes. Wipe down the area you in which you plan to work with a bleach based sanitizing solution. Contamination can be common until you are well practiced in sterile technique. If you have access to an autoclave, by all means, learn how to use it. If not, the next best methods are boiling all ingredients, which does not guard against spores but will suit most of a homebrewer's needs, and sanitizing all equipment with bleach solution. Also, it would not be a bad idea to check out a book on microbiological techniques (1,2) from your library for this all important concept

**MAKING MEDIA** The next thing to do is to prepare some media to grow and keep the yeast on. I decided to use agar plates for storing my yeast. The advantages of this method are that it is easy; single colonies can be isolated, thus allowing you to "purify" yeast away from contaminating organisms; and that cultures can be kept for months in a refrigerator with a properly stored plate. To do this requires getting some pre-sterilized disposable plastic petri dishes (Fischer Scientific 711 Forbes Avenue Pittsburgh, PA 15219 ). The best buy is cat#08-757-14G, p.683 (\$50/ case of 500). Also needed is some agar. The best is from Difco Laboratories ( P O Box 331058 Detroit, MI 48232 1-800-521-0851) and it is called Bacto-Agar. Start by buying 1/2#, which should run about \$37. Also, we will need some DME, and a source of hop oil (any flavor). A good pot to use is one that has a handle, a tight fitting lid, and preferably a lip for pouring on the side. It should be big enough to avoid boil-overs, yet small enough for handling with one hand. Mine is 12 quarts. Start by boiling up 3 cups of water. Throw in a good amount of DME (up to 1

cup) or pure maltose, (if you can get it), stir to dissolve, and continue boiling for 15 min. Keep the lid on loosely, to allow steam to escape

and "steam sanitize" the lid. Add 18 IBU's of hop oil. Use oil. We do not want to have to strain this mixture. The hops, as any casual reader of Papazian might know, is to act as a microbicide, thus helping to select for our hop-tolerant yeast. Then slowly add 1/2 teaspoon of agar, stirring constantly to avoid boiling over. Watch it carefully, and continue boiling for another 20 minutes. When done, remove from heat and put the lid on tightly. Allow to cool. Do not use a wort chiller, or similar device. Agar melts around the boiling point,

and solidifies at around 50 degrees Celsius (your body temp is 37 C). While you are waiting, crack open a sleeve of plates. Take out 10 and put them on your freshly scrubbed-down counter in two piles of 5, with the lids on top. Do not take the lids off. When the pot is still very warm, but within handling temp., quickly flame the lip you plan to pour out of by passing it over your stove burner (for people with electric ranges, see below under "other equipment"). Now, with one hand tilt the lid, and the stack of plates above it, off the bottom plate.

Pour the media in to fully cover the bottom of the plate, but only go about 1/2-3/4 of the way up the sides. Try not to mar the surface with bubbles. Replace the lid and stack of plates, and proceed to the next highest plate, etc. Let the plates sit undisturbed for 45 minutes to an hour. You will know the agar has solidified when the media color lightens to a buff, and the media stays when tilted. When you are sure the agar has solidified, turn the plates upside down, and store them that way to avoid dehydration, in a cool area, like a cupboard, away from air currents. If your plastic sleeve wrapper is empty, slide it back on the stack of plates before flipping, and seal with a twist tie. These can be stored for weeks at room temp., and longer if you wrap them and refrigerate.

**OTHER EQUIPMENT** Other things you will need include a source of flame, for sterilizing. A gas stove does the trick for me. Also good is a

small alcohol lamp. Do not use an oil lamp. A disposable lighter works in a pinch. We also need to construct a loop. This consists of a straight piece of wire, a little longer than a long neck bottle, with a handle on

one end. The other end is twisted around into a circle, about 10 mm dia., to form a loop. A good handle would be one of those twist-to-clamp X-Acto knives, minus the blade. The more inert the loop material, the better. A good bacteriological platinum loop is probably out of the price range of most homebrewers. Try stainless or regular steel, about .5mm dia. Fischer (see above) also sells pre-sterilized, plastic, bad-for-the-environment loops for those so inclined. Also, a source of Parafilm, a wax-like wrapping paper for the lab, will be helpful in extending the life of your plates. Finally, find a good, dark

spot in your house, preferably away from air currents, where the temperature is consistently around 30-37 C. This will be our makeshift incubator. I use this spot on our range above the pilot light, and keep a bowl over my plates to shield from air, light, and grease. Keep this area especially clean.

**MAKING A PLATE** Okay, so we've made it this far, let's start to collect yeast. Take a bottle of beer with a good amount of yeast on the bottom. Allow it to settle in your fridge overnight. Carefully pop it open and slowly decant the brew. Set this aside. Be sure not to lose

too much yeast pouring. It is best to leave that last bit of beer/yeast

slurry in the bottle. Flame the lip of your bottle and the business end of your loop. Insert the loop into the bottle. If the loop is still hot, touch it to the inner bottom of the bottle, so as to dissipate the heat.

Scrape up some yeast sediment or swish the loop in the yeast slurry to fill the loop. Taking care not to touch the loop to anything, withdraw your sample. Grab a plate and remove the lid. Pick up the plate and streak the loop back and forth across the plate. Do not press too hard, or you will ruin the agar surface. To get nice isolated

colonies, confine your streaks to one region of the plate. Flame the loop, and poke it into a spot of the agar to cool. Pull the loop through

the streaked region twice and streak in a new region. Repeat this dilution technique again. Replace the lid, and put this plate upside down in your incubation zone. With practice comes speed, which is important for avoiding contamination from airborne nasties. Within a few days you should see signs of growth. Yeast colonies should be round, white-to-brownish bumps on the surface, in the pattern you have streaked. Hopefully your plate will not sport any contaminants, which could look like almost anything. Contaminating wild yeasts are hard to discern, but usually look slightly different than what you have spread. Look carefully, but remember not to open up the plate. To store your plates, cut a small strip of Parafilm (1 cm x 5 cm), if you plan to use it. Holding it to the sides of your plate with a thumb,

pull it around the lid/bottom edges of the plate, taffy-like, to seal the

sides. Sanitize a Rubbermaid container, big enough to hold plates, and lid. Store the plates in your fridge.

**CHOOSING BEERS** Not all commercial beer has yeast in it. When scouting for yeast in the liquor store, I hold the bottle up to the light and check for sediment. Also, beer yeast with high attenuation may be hard to revive. They may have literally drowned in their own alcoholic poop. Try as I might, I cannot seem to culture Old Peculier Ale or Duvel's Belgian yeasts. Other yeasts will have simply run out of food, and settled down for a nice nap in the bottom of our bottle. These are the ones we want. So, choose a beer without too much alcohol and a good amount of yeast. German lager yeasts come up nicely, as do Weiss yeasts (note: many Weissbiers use two yeasts, and you can see two discrete colony types). Ales can be had too: try Chimay. Why not start out with one of your own? This is a good way to keep a free culture of Wyeast on hand. Additionally, the re-use of a yeast culture (assuming good maintenance) will make a yeast your own. It will get used to your brewing methods by selecting for variants that grow well in with your setup. This is how all the different yeasts used in brewing came about in the thousands of years B.G. (before genetics).

**MAKING A STARTER** Well, thats just great. We've got our yeast on this little plate of agar. But let's not forget our reason for doing all

this: to make better beer. So, we need to make a starter for these critters, so we have something to pitch. Start by making the above recipe, but leave out the agar. When cool, aliquot into very sanitary beer bottles, about 1/4 volume and cap. Flame your loop and an open bottle of starter wort. Tap the loop on agar surface to cool, and scrape

up a single colony. Swish it around in the starter to get the yeast in

suspension. Cap the bottle with an airlock, and store in a nice warm place. The yeast should be ready to pitch within a few days.

**MAINTANING YEAST STOCKS** The main reason a plate will go bad is a contaminating organism may appear. If so, pick a clean yeast colony with a sterile loop and streak onto a new plate. If you are safe

from contaminants, plates will go bad from dehydration. When a stock plate shows signs of this, it is good to streak a fresh plate.

Subject: re:hops

>...3 lines, with 2 shoots on each...

One author on the subject (name forgotten, article not at hand) says `let 'em grow, I get a fine harvest that way' (paraphrase) but goes on to admit that he has never tried culling the shoots, so he wouldn't know if it's better to do so. Other authors recommend culling. One suggestion I like is letting three go, when they're a third of the way up the support, let three more go, repeat. I plan to try this.

>...making a plant split into 2 main branches by snipping off the top...

The plant won't necessarily split at the `snip point', but snipping will encourage side branches to grow.

From: David (D.R.) Brown <DRBROWN@BNR.CA>  
Subject: Fermentation lag time.

I brewed an all-grain IPA last weekend using "British Ale" Wyeast (1098)  
,  
After bursting the inner pouch, the Wyeast packet expanded before I was  
ready to use it. I tried to buy some time by pitching the contents into a  
1/2 gal, 1.020 SG starter of corn sugar and water.

Two days later I was ready to pitch the starter, but its SG had only  
reduced  
by a couple of points. I pitched anyway but after three days there was  
no sign of fermentation. A lag time of three days seemed a bit excessive,  
so I decided to dump in a package of dried yeast. Now the fermentation is  
in full swing.

I now realize that the starter should have been made with malt extract,  
NOT  
sugar. Still, why did the yeast lose its spunk after it hit the sugar  
water?  
Did I induce the dreaded Crabtree effect in my starter culture? If so,  
why  
didn't the yeast recover after three days in the wort?

Even though I used a wort chiller, a considerable amount (~1/2") of  
material  
precipitated out after the yeast was pitched. Is it also possible that  
falling  
 trub took some yeast out of suspension, burying it in the bottom of the  
carboy? It seems to me that this would contribute to the lag time.

Any thoughts or suggestions?

- Dave

From: mccamljv@ldpfi.dnet.dupont.com  
Subject: Recycling Yeast

Fellow Brewers,

I am looking for a less maintenance intensive yeast 'culturing' method. I have Leistad's book on the subject, and thanks to the contributors to the HBD I have many other 'primers'. BUT, I am by no stretch of the imagination a micro-biologist AND I have no wish to be (all of the primers and Leistad's book advocate the microbiological approach).

I have seen numerous mention of people re-using the yeast slurry from the primary or secondary. Would anyone care to post a procedure/process/primer on how to get 2-3 batches from one packet of yeast (liquid or otherwise).

I guess what I am after, is a means of storing yeast for a period of time AFTER it has been used to make a batch and re-using said yeast to make another batch.

I hope that the great wealth of knowledge represented here can come to the aid of people like me who have neither the time to be a mad scientist (not intended as a flame) or the knowledge, equipment, space, patience, etc... etc... Thanks in advance to any and all who respond.

Yours in brewing,

>  
> Wouldn't this break the yeast cell walls? I mean the  
> argument for using a hydration step in water rather  
> than in wort is because of cell damage. So, wouldn't  
> the pressure be as bad for the yeasties as tossing  
> them straight into wort for hydration purposes?

Here's an example of one other thing not to worry about.  
Water (and presumably beer) is essentially an incompressible  
fluid. That means that if you push on the top of it harder  
basically nothing happens. If you don't believe me try  
squeezing a completely full plastic soda bottle (no air in  
the top now - that's cheating) and a completely empty  
(except for air) soda bottle. The full one will deform but  
not compress.

It's true that more CO<sub>2</sub> goes into solution under pressure  
but that's because of the surface interaction. The gas  
diffuses both ways across the surface but the bubbles  
coming out of the beer say "Woha, too much pressure  
out there. I'm going back into the beer to relax!"

The bottom line is that you shouldn't have to worry about  
yeast cell walls. The purpose of hydrating is to reduce  
osmotic pressure which is a completely different story.

If you really want to put your beer under CO<sub>2</sub> pressure  
while fermenting (and I'm still unclear why) then you need  
to use some sort of relief valve. A cheap one is to blow off  
into a column of water. Unfortunately to get an extra 1.5 atm  
of pressure you need a 50 foot column of water :-)

Date: Fri, 1 May 92 12:39:05 EDT  
From: jj@research.att.com  
Subject: Stout (or is it Porter) Recipe

Stout, or is it Porter by another name?

5 gallon batch

Grains:

1 Lb roasted barley  
1 lb Crystal (~100 lovibond)  
1 lb pale malt  
2 oz black patent  
crack, put in bruheat with 6 gal or so, in grain bag.

Rest at 110-115 for 15 minutes.

Mash circa 150 for about 40 minutes (full conversion via iodine test and wait a bit) There's not really much to convert.

Sparge, but don't cook the flippin' hulls.

Add:

1 Can (1.5kg) John Bull Dark unhopped  
1 Can (1.5kg) John Bull Amber unhopped  
(I'm sure somebody else's unhopped extract would do just fine, too.)

Boil until hot break starts. Skim well. Either this likes to throw scum or my grain cracking is bad, but who cares.

Add 1 oz galena hops. Boil for 45 min or so, skimming when necessary. You will find some scum here, too.

Add a pinch of irish moss.  
Wait 5 minutes.

Add 1/2 oz fuggles and 1 oz cascades,  
and boil for 5 minutes. Before boil stops, bring total volume to about 5.5 gal, of which you'll use 5 gal.

Cool (I use immersion chiller- expect a cold break, too)

Rack to carboy.

Pitch with Whitbread's Ale yeast (I plan to try some Wyeast as soon as I get the chance, but I have nothing against Whitbreads.). I don't use a blowoff, but I do have a spare bathroom with a spare bathtub to put the carboy in. I just use a good ol' s-lock.

Starts at somewhere around 1.045 (I don't let it cool far enough to know for sure.)

Finishes in about a 1.5 week for me at about 1.23 or so, circa 64-65 deg. F There are lots of unfermentables in this beer, no kidding.

Rack back to bruheat, prime with 1/2 C light DME boiled in 1qt of water or so. Stir cooled priming liquid into bruheat.

Bottle.

**\*\*NOTE\*\*** this beer has enough unfermentable stuff in it that you do NOT want wild yeast in it, or you will get gushers that taste rather (as he mixes his metaphors) like something you'd rather see in an old Godzilla movie. So, get out that chlorox and b-brite.)(NO! Don't MIX them. No! No! NO!)

It conditions sorta slow, it's not dried out for about three weeks here.

This tastes a bit like Sheaf stout, but without the "I'm too old" flavor. After it sits on the tongue, it's sweeter (but not at first taste, you need to break some of the higher sugars with your pepsin first).

It's hoppier, it could probably stand to condition a while longer. I've thought to add some cara-pils but I have yet to get around to it.

Head retention is so-so.

People must like it, I've gone through the last batch in about 2 weeks after conditioning, with lots of cheerful help.

i hope you liked my last post. i wish to thank larry stuntz for reviewing

it, he pointed out a few things that i may need to clarify. first of all, the solid agar should be gelatinous, but stronger than jello. therefore, when streaking a plate, be gentle. keep the loop on top and do not mar the the surface. if you wish to scale the recipe, shoot for 2% (w/v) agar. my quantity was a guess, but it is plenty. agar is derived from red algae, and its quality is dependent on its purity. for homebrewer's purposes, it does not have to be real high grade. therefore, i think that the chinese agar-agar (found in oriental marts) would probably be fine.

Subject: ENOUGH ALREADY

Hi folks,

Sorry to flame, but I am really getting tired of some individual (whose initials are js) who just can not post a message without the obligatory "real" brewer BS. Any time I read a post from this individual I just stop relaxing because I know his arrogance and self-importance will creep into it somehow. The most recent posting by this "real" homebrewer went on pretty innocently, but alas it was too good to be true, for the last line was

> BTW, congratulations on taking home brewing one step further. No one will  
> accuse you of being a cake mix brewer.

I do not care what your or anyones definition of brewing is. I make beer. Period. I and my friends enjoy it, and I will continue to make it the way I prefer to make it.

Drop it already, guy. We are getting sick of it and it only continues to lessen your credibility with us.

For the rest, I am sorry to flame, but it's really been annoying. We are all sharing a rewarding hobby here, and I enjoy learning more about it. However I do not enjoy the few people who have to lord advanced techniques over us. I respect the extra effort that goes into all-grain brewing, but do not respect those who do not respect us.

So if you don't like it or my extract brewing, you can bite me. To the rest, keep the good advice and questions coming.

Relax,

Dear Brewers;  
I subscribed to this list quite recently when I saw it on the listservs list... I have always wondered about fermentation and making home-brews.  
..  
Im am currently studying in the wonderfull island of Cyprus (actually doing my BSc on Electronic Eng.) A corner of earth touched by heaven... Anyway let me come back to the point I tried a little experiment a week ago. Mixing 5 litres of grape juice into 3 table spoons full yeast boiled in 2 cups of water and about two full cups of sugar... And put the whole mixture in a plastic sealed container with a airlock lid| I know the whole thing soudns silly and I already knew about wine turning into vinegar when in contact with air but to smell it I lifted up the airlock lid as i did so because of the preasure inside the whole thing blew up in my face....  
NOW since my knowledge on fermentation is no more than I learnt in biology in high school please someone guide me on how to make my first dry wine? I know that I need a proper airlock| and maybe some other stuff too...  
SO PLEASEEEEE HELLP

Ege Serim.... <S901322 at EMUNIVM1> Keen beer/wine enthusiast|

Joel> procedure/process/primer on how to get 2-3 batches from one  
Joel> packet of yeast (liquid or otherwise).

Joel,

Try saving the slurry from primary in sanitized jars in your refrigerator. I haven't done this myself, as I rarely use the same yeast for two consecutive batches of beer, but I was reading through the Zymurgy yeast special last night (again), and this method was mentioned as a good first step towards home yeast maintenance. Try to use the yeast as soon as possible, I think the article said a week was ok. There was also some information on pitching volume that you might find useful, you want to get 40 billion cells pitched into 5 gallons of wort, and 1 cup of slurry from primary should do it. So should 10 puffed up Wyeast packages :-)

Speaking of yeast, a follow-up on my Red Tail Ale yeast query of a week ago: I went ahead and pitched the dregs from two bottles of unknown age into an 8 oz starter and attached an air-lock. I finally saw some activity about 4 or 5 days later, which wasn't a quick enough start for me to be confident about brewing with it. Anyway, the yeast is viable; I'd suspect that it's very similar to Sierra Nevada's yeast, as it sticks very well to the bottom of the bottle (as does SN), and the Mendicino Brewing Co. in Hopland, CA (brewers of Red Tail Ale) is fairly close to Chico. By the way, they also make a seasonal (Winter) ale called Eye of the Hawk, a strong ale whose yeast sediment looks very Chimay like; those of you who can find this beer may have better luck reusing this yeast rather than Chimay, as it will probably be fresher (in the Winter, anyway) and will probably have seen less rough handling than a beer that has been imported from Belgium.

> Here's an example of one other thing not to worry about.  
> Water (and presumably beer) is essentially an incompressible  
> fluid. That means that if you push on the top of it harder  
> basically nothing happens.

(this has nothing to do with beer, but...)  
my brother got a very good illustration of this incompressibility when a friend of his went four-wheeling in a stream with his Ford Bronco. Water shot up the air intake and into the cylinders. When the pistons came down on the cylinders for the next cycle, they encountered water, which does not compress, instead of air, which does. The resulting force on the pistons bent the cam shafts into fairly severe angles (and cam shafts are very thick, strong pieces of metal) and the engine had to be rebuilt.

Come to think of it, this does have to do with beer, since they probably had a few before going out on this ride. BUT it wasn't homebrew... that must have been their error :)

On a beer-related topic: our last mead fermented down to .997, and was so dry that it tasted like champagne. We're not complaining, (it was/is fabulous) but what is the approved way of achieving a sweeter mead? Two alternatives I've heard are:

- use a less attenuative yeast than Champagne.
- spike the batch with grain alcohol to inhibit the yeast at the level of sweetness desired. This prevents you from then carbonating the mead, though.

Thanks,  
Jim Buchman

Re-using yeast slurry is quite simple, especially if you are going to use it immediately. If you're going to store it for a few weeks, you need to wash it. (see below) To recover the yeast, simply leave a small amount of beer in the secondary when you bottle or keg -- just enough liquid to dissolve the yeast pack. Flame the neck of the carboy and then pour the slurry into a sterile jar (I like peanut butter jars because they have a wide mouth) and refrigerate. Because you're not plating out the yeast to check for purity, the general rule is that you should only re-pitch once (but then, you have a LOT of slurry in that jar and don't need to use it all when you pitch the next batch). Dave has recommended to me that if something needs to be stored for more than a couple of weeks, it be re-started with some fresh wort before pitching, just to get everything lively.

#### Yeast Washing for the Homebrewer

The following notes were taken from a demonstration given to the Oregon Brew Crew by Dave Logsdon of WYeast Labs, on September 12th. According to Dave, it was important for healthy yeast to be washed free of trub and hop residue so that it could be stored for future use. Dave said that the problem with simply storing the mixed contents from a carboy after fermentation was that the unwanted particulates would suffocate the yeast over a period of time. Most breweries, Dave stressed, use an acid wash; the sterile water wash is much more practical for homebrewers.

Objective: To recover yeast from a finished batch of beer for repitching or storage for future brewing.

Materials: One primary fermenter after beer has been siphoned off or otherwise removed.

Three sanitized 1-quart Mason jars with lids, half full of sterile or boiled water. They should be cooled down, then chilled to refrigerator temperature (ca. 38°F).

#### Procedures:

- 1) Sanitize the opening of the carboy (flame or wipe with chlorine or alcohol)
- 2) Pour the water from one of the quart jars into the carboy. Swirl the water to agitate the yeast, hop residue and trub from the bottom.
- 3) Pour contents from the carboy back into the empty jar and replace the cover.

4) Agitate the jar to allow separation of the components. Continue to agitate periodically until obvious separation is noticeable.

5) While the viable yeast remains in suspension, pour off this portion into the second jar. Be careful to leave as much of the hops and trub behind as possible.

6) Agitate the second container to again get as much separation of yeast from particulate matter as possible. Allow contents to rest (about 1/2 hour to 1 hour) then pour off any excess water-- and floating hop particles--from the surface.

7) Pour off yeast fraction which suspends above the particulate into the third container.\* Store this container up to 1 month refrigerated. Pour off liquid and add wort 2 days before brewing or repitch into a new brew straight away.

\*It should be noted that in the actual demonstration, Dave eliminated the final step; the yeast in the second jar was essentially clean at this stage and seemingly fine for storage.

I find I get the best results by letting the beer clear very thoroughly in the carboy before I keg. Then I sterilize everything thoroughly and had priming sugar to the keg, and rack on top of it. (Usually I also throw in a bag full of hops, but that's just because I love hops!) Then I tighten down the valves thoroughly, put on the top and hook up the gas. I pump CO2 on top of the beer, then bleed it out, pump it in, bleed it out, etc. until I'm pretty sure I've flushed out any O2; then bleed off the CO2 so the beer can carbonate by itself. >>>Make sure the beer is finished before it goes into the keg or be prepared to bleed the CO2 daily. As someone else has pointed out, an excess of CO2 will severely inhibit the fermentation and may interfere with flocculation.

Some people like to cut off the bottom 3/4" or so of the flow tube so that the first draw leaves behind any yeast. I prefer to suck the yeast out completely so it won't get stirred up if the keg gets bumped. One of the reasons I let it clear in the carboy is so that little yeast is left: the beers clears more quickly and there's less in the bottom of the keg.

I tried using finings once but have found it to be completely unnecessary, particularly with a good flocculator like 1056/Sierra N. I can usually start drinking the beer within a week after it's kegged,

although the conditioning and the flavor (especially with dry-hopping) improve if I hold off another week or two.

With proper conditioning you shouldn't have to add any CO2, even during the use of the keg. If you do, just pump in about 10 psi and then turn off the gas. If you leave it on you can easily over-carbonate the beer. On the other hand, of course, if you do over-carbonate, you can also bleed gas off with the release valve.

If you're going to dry-hop, don't use naked hop pellets. This is the voice of experience, believe me. They will glue themselves back together and plug up your Out valve. No beer will get into your glass. This is BAD. And when you bleed of the gas and open it up, and take off the valve, beer will shoot straight up and hit your basement ceiling. This is also BAD. Trust me.

From: MEHTA01@SWMED.UTEXAS.EDU  
Subject: Reusing yeast

Here's what i do (from reading previous HBDS and asking around):

After bottling fermented homebrew (and taking ample samples to ensure the quality of the fermentation :-)) ), shake up the slurry from the almost empty SECONDARY fermentor and bottle (fill 1/3 of bottle) in 3-4 bottles. Put

in fridge until ready to use. i make sure the bottles are clean (dishwasher) and that's it!!

i use Glosch-type bottles, and when i need yeast for my next batch, i simply open bottle and pour half into starter (or even into wort) and it works (:^)) !!

Of course i have never really done a second passage reuse (i.e. reuse the slurry from this second generatoin of yeast), but it should be ok!!

The yeast have stayed in the fridge as long as 4-6 months before use, and they start up happily and ferment very smoothly.

Good luck.

Date: Mon, 4 May 1992 19:42:22 -0500 (CDT)  
From: MEHTA01@SWMED.UTEXAS.EDU  
Subject: thanks to all who helped.

A few months ago, i posted some questions on procedure with problems of persistent cloudiness in beer. Well, thanks to some very patient and kind replies and suggestions, i have now got two all-extract batches that are my best ever!! and CLEAR!!

Errors i corrected: i thought conversoin wasn't occurring as i was iodine-testing the husk residue. After letting the haze settle during mashing, i now test in the more clear supernatant and the magic works!!  
i was boiling for too short a time: i now boil for one hour (SBT std. boiling time) and this probably helped a lot too.

Now just one more quickie: After boiling, as i am letting the wort cool a little on the stove, how do most people get the wort off the hot break leafy coudlets precipitate? Is there some trick? Do you just wait a while? It seems a shame, after boiling to get this sexy hot break, to just throw it all (well, most of it) in to the primary while pouring...  
i pour onto ice-cold water through a bed of ice; this cools it fast enough.

Thanks again for the wonderful support group ;-)

Happy brewing

From: "Jean B. Hunter" <MS3Y@CORNELLA.cit.cornell.edu>  
Subject: NA Beer - the Schmidling Method

Howdy fellow brewers -

My first post on this having apparently been lost into the bit bucket of the Internet, here goes again:

HPLC results on alcohol content of Jack's beers are in! The method appears to remove 60 to 70% of the alcohol from the beer, based on an estimate that an ordinary homebrewed ale will run 4% to 4.5% alcohol by weight. Jack sent me samples from two batches of NA beer which I analyzed against Labatt's 50 and Freeport NA Brew as controls.

Labatt's 50: 3.51% alcohol by weight

Jack's batch 1: 1.51%

Jack's batch 2: 1.76%

Freeport NA Brew 0.00%

The bottle that Jack sent me for tasting developed a small mold colony at the meniscus during storage; so did the other glass bottle which was not carbonated. The Batch 2 sample in the plastic bottle did not develop mold. A lesson here is that low alcohol beers are probably more prone to infection than full-alcohol beers.

I apologize to Jack for the surprise posting of a review of the taste of his NA beer that had become contaminated with mold. At the end of a workshop on beer faults and off-flavors, I served several homebrewed and commercial beers with distinctive flavor profiles -- including Molson, Yuengling Porter, Rodenbach, and Freeport NA Brew. Jack's brew was served

as a comparison to the commercial NA brew, but unfortunately the subtle "low ethanol" attribute was masked by the various intense herbal flavors in the beer.

Bottom line on batch flash distillation to remove ethanol: Using Jack's method of a slow heat to 170C and a slow cool to room temp, you can remove over half the the alcohol in homebrew. A valid review of the effects of the "Schmidling method" on flavor is not possible at this point. Any more experimenters out there?

Thanks, Jack, for sending your beer for analysis, and again, sorry for the delays.

Cheers and beers -- Jean

Subject: question about mash conversion

Hello fellow HBD'ers,

Having just started to include mashing as part of my brewing process, I have come across a question I'm hoping some of you more experienced NET'ers might be able to answer. I think I got pretty good starch conversion, but iodine testing didn't give me the specific answer "YES, you are done" that I was looking for. What I'm wondering is what would happen if the starch hadn't converted to suger? Would sparging still result in a specific gravity close to a normal one? Would I end up with a beer with lots of unfermentables, not much alcohol, and flavor somewhat similar to wallpaper paste?

Any insight is welcome and appreciated.

John.

Subject: Re: Homebrew Digest #876 (May 05, 1992)

Dear HBDers.... Here is what I have been doing to re-use yeast. I would appreciate any comments/advice, etc you might have..

During primary ferment at high kruesen I fill a mason jar with wort and store it in the fridge. (jar has been sanitized with a chlorine soak). This way the wort is filled with active yeast. A day or so before I am going to brew I take the jar out of the fridge and let it warm to room temp. I make up a starter ( a pint or so of boiled wort) and add the contents of the the mason jar. Within 12 hours or so the starter has a 'head' and I know that the yeast is active.

So far I have used this technique with wyeast 1007. I have stored it in my fridge for up to a few weeks but don't think longer storage would be a problem. I am on my fourth batch with the same yeast and have had no problems nor noticed anything bad happening. One thing I did notice is that when opening the mason jar before adding to the starter I may have a sour smell (rotten eggs). This may be due to the the trapped gasses in the jar since the yeast was active when stored. I used it anyway with no problems.

This method was recommended to me by my local brew supply shop.

From: lee\_menegoni@ptltd.com  
Subject: Strange smelling Lager

I have brewed ales for the past 2 years. I have a second refridgerator now and just begun brewing lagers, 2 batches, both seem to suffer from the same problem. After bottling they have a strange odor, the taste is fine. I use a refridgerator and Hunter Air Stat for a temperature controlled environment to brew in. The odor reminds me of the smell inside the refrigerator when I check on the brew during primary fermentation. I use partial mash recipes, is this be like a cake mix with scratch frosting? , rack off the trub, ferment in glass and use liquid yeast, WYeast Bavarian. I begin fermentation at 55 once active I step it down a degree per day to 50 after 15 to 20 days I rack into a glass secondary for lagering at 40 for 6 to 8 weeks. When it was time to bottle I tried to produce a starter culture from the slurry I retained from the primary, no luck. I then purchased a new pak of Bavarian yeast and made a starter culture. I poured about 15% of this and 3/4 cups corn sugar which was dissolved in water and boiled for 5 minutes into the beer and bottled. Two weeks later I tried the brew and it has this strange smell. The other 85% of the starter was used in my second batch similar recipe same fermentation process same bottling process same smell. Batch 3 is fermenting and needs to be bottled soon any ideas on what is causing this smell? How can I eliminate it in subsequent batches? I added the yeast to the beer at bottling time per the suggestion in the Noonan book on brewing lagers where he states that after long cold lagering the yeast may be very weak and a small population needs to be added for carbonation.

From: rossini%hsph@harvard.harvard.edu (Anthony Rossini)  
Subject: Raspberry Ale

Thanks to all who sent in information. Seeing as that the ale is now 5 days in the bottle, I thought I'd describe what I ended up doing (being from the "I think that I'll add some more of that stuff" school of HB'ing, amounts are probably +/- a bit... :-).):

5 lbs M&F light syrup  
1/2 lb crystal (added in with water, removed just before boiling)  
1 1/2 oz Cascade for boiling, 1/2 oz at the last 3 minutes of the boil  
24oz frozen raspberries added right after I turned off the stove

OG about 1.039

Sat a week in the primary. Added 24oz more frozen raspberries into the secondary, then added the wort (beer?). Didn't worry about sulfiting or other forms of berry sanitizing...

Sat 2 weeks in the secondary.

FG about 1.010

So anyhow, 5 days later, I think that I might've put in more malt, maybe 1-2 more pounds. It is a light beer, plenty of berry flavor and smell, a nice red color, and also tastes quite good (though I should qualify that by saying that while I enjoy great beers, I've never turned down swill, either...).

Anyhow, a bit more hops might've been nice, but definitely not necessary, as someone suggested to me.

More berries might've over-powered the beer flavor, but increasing berries with malt would probably give a decent full beer (I should state that I was looking for something on the light/refreshing side, not too complex!)

Anyway, back to work...

-tony  
p.s. another possibility would've been a wheat rasp beer... maybe next time...

Subject: yeast, NA

Couple of questions: First, for Jeff F., in your yeast cleaning directions, step 4 says to agitate the water/yeast/trub mixture "until obvious separation is noticeable" and then to pour off the yeast in suspension. Is this a quick process, or should the jar sit for a while to separate?

The second question has to do with distillation and NA beer. I thought that a danger with heat distillation, as JackS. does with his NA beer, is that alcohols more dangerous than ethyl can be produced. Will keeping it to 170 degF max. avoid that problem? Are the "bad" alcohols produced by a (enough heat + ethyl) reaction?

Russ

**Subject: Growing hops**

Ok... my husband is the homebrewer; I'm the gardener. He wants to grow hops, but keeps procrastinating on getting information I need for getting them started. So, here are some questions. The more I can get answered the better, but I'll muddle through even if y'all can't answer everything.

1. Growing pattern -- I understand they are vines. Is it preferable to have them grow straight up? I could set up tall poles driven into the ground about a foot or so. Is this the preferable way to grow them? Also, we have vinyl siding (very rough) on the house. Will they grow up the side of the house on their own?
2. When should they be planted? We are in New York (Buffalo). Do they need to go into the ground soon? And how long before we can expect harvesting? Will they even bear hops the first year?
3. Light requirements -- For growing in New York state, how many hours of sunlight per day are required? Is this direct sunlight or is indirect ok? Does amount of sunlight affect yields?
4. Soil requirements -- Anyone know the preferred soil PH level?
5. Root (rhizome) depth -- how much depth of soil do I need to provide for the hop plants?
6. Recommended planting distance -- how far apart should I plant them. I gather they grow side to side. Would growing one plant per 1/2 whiskey-barrel planter work? These are about 18 inches deep and about 2 ft in diameter. We could then move them mid-day to give them more sun.
7. Fertilization schedule? Anyone have any suggestions on this? I usually put a layer of manure down, then soil, then plant. About the time the plant's roots get down to the manure layer, it is the right time for a little food boost. I know bulbs also like some food below their roots. I have never grown rhizomes before, so I'm clueless here.
8. How many should we plant? I realize yields probably won't be great the first year, but what do you all say about someone who brews approximately 1 batch every 1 or 2 weeks?
9. How do you "winter" the hop plants? Let die then cover with straw? Bring inside? Let dry out or trim down? Give them a fertilizer boost before wintering?
10. Watering requirements -- (Almost forgot this one.) Do you need well-draining soil? How often should you water? Generally I make a ring-like pit around plants that will hold and cradle water. I also mulch so as to retain water. (I use straw.) Is this a reasonable strategy?

You can send to the digest or email. I will keep an eye on this digest for the next week or so.

(By the way, my husband -- and the guilty procrastinator -- is

Frank Tutzauer! Are you out there, Frank?)

From: mcnally@wsl.dec.com  
Subject: MBC yeast

It's been a while since I've tried Eye of the Hawk, but I seriously doubt that the yeast is anything at all like the Chimay culture. It's hard to tell yeast by appearance. The Chimay culture is supposedly five different strains of yeast. I've always had success reculturing it (I've got some bubbling away now).

(yeah, I know, ankle weights)

I haven't enough experience to answer this, and the books don't mention it.

How far down into the ground would I have to stick metal or plastic dividers to keep my hops from spreading too far? Does the rhizome stay fairly near the surface? Is the rhizome a continuous structure? Would blocking the rhizome be enough to do the job?

From: pgsjay@atlas.cs.upei.ca (Scott Jay)  
Subject: Beer - of course!

A few people I work with and myself have formed a brewing association - F.A.B. (Forestry Association of Brewers). Most of us are fairly new to the art of brewing, so we do have some questions. I have been receiving this digest for about two weeks and, although most of it really does not pertain to us (we are CAKE MIX BREWERS!) it is certainly interesting. Who knows, we may someday make a SCRATCH CAKE!

Anyway, we thought we'd try to find the answer to a question that we've pondered over for quite awhile. :-) It may be a FAQ but here it is anyway: What is the difference between different types of beer (i.e. lager, ale, pilsner, draft, etc.).

Thanks.

p.s. If you are planning a trip to the most popular vacation spot in North America, Prince Edward Island, Canada, this fall we are tentatively planning an Octoberfest for Home Brewers (obviously some time in October). Let me know.

From: David Suda <suda@barley.Colorado.EDU>  
Subject: Summary: mead question responses

A couple weeks ago my friend Susanne asked me to post several mead making questions to the HBD. Thanks to everyone who replied. Susanne's article has been accepted by Zymurgy and is scheduled for publication in the Fall issue. Here's a summary of the responses we received:

- \* What flavor/aroma/clarity trade-offs have you experienced for boiling vs. not boiling the honey?

The consensus was that boiling results in a mead which clears rapidly and ferments well, but at the cost of most of the honey aroma. While unboiled meads retain more honey aromatics, they can take a very long time to clear. Irish moss helps in the clarification of both boiled and unboiled meads.

- \* What type of honey is best for making a smooth traditional mead? What type of honey is best for making a melomel or metheglin with "character"?

This question appears to have as many answers as there are meadmakers.

Some favor lightly flavored honeys (such as clover and alfalfa) for tradition meads to produce a delicate bouquet and strongly flavored honeys (such as wildflower or orange blossom) to balance the fruits and spices in melomels and metheglins. Others like an assertive honey flavor in traditional mead and use mild honey for flavored mead so that the fruit and/or spices are not masked. In any case, honey should have a flavor you like and be as fresh as possible. As honey ages, chemical changes make it less desirable for mead making.

- \* What is the most attenuative yeast? How does the attenuation of various yeasts compare?

Prisse de Mousse appears to be one of the most attenuative yeasts available. Charts comparing the attenuation and other characteristics of various yeasts will accompany the Zymurgy article.

- \* What water additives do you use and why? Why add gypsum?

Most meadmakers add yeast nutrients to speed fermentation and acidity or tannin to balance the sweetness of the honey. The article will present details about various nutrient blends. The amount of acid or tannin to add is a matter of taste. Sources of acidity include acid blend and lemon juice; tea is often used as a source of tannin.

In mead, gypsum is probably not needed. In wort, Ca++ reacts with phosphates to lower the Ph. Since honey contains a much lower concentration of phosphates than malted barley, this doesn't work.

- \* What are some good regional honey suppliers?

Several people recommended health food stores and farmer's markets as good sources for fresh, unpasturized honey.

Once again, thanks to everyone who responded.

Dave

From: ingr!ingr!b11!mspe5!guy@uunet.UU.NET  
Subject: Another yeast reuse data point

As another point in the yeast reuse topic, I will share my experiences. I have had great success reusing yeast slurry retained from the secondary. After I siphon into my bottling bucket, I immediately put the stopper and airlock back on the secondary fermenter. When I finish bottling, I sanitize a half gallon glass jug and my funnel. I then flame the mouth of the carboy, swirl the yeast back into suspension, and pour it through the funnel into the jug. I then screw on the sanitized lid of the jug and put it in the refrigerator. I have stored yeast in this manner for as long as a month and a half and had no problems with it starting or producing undesirable characteristics. I have also re-used yeast with this method up to three consecutive times with no ill effects.

Another method I have success with is to pour the dregs of several bottles of my homebrew into a single Grolsch bottle and store in the fridge. I then pitch this into a starter solution when I'm ready to brew and off it goes. I have a copy of Jeff Frane's yeast washing article in my brewing notebook from the first time he posted it. I fully intend to start washing my yeast before reuse someday but I have been successful thus far without it.

And finally, a story:

Once there was a beautiful apple. It was a joy to all who happened upon it. The pleasure derived from it seemed endless to all who partook of it. Then one day, unnoticed at first, a worm crept into the apple. It immediately began vomiting forth corruption, causing a rotting of part of the apple. Its unceasing toil was to try and corrupt the whole of the beautiful apple, much as it had been able to do in other apples it frequented. At times, the apple seemed in danger of rotting completely, so quickly the corruption had spread. Many who once derived great joy from it began to loathe and despise its condition. It would always fight back from the brink of total corruption and become nearly as whole and wonderful as it once was. The worm, however, still frequented it and threatened to turn it into just another apple rotting on the

branch. The apple must use all of its strength and all of that which is  
good  
within it to combat this tragic possibility. In the end, the worm cannot  
rot  
the entire apple unless the apple relents to rottenness. May the apple  
remain  
strong and beautiful and leave the worm to wallow in the corruption it  
spews  
forth.

From: bszymcz%ulysses@relay.nswc.navy.mil (Bill Szymczak)  
Subject: Correct IBU Corrections

In HBD 871 there is a clip from a note from srussell which mentioned that in Jackie Rager's article in the Hops ZYMURGY special issue that to correct for specific gravity of the wort you should divide by

$$1 + 5(G-1.050) \quad \text{if } G > 1.050 \\ 1 \quad \text{if } G < 1.050$$

After reading the Rager article myself, I found some obvious errors. (I'm new to subscribing to HBD and don't know if these have been already discussed.) In the ZYMURGY issue the correction factor given by Rager is  $1 + GA$ , where

$$GB - .050 \\ GA = \frac{\quad}{0.2}$$

if  $GB$  (gravity of boil)  $> 1.050$ , and  $GA=0$  otherwise. If this formula were correct the value of  $GA$  would jump from 0 to 5 as soon as  $GB$  hit a value of 1.050, and you would need about six times as much hops with a gravity of 1.0501 than a gravity of 1.0499. Replacing the value of .050 by 1.050 (as srussell correctly did) gives more reasonable values. Even worse is the example Rager computes on page 54 of the ZYMURGY issue, where the equation

$$\frac{1.096-.050}{0.2} = .24??????????$$

appears. It seems to me that

$$\frac{1.096-.050}{0.2} = 5(1.096-.050) = 5(1.046) = 5.23$$

If the value of .050 which was repeated in the example is replaced by 1.050, then  $GA = .23$ , which is getting closer to Rager's value of .24. No wonder we're all confused about IBU's.

Besides these obvious errors I have found Rager's article very useful. The formula given by Frank Tutzauer/Tom Hettmansperger in HBD 871 also seems very convenient since it eliminates the need for a utilization table and accounts for gravity at the same time. Does this formula agree with the table listed in Rager's article and the "corrected" gravity correction formula? (Or equivalently, do the formulas given in Charlie II agree with Rager's?)

I apologize for this being a little outdated, but it was originally sent last week and apparently lost during one of the "down" days.

Bill Szymczak

> for it?

I have quite a few Grolsch bottles that I typically use to bottle  
stouts  
and "special" beers in. These bottles have had around 5 batches in them  
and  
the gaskets have never been replaced. In my last batch, a stout, I had  
one  
bottle out of 40 that developed almost no carbonation and I suspect that  
the  
gasket on that one either needs replacing or did not get seated properly  
when  
I bottled. All of the rest of them carbonated perfectly. The  
undercarbonated  
beer tasted fine, just rather flat. I therefore offer that the gaskets  
need  
replacing only when they show signs of cracking or other type of wear.  
You  
certainly should not need to replace them on your bottles since they have  
been  
used only once to bottle commercial beer in. Of course, if it makes you  
feel  
better, the gaskets are readily available...

From: polstra!larryba@uunet.UU.NET (Larry Barello)  
Subject: Re: yeast washing

I have been using the yeast wash trick described by Jeff Frane for about nine months now. I found the instructions a little vague. Basically what I do is dump the slurry in a qt jar, cap and shake hard. There will be three layers after about 10-20 minutes: a top frothy gelatinous layer, a middle tan layer and a bunch of crud on the bottom. I use a bloiled spoon to remove the top layer, pour off the middle layer into a clean jar and toss the crud.

The middle layer will eventually (30-60 minutes) seperate again into a thick layer of yeast and clear liquid. Depending upon how much crud there was originally I might shake and separate again. Anyway usually at this point I stop as the stuff in the second jar looks pretty clean.

I have stored yeast like this (under clear liquid) for a month and have had incredible starts by just dumping it into the chilled wort. Also, beers made with the washed yeast have *\*always\** started faster, fermented faster and been much much better tasting than beers made with a classic Wyeast starter.

Oh, I usually get two pint jars of yeast from a 5 gallon carboy primary each containing about 1/2" of yeast after everything settles down in a couple days.

Mike> It's hard to tell yeast by appearance.

Agreed, and I'm certainly no expert, but when I had a bottle a few months ago the yeast was easily disturbed from the bottom of the bottle (unlike the sticky Red Tail yeast), and it broke up into a bunch of little yeast "pebbles". The only other times I've seen yeast do this is in Chimay, and homebrew that a friend made from yeast he cultured from a Chimay bottle.

Perhaps MBC is maintaining their own yeast, cultured from Chimay? The aforementioned friend, no longer on the net, visited MBC a couple of years back, if I can find anything out from talking with him I'll report back.

Subject: Re: Chimay...Not:-)

[ Sayeth Glenn Tinseth <tinsethg@UCS.ORST.EDU> : ]

Wow, that's news to me. (Vague memory warning: ON) I always thought that Chimay was finally isolated down to one yeast by Fr. Theodore(SP?) at the abbey.

You may be right; I was re-stating a rumor. I will retract that.

This led to a great improvement in their consistency.  
Jackson sez that Orval, on the other hand, does use 5 different yeasts at different stages in the brewing process.

I have never been successful at reculturing Orval. I've just found a source for 750ml bottles of Grimbergen, and those seem to have a healthy amount of yeast in them. Chimay is, however, unbelievable.

The new Belgian Ale strain from Wyeast is a monoculture and is according to Dave (the owner) from Chimay.

My local homebrew shop hasn't bought any because they're unsure of the volume they'd sell. Urrrgh; how will they know if they don't get some?

From: PHILLIPSA@LARS.AFRC.AC.UK  
Subject: Re: fining without cruelty

Thanks to all those who responded so promptly to my posting about fining beer without using animal products. The consensus was that Irish Moss in the boil, and/or fining with Bentonite, agar or Polyclar is the best solution. I already use Irish Moss, and I'll probably try adding Polyclar to the secondary fermenter a few days before racking into barrel. This has the advantage that for a trial run I can "borrow" a few grams of Polyclar from the lab - we use it for adsorbing polyphenols from homogenized plant tissue to reduce inhibition of enzyme activity. One concern I have is that Polyclar may remove some of the arome, taste, feel, colour, etc in addition to removing haze. We shall see. Incidentally, Polyclar is a trade name for poly(vinylpyrrolidone) - not quite Reinheitsgebot, but if you're worried about putting synthetic chemicals in your beer, just remember that there are probably far nastier things in hop resins.

[P.S. In answer to Chris Campanelli's question (I tried to respond directly but my mailing bounced back with a "no such user" message): as far as I know, there is no British equivalent of HBD - at least on JANET, the academic network. There may be an interest group on a commercial network such as Telecom Gold, but I don't have access.]

> From: Crawford.Wbst129@xerox.com

> A while back I believe there was a discussion on where to get Calcium  
> Chloride. What was the final outcome? Does anybody know where to buy  
> Calcium Chloride?

Greg-

Seems to me that crystalline stuff you buy at the hardware store to  
sprinkle on you iced-up driveway in the winter is calcium chloride.  
Another name for it is rock salt. I doubt they add anything to it -  
probably just crush it up. Be sure you check the ingredients if you  
plan to use this in beer (?!). You obviously don't want to use any  
of those weird chemicals they also sell for melting ice.

Another possible source is at a water softener \*type\* store  
(Culligan?). I think they use calcium chloride to soften hard water,  
and I imagine this is "Food grade." When I need wierd chemicals (not  
too often!) I usually try the chem supply dept at Lehigh University.  
The last time I got something there, I was after dry ice! Maybe  
there's a college in your area that could supply it. Who knows, maybe  
even a good pharmacy carries it!

Good luck!

-Pete

Date: Wed, 06 May 92 15:07:47 CDT  
From: Darren Evans-Young <DARREN@ualvm.ua.edu>  
Subject: Reusing Yeast / Hot Break / Starch Test

Reusing Yeast:

I've been reusing my yeast now for 5 batches. I always taste the beer when transferring to the secondary to see if I notice any off flavors. So far, everything is going good. When I dump the new batch of beer on top of the yeast cake, I have a kraeusen (sp?) covering the surface within 2 hours! The more I reuse the yeast, the faster the beer seems to ferment. The beer taste good though. You MUST be up on your sanitation procedures if you plan on doing this. BTW, I'm using William's Burton Ale yeast. I'm not sure what Wyeast strain this translates to. Anybody know?

Hot Break:

To remove your beer from the hot break after boiling, rapidly (without aerating) stir your wort in one direction to get a nice low pressure area in the center, then cover your wort and let sit for 15-30 mins. This whirlpooling will cause most, if not all, the hot break material to settle into a nice cone in the center of your boiler. After 30 minutes, I can usually see all the way to the bottom of the boiler toward the outside with a flashlight. Simply siphon from this area. I use a counterflow chiller. Since I've started doing this, I've let my cooled wort sit in a sanitized container for 2 hours to let any break material settle, and the has been NONE! I now skip this step.

Starch Test:

To get an idea of what your iodine starch test will tell you, take the test immediately after doughing in your grain. You can use this reaction as a reference. My last batch I started using a thicker mash and the starch test was misleading. I'm still investigating the cause of this. Could have been husk material or I could have screwed up my mash somehow.

>sorry,  
>aem

This is indeed sad news for the net.homebrewing community. Andrew, you've provided a very valuable service to homebrewers, and I thank you for your efforts through the years. The archives at mthvax have been an important resource for beginning and experienced brewers alike.

Of vital consideration to the HBD/rec.crafts.brewing community is:

- 1) Do we want the HBD automatically gatewayed to rec.crafts.brewing as it has been for these many months?
- 2) Are there any other internet sites with anonymous ftp access willing to pick up and carry forward the homebrewing archives?
- 3) While we're at it, the issue of the continuance of HBD itself has arisen recently. Rob Gardner, the HBDigest Coordinator (thanks Rob!) has mentioned that HP has been making unfriendly noises about the volume of mail passing through HP having to do with the HBD.

It may make sense to have the HBD automatically gatewayed from hpfcmi.fc.hp.com into rec.crafts.brewing and e-mailed only to those people who do not have a news-feed which carries r.c.b.

I've snarfed all the current archives from mthvax and have locally added the incoming issues not stored at mthvax (incoming stops at issue 872 : 92/04/27 03:09:52 : 378), but alas, the internet machine I use does not have anonymous access, nor is it likely it ever will. Any volunteer sites? I hope there will be a transition time before "the plug is pulled" on the homebrewing archives at mthvax...

From: "Stephen Hansen" <hansen@gloworm.Stanford.EDU>  
Subject: Homebrew archives transfered.

In HBD 877 Andrew Mossberg wrote that the archives at mthvax.cs.miami.edu would be ending soon. In fact it appears that HBD 872 was the last one deposited in the incoming directory. This has prompted me to finish what I started almost a year ago which was to copy the entire homebrew archive from mthvax to Sierra.Stanford.EDU (36.2.0.98). The transfer is complete and I have brought it up to date. Sierra is not yet running a netlib server so ftp is the only way to access the archive at present. I will let you all know once I have netlib service available.

Many thanks to Andrew for the fine job of maintaining the archive for so long. While I've been a systems admin for more years than I care to think about, this is the first time I've tried to maintain an archive like this, so please bear with me.

From: whg@tellabf.tellabs.com (Walter H. Gude)  
Subject: Caloric Content of HB

The other day after an exhusting hour of raquetball, I sat slumped against the wall nursing a Gatorade. Glancing at the "Contents" I noticed "Water, High Fuctose Corn Syrup, Dextrose....." and not much else. So this great sports drink is basically sugar water. Furthur, this 16 oz bottle contained 100 calories. This got me thinking about the "beer belly". Would drinking a "Milwieser" Light with about 100 calories cause any more belly than the Gatorade I was currently drinking?

Now, given the 100 cal in a light and then approx. 150 cal. in normal american swill, how many calories can I expect my normal 1.045 O.G. => 1.010 F.G. homebrew to have? How does one determine the caloric content of anything? Is this possible to do at home?

"Homebrew, gives your body what it's thirty for."

From: "Chris Dukes" <imagesys!file\_server\_1!CRD@uu.psi.com>  
Subject: **Brown ale recipes needed**

Help!

I have recently jumped head first into the world of home brewing and would like to get some recipes for a nice brown ale. I haven't much brewing experience, so please keep it very, very simple. I apologize to those more experienced brewers, but I need to start someplace and I figured this would be the place to ask.

I do have access to the necessary materials/ingredients for brewing as there is a great homebrew shop just up the road from my office, but I don't have much direction and find myself lost upon walking in the door.

Any help with recipes and advice would be very much appreciated. I've been checking out the digest for a couple of weeks and it seems like a great place to start.

Thanks, chris      crd@imagesys.com

>

Roger asks if he's beer from last September was bad. Taste it, Roger. Unless there's something visibly growing on it, you ought to just taste it and see if it's worth bottling. (The only thing likely growing on it is mold.) You may need to pitch some fresh yeast along with the priming sugar; whatever was in the beer has undoubtedly flocculated out by now.

The odds of anything BAD growing in the beer (pathogenic) are slim to zip. If the beer smells really foul (or even just unpleasant), toss it out; it's not worth the bother of bottling.

Treacle is apparently the British name for molasses. I have been assured this by Brits. On the other hand, if you insist on using treacle, I know F. H. Steinbart, here in Portland, carries tins of treacle.

As I recall, this process takes about five or ten minutes.

ON ANOTHER NOTE ENTIRELY:

I will be arriving in Milwaukee sometime on the ninth of June (probably in the evening) and will not be staying at the hotel until the following night (esp. at \$70 a pop!). Is there a homebrewer in the Milwaukee area who could put me up for the night? (I figure the people at Sprecher would probably throw me out at closing time, so that idea's out.)

Any help would be appreciated. This is a budget cruncher.

From: Michael.Burgeson@Eng.Sun.COM (J. Michael Burgeson)  
Subject: denaturing acid carboys

I have recently come across a 7-gal acid carboy, but I am not sure of its history. It is still in its styrofoam container with a nitric acid label on it. It is empty and capped. I looks clean. Since I don't know its history, I thought the best thing to do was denature it before I use it, regardless of what it smells like when I open it.

Has anyone out there ever prepared acid carboys for use in homebrewing? Is denaturing something I can do myself, or should I take it to a chemical lab?

Thanks,  
Mike B.

From: avalon!jm@siemens.siemens.com (Jeff Mizener)  
Subject: Old Peculier - New Peculiar

In response to Scott's (sfw@trionix.com) question about obtaining treacle to imitate Old Peculier (a traditional Yorkshire Ale), I thought the following to be of general interest:

You can find treacle at fancy grocery stores, or from American Brewmaster in Raleigh (mailorder). The treacle I used was made by Lyons, the same people that make Golden Syrup. If you can't find treacle, try unsulphured molasses (find treacle...).

I have made a stab at O.P. based on the Elbro Nertke Brown Ale recipe from Papazian:

New Peculiar

6.6# dark extract  
1/2# crystal malt  
1/4# black patent malt  
1.5oz fuggles 45min boil (pellets)  
0.5oz fuggles 10 min boil (pellets)  
2 tsp 'water crystals'  
1 tsp irish moss  
Whitbread Ale Yeast  
1/2C black treacle

Put malts into a boiling bag and place into 2.5g cold water. Bring to boil and remove, sloshing about and draining well (as one would with a [giant] tea bag). Add extract, 1.5oz fuggles and boil 45 minutes. During the last 10 minutes add the remaining hops. Cool (I take my pot outside and put it in a baby bathtub full of circulating cold water from the garden hose). Rack into a carboy and add yeast (I started the yeast with cooled-boiled water but recently I have taken to putting the yeast directly into the warm wort). I let it go for 4 days then racked into a second carboy where it sat for another week before bottling. Bottle as usual. SG: 1.055, FG: 1.016

Result: very nice, matured well. Dark but not black, could use some more body, but definitely not thin, lightly burnt taste (my wife's words) that I attribute to the black patent malt. Tasty. Not lawnmower beer. And it was only my 4th batch...

I now have a treacle amber ale fermenting (New Peculier Lite?) in the secondary. Bottling is scheduled for this weekend.

Hopfen und Malz, Gott erhalt's.

From: Jay Hersh <herhsh@expo.lcs.mit.edu>  
Subject: EZ mash tuns

I went with the 5 gallon Gott cooler approach.  
\$25 for the cooler. to replace the spigot get a 3/8 inch to 3/8 inch  
right angle compression fitting and 6 ft of 3/8 copper coil. You'll  
also need a 3/8 female threaded spigot (the type you find underneath  
sinks and toilets). It is best to get the kind with a right angle  
(like the simple diagram below) so the knob is easily accessed.

```
flow in -> -----| <- knob
                |
                | <- flow out
```

Simply screw out the spigot. Tighten the coil on the 3/8 copper coil  
tubing.  
get a hacksaw and cut slots in the bottom of the tubing every 1/4 - 1/2  
inch.  
mount the outer end of the coil in the compression end of the compression  
fitting. Pop this into the cooler, and put the compression fitting  
through the  
grommet where the spigot used to be. On the other side screw on the new 3/  
8 in  
threaded spigot you bought. This system works best with a 6.7 gallon size  
nylon sparge bag.

I spent less than \$40 on the whole setup. It loses less than 2 degrees  
temperature over an hour and is perfect for doing 3-6 gallon batches  
(depends on the OG you seek) as you can sparge up to 5 gallons and 12-15  
lbs of  
grain in it. It sets a nice grain bed, and with a collander and bottling  
bucket  
(kind with a spigot) you can set up a nice sparge. Also re-circulation of  
the wort is pretty easy as well.

Happy mashing

JaH

Subject: Cat's Meow, Archives, Homebrewing in MO

Three big topics from the quiet one today:

1. Please don't bug Rob about The Cat's Meow. Since I helped in creating this monster, please send all email regarding The Cat's Meow directly to me

at the internet address below. I will make an attempt to answer email as quickly as possible, but as I get swamped with work with no warning, delays are inevitable.

2. Stephen Hansen said in HBD 878 that he has transferred the archives to a system of his. Nothing was mentioned if this was the official new home

for the HBD. As we are getting several new unix systems here, and I will be the local administrator, I may be able to set up an archive. I already have all the files from mthvax and have placed them in .ZIP files for DOS folks, so I will offer my services to at least maintain a backup site (when the systems get here).

3. Since 1939 it has been illegal in Missouri to brew beer or make wine without a manufacturer's license. As I am in Missouri, I have been talking with my reps, a homebrew club (Hi Andy!) as well as the AHA. According to my well informed sources, our Governor \*WILL VETO\* any bill coming across his desk trying to legalize homebrewing. However, this is his final term and in January of 93, we get a new Governor. I have asked my Rep to toss the proposed bill out onto the floor the day after the new Governor takes over. I will be keeping the world informed as to the progress (none right now as there are no bills that we could amend.) BTW: It is legal to brew up to 3.2% beer as it is not defined as an "Intoxicating Liquor". (Yes sir. I am planning to dilute this to 3.2% when I bottle it. :-)

From: devenzia@euler.jsc.nasa.gov (John Devenezia)  
Subject: Wheat Beer recipe and question

Hello Fellow Homebrewers!

I have a delicious wheat beer coming out of the bottle right now and I thought with summer here y'all might want to give it a try. This beer is the best I've made so far and is also the first I've made with liquid yeast. Draw your own conclusions, but I know I will be using the liquid stuff from now on. The taste is hard describe; flavorful and slightly sour like a wheat beer should be, with a nice hop to it. It has a medium alcohol content.

But first a question. This wheat beer was so good I'm going to make a variation of it for my next batch. It will a raspberry wheat beer and I'll be adding about 4 pounds of berries to it. My question is this; when and how do you add berries or fruit to your beer. I know there is no right or wrong here, I'm just curious as to first hand accounts. I've seen some recipes call for steeping the berries in the just boiled and cooling wort. Other recipes say to add the berries to the secondary fermenter. I'm sure there are even more way to add fruits or berries to beer. If you could email your responses I will summarize or just post away and I'll still summarize.

And now the recipe (<- insert drum roll here)

Source:Variation on recipe from St.Patrich's of Texas

Name: Day after 1040A Wheat (note date of brewing)

1 lb malted wheat  
4 lbs Weizen extract  
2 lbs pale malt extract  
1 oz Mt. Hood - boiling  
1 oz Hallertau - finish  
Wyeast Bavarian Wheat Ale yeast

Popped the yeast bag a day before brewing and it puffed right up.

April 16th:

Put 2.5 gallons of cold, filtered water into pot. Added malted wheat (in muslin bag) to pot and brought the water to 180 degrees. Steeped the wheat for 30 minutes. Removed bag of wheat and brought the water to boil. Added malts and boiling hops to pot and let boil for 60 minutes. Turned off the heat and added finishing hops. Force cooled the wort in an ice bath and put into primary fermenter. Added cold water to fermenter to bring the water level to 5 gallon mark. Pitched yeast.

O.G. 1.038

Fermentation started in about a day and was relatively calm.

April 20th:

Racked to secondary. Very little trub in bottom of fermentor. S.G. 1.010

April 27th:

Bottled. Very clear beer with only yeast sediment on bottom of fermentor.  
S.G. 1.008.

the  
>Gatorade I was currently drinking?

I recently read about a study in the Boston Globe (sorry, I can't cite  
any more than this as I am doing it from memory) that found that alcohol  
reduces the body's ability to burn fat. The study went on to say that  
the body burned all the alcohol calories and all the carbohydrate  
calories, while not burning all fat calories. A person drinking the  
equivalent of three beers a day burned 1/3 less fat than the person  
not consuming any alcohol, with similar dietary intake. The alcohol  
was not beer, but I think that it is a safe extrapolation to assume  
that beer would cause the same effect.

Thus, beer is not directly fattening, since all the calories in  
beer are carbohydrate or alcohol calories. However, if you drink  
beer, you should be more careful of your fat intake. (Which, for  
me has been exactly my problem; when I drink a lot of beer, I tend  
to go for the more fatty foods: sausgages, steaks, ice cream, etc :-)  
This study, BTW, shows that lite beer is just as fattening as regular  
beer (excepting for pychological effects: people drinking lite beer  
are probably more likely to go for a less fattening meal). So,  
eat well, exercise regularly, and party on! :-)

I have been successful at reculturing Orval. I bought a case of it and sometimes when I had one, I'd add 8 fl oz of 1018 wort to the dregs and put on an airlock. Of the 6 I did, three did not start and 3 did. Each smelled and tasted different. I chose the cleanest smelling and best tasting one of the three and pitched it into a batch I had engineered to be as close to Orval as I could get it. It took \*FOREVER\* to ferment out.

We're talking 6 weeks at 66F! It started at about 3 bubbles per second after 3 days in the fermenter and then tapered down to 1 bubble per second for about 4 weeks! Finally, last week it quickly tapered down to 1 bubble every 2 minutes, so I bottled, using 7/8 cup of corn sugar to (hopefully) get that effervescent carbonation. That was a week ago. The initial tasting at bottling time was very positive. I suspect that I came pretty close to the real thing.

My understanding from reading Jackson, is that Orval uses one yeast to ferment and then 5 yeasts for bottle conditioning. This would explain why I got widely differing flavors in the starters. I'm quite confident that I got the right one because only one had the characteristic Orval "Banana/Bubblegum" nose. That's the one I used. The ferment and the initial tasting both had that nose.

**Subject: Calories**

I believe alcohol is 80 calories per ounce. The snag with alcohol and the reason I believe it causes beer-bellies, is because it lowers your metabolism. Therefore, 800 calories from pasta is not the same as 800 calories from beer. The lower your metabolism, the less calories you burn per hour. I choose to make up the difference by excersizing to increase my metabolism rather than drink less beer.

> affecting the quality of the beer.

I have just had my CO2 tank refilled for the first time since I  
bought it over a year ago. I estimate I have "lifted" about 20  
Cornelius kegs of (sugar) primed beer with the 5 lb or so of CO2 that  
originally came with the tank.

Although I remember reading somewhere that one should refill the tank  
before it is totally empty, I didn't have the chance. I used it  
one evening till it was totally empty with no ill effect to tank, keg  
or brew.

Incidentally, refilling it to 800 psi cost me \$12.50. I now have a T  
connector with two valves, so I can dispense two different brews  
simultaneously.

Subject: Re: rec.crafts.brewing and HBD

I like the notion of the HBD sort of dying and being gatewayed into rec.crafts.brewing. The only difficulty is the folks who don't have access to Usnet news. I don't know what the solution is to that problem. Also, the current scheme of copying HBD into Rec.crafts.brewing isn't a good solution (although easy) - the HBD is delayed a day (on my machine) and it still comes over as a big chunk.

Modern news readers (trn) make wading through stuff so much easier and faster. I read news and HBD via a modem and being forced to go through all the articles to see what is next takes a long time at 2400baud.

Cheers!

From: tomm@pet.med.ge.com (Thomas Manteufel 5-4257)  
Subject: diacetyl, anyone?

I want to produce a Scottish Ale with lots of diacetyl. What I propose to

do is modify the pitching and fermentation procedure to make the yeast produce a lot up front, and then not reduce it to diols. I would use Whitebread Ale, and make a starter to get a good healthy colony going. Pitch the yeast when the wort is still on the warm side (75F) [24C] and aerate

like crazy to get lots of oxygen into the wort. Ferment cool (55F-60F) [13C-15C] and bottle as soon as possible, without letting the beer go through

secondary fermentation.

So, all you power brewers, does this sound reasonable? Is there a better way to get diacetyl? Has anyone ever done this, and do you have any tips to

share?

Thank You,  
Thomas Manteufel

From: hartman@varian.varian.com (John Hartman)  
Subject: Oregon Brewer's Fest Date

Could someone who knows please post the date of this summer's Oregon Brewer's Festival? I'd appreciate it as I plan on being there.

Also Darren asks about the lineage of William's Burton Ale Yeast. I've used that yeast in the past and wondered same. I called William's and asked. They claim that it's their own strain produced specifically for them by Wyeast. I.e., there's no equivalent Wyeast #. Based on my observations, it doesn't appear to be either Wyeast #1098 (Whitbread) or 1028. The same situation applies to their English Brewery Yeast. Perhaps there's someone the knowledgeable Jeff Frane could ask...

Well now that I'm posting I guess I should mention that I just got back from England and yes I tasted quite a few beers. I visited the Young's Ram Brewery in Wandsworth, London. I you ever are there, you must visit them. The hospitality was spectacular and they're very open and forthright about their brewing. When I mentioned that I was a brewer, I was taken to the laboratory, where the chemist inoculated my slants and answered my questions. Later, in the tasting room, I and the six others on the tour were joined by two of the five brewers and by the the acting chairman, Mr. James Young. We chatted and discussed brewing while consuming many of their fine beers for some two hours. As Wayne Campbell would say, "excellent" and after learning about their brewing, "I did not no that". Upon leaving they were kind enough to send me off with a six pack of my choosing. If you go, you'll have to make a reservation in advance by phoning Mrs. Betty Moran any Monday betw. 11am and 1pm London time. I don't have the number at the office but have it if someone would like it.

I'm brewing a batch of IPA with their ale yeast now. It's a slow-burning true top fermenter. After six and one half days, the krausen is still riding the beer. I've not had a yeast stay so long atop before. Perhaps it has to do with having been recently cultured from the slant, but I don't think so. The brewers told me that they don't even krausen their beer. They simply cask it and let it finish in the cask. If others are interested I could provide this culture on slants. Right now though I'm waiting to see how the IPA comes out.

Here's to a healthy apple,  
John

From: ZLPAJGN%LUCCPUA.bitnet@UICVM.UIC.EDU  
Subject: mead questions

Dear Brewers

This weekend I hope to brew up my first batch of mead and I was hoping I could pick up a few pointers from anyone who's already tried this type of brew. I'll be referring to Papezian's recipe for Antipodal (Traditional) Mead, but adjusting the measures for a one gal. batch instead of a five.

Pap. instructs to begin the fermentation in a closed, glass vessel and then rack to a secondary to clear after fermentation's complete. My question is: what sort of fermentation activity can I expect? Will I need a blow-off hose for this stage, or will a lock suffice - I suspect I'll need a blow-off... Secondly, he recommends using yeast extract to assist fermentation, but the shop I ordered from doesn't carry "extract" per se, but something they call "yeast energizer" which they say is really the same thing, but most often used to unstick stuck fermentations. Anyone got any feedback?

Finally, here's an update on 3 of my previous batches for which many of you on the network provided much needed input... I'm sad and embarrassed to say 2 of these batches are complete and dismal failures - the ginger-spruce lager is so repulsive that it's tough from gagging after just smelling it! Pine-sol is even more pleasant than this stuff! It is simply undrinkable... The other batch - the recipe for which again comes from Bravery - I call "Chicago Tunnel Water (let your imagination wander on this one!!) There is little I can say that could adequately describe this ... this ... stuff! It's even worse than the "Pine-sol Brew" above!

But I can't say that I've not learned something (and that is, in my opinion, the whole point of this hobby): If nothing else, shelf the Bravery book (perhaps the author's chosen a rather ironic nom d'plumme!!). I have yet to find success for any of the recipes in his book, beginning with the now infamous "Monstrosity Ale" (which, yes, did actually sprout legs and walk away!). Secondly, regardless of whose recipe you're following, now that all else's failed, READ THE DIRECTIONS!! I did exactly that for the Propensity Lager in Papezian and it was magnificent! Finally, I've learned that in sharing your enthusiasm for a successful batch by hosting a "homebrew" party (such as the one I held for the batch of Propensity Lager) you'll inevitably wind up with empty bottles and a "where did they all go?!" feeling :-)) and a ton of new friends all wanting to know when the next batch is due!

Ah, well... I'll be brewin' this weekend. I think I'll try Pap's recipe for (snicker) "Goat Scrotum Ale" (I wonder how well-attended THAT party will be!!). Also, thanx in advance for any direction on the mead.

Cheers

John

High  
> Fuctose Corn Syrup, Dextrose....." and not much else. So this great  
> sports drink is basically sugar water.

Not quite: the "not much else" include electrolytes which get used up  
during  
heavy exercise. Also, being mostly sugar water is just fine, since it is  
felt  
that glycogens burned during exercise are most efficiently restored if  
some  
sort of carbohydrates are consumed within two hours of exercising.  
"Runner"  
magazine advocated eating a meal within two hours of exercising, but most  
folks aren't usually hungry so soon.

> Furthur, this 16 oz bottle contained  
> 100 calories. This got me thinking about the "beer belly". Would  
drinking  
> a "Milwieser" Light with about 100 calories cause any more belly than  
the  
> Gatorade I was currently drinking?

It isn't just a matter of calories. The body metabolizes fats only very  
reluctantly, and this process is slowed down even more by the presence of  
alcohol. (by about thirty percent, recent studies have found). If you  
drink \*only\* one or two light beers after an hour of Racquetball, it will  
probably not matter; but if you have anything containing fats with it,  
the fat will tend to be stored rather than burned.

Also, beer is a diuretic; it tends to make you lose water rather than  
retain it. Again, one or two shouldn't make much of a difference, but  
after you've just lost water working out, your aim is to rehydrate.

(but a cold homebrew tastes great after racquetball!)

> How does one determine the caloric content of anything? Is  
> this possible to do at home?

One burns it, and determines the heat output. Or, one calculates the  
calorie based on the ingredients. I doubt that your home has the  
equipment  
to do either of these accurately.

On another subject:

Thanks to everyone who answered my questions on how to control mead  
sweetness. The most popular answer was to use enough honey so that  
even champagne yeast couldn't consume all of it; 3 to 3.5 pounds per  
gallon is about right to achieve a sweet mead. Making it both sweet and  
sparkling is tricky, since yeast does not always ferment honey  
consistently;  
you can try bottling before fermentation is complete, though.

>Would it be worth the money?

One of my all time favorite brews was made using a pound of Maple Syrup in place of a pound of malt extract. I used it in a 'standard' ale recipe. (I have never made the exact same brew twice. I may not have consistency, but I have FUN.) I doubt you would want to ferment 100% Maple syrup. It is far too close to pure sugar. It would also be incredibly expensive. I would hesitate to go more than 25% Maple syrup. What I used translates to about 15%. As far as using Maple Syrup as flavoring, DO IT. I think you'll enjoy it.

From: polstra!larryba@uunet.UU.NET (Larry Barello)  
Subject: Re: Calories

Another point to keep in mind with the calorie counting: Apparently it takes about 23/100 calories of carbohydrates to convert them into FAT on your body. It takes only 3/100 calories to lay down fat (e.g. butter or vegetable oil). I am sure the numbers are generalizations, i got them from a recent issue of Longevity. So, regardless of the effects of alcohol on your metabolism, if you eat fatty food you are going to be more prone to laying down fat.

Date: 12 May 1992 08:06:53 -0600 (MDT)  
From: JLAWRENCE@UH01.Colorado.EDU  
Subject: Newbie brewer questions, wort chillers

I am a relatively new brewer, and have been reading the HBD for about 2 months, trying simply to get a grip on the terminology. I will be the first to admit that I do not spend a whole lot of time on brewing. With a full-time job and 2 small children, this has to be, at least for now, a hobby, not an avocation. My goal is to brew good (not necessarily superior) beer in a relatively simple manner.

Anyway, I have some questions, which are probably pretty elementary to most of you contributors. However, answers would be appreciated.

1. I am using a single-stage fermenter. Pros/cons? Seems to work great, with no necessity for transferring to another container part way through the process.
2. I have a book called "Home Beermaking" by William Moore. It appears that he recommends pouring the hot wort into the fermenter and cooling there. I usually cool in the pot, then transfer. Any comments?
3. Speaking of transferring, should I pour the whole pot into the fermenter, "sludge" and all, or should I attempt not to dump in that stuff? What is it, anyway? Is this the hot/cold break stuff I've been reading about?
4. I have cooled the wort 2 ways: by sitting it in a bath of cold water, and by simply letting the pot sit overnight. Haven't had any problems with contamination either way, with about 20 batches under my belt. What are the pros/cons of using a wort chiller? Seems like a huge waste of water, and living here in the West, that's of concern.
5. Miller also recommends boiling the priming sugar with water before mixing it in. Is this necessary? I've always just dumped it into the brew before bottling, with fine results.
6. Does anyone have any guess on whether our mile-high altitude has any effect on theoretical specific gravity? Can't remember my high school chemistry. I tried a recipe this weekend and have a 5 degree higher starting gravity than expected.

I got an order from William's last week with a special flyer inserted. They've got various stuff on sale through June 30, including an "imperfect wort chiller" for \$21.90. It's billed as the same quality as their regular chillers except not as pretty. Phone (510)895-2739; P.O. Box 2195, San Leandro CA 94577.

By the way, I use a pot designed for canning to brew in. Got it at McGuckins in Boulder, a terrific "we've got everything" hardware store.

Thanks for your help.

- JKL

I have made a couple of raspberry ales with surplus bright red raspberries from my backyard. In both cases, I pitched them early in the boil, so they were in there for an hour or so, by which time the raspberries were completely "dissolved" in the wort.

I racked the wort in the fermenter, and all (or most) fruity residue settled at the bottom along with the yeast. The ale is still amber, little or no hint of raspberry flavor, but the aroma of hops and berries is out of this world. The head also has a slight reddish hue.

I have read lately of people pitching their berries along with their aroma hops. I will try this approach in a couple of months, when the berries are ripe!

From: ISENHOUR@LAMBIC.FNAL.GOV (John L. Isenhour)  
Subject: lagering in cornelius kegs

Kieran O'Connor <OCONNOR%SNYCORVA.bitnet> asks about Lagering in  
Cornelius Kegs

>Can anyone out there give me a primer on how to do this?

Some of my best beers are a result of lagering in cornelius or regular SS  
kegs.

I usually don't prime, I just force CO2 into it at slow intervals at low  
pressure (as I recollect about 16 psi at 34 d F.) till it stops taking it  
(i.e.

when I hook up the gas, the headspace is @ 16 psi already).

> How 'bout CO2 buildup?

I've never had a problem with it, if its fermented out pretty well (I  
only do

this with classic lager style beers, so theres not a ton-o-  
unfermentables left

like in a sweet stout:)

>Is there a problem with sediment because they would be on their sides?

I consider this an advantage, the yeast tends to stick to the sides of  
the  
cornelius keg and if you upright it gently it stays there. The yeast has  
such

a shorter distance to fall, it makes for quick clearing, this may not be  
important depending on your lagering time.

>How about aeration during transportation to the freezer (30 miles away)  
?

I always hook CO2 to the pickup tube and blow the air out of the keg  
before I  
fill it. If you transport it then, what you will get is a small amount  
of  
carbonation (vrs oxidation).

>How 'bout anything answers to anything else I forgot to ask?

If you prime, be sure to put a little CO2 pressure (~5-7 psi) on the keg  
to  
'seal' the seals, I've had trouble with the seating of the large 'O'  
rings  
leaking and killing the priming. If its on its side the beer should seal  
it  
but I dont take the chance.

Date: Tue, 12 May 92 09:56:41 CDT  
From: gjfix@utamat.uta.edu (George J Fix)  
Subject: lagering in cornelius kegs  
Subject: Caloric content of beer (George Fix)

Walter Gude asked in HBD#878 about the determination of calories in beer. The following empirical formula is remarkably accurate, and widely used to check direct measurements. Let A, FG, and RE be defined as follows:

A = alcohol content of finished beer in % by wt.  
RE = real extract of finished beer in deg. Plato  
FG = final gravity of finished beer.

Then the number of calories per 12 oz. bottle is the following:

$$(6.9*A + 4.0*(RE - .1))*3.55*FG .$$

Since A and RE are generally not known to us, additional approximations are needed. The following are due to Balling, and have proven to be reasonable. Let OE and be defined as follows:

OE = original extract (i.e., extract of finished wort in deg. Plato)  
AE = apparent extract (i.e., measured deg. Plato of finished beer).

Then

$$RE = .1808*OE + .8192*AE,$$

and

$$A = (OE-RE)/(2.0665-.010665*OE).$$

To take Walter's specific case, first note that from Plato tables an OG of 1.045 is equivalent to

$$OE = 11.25 \text{ deg. Plato},$$

while a FG of 1.010 is equivalent to

$$AE = 2.5 \text{ deg. Plato}.$$

Therefore,

$$RE = .1808*11.25 + .8192*2.5 = 4.08 \text{ deg. Plato},$$

and

$$A = (11.25 - 4.08)/(2.0665 - .010665*11.25) = 3.68 \% \text{ wt.}$$

We conclude that there are

$$(6.9*3.68 + 4.*3.98)*3.55*1.010 = 148.12$$

calories in Walter's beer. Note that 61.5% come from alcohol, and 38.5% come from the residual extract.

Errors in the formula for calories using A and RE will be under 1%.  
Errors  
in Balling's approximations can be as large as 3-5%.

I am looking forward to Milwaukee for I know there will be a big HBD  
turnout  
there.

Date: Tue, 12 May 92 10:26 CDT  
From: korz@iepubj.att.com  
Subject: Re: Diacetyl

Bottling "as soon as possible, without letting the beer go through secondary fermentation" as Thomas suggests is not the right way to go (I feel). Either the sugars will all be used up by the yeast or not. If not, then beer grenades. What you need to do is to first choose a yeast that produces a lot of diacetyl. There is a sheet from Wyeast Labs that you should be able to get from your supplier that gives the approximate attenuation, diacetyl production and some other comments on each yeast. Then, when the initial fermentation has died down, get much of the yeast to drop out of solution by using finings, such as gelatine. Some of the diacetyl will be reduced, but the lower concentration of yeast will leave more diacetyl in the beer. Al.

Subject: Old Peculiar

> I have made a stab at O.P. based on the Elbro Nertke Brown Ale  
> recipe from Papazian:

> New Peculiar

> 6.6# dark extract  
> 1/2# crystal malt  
> 1/4# black patent malt  
> 1.5oz fuggles 45min boil (pellets)  
> 0.5oz fuggles 10 min boil (pellets)  
> 2 tsp 'water crystals'  
> 1 tsp irish moss  
> Whitbread Ale Yeast  
> 1/2C black treacle

A couple of constructive suggestions. First, what are we aiming for ?  
My answer would be that OP is distinguished by being an exceptionally  
bitter-sweet dark ale, with a very characteristic 'liquorice' after-  
taste.

The original gravity (on draught at least) is around 60, and the alcohol  
content is around 5.5% by volume, meaning that it must finish around SG  
20.

Hop aroma is not especially pronounced. Another way to describe it might  
be to

say that it is a scaled-up brown ale with compensating bitterness.

The above recipe looks to me like it might make a dark ale which doesn't  
have

the residual sweetness of OP. I would normally use at least 4 oz of  
Northern

Brewer (English, seeded) with no late addition technique. Can't say how  
that

might translate into US pellet Fuggles.

People keep suggesting that OP relies for its character on treacle or  
molasses,

but my personal opinion is that using sizable amounts of either will  
create a

beer that takes forever to mellow out. The best way to get the liquorice  
character is to use crystal malt, and lots of it. I would normally use  
around

4 lbs in a US 6 gall batch (can't quote a colour rating, I'm afraid).

Caveat -

I have found from experience that I get an extract of around 8 per lb per  
gall

for the crystal, whereas the textbooks all suggest that the theoretical  
extract

is on a par with pale malt (ie, approx 30). For me, the extract has  
remained

the same regardless of whether I have mashed, infused separately, or even  
(in

desparation) boiled. Others' mileage may vary.

>better  
>way to get diacetyl? Has anyone ever done this, and do you have any  
>tips to  
>share?

Scottish Ale doesn't normally have much of a head, and what you're  
proposing  
sounds like a recipe for glass grenades. Then again, whitbread ale yeast  
is pretty good about fermenting out quickly, then stopping totally...

- - - - -  
>sp. instructs to begin the fermentation in a closed, glass vessel

>and then rack to a secondary to clear after fermentation's complete.  
>My question is: what sort of fermentation activity can I expect?  
>Will I need a blow-off hose for this stage, or will a lock suffice -  
>I suspect I'll need a blow-off... Secondly, he recommends using  
>yeast extract to assist fermentation, but the shop I ordered from  
>doesn't carry "extract" per se, but something they call "yeast  
>energizer" which they say is really the same thing, but most often  
>used to unstick stuck fermentations. Anyone got any feedback?

you won't get much blowoff - only a little if you fill the fermenter  
all the way to the top (as recommended). yeast energizer works, but can  
impart a flavor (sharp, nauseating) into the mead that takes a long time  
(about 9 months) to settle out. If you're planning on letting this one  
age

a long time (like you should, unless maybe you're making a sweet mead  
w/o any fruit), then use it. Ground up dead yeast also supplies the  
necessary nutrients to get yeast going, but that can also impart  
different off-flavors that don't go away with time. If you're  
making a sweet mead to drink young, I would use it instead of  
yeast energizer, though. You probably won't notice a yeasty note  
nearly as much in this type of beverage. By all means, use some  
sort of energizer, or else pitch a lot (3 packets) of yeast. It  
will take a while (> 2 mo.) to ferment as it is. Also, do not  
exceed, say, 1.020 initial S.G. Anything higher than this will  
take forever to get going, and never get out of the undrinkably  
sweet range.

In My last batch of mead, I used 15 lbs of honey and 8 lbs of  
blubberies (for that extra "staining" power) to make 6 Gal of  
1.005 must. I took it to my friend's house where it could ferment  
in the cool basement on a (hard) cement ledge. I was extra careful  
in setting the carboy down, but still managed to crack a 6" hole  
in the side. Glug, glug, glug...

What do you think of a spruce-flavored mead? I have a bunch of  
spruce flavoring (more than I'll ever use).

- - - - -

Does anyone have any experiences using rye malt? I bottled my  
batch of Bock 'n Rye 2 months ago. One month later, the carbonation  
was just starting to kick in, and there was nice whiskey-like  
taste, but also quite a nasty aftertaste. Last night, I popped  
one open, and it seems to be mellowing nicely.

From: Darren Evans-Young <DARREN@ualvm.ua.edu>  
Subject: Sparge water level / Grain bed temp

I've read two different ideas on sparge water level in the grain bed. One says, maintain the water level just below the top of the grain bed. The other says maintain the water level one inch above the grain bed. Which is better/correct?

Also, I always stick a metal probe thermometer into my grain bed while sparging to monitor the temperature. With 190 F water, my grain bed temperature is 150 F. I use the Listermann sparger setup. Anyway, just another data point.

From: RRINGEL@LANDO.HNS.COM  
Subject: wheat beer, carboys, yeast, procedures

Hello brewers!

This last year has been a learning experience! I brewed my first ten batches and have improved my beer with each iteration - thanks in large part to the information I get from HBD.

I remember my second batch - interesting flavor, nothing like I had ever tasted. Also, I wondered what the ring around the neck of the bottle was. But like a child that only a mother could love, I drank all of it. NOW I know better!

Now I use liquid yeast, partial mash (spent grain goes into the garden), 5 gallon boil, IBU calculations instead of HBU calculations, glass at all times, 1 inch blow-off tube, secondary fermentation, pitch on top of the trub and rack off before fermentation starts, whole hops, bleach as a sanitizer, a 50 foot home-made immersion wort chiller, wide-range aquarium thermometers, and yeast starters. What's next? Stainless steel brew pot, full mash, digital PH meter, kegging system, yeast culturing, competitions, and lots of relaxing!

I have a few questions about some current threads in the HBD, and a few of my own.

First, when storing yeast slurry in the refrigerator for re-use, does it matter whether it is ale or lager yeast? It seems to me that the lager yeast will continue to be active and thus progress to autolysis much sooner than an ale yeast.

John Devenezia supplied an interesting wheat beer recipe in today's HBD that called for a 180 degree steep of wheat malt. From what I know, I would conclude that no fermentables were added to the wort from this process. Is this correct? If this is true, then what flavor contribution does this make? While we are on the topic of wheat beer, how does one achieve the clove-like flavor in some of the commercial brands (Spatan, for instance)?

Has anyone found a good way to cold-ferment a 5 gallon batch without using a refrigerator? I'm trying this right now, with batch #10. I set the carboy in a water bath with a wet towel draped over the top, and have a fan blowing air onto it. I also have a de-humidifier in the room to keep the evaporation as rapid as possible. While this seems to be working, it is eating alot of electricity. (Room temp 63, beer temp 55 and dropping daily) I am reluctant to use ice, because I would worry that the temp of the beer would fluctuate, thus hurting my yeast. Are there any better methods?

Two of my carboys have developed little "crystals" on the inside that I can't get rid of. They are about the size of a small grain of sand, and are along the shoulder of the carboy. They are also grouped near the bottom. What are they, and how do I get rid of them? When the carboys are not in use, I fill them with a bleach solution (4 or 5 glubs from the bleach container). Is this some form of crystalized

clorine?

Now that I got started, I can't seem to shut up... That's typical when home brew is involved!

Subject: CO2 tank pressure

Just as a point of information, the tank pressure reading on CO2 tanks has little to do with the actual amount of gas left in the tank. This results from the CO2 being present in a liquid form at the bottom of the tank, evaporating to replace gas which is let out of the tank. The observed pressure is purely a function of the temperature and can vary from 500 to over 900 psi, depending on the tank temp. For this reason, suppliers of the gas sell it by the lb (literally, they weigh the tank before and during filling). In a 72 (F) degree room the pressure will remain at ~900 psi until all the liquid is gone, then the pressure will drop at a linear rate as the gas is used. The dropping pressure is a sign that the tank is almost empty and should be refilled. The only reason I can think of for not using the tank until it's completely empty is the danger of backpressure. The beer, exerting pressure of it's own, could back up through the regulator and into the tank. This would be bad for the regulator, the tank, and the beer ;). This actually happened to a gas pressure system in our lab, so I know it's possible. Keep on brewing...

Syrup?  
> So, has anyone out there ever heard of maple beer or anything of the  
sort?  
> Would it be any good?  
> Would it be worth the money?

MMMMMaybe. . . . I tried a bottle of a friend's "Mappelbrau" (no umlaut  
but say "maple" anyway), which was strange enough that I can't  
remember whether I even \*liked\* it enough. His recipe was a light ale  
kit, plus too much maple syrup. Basically, it tasted like maple syrup  
smells, except it wasn't sweet. My! If you do this, I suggest you  
start with something stronger-tasting than a light ale, like maybe an  
imperial stout. And be conservative with the maple! And don't use  
processed syrup! (I am assuming that fermented Miz Butterworth would  
be at least as nasty as any other fermented substance with artificial  
ingredients.) And whatever you do, AGE IT! In months previous to my  
sampling, Mappelbrau had perplexed and nonplussed many people braver  
than I.

Good luck and have fun,  
Jake.

PS - Sorry I don't know how much maple syrup he used. I'd start with  
say half a cup and work from there.

From: S94WELKER@usuhs  
Subject: Re: Maple Beer

Scott Weintraub asks about maple beer.  
I have read about the possibility fo such beer in Papazian, who basically says "it's not worth it." Then, when I finally met the man, another brewer was offering him a taste of the very thing...maple beer, with 20% of the fermentable sugar supplied by fresh Vermont Maple syrup (about \$15 worth. ..1.5 lbs or a little less). I tasted it too, and the maple note was very prominent, but mixed poorly with the very mild hop flavor. The maltiness of the medium amber ale on which the beer was based was quite pleasant as a background to the malt. Charlie commented he would use almost no hops (I might suggest dry hopping only with an aromatic variety like Saaz or Hallertauer), and add sweetness with ~1lb of crystal malt. I think even more sweetness would be called for...try adding some unfermentable sugar (lactose, dextrin). I would also use a small amount of roasted barley to darken the color, improving the visual impression of the 'Mapleness'. The taste buds of my mind would avoid using black patent malt to darken-the smokier flavors (as compared to roasted barley) don't sound good mixed with maple.

Good luck--let us know how it turns out!

End of HOMEBREW Digest #880, 05/13/92  
\*\*\*\*\*  
-----

Date: Wed, 13 May 1992 9:49:43 -0400 (EDT)  
From: COLE@IRENE.MIT.EDU  
Subject: Maple Mead (Not mine, from coz@triton.unm.edu)

I though I would contribute a recipe for maple-syrup mead that was sent to me by coz@triton.unm.edu as an answer to an inquiry I made a few months ago on rec.crafts.brewing about maple mead. I haven't had a chance to make it yet, but am in the process of procuring the syrup from friends in Vermont. Below is the recipe I received verbatim:

-----  
3 1/4 lb maple syrup  
7 pts water  
1/2 tsp acid blend  
3/4 tsp yeast energizer  
1 campden tablet  
1 pkg Red Star champagne yeast

If you are going to make a small quantity of this brew, I suggest that you follow this recipe fairly closely. I, on the other hand, make mead 5 gallons at a time and so my recipe for a large batch varies a bit. If you want to make a lot, try it this way:

in a 6 gallon primary, place:  
1 1/2 gallons of maple syrup  
4 gallons water  
2 tsp acid blend  
4 tsp yeast energizer  
1 campden tablet  
1 pkg Red Star champagne yeast

It'll take about a day to really get fermenting, and should go like crazy for 4 to 6 weeks. Rack off the yeast sediment at that time and then re-rack at least 3 times at 3 month intervals. It'll be ready to bottle by 9 or 10 months of age, but the longer it sits, the mellower and smoother it becomes. hope this is was what you were looking for...let me know how it turns out.

-----  
Just as there is a great variation in honey, there are great variations in the types and flavors of maple syrup. The quality and flavor of the syrup depend on the climate and spring weather in the region of interest and vary greatly from year-to-year. True maple syrup (Mrs. Butterworths ? ??? arg!!!!!!) can be obtained in different grades which reflect the degree to which the sap has been boiled down. Typically the marketed, expensive syrup is Grade A, fairly light in color and fairly light in taste also. Good Grade A syrup tastes nothing like pancake syrup, it has a woody-tangy taste (best I

can describe it) and is not overly sweet. This will probably make a nice smooth mellow mead. Lower grades of syrup are darker and sweeter, though I don't know how available they are in regions where sugaring is not done. I would use a lower grade syrup for something like a stout as the flavor is stronger and the color darker. I would think Grade A syrup would get lost in a true stout. This is of course all theoretical as I have not actually brewed a beer yet with maple. However, we used to make our own syrup when I was young and living in Maine, and I look forward to making a maple-syrup based beer.

Hint:: If you have a little left-over syrup sitting in the bottom of a tin and you can think of anything to do with it, pour a tablespoonful into a glass of milk and stir it up. This makes a wonderful drink.

Subject: Calories

korz@iepubj.att.com writes:

> the Swiss study ... found that metabolism was increased by alcohol.

Overall metabolism was increased by alcohol. Fat metabolism was reduced. Moral: don't eat fatty food with your beer. They added/replaced (two different experiments) 25% of the daily calories in alcohol. More than you're likely to drink in an average day!

At higher levels (!) of alcohol consumption, the body converts alcohol to fat. The authors of the Swiss study did not think that was happening (although their method could not rule it out). The complete abstract is included below for the masochists.

=Spencer W. Thomas HSITN, U of Michigan, Ann Arbor, MI 48109  
spencer.thomas@med.umich.edu 313-747-2778

Suter PM Schutz Y Jequier E  
The effect of ethanol on fat storage in healthy subjects.  
N Engl J Med (1992 Apr 9) 326(15):983-7

BACKGROUND. Ethanol can account for up to 10 percent of the energy intake of persons who consume moderate amounts of ethanol. Its effect on energy metabolism, however, is not known. METHODS. We studied the effect of ethanol on 24-hour substrate-oxidation rates in eight normal men during two 48-hour sessions in an indirect-calorimetry chamber. In each session, the first 24 hours served as the control period. On the second day of one session, an additional 25 percent of the total energy requirement was added as ethanol (mean [ $\pm$  SD], 96  $\pm$  4 g per day); during the other session, 25 percent of the total energy requirement was replaced by ethanol, which was isocalorically substituted for lipids and carbohydrates. RESULTS. Both the addition of ethanol and the isocaloric substitution of ethanol for other foods reduced 24-hour lipid oxidation. The respective mean ( $\pm$  SE) decreases were 49.4  $\pm$  6.7 and 44.1  $\pm$  9.3 g per day (i.e., reductions of 36  $\pm$  3 percent and 31  $\pm$  7 percent from the oxidation rate during the control day; P less than 0.001 and P less than 0.0025). This effect occurred only during the daytime period (8:30 a.m. to 11:30 p.m.), when ethanol was consumed and metabolized. Neither the addition of ethanol to the diet nor the isocaloric substitution of ethanol for other foods significantly altered the oxidation of carbohydrate or protein. Both regimens including ethanol produced an increase in 24-hour energy expenditure (7  $\pm$  1 percent with the addition of ethanol, P less than 0.001; 4  $\pm$  1 percent with the substitution of ethanol for other energy sources, P less than 0.025). CONCLUSIONS. Ethanol, either added to the diet or substituted for other foods, increases 24-hour energy expenditure and decreases lipid oxidation. Habitual consumption of ethanol in excess of energy needs probably favors lipid storage and weight gain.

From: Jacob Galley <gal2@midway.uchicago.edu>  
Subject: Re: Homebrew Digest #880 (May 13, 1992)

Hi again. I forwarded my yesterday's post to the Mappelbrau's brewer, and he wrote back saying he used 5 lbs ~ 2+1/2 cups of maple syrup. He says his next experiment took 3 lbs, and that was still a little strong.

I just remembered another friend who was telling me about his recent coffee/maple porter ("The only beer to drink with breakfast") which imparts a walnutty taste . . . This might be worth trying.

Let me just correct the estimation I made yesterday: try 1 cup of syrup.

Cheers,  
Jake.

> Would it be any good?  
> Would it be worth the money?

At our last homebrew club meeting I tried some maple syrup barley wine.  
It was very good, but not an 'everyday' beer. The first impression was  
of alcohol, the maple flavor hit in the aftertaste. This was a very well  
made brew; you need something strong like a barley wine to counter the  
flavor of the maple syrup.

The overall effect was almost overpowering. The beer is suitable for  
sipping after dinner, but I don't know if I could drink a whole bottle  
by myself.

Subject: Re: Newbie /

JLAWRENCE writes:

>1. I am using a single-stage fermenter. Pros/cons? Seems  
>to work great, with no necessity for transferring to another  
>container part way through the process.

If you're making ales and their fermentation is complete within two or three weeks, then single-stage is probably best -- I personally, feel that there is less to be gained from two-stage on such short ferments and the increased risk of infection and oxidation is not worth it. For longer ferments, lagers, very high-gravity ales and slow yeasts (such as my Orval-clone and my pseudo-Lambic), I use two- or even three-stage.

>2. I have a book called "Home Beermaking" by William Moore.  
>It appears that he recommends pouring the hot wort into the fer-  
>menter and cooling there. I usually cool in the pot, then  
>transfer. Any comments?

Yes. Aerating wort over 80F will most certainly oxidize the wort. What you want is aeration not oxidation. The result of oxidizing the wort is darkening and sherry-like or wet-cardboard aromas and flavors in the finished beer. My beer improved considerably when I began chilling before aeration. You're doing the right thing by cooling quickly. Another reason for cooling quickly, is that as the beer cools, while it is between 212F and 140F, DMSO is being converted to DMS. DMS will give your beer a "cooked corn" or "cooked vegetable" aroma. Remaining DMSO will be used up by your yeast and will not be evident in your beer.

>

>3. Speaking of transferring, should I pour the whole pot  
>into the fermenter, "sludge" and all, or should I attempt not to  
>dump in that stuff? What is it, anyway? Is this the hot/cold  
>break stuff I've been reading about?

Leave the sludge. It's called trub, in general, and yes it's hot and cold break. Hot break is cooked proteins and is created during the boil. Cold break is clumped proteins which coagulate as you cool the wort. I've read that yeast ingests the trub and produces additional fusel oils/alcohols from them.

>

>4. I have cooled the wort 2 ways: by sitting it in a bath  
>of cold water, and by simply letting the pot sit overnight. Haven't  
>had any problems with contamination either way, with about 20 batches  
>under my belt. What are the pros/cons of using a wort chiller? Seems  
>like a huge waste of water, and living here in the West, that's of  
>concern.

As soon as the wort drops below 160F or so, it is fair game for wild yeasts and bacteria. The quicker you cool, the sooner you will be able to pitch and therefore, give your yeast a head start over the wild yeast and bacteria. You will always have some wild yeast and bacteria in your wort and thus in your beer, but if the "good," cultured yeast you pitch eats up all the sugars, then there's little left for the bad guys to eat. Minimizing DMS (see above) is another reason for cooling quickly.

>  
>5. Miller also recommends boiling the priming sugar with water  
>before mixing it in. Is this necessary? I've always just dumped it  
>into the brew before bottling, with fine results.

Boiling is a good idea to kill any bad guys. Once the beer is fermented-  
out, the acidity and alcohol level and antiseptic qualities of the hops  
are often enough to keep bad guys at bay, but I just boil it and it  
gives me one less thing to \*potentially\* worry about.

>  
>6. Does anyone have any guess on whether our mile-high altitude  
>has any effect on the specific gravity? Can't remember my high  
>school chemistry. I tried a recipe this weekend and have a 5 degree  
>higher starting gravity than expected.

>  
Water boils at a lower temperature at higher altitudes. This fact would  
skew decoction mashes by a few degrees down and would require  
compensation.

Robert writes:

>I have read lately of people pitching their berries along with the  
>aroma hops. I will try this approach in a couple of months, when the  
>berries are ripe!

The advantages to adding both fruit and aroma hops after the initial  
fermentation is over are:

1. Increased alcohol level and decreased pH are a less-hospitable  
environment  
to nasty organisms, and
2. The intense CO2 bubbling during the initial ferment tends to scrub the  
aromatics we want (from the dryhops and fruit) out of the beer.

From: eisen@kopf.HQ.Ileaf.COM (Carl West)  
Subject: Growing hops

1. Growing pattern -- Straight up is best, that's where they want to go. They climb by twining, they don't have grippers like ivy, so, no, they won't climb the side of your house. Give them a length of twine to climb. If you're going to use poles, they should be 10+ feet tall, you'll probably want to put them in more than a foot. A suggestion I'm trying is to drive 4 foot iron bars into the ground and lash my poles to them, it's s'posed to make harvest time easier.
2. When should they be planted? ASAP, I'm in the Boston area and I got mine in in May last year, my tallest reached about 8 feet and yielded about 1/8oz. this year should be better.
3. Light requirements -- direct sun, minimum half a day.
4. Soil requirements --???
5. Root (rhizome) depth --???
6. Recommended planting distance --2-3 feet for same-kind, 6+ between different kinds (so you can keep track of what's what)
7. Fertilization schedule? ???
8. How many should we plant? 4-6 rhizomes
9. How do you "winter" the hop plants? Let die,trim down, then cover with straw and manure.
10. Watering requirements -- Well drained, but lots o' water. I don't think they like mud, but they do like water. Mulching helps.

That's what I know about it.

Subject: NA beers from Micah Millspaw

I told myself that I would not enter into any more HBD frays, but the posting of the analysis of Jack's N/A beer and the commercial N/As interest me. About three years ago a fellow homebrewer and myself began writing a book on making low alcohol, non alcohol and Diat beers. After a lot of notes, experiments and recipes we found that the AHA was not really interested publishing something like this. In the spring of '91 the California Celebrator ran a small item of mine about making N/A beer. This seem to stir some interest in this line of brewing. I refrained from the earlier HBD disscussion about N/A (they were very heated) but now that things have become calm and rational I would be more than willing to share my info. I also would be interested in having some of my N/A tested ( you can drink it too ) my measurements indicate that the alcohol levels I am getting are below 1% by weight, but my methods are slightly different than the one that Jack described. Anyone in HBD land interested? let me know.

From: Bob Jones <BJONES@NOVA.llnl.gov>  
Subject: AHA competitions from Micah Millspaw

I've heard some rumors about the prize situation in the AHA national homebrew competition. First, in the winter issue of zymurgy it was said that the prizes for 92 would be announced in the spring issue, they where not. And now I have heard that there will be no big prizes this year. At \$7.50 (for members) and \$9.50 (for non-members) entry fee,the investment in entering is hardly offset. Unless the AHA makes some changes, this years 2300 or so entries may be as big as it gets. Lower entry fees and lower shipping cost will make the local competitions look a lot better. Since the AHAs officers are not elected by the general membership perhaps they should at least be called to a vote of confidence. And yes I hope that this stirs up some #%#@#!!!

From: "Joe McCauley" <mccauley\_je@vnet.ibm.com>  
Subject: Pre-boiling

Greetings. I have been an extract brewer for the last few years, but plan to move up to mash/extract in the near future and eventually to all-grain.

Early on I began the practice of pre-boiling and chilling the water used in the brew. This will kill any beasties in the water supply, and will remove other chemicals that may be present in trace amounts and which are bad for your beer. However, I've only been pre-boiling the water that gets added in the fermenter, not the water used in the wort boil. Of course, I bring this water to a boil anyway before I add the extract, but when I use specialty grains I steep them in the water before it ever comes to a boil. Is there any reason to use pre-boiled water in this case?

On to mashing...is there any advantage to using pre-boiled water in the mash? What about the sparge water? How about the water I use to take a shower the night before? Oh, sure, I could just stop worrying and boil it all, but I'd rather not spend the time and the electricity (or gas) if there's no reason for it. Thanks for any information.

From: sterling@gandalf.umcs.maine.edu (Sterling Udell)  
Subject: rec.crafts.brewing and HBD

I would strongly vote against the HBD being replaced with r.c.b, for a number of reasons.

First, the accessibility. Internet, Bitnet, et al access is MUCH more common and easy to come by than Usenet access. For many people, this (the HBD) is the only way that they could participate in such a forum.

Second, the reliability. In my experience, news feeds are are a tricky and undependable thing. At several sites I've been at, the news came quite sporadically, and the ordering of the messages was site-dependent as well. How many times have you Usenet users read dozens of replies to a single message, and then have the original show up much later? Or not at all? I know I've seen that a LOT. Internet mail, in contrast, goes through like the USMail should. Except for the rare occasions when something breaks on Rob's machine, I can count on my HBD every day.

Third, the attitude. This may be just me (though I have reason to think otherwise) but . . . Usenet seems MUCH more flammable than Internet digests are. With a few exceptions, the HBD has been a sober (well mostly :) group with an excellent s/n ratio - much better than the times I've followed r.c.b.

Well, I guess I can climb down off my soapbox now, and slake my thirst with a cool ale. Ahhh, that's better. Other opinions?

From: rfozard@sword.eng.pyramid.com (Bob Fozard)  
Subject: pasta mill mod

After having read about using a pasta roller for a grain mill here in the digest, and then finding one on sale for \$40, I decided to give it a shot. The poster recommended scarring up the rollers with a grinding wheel or some such device in order to roughen them up enough to cause the grain to be fed through. I did a version of this, but was never quite satisfied with the feed rate. I have recently applied a few 1/2'' wide strips of self-adhesive friction tape down the length of the rollers (4 strips on each roller, with about 1/4'' space between each), the same stuff you might put down on a step to keep people from slipping. This has resulted in a huge increase in the feed rate, with no apparent degradation in the crush. I thought that the sand-papery tape might shred the husks to bits, but they come out quite nicely. The adhesive seems to work quite well, so I doubt I'll need to refresh them very often.

From: jmiller@anubis.network.com (Jeff J. Miller)  
Subject: Hop poles

Sorry I didn't think of mentioning it earlier, but I think I found a truly great way to grow/harvest hops. Make a flag pole and run the hop strings up it for growing, and lower for harvest.

I did this this year by taking 4 10' 2x4's and joined them with LOTS of screws to make a 20' 4x4. Then I rigged it with two sets of pulleys (needed to run a flag as well as hops :) and planted it 5 feet in the ground. Finally, I attached a 2" ring on the hop side cord and then attached strings to the ring. Finally I took staked the other end of the hop ropes to the ground, adjusted the lengths, and ran them up the pole. I now have 9 very happy vines growing that are easily over 9 feet tall. I'm really looking forward to harvest this year!

From: fjdobner@ihlpb.att.com  
Subject: Beer Head and Fruit

Brewers,

I have one comment and one question:

1. Regarding the point at which fruit should be added in the homebrewing process, my conclusion was the following: Adding fruit anywhere in the boil would cause haze in the end. Therefore, assuming that a lighter style beer is the desired product my intention with my first batch next month is to add it to the secondary so that bacteria and the wild things are not encouraged due to the alcohol content present there. However, should a darker beer be sought (cherry stout for instance), I do not believe there should be a problem in adding the fruit to the boil, if appearance is all that is at stake.

2. I have about two years and a few dozen batches behind me now and I have a question regarding beer head. I have brewed both extract and grain beers, but I have the persistent problem of a short-lived head. Meaning that the head does not last long in the glass soon after it is poured. Initially after the beer is poured it is a nice uniformly small-bubbled creamy head but does not last long. I had a problem with crushing my grain too finely which I have corrected. I also thought about how much detergent may have been used in cleaning the glasses and have corrected that already. Could water quality affect head? Could the presence of both cold and hot break in the fermenter destroy head? I could use some experience and knowledge on this issue.

Thanks

The entry fees never have, nor do I think ever will, cover the cost of  
BIG prizes. I assume that you are talking about trips to Norway, etc.  
These BIG prizes are provided by sponsors. I am not associated with the  
AHA other than being a member (I'm not an officer or anything -- I'm not  
even a Zymurgy author yet), but I'll bet the AHA (as well as its  
membership)  
would be very grateful if you could convince a few importers or breweries  
to sponsor some prizes.

I believe that annually, the AHA prints a financials report. I've seen  
one  
and I assure you that no one at the AHA is getting rich.

Maybe someone who knows for sure, can comment on where the \$7.50/\$9.50  
goes.

From: pgsjay@atlas.cs.upei.ca (Scott Jay)  
Subject: Fine sediment

I want to say thanks to all those who answered my query re. beer styles. It helped alot for all of us novice brewers in my brewgroup, FAB. Now I have another question!  
Last evening I tried some of my latest brew - a lager, probably actually a steam or common beer (thanks) - and noticed a deposit of fine sediment up the sides of the bottle, almost to the neck. When poured, this fine material mixed with the beer making it cloudy. I did not notice an off flavour - actually it was quite good :- ) - but the beer did not look pleasing. Is this normal (i.e. does it happen often)? How could I have prevented it? I did rack into a secondary fermenter and racked again just before bottling.

>On to mashing...is there any advantage to using pre-boiled water in the  
>mash? What about the sparge water? How about the water I use to take a  
>shower the night before?

You should pre-boil the water you use in your mash, in order to  
drive off the chlorine. If you don't, the chlorine will create  
a buffer, and the grains will not lower the ph appropriately.  
>From my experience, if I did not boil off the chlorine, I could  
not get the mash ph below 5.8 or 5.9, no matter how much gypsum I  
added, but if I pre-boiled the water, I could reach the recommended  
mash ph of 5.3 quite easily.

Now days I preboil the mash water and add a tsp of gypsum and leave  
it at that, especially when making dark beers; It's hard to get an  
accurate reading when the dark malts in the wort stain the ph paper.

Subject: Brewing at high altitude

Just another data point: At a Belgian beer tasting I attended at the  
Brickskeller in DC a few weeks back, the owner of the New Belgium Brewery  
in  
Boulder, CO, mentioned the first time he tried to send some of his  
wonderful  
trappist ale (previously found mostly at elevations above 6,000 feet),  
the  
stuff was pretty flat. So if you're used to acieving a certain degree of  
carbonation with X amount of priming sugar, consider increasing it if the  
beer will be consumed closer to sea level. That way, you'll have a nice  
foamy head on your homebrew (which you're drinking to help you not worry  
about  
the toothpaste tube that exploded in your underwear) when you visit  
friends  
in San Francisco.

From: fiero@pnet51.orb.mn.org (Bill Fuhrmann)  
Subject: Calcium Chloride

--- Pete replied to Greg  
Seems to me that crystalline stuff you buy at the hardware store to sprinkle on you iced-up driveway in the winter is calcium chloride. Another name for it is rock salt. I doubt they add anything to it - probably just crush it up. Be sure you check the ingredients if you plan to use this in beer (?!). You obviously don't want to use any of those weird chemicals they also sell for melting ice.

Another possible source is at a water softener \*type\* store (Culligan?). I think they use calcium chloride to soften hard water,

I suspect that you will get more than one reply like this:

Calcium Chloride is used for melting ice on sidewalks, however, it is not the same as Rock salt or Water Softener salt. Those two are common forms of Table salt or Sodium Chloride. Calcium Chloride tastes terrible.

You might be able to find Calcium Chloride in a drug store, it's supprising how many chemicals you can get there.\*

From: fjdobner@ihlpb.att.com  
Subject: All Grain

I have a rather large ten gallon brewpot that was a gift from my father in which I brew everything including extract and all grain. When I am doing all grain brews however, I must lug this thing with about 5-7 gallons of boiling hot liquid through my kitchen, living room, down a flight of stairs, across my basement to my workshop which is where I have an area cool enough (unfinished part of the basement) to ferment anytype of ale or lager.

I am awaiting disaster while doing this everytime and am also searching for solutions to overcome this such as:

1. Investigate using less mass water as posted yesterday by Kenneth Haney.
2. Get a dedicated range/cooker for my workshop. Perhaps the beer/fish cookers that Dave Ballard posted also yesterday would be of use. Would you need to have ventilation for these things. I would imagine so but maybe someone is more aware of this than I. Also would these cookers put out enough energy so that I would not need to wait a millenium for my 5-7 gallons to boil?

Your comments are welcome.

From: michael@wuppsych.wustl.edu (Michael Biondo)  
Subject: Beechwood Aging

While thumbing through Michael Jackson's 'The New World Guide to Beer' something interesting caught my eye. At the bottom of page 31 there is a picture of a lagering tank with chunks of wood sitting outside of it. The caption reads: 'Beechwood "aging" at another brewery, in Bohemian forest country. The beechwood chips are used to fine the beer in the lagering tank.'

I know AB makes a big deal of their "Beechwood Aged" process and in fact have actually seen the large collander-like trollies full of chips that are inserted into the lagering tanks, and also the special washing machines the chips are washed in prior to reuse. (I think the chips are reused 5 times) But until reading the above caption from Jackson (Woo! nice rhyme...), I never realized that the beechwood was actually used as a fining agent.

Does anyone have any additional info on using beechwood as a fining - I don't recall ever seeing it mentioned in any of the texts. How effective is it as compared to the more standard finings? Has anyone actually tried using beechwood on a home brewing scale?

If you are going to make a small quantity of this brew, I suggest that you follow this recipe fairly closely. I, on the other hand, make mead 5 gallons at a time and so my recipe for a large batch varies a bit. If you want to make a lot, try it this way:

> in a 6 gallon p> r> imary, place:

Subject: "Klages" probably ain't

A week or so ago there was a good discussion about mashing and various malts, american and european. One inaccuracy that ran thru the discussion of american malt was calling it "Klages".

There are 2 principle suppliers of american malt to homebrewers, brewpubs, and some microbrewers in the U.S. Great Western Malting as noted by someone (Jeff Frane?) sells a mix of pale malt varieties one of which is Klages. Briess Malting is the other and (i think) the largest homebrew supplier. It is there pale malt which is continually, and wrongly called "Klages". There pale malt is also a mix of 2-row varieties including Klages and perhaps 4 or 6 others. Briess calls this mix "brewers malt" not Klages so it is not clear why so many brewpubs and homebrew suppliers (wholesale and retail) refer to this as Klages. For the most part it is not.

From: Jay Hersh <hersh@expo.lcs.mit.edu>  
Subject: Boston Beer Blah....

I just got off the phone with someone at the BBC.

Yes they are definitely suing the BBW, and said this fact was reported in the Herald a few weeks ago. They said they have to do this in order to protect their trademark, and their product integrity (i.e. if the BBW brews bad beer they don't want it getting confused with the BBC)

I pointed out to them that if they were worried about protecting the trademark (which if they don't they can legally lose it, or so they say) then they should make a legal agreement with the BBW to license it for some trivial fee. This obviates the question of who really owns it and stops wasting time/money.

I further indicated that BUD/MILLER/COORS is to BBC as BBC is to BBW, i.e. they were picking a fight with the wrong people, and thus were wasting their energy as well as pissing off the homebrewing community. I let them know that lots of people were aware of this nationwide and more and more of them were getting pissed off about it, and talk of a consumer boycott was being bandied about.

The person I spoke with took my # and said they were unaware of people's feelings on this, that this would be passed along to Jim Koch (who is rapidly becoming persona non-grata among more than just Marelene :-)) and he would perhaps call me back....

This whole thing irritates me cause I think it's real petty and that it's just another example of lawyers and corporate geeks run amok....

Well, yes, I see a problem. The CO2 that is violently produced during  
the  
first few days of fermentation will scrub much of the fruit aromatics  
from  
the beer. I suggest adding the fruit later in the ferment to avoid this  
phenomenon. I suggest the same for dryhops too, for the same reason.

Subject: Re: Pre-boiling/full boil/Beer Hunter

I've lost the original posters of these questions, so forgive me, but:

Re: Pre-boiling mash/sparge water

If you have a lot of temporary hardness (see your water analysis), which is caused by Bicarbonate, you can lower the hardness by boiling and cooling the water -- it will precipitate out the bicarbonate.

Re: why do a full boil for all-grain

A full boil is sort of necessary -- you see, you can get away with a small mash (say 2 or 3 gallons) but then when you sparge, you will collect about 6 to 8 gallons of wort. This you need to boil down to 5 gallons. You \*can\* do this in two batches, adding half the hops to each batch, but you can't boil a small amount and then add to pre-boiled/cooled water in the fermenter as mentioned by the poster.

Re: Beer Hunter

You can order it (or at least you used to be able to) from the Discovery Channel at 1-800-TDC-8343. They used to throw in a free copy of Jackson's pocket guide.

Hello all: Last week some one ask about a beer festival in Lancaster PA.  
well here it is sorry for the delay.

Microbrewery Festival

place: Adamstown PA  
Stroudt brewery hall  
date : June 13 Saturday  
cost : \$15 per person(12.50 group of 15 for more)

Incudes "Best of the Wursts Buffet" with potatoes and horseradish  
Music by Hans the Happy Wander.

Microbreweries to attend(more to come) as of 1/92

Boston Beer Co  
Brasal Brasserle Allemande  
Buffalo Brewing co  
Wild Goose Brewery  
New Englang Brewing Co  
Old Dominion Brewing Co  
Oldenberg Brewing Co  
Otter Creek Brewing Co  
Pennsylvania Brewing Co  
Samuel Adams Brew House  
Stroudt Brewing Co  
Vermont Pub and Brewery

Call or write

The Great Eastern Invitational Microbrewry Festival  
RT 272 P.O. box 880  
Adamstown PA 19501  
1(215) 484-4387

directions: The hall is located between Reading and Lancaster just off  
the PA turnpike exit 21.

See ya there

Subject: Marga Mulino Grain Mill

I got mine from Zabar's in New York. I dont have the phone number here at work, perhaps someone else can furnish that. I paid \$60 for it. Beware, the price can be as high as \$100 (Sur La Table, Seattle). I would not pay more than \$60 for it. Mine works great. I use a 4.5 amp 1/2 hp variable speed drill with a screwdriver bit. You'll have to play with the adjustments some. It depends on the grains you use. I had to use a different setting when I got my grains from a new source. The settings past #2 work best for me. Setting it to #2 powdered my grains.

```
132  
oooo  
  |  |
```

Either of these two settings should work. Note the setting on the far right doesnt have a notch, so the adjustment knob wont be seated. But it doesnt seem to move when operating the mill. Let me know if you need more information.

From: Darren Evans-Young <DARREN@ualvm.ua.edu>  
Subject: All-Grain questions

Sparge water level:

I got no responses to my inquiry about sparge water level in the grain bed. Perhaps you all-grain brewers will send me mail indicating whether your sparge water level is above or below the top of the grain bed..also, if you have any reasons why you choose that method. I'll post a summary of the responses I receive.

Sparge water amount:

I'm planning a brew using 15lbs of pale malt. Using 1 qt/lb of grain, I'll be using 4 gallons of water in the mash. Do I still sparge with 5 gallons? Less? More?

Subject: CLASSIC FERMENTATION LOCK

To: Homebrew Digest  
Fm: Jack Schmidling

>I am looking for a autoclavable air lock of the type which can do reverse flow (for when it cools). Anyone know where I can get such a beast, or have an idea for how to make one?

One sure sign of an old salt at home brewing is the classic glass fermentation lock. When I first started wine/beer making, there was nothing else available, now they are scarce as hens teeth. As a far out aside, one home brew shop returned my video because of all the "odd looking equipment" I demonstrate in it. Not sure where you can find them but I treasure my remaining three and treat them like crown jewels.

One of the nifty things you can do with them is to fill an Erlenmeyer flask with your starter and bring it to a boil. When you are sure it won't boil over, attach the empty glass fermentation lock and turn off the heat. The steam will sterilize the stopper and lock and enough water will condense out to fill the lock to the proper level. If it sucks some back in on cooling, it's no problem because it's sterile water.

For what it's worth, I use a 500 ml flask about 3/4 full as a starter for 7 gal batches and get vigorous fermentation within 24 hrs.

I have never tried starting from a petri dish without going through the slant step but I have a hard time believing that it would not work as well without all the extra stages. I can't believe the yeast cares whether it is in a gallon of wort or an ounce.

Back to your original question, they exist and if you look hard enough, you can probably find one. I will sell one of mine for a grand or two :) Making one would be a simple task for a glassblower. It is basically an "S" shape with a bubble in each leg. There are some good shots of it in my video if you have access to it or someone wants to send you a "preview" copy.

From: avalon!jm@siemens.siemens.com (Jeff Mizener)  
Subject: Racking/Siphoning Hardware & Pumps

Some time ago there was a discussion about using a pump of some sort to eliminate the hassle of siphoning. Did we ever get closure on this issue? Are there any pumps out there (ideally self-priming) that can be had for not-too-much money that do the job?

I have an Edmund Scientific catalog and they have some pumps, but what I know about pumps could be written in very few words. If anyone has any recommendatuons, I'd love to hear them.

What do all you siphoners out there do to seal the hose to the racking tube and bottling wand? I have tried hose clamps (the tiniest worm gear type I could find) as well as cable ties (Ty-Wrap brand). Nothing I do seems to seal the hose to the tube as well as I'd like (which is to say that they leak).  
What am I overlooking?

Non HB-related question: What are Fosters Lager cans made of? They seem to be steel sided with aluminum tops & bottoms. They were on sale so I bought some. I just need to know into which compartment of my recycling box they should go.

I don't agree with this statement. If you pitch a yeast packet into a 12 oz starter, wait one day, and then pitch to the fermenter, it seems to take off faster than just pitching into the fermenter directly, plus the extra day.

i.e., If you dilute yeast too much, they seem to slow down more than proportionately.

From: NCDSTEST@NSSDCA.GSFC.NASA.GOV  
Subject: Belgium Wit/Raw wheat/Oranges

From: Jim Busch aka ncdstest@gsfc.nasa.gov

Ok, Im brewing an all grain Belgium Wit beer this week and I thought I would look here for tips/comments on my upcoming procedure. Here's the plan:

15 gallon brew pot, 15 gallon lauter tun  
60% pale malt  
35-40% raw summer wheat (NOT malted)  
about 1-2 pounds 6 row pale for adjunct cooking  
1 tsp corriander  
several orange peels, added at conclusion of boil.

Mash pale malt separate from adjunct mash. Combine raw wheat with 2 Qts per pound water, hold 180, 10 minutes. Reduce temp to 150, add 2 lbs 6 row malt. Step mash/decotion, boiling adjuncts 15 minutes. Now, Ive heard two methods: 1. lauter pale mash first then add adjunct mash on top, using pale mash as a filter bed, and 2. Mix both mashes well and hope the lauter works. I'm still deciding on this point. Boil 90 minutes, lightly hopping with Hallertau. Add corriander and orange peels at conclusion of boil (steep for 20 minutes as wort chiller is sanitized). Ive also heard to add the fruit in the secondary or late primary fermenter- any comments?? Pitch 1 litre phenolic top fermenting yeast per 6 gallon fermenter. Push batch through to tap quickly to maintain yeast suspension/freshness.

Any comments are appreciated, the sooner the better. I am waiting until Wit batch 2 to attempt raw oats, unless someone suggests otherwise.

I'll let you know how it goes.

From: hartman@varian.varian.com (John Hartman)  
Subject: re: Oregon Brewers Festival

Oregon Brewers Festival--  
The festival will be from Friday, July 17 to Sunday, July 19.

Sparge Water Height--  
I've tried it both ways, i.e., with water 1" above grain bed and  
somewhere below  
the top of the bed. It doesn't seem to make a great deal of difference.  
You will  
likely have a stiff mash if you only use 1 qt. water per lb grain. I  
would recommend  
a 1.25 qt/lb ratio. As far as how much water to sparge with, well that  
depends on  
how much water will evaporate during your boil. It's generally about 1  
to 1.5 gal.,  
but you'll have to determine this experimentally. I always prepare an  
extra few  
gallons of sparge water. When 3/4 of the target wort volume has been  
collected, I  
wait for the tun to drain. At that point I know how much I have  
collected. From then  
on I carefully and slowly sparge to achieve the correct pre-boil volume.  
Since  
I'm adding slowly, the water level is definitely below the grain bed, if  
there is  
a level... It also speeds the process up to have begun the boil earlier  
but that's  
another story.

Cheers,  
John

Date: Mon, 18 May 92 10:24:21 -0700  
From: Carl.Hensler@West.Sun.COM (Carl Hensler)  
Subject: Re: Los Angeles (PETTEWAY)

> I have recently moved to Los Angeles from Seattle and I am going  
> through serious withdrawal. NO GOOD BEER !!!

WRONG! (IMHO)

On tap in Santa Monica:

Micro-brewery beer: Father's Office, 1018 Montana.  
Micro-brewery and German beer: McGinty's, 2615 Wilshire.  
English beer: The King's Head, 116 Santa Monica Boulevard.

To buy beer in West Los Angeles:

Wine House, 2311 Cottner, (310) 479-3731.  
Beverage Warehouse, 4935 Mc Connell, (310) 306-2822  
Trader Joe's, 10850 National or 10011 Washington Blvd, CC,  
- occasional bargains, e.g. Pilsner Urquell for \$5.49/6

Granted, we have no good brew-pubs or micro-breweries.  
But that doesn't mean we don't drink good beer.  
We just import it from places where it is cold, gray and rainy.

I am setting up a Los Angeles beer mailing list.  
Let me know if you want me to put you on it.

From: fjdobner@ihlpb.att.com  
Subject: Sparge Water Level

Darren,

In response to your unrequited call for help in sparging, I have this answer. Borrowing from the discipline of Geotechnical Engineering of which I studied ardently between beers at U of I at Champaign-Urbana, I have the following orientation towards level of water during THE SPARGE. Treating grain as soil, should the water level fall below the level of the grain, the interparticular stress (pressure) in the grain is increased which in turn would tend to compress the grain restricting the flow through the grain. Should the water level be above the level of the grain, you are reducing the interparticular stress (actually called effective stress) and thus you increase the flow. When I speak of particles, I am of course referring to the grain.

Should the grain become compressed ever during sparging, I find that unlike soil, grain does not rebound (snap back) or become un-compacted. Therefore do not let the water level go below the grain at any time during sparging. Thus in a long-winded response to your question, I recommend keeping the water level above the grain bed level. This is not only a theoretical response it also a experienced-based one.

I hope this gives you someplace from which to work.

Date: Mon, 18 May 92 14:12:56 EDT  
From: jdr@wang.com (Joe Rolfe)  
Subject: cookers etc

someone was asking about cookers yesterday and thought i add my 2 cents:

i have a fairly large kettle (2bbl) and have completed my first batch in it.

i used a 135k btu propane fired cooker with a 40lb tank in my basement, with windows and a cellar door wide open. the tank and hose assy is set up for the 10psi regulator, i'd like to go 15psi, but 10 works just fine for me. i also ventilated the brewhouse with a fairly good size fan (in blowing out a thru a window). there was plenty of ventilation and little or no build up of fumes. i am told tho to meet code i will probably have to put a hood over it.

i boiled a 44 gal batch, which the water temp out of the hose was 50 F. the cooker brought the temp up between 1 and 2 degrees per minute. the boil was vigorous and rolling during the entire boil.

as a test the night before i boiled a 5 gal pail of water in about 5 min or less. for smaller batches you can get away with alot less btu, probably 35k will do. i know of a person doing a similar brewlength (2bbl) with twin 35k btu burners with an electrical element assist.

Doug Henderson will probably jump on this, as I think he's on the list, and he's also in charge of lining up volunteers for the Festival. It is scheduled (again) for the third weekend in July. What I heard last night from Steelhead Brewery's Teri Fahrendorf was that there would be 50 breweries represented this year. Without a hint of Portland chauvinism I would not hesitate to say that this is the biggest and best microbrewery/brewpub festival in the US and well worth attending. Thousands do! The weather has always been perfect, and the waterfront site makes for fun people watching.

According to the Judges' List this is Doug's mail stop:

uunet!e3bsr@psuorvm.bitnet

Contact him if you're interested in working at the Festival. Volunteers pour beer but don't need to answer questions. Shifts are 4 hours, and for this you get a free festival mug, a t-shirt different from those on sale, and a few free beers. You also get to gawp at the crowds.

Subject: Water use

Subject: Water use Time:8:21 AM Date:5/18/92  
Darren Asks:

>Sparge water amount:

>

>I'm planning a brew using 15lbs of pale malt. Using 1 qt/lb of grain,  
>I'll be using 4 gallons of water in the mash. Do I still sparge with  
>5 gallons? Less? More?

First, 4 gallons is not 1:1 for 15 lbs of grain, so perhaps you didn't  
tell us  
the whole story.

I use the same water to grain ratio (1:1) and I find that about 25% of my  
strike water is lost to absorption in the mash. I sparge with the intent  
of  
collecting between one and two gallons in excess of my final batch size.  
So in  
this case (assuming your 4 gallon figure is accurate) you'll get 3  
gallons out  
of the mash without sparge. If you want 10 gallons after the boil you'll  
need  
to collect 11, or sparge with 8. For smaller batches just work it out.

I can also calculate it as a 10% loss of water over the total water used  
in the  
mash and sparge, but I suspect this is tied to batch size. For example,  
this  
weekend I brewed a batch using 20 lbs of grain. I put a total of 13.5  
gallons  
of water through the grains and collected a little more than 12 gallons  
(by  
running the grains "dry") for the kettle. This I boiled down to 10.5  
gallons. I  
got a yield of 31.5.

In a related area:

I did some rough calculations while I was waiting for the boil to finish.  
I  
figured I use about 70 gallons of water to make and serve 10 gallons of  
beer.  
That means when I brew I exceed my daily allotment (that's for San  
Francisco).  
I use a lot of boiling water to clean my kegs, stainless fermentor and  
wort  
chiller. I try to recycle as much water as I can by cleaning the  
equipment with  
the hot stuff and rinsing with left over coolant water from my chiller.

I'm curious as to the water consumption that the rest of you experience.

Subject: Re: pre-boiling water

you write:

>I would say definitely pre-boil all water used in brewing to drive  
>off Chlorine. My mash pH goes all the way down to 4.6-4.8. I attribute  
>this to the absence of Chlorine.

I thought 4.6 was too low for a proper mash. Miller  
recommends 5.0-5.3. Can one go too low or is the majority of sparge  
problems when the pH is too high (e.g. > 5.6)?

The reason I ask is that I have *\*never\** seen a mash above 5.0. I treat  
my  
water with gypsum (1gm/gallon usually). I was working up to worrying  
about  
it, but maybe I won't ;-)

Cheers!

OK, I have made arrangements with a sign-maker friend (and occasional  
Digester)  
Bill Stender, to make up some unique stickers to identify the Electronic  
Brewers. The stickers will be added to the name tags at the conference.  
All you  
have to do is find me in Milwaukee to get yours. I'll be at the Milwaukee  
Grand  
as of the 8th and move over to the Marc Plaza on the 10th. And I'll be on  
the  
tour on Tuesday.

I'd like to get a head count so I don't come up short on these so please  
E-mail  
me if you will be at the conference. (CI\$er's need not respond via the  
Net if  
you have previously done so via the Beer Forum).

Hope this satisfies everybody, RW...

From: James Spence <70740.1107@compuserve.com>  
Subject: National Competition

We'd like to thank you all for your comments and criticisms of the National Competition. It is always very valuable to us to have input from the participants.

We will be having an open forum about the National Competition at the National Conference at the Marc Plaza Hotel in Milwaukee on Tuesday evening, June 9 (time and location TBA). Everybody is welcome to attend and provide input and suggestions about the National Competition. All suggestions will be passed on to a National Competition Committee that will be formed after the Conference that will discuss the issues you raise.

The following article excerpt appeared in the Spring 1991 issue of Zymurgy magazine. It outlines the short and long range goals for the National Competition. Many of these were fulfilled this year and we hope to continue to fulfill these goals.

ASSOCIATION NEWS--Spring, 1991 Zymurgy

NATIONAL COMPETITION CONTINUES TO CHANGE

The AHA National Competition continues to undergo transition in response to

membership needs--to maintain quality and meet the dramatic growth in past years.

The AHA Board of Adviser Competition Committee, the membership and staff, together with comments from participants have helped to establish goals for the

Nationals.

The short-range goals include:

Anticipating 2,000 entries in the 1991 Competition.

Maintaining the quality of the Competition while systems and judging expertise are developed, and familiarizing participants with competition changes.

Testing and evaluating registration, data, communication and judging systems with an interim format for first-round judging in San Francisco, Boston and Boulder. This interim format limits and splits certain styles of beers judged on the West and East Coasts.

Keeping the number of entries at the new sites to 500 to 600. This will be done by carefully analyzing last year's entry data and selecting categories to be judged at new sites. This will be done so that new sites are not overwhelmed with unanticipated responsibility for judging an excessive number of beers using new systems.

Developing, writing, implementing and publishing a "Manual for Judges and Judging Procedures" and "A Manual for Competition Entry Registration" to help assure maximum consistency in entry handling and entry evaluation.

Evaluating and considering the results and comments from participants in the 1991 Competition to develop the long-range goals.

Encouraging the support of the homebrewing community and beer industry through various sponsorships to help defray the costs of running the Competition and keep entry fees at a reasonable level.

The long-range goals include:

Developing systems to maintain a quality Competition that is expected to exceed 3,500 entries by 1993

Having multiple sites throughout the United States and perhaps Canada that will undertake judging all entries for all beer classes for homebrewers residing in a given region. The top-scoring beers in each class for each region would advance to the final round of judging.

Developing registration and scoring systems, judging expertise and accurate and well-defined style descriptions. The goal is to maintain a one entry/one bottle requirement for first-round judging and a two-bottle submission to the final round.

Developing accurate style definitions for the AHA Nationals that will enhance

consistency in judging and help eliminate the possibility of "regional biases."

The entire National Homebrew Competition program, including styles, categories, rules and regulations have been revised and updated. The program was reviewed by the Board of Advisers Competition Committee and numerous professional brewers. Suggestions and comments were incorporated to improve the program.

Subject: Avoiding Disaster, The BEEB, Sparging

To: Homebrew Digest  
Fm: Jack Schmidling

>From: fjdobner@ihlpb.att.com

>I have a rather large ten gallon brewpot that was a gift from my father in which I brew everything including extract and all grain. When I am doing all grain brews however, I must lug this thing with about 5-7 gallons of boiling hot liquid through my kitchen, living room, down a flight of stairs, across my basement to my workshop which is where I have an area cool enough (unfinished part of the basement) to ferment anytype of ale or lager.

The most obvious step would be to chill the wort in the kitchen before moving it downstairs.

If your are going to ferment in the kettle, all you need is enough gal jugs to hold the wort till you get it cleaned out and moved downstairs. If you have a separate fermenter, you only need one. The aeration it gets being plugged from the jug into the fermenter is also useful for oxygenating the wort prior to pitching.

Personally, I would never carry boiling stuff around. You are just asking for trouble.

>From: Jay Hersh <hersh@expo.lcs.mit.edu>

>I just got off the phone with someone at the BBC.

>They said they have to do this in order to protect their trademark, and their product integrity (i.e. if the BBW brews bad beer they don't want it getting confused with the BBC)

I suppose I am being sucked into another ... duhhhh

But I listen to the BBC every night and just do not see how one confuse their excellent programming with bad beer.

>From: Darren Evans-Young <DARREN@ualvm.ua.edu>  
>Subject: All-Grain questions

>I got no responses to my inquiry about sparge water level in the grain bed. Perhaps you all-grain brewers will send me mail indicating whether your sparge water level is above or below the top of the

grain bed..also, if you have any reasons why you choose that method.  
I'll post a summary of the responses I receive.

Now I suppose tomorrow's Digest will be flooded with answers. I assumed there would be no shortage of responses.

Here's the word from the World's Greatest Brewery, the home of ARF  
Generic  
Ale.....

Unless you can spray the sparge water, evenly over the entire surface for the total sparge time, it is most efficient to keep the water level above the grain top. This keeps the whole mess in solution until you are into the dregs.

>Sparge water amount:

>I'm planning a brew using 15lbs of pale malt. Using 1 qt/lb of grain, I'll be using 4 gallons of water in the mash.

Sounds a little stiff. But the important point is that you have a nice creamy "dough-in". It should be about the consistency of runny oatmeal.  
I use 3.5 gals with 10 lbs malt.

> Do I still sparge with 5 gallons? Less? More?

You sparge till the gravity gets below 1.010. Depending on lots of variables you should get 10 to 15 gals of wort from 15 lbs. You can quit anytime you want but you are just throwing away good beer.

From: Jay Hersh <herish@expo.lcs.mit.edu>  
Subject: Boston Beer Blah...

Sorry this was a cc of a message to a local discussion group.

BBC is Boston Beer Co. makers of Sam Adams products.  
BBW is Boston Beer Works, a respectable new brewpub that just opened  
across the street from Fenway Park.

Seems the BBC waited until after the BBW had opened (i.e. purchased  
signage,  
did lots of interior decorating with the BBW name, printed stuff like  
coasters, menus, napkins, etc....) and then decided to sue them over the  
name (they have trademarked Boston Beer Co and claim the BBW name is too  
similar, and thus must enforce or lose their trademark).

Since everyone else around here knew for months before hand what the name  
of  
the place was gonna be, we find it hard to believe that the Sam Adams  
folks  
could have missed it. Also since they market their stuff under the Sam  
Adams  
name (and few buyers actually know the real name of the company, i.e. BBC)  
many are dubious of the claim that the BBW name intereferes or threatens  
the  
BBCs product. Most of us feel like the Sam Adams people if they had a  
gripe  
should have engaged in discussion up front and come to some reasonable  
solution.

Don't want to take up any more bandwidth, but if you want to call and  
gripe,  
the number is 617-522-3400 I think an address is on the side of the  
bottles,  
there is none in the phone book and i don't know off hand (well it I  
think the  
bottles say The Brewery, Germania St., Boston, Ma... zip=?????)

Date: Tue, 19 May 1992 10:27:50 MDT  
From: oopwk@terra.oscs.montana.edu (Warren Kiefer)  
Subject: Mega Batch (HELP) :\*)

Howdy All,

This is it, my brew buddy and I are ready to take the plunge into some larger batches, we have aquired a nice 40-45 gal. stainless steel vat from a nearby dairy, even has a stirring wand in it !! We have a nice pump

to help do the sparge and as of this moment we have four 10 gal. milk cans to be used for something ?? We also have a Creole Cook'r and a 100lb. propane tank. So I would really like some input from all of you on how much grain, hops and so forth we would need for a batch of this size.

As of now we are still doing 5 gal. batches, so we use 1.33 qts. of water per lb. of grain, if we use 10 lbs. of grain we mash with approx. 11 qts. and use around 5 gals. of water to sparge with. So if we want to make

30 gals. of beer do we just use 6 times as much of everything ?? Say 60lbs. grain, 20 gals. of mash water and 15 gals. to sparge with ???

So if there is anyone out there who has experience doing the mega batches, could you please help us out, maybe a recipe ??? Any ideas on how to crush the grain ?? We've got some cleaning to do so we probably won't

try it for another couple of weeks or so. Any suggestions would be greatly

appreciated !! I can honestly say I've never REALLY worried about any of the 5 gal. batches before, but I am getting a tad worried about 30 gals. of

brew, I'm sure once I see and smell 30 gals. of black as night stout, I WILL

relax :\*)

Yes I can hear it now :

Me: How many pounds of Northern Brewer do you have ??

Homebrew Supply : Do you mean pounds or ounces ??

Me: You heard me right, I mean pounds !!

Homebrew Supply : Uh, okay, let me check !!

Me: Great, you don't happen to have a pallet of grain !!

Keep on Brewin' we're gettin there..

whether it is in a  
>> gallon of wort or an ounce.

bb replies>I don't agreee with this statement...i.e., If you dilute  
>yeast too much, they seem to slow down  
>more than proportionately.

While on this topic, I thought I'd bring up my experience. First, I  
bring up active  
cultures from single colonies (see my "too-scientific" yeast primer  
from a few issues  
ago). I have found that it is best to scale up gradually (ie. single  
colony --> small  
culture--> large culture, etc.). The reason is purely from the  
perspective of  
avoiding contamination. If you inoculate a medium with 1% active cells,  
it has  
a greater chance of outcompeting anything in that other 99% than if you  
inoculate  
with only .001%. This is a well established fact that is exploited by  
people who  
run fermentations (including non-alcoholic ones). Also consider that  
most home-  
brewers do not sterilize, but only sanitize their wort through boiling.  
Thus, you  
will be doing your yeast a favor if you give them a numerical advantage  
over other  
organisms. The bottom line: SCALING UP PRESERVES CULTURE INTEGRITY.  
Hope this clears things up. Cheers!

Date: Tue, 19 May 92 10:27:53 -0600  
From: copeland@calypso.atmos.colostate.edu (Jeff Copeland)  
Subject: Yeast, Pumps, Propane and Festivals

Got about 8cents to put in:

- 1) Jeff Mizener was asking about siphoning: I would think some sort of fluid pump for indoor fountains would do the trick I'm not sure what flow rate to use, obviously greater than natural flow but at higher rates one runs the risk of sucking out trub and/or sediment. I just stick the tubes into the hose VERY tight fit, try finding hose with a smaller inner diameter.
- 2) I'd second Brian Bliss's comments on yeast population. Qualitatively, I figure yeast grow exponentially limited by the amount of food and alcohol content. When you pitch into starter then a day later into the wort you're introducing orders more yeast cells than pitching directly into the wort. What have the micro-bio's have to say?
- 3) The problem with cookers indoors (ie: basements) is that propane is heavier than air and if you have a leak or incomplete combustion, the propane will collect on the floor running the risk of explosion (static electric discharge is enough to trigger) hence the need to use them outdoors or with an industrial, NOT a kitchen ventilation hood.

Finally 4) Since we've had postings on East and West Coast brew fests Fort Collins, Colorado is having its 3rd Annual Colorado Brewer's Festival Saturday June 27. About 20 Colorado commercial brewers (over 20 if you count Coors and A.B.) will be pouring in the Old Town area, bands and food too.

From: Mark J. Easter <eastern@ccmail.orst.edu>  
Subject: Source for maple syrup

I've been reading with interest the submissions on brewing with maple syrup. Being a former Vermonter, I've come to learn that maple syrup is overpriced in most locations, and you don't \*have\* to brew with the grade A light amber that is usually offered in the shiny little tins. Our local food cooperative sells grade A dark amber for about \$2.40 per pound, which is comparable to buying quality malt extract or extremely good honey. I have seen bulk maple syrup for sale by the pound for similar prices in many food cooperatives and natural food stores. Check it out!

Another option is to purchase Canadian maple syrup (from Quebec and Ontario). It is typically less than \$2.00 per pound and the quality is fine.

From: dipalma@banshee.sw.stratus.com (James Dipalma)  
Subject: Plugs vs. pellets

I am considering switching from pellets to plugs, and I have a couple of questions.

I have heard that plugs are superior to pellets with regard to aromatic qualities, that they are close to whole hops in this regard. True or false?

What is the relative utilization rate of plugs versus pellets?

I know pellets yield a slightly higher utilization rate than whole hops, because they are more resistant to oxidation.

Where do plugs fit in this picture?

I'll post a summary of any responses I receive.

Date: Tue, 19 May 92 21:45:47 EDT  
From: jdg@grex.ann-arbor.mi.us (Josh Grosse)  
Subject: Beechwood Fining

In 883, Michael Biondo asked about using Beechwood slats or chips as fining agents as used by A-B and as Jackson says, it's "an old method still used by some Bavarian Brewers to clarify beer."

My understanding (from Miller or Papazian, I can't recall) is that the wood acts as an aid to flocculation. The yeast clings to the wood and flocculation is enhanced. I also understand that metal slats are used in some breweries because the wood is expensive (in time, materials) to sanitize than metal.

I can't recall if ionization plays a major role here or not. Likely, it does, as us homebrewers use clarifiers like polyclar that are quite effective as aids to flocculation and settling of yeast cells.

>> gallon of wort or an ounce.

>I don't agreee with this statement. If you pitch a wyeast packet  
into a 12 oz starter, wait one day, and then pitch to the fermenter,  
it seems to take off faster than just pitching into the fermenter  
directly, plus the extra day.

I was just speaking intuitively and suggested controlled experiments to  
corroborate the hypothesis. I don't doubt your experience, I just can  
not  
hypothesize a cause and this....

>i.e., If you dilute yeast too much, they seem to slow down more  
than proportionately.

.....isn't very scientific.

Your experience could be the result of:

- Temperature variation
- Different Nutrients in starter/wort
- Barometric pressure
- Being correct in your hypothesis

I am not sure why one would want to go directly from petri dish to the  
wort  
because for the same amount of effort you can make dozens of slants for  
future use.

On a slightly different subject, I pure cultured a granule of Red Star  
Champaign yeast for my dandeline wine and it worked out real well. It  
was  
down to 1.010 ten days ago when I racked it but it is still blurping  
every 5  
seconds.

I find it very satisfying to take a cheap dry yeast and turn it into a  
pure,  
single cell culture. It's sort of like the guy who bragged about  
building  
his own maltmill for only \$12.

If anyone would like a re-run of my simplified yeast culturing article,  
I  
will be happy to mail it out.

>>fermentation lock. When I first started wine/beer making, there was  
>>nothing else available, now they are scarce as hens teeth.

>I think, but don't know, that Sempalex of USA in Minneanapolis sells  
glass S-locks for about \$5-6. Write me if you need the address, phone  
number or price.

Funny you should mention Sempalex. In the 60's, they were about the only  
mail  
order house in the country. My ancient catalog lists them at at \$1.29  
ea or  
3 for \$3.25. You might want to verify the price :) They also show a  
fruit  
crusher for \$55 and a fruit press for \$31.90. I have been drooling over  
the  
crusher at my local homebrew shop but the \$250 is a bit more than I want  
to  
spend.

Stand-by for "MALTMILL SR." it dices, slices, shreds, makes tons of  
cole  
slaw and crushes everything from malt to apples:)

From: Richard Dale <rsd@silk.udev.cdc.com>  
Subject: RE: Ball lock vs pin lock.

I own both. I find that the ball lock is much easier to dismantle than the pin lock. The ball lock fittings can be easily removed/installed from your kegs using an ordinary deep socket. (Some require a 12 pt socket) It's fast and you have good control over torque, etc...

There may be a special tool you can get for removing/installing pin-lock fittings from/on your kegs but I don't own one or know where to order one. I do it by working with an open-end wrench through a handle slot, doing the "turn your open-end wrench over every 30 degrees" technique, with the wrench wedged in at kind of a funny angle. Not as good. Maybe I'm doing this wrong, someone tell me.

From: jmillier@anubis.network.com (Jeff J. Miller)  
Subject: Mega Batch - long

Sorry this is so long but I'm a wordy person I guess :)

Congrats Warren and welcome to the world of Mega BREW! I cook in an old piece of dairy equipment that is a little larger (60 capacity) so perhaps some of my experiences might help.

> This is it, my brew buddy and I are ready to take the plunge into  
> some larger batches, we have acquired a nice 40-45 gal. stainless steel  
vat  
> from a nearby dairy, even has a stirring wand in it !!

The stirring wand sounds like a great addition. The big problem with large batches is getting all that mass up to temp. Constant stirring is a requirement to avoid excessive heat spots (burn wort!).

> We have a nice pump  
> to help do the sparge and as of this moment we have four 10 gal. milk  
cans  
> to be used for something ?? We also have a Creole Cook'r and a 100lb.  
> propane tank.

I hope this pot has a spigot on it. The pump would probably be a hassle if you had to lift the wort out of the pot but this is just an opinion, try it and find out. Seriously, if the pump will work for you it should make life LOTS easier. Without the pump you will end up with lots of intermittent carrying and holding containers. The milk cans might work for this but I would bet that 10 gals will be too heavy for you to deal with over a long brew day. Perhaps the cans might work for fermenters that you can siphon out of (put them high when you start ferment so you don't need to move them later). When heating your pot, check for hot spots and be careful of burns. My pot is insulated with fire brick but because its been around the block so many times the brick is in a sorry state and this causes hot spots in odd locations; I have been burned more then once by these hot spots.

> So I would really like some input from all of you on how  
> much grain, hops and so forth we would need for a batch of this size.  
> As of now we are still doing 5 gal. batches, so we use 1.33 qts.  
> of water per lb. of grain, if we use 10 lbs. of grain we mash with  
approx.  
> 11 qts. and use around 5 gals. of water to sparge with. So if we want  
to make  
> 30 gals. of beer do we just use 6 times as much of everything ??

Yup! About the only things that won't scale up real weel is hops. I'm a hop head and I notice that for a 20 gal brew I hop at about 3/4 the rate I do for a 5 gal brew.

You may want to watch the thickness of the mash also. When I mash I usually use much more water then most so I'm not sure how yours will scale up. The important thing is that 60 pounds of malt is a lot!

> Any ideas on how to crush the grain ?? We've got some cleaning to do  
> so we probably won't  
> try it for another couple of weeks or so. Any suggestions would be  
greatly

> appreciated !! I can honestly say I've never REALLY worried about any  
of  
> the 5 gal. batches before, but I am getting a tad worried about 30  
gals. of  
> brew, I'm sure once I see and smell 30 gals. of black as night stout, I  
WILL  
> relax :\*)

You NEED a motorized grain mill (Jack can probably help). Some suppliers will mill for you but if you walk into your average homebrew shop and ask for 60# of milled grain I doubt that you will get a very good reaction. A nice kicker is that when you buy this much grain at one time you do get some nice price breaks.

Something you should think about is how your going to get all that grain out of the pot (I'm assuming your mashing and boiling in the same pot). If you need to sparge off the grain and hold the wort until you shovel the grain out of the pot you are going to need lots of holding vessels and you will add a significant amount of time to the brew. Grain bags are nice but you need a whole lot of them for 60# and I'm not sure how they would work with the stirring mechanism. I currently use a stainless mesh bucket that fits inside the kettle. When the mash is complete I lift it out and sparge through it. This works great but I am still working on ways to get better efficiency. Do you have cattle around? Getting rid of 60# of grain will be an experience. You can compost it but you better have a big pile if your going to brew more then a few times a summer.

Fermenting this much beer is interesting. If you do this indoors, watch for excessive CO2. You may want to open a window at the peek of fermentation just to air out. I think fermentation in a single vessle is the way to go. I use a barrel but I think a garbage can would be easier. Planning is the key; put the fermenter where you can siphon out of it without moving it. It is damn difficult to move 40 gal of beer. Oh yea, when I first got my cooker I used to use it as a fermenter also. It has a lid but it is not an air seal. This worked great until I got an infection; I don't ferment in it anymore.

If you don't have one yet, get a kegging system! I always like to 1/2 a batch in bottles and 1/2 in kegs. Sure makes bottleing day go faster.

If you don't have a chiller - get/make one.

Be VERY careful about infection. Loseing 5 gallons is a bummer but it really hurts on a big brew.

First batch: I would suggest starting with an extract batch in the 10 to 20 gallon range. This will get you used to the amount of water that your going to be using as well as get you used to some of the logistics of using this thing. After doing a brew like this you will get a better feeling for time frames, hop rates, and all sorts of things that you never thought of. After you conquer these problems then you can add grain and feel like your starting the learning curve all over. Get a stick or some other measuring device. It is very difficult to look in a large pot and know within even 5 gallons how much is in there.

> Yes I can hear it now :

>

> Me: How many pounds of Northern Brewer do you have ??

>

>Homebrew Supply : Do you mean pounds or ounces ??

>  
> Me: You heard me right, I mean pounds !!  
>  
>Homebrew Supply : Uh, okay, let me check !!  
>  
> Me: Great, you don't happen to have a pallet of grain !!

Grow your own hops! If you can get bulk extract/grains from suppliers your costs will be greatly reduced. The only thing I can't get cheap from suppliers is hops. Since you have already figured out that your going to be using pounds instead of ounces, growing your own is about the only way to brew and keep costs in check.

You might be able to check bakery suppliers for a source of bulk extract. If you happen to have a malster around you can sometimes bring them 5 gallon buckets and some homebrew and get a great deal. Or... you could join/start a club and supply most of the need for a true pallet of grain purchase :)

Good luck!

**Subject: Mega Batch - long**

I FINALLY RECEIVED THE MARGA MULINO GRAIN MILL AS A WEDDING PRESENT AND USED IT FOR THE FIRST TIME A FEW WEEKS AGO. I AM QUITE IMPRESSED BY THE QUALITY OF THE CONSTRUCTION OF THE MILL AND WITH THE WAY THE THE GRAIN WAS CRUSHED WITHOUT CREATING ANY FLOUR. MY ONLY PROBLEM WITH THE UNIT WAS THAT I HAD TO KEEP A FINGER IN THE HOPPER CONSTANTLY SWIRLING THE GRAINS OR ELSE THE GRAINS WOULD EVENTUALLY SETTLE IN OVER THE HOLE IN THE BOTTOM OF THE HOPPER AND NOT FEED THROUGH. MAYBE I NEED TO ENLARGE THE HOLE. ALSO THE HOPPER AND CATCH BASIN ARE VERY SMALL. IF ANYONE ELSE OUT THERE HAS ANY EXPERIENCE WITH THIS MILL, EMAIL ME WITH YOUR SOLUTIONS.

BECAUSE THE GRAINS WERE PROPERLY CRUSHED WITHOUT ANY FLOUR( MY CORONA MILL WOULD ALWAYS GIVE ME LOTS OF FLOUR) MY SPARGING IMPROVED SIGNIFICANTLY BY GIVING ME A HIGHER STARTING SPECIFIC GRAVITY AND FOR ONCE MY SPARGING RAN CLEAR AFTER ONLY TWO RUN THROUGHES.

I BOUGHT MY MILL FROM TABLE TALK HERE IN TUCSON FOR \$69.00. THEIR PHONE IS 602-293-7139.

ABOUT A MONTH AGO I ORDERED A STARTER KIT FROM THE YEAST CULTURE CO. I HAVE ALWAYS BEEN AFRAID OF THE COMPLEXITY AND SANITATION REQUIREMENTS OF YEAST CULTURING. WELL FEAR NO MORE! THE PRE-PREPARED KIT MAKES CULTURING A BREEZE AND I HAVE EVEN CULTURED TWO OF WYEASTS ALE STRAINS SO THAT I DON'T NEED TO BUY THEM ANYMORE. MY LAST BATCH OF ALE WAS PITCHED WITH A STARTER THAT WAS CULTURED FROM ONE OF MY PETRI DISHES. IT TOOK OFF LIKE A BAT OUT OF HELL AND FERMENTED STEADILY FOR 5 DAYS WITH A HEAD OF YEAST FOAM 8 INCHES THICK. ONLY A FEW MORE DAYS UNTIL I CAN ENJOY MY FIRST CULTURED FROM SCRATCH BATCH. THE YEAST CULTURE KIT CO. CAN BE REACHED AT 1-800-742-2110 6 TO 8PM EST.

MAY YOUR BEER ALWAYS GIVE YOU LOTS OF HEAD!

From: richer@ionic.HQ.Ileaf.COM (Al Richer)  
Subject: Keg parts / cleaning info

Greetings!

have recently stumbled over a complete keggng outfit (for \$10. in a flea market!! 2 kegs, a 2-regulator rig with a 20-pound cylinder, and all the hoses and fittings.. drool on, envious rabble...8\*)..). Unfortunately, neither keg is a standard type, and the gaskets in both are terminally root-beer contaminated. Has anyone got any suggestions as to where I might obtain replacemt gaskets? Both have twist-on lids, one in 1 piece, one in two, an inner lid wth an external lock ring, if this helps to identify them.

One is also missing a pickup tube.I can easily fabricate one from hard copper tubing, but I'm a little concerned about the long-term effects of copper contact with an acid medium like beer. Any opinions?

Finally, this rig came with a refrigerated 4-tap dispenser made by Cornelius, which was used for carbonating and dispensing premixed fountain drinks. Does anyone have any suggestions as to a good cleaner to pump through the feed lines to clear them of the old soda residue? They're stainless-steel and wire reinforced plastic, so it seems like I could get away with running something fairly strong through them with little fear. I don't want to use chlorine, though, as I've heard bad things about it in contact with SS.

I await your opinions with bated breath.

Email or post would be good for this, as it seems like it would be of general interest.

Until later,

ajr

From: David Arnold <davida@anagram.umd.edu>  
Subject: German recommendations

I have a friend going to Germany for three weeks soon, and was wondering if some of you kind souls would be so kind as to suggest:

- 1) What beer(s) to check out,
- 2) Interesting pubs, etc. to try

He's going to be in/near Reganburg (Regansburg?), if that helps some of you.

Also, I'm having him bring back beer for me. My tastes run from a good lager to medium ales and bocks. Can anyone suggest beers he might try to bring home?

He may also be taking a trip to Amsterdam while he's over there; any suggestions for him while he's there?

If you post back, please respond via e-mail as well, as I need the responses soon.

Thanks in advance,  
David Arnold

Subject: sterile vs. sanitary

Subject:  
Time:12:05 PM  
OFFICE MEMOsterile vs. sanitary  
Date:5/20/92

After my last post regarding the importance of scaling up starters, I received a rash of letters with regards to the following statement:

> most homebrewers do not sterilize, but only sanitize their wort through boiling.

For instance, someone wrote:

>I would have said that an hour's boil at something slightly above 100C would be sufficient to sterilize the wort; it's all the other tools that are merely sanitized....

I would like a chance to comment and hopefully clear up any misconceptions out there. The argument begins with semantics: the definition of sterility is the \*complete\* destruction of all living organisms. ie there is no such thing as "partial sterility," it is an all-or-nothing thing. Anything less is considered to be sanitized, which can be measured in degrees. While sterility may seem like an impossible ideal, it is a goal that can be reached. The two main factors are temperature and exposure time. A guy named Bigelow once studied this topic, and came up with the idea of Thermal Death Time, the shortest period of time required to kill a known microorganism at a specific time. He then went about calculating various TDT's. What he found is at 100C (Chip-I don't know about you, but my water boils at this temp (although I realize altitude and [sugar] will affect this, but usually lowering it)), it takes 788 to 834 minutes (average) to insure destruction of 15 typical thermophiles. I sure hope nobody boils their wort this long! How do microorganisms do this? Spores! Anyways, the long and short of it is that the longer you boil, the closer to sterile you approach, but please do not confuse the two. Why am I such a stickler? I hope that through brewing, people can better appreciate the biology behind it all. Cheers! -BDL

Subject: Review of Brewers Resource Yeast Kit ( George Fix )

I have long tried to get producers of yeast to come up with an inexpensive, self-contained, user friendly kit for yeast culturing using the classic Hansen procedures. Up to now these appeals have fallen on deaf ears. Happily, a company called Brewers Resource ( phone= 818-887-3282) has just introduced such a kit. Since this is going to be a highly favorable review, let me state at the outset that I have no connection with this company nor this product.

The designer of the kit is Dr. Maribeth Raines, a professor of microbiology at UCLA. She has had a distinguished research career, and this kit clearly shows that she has a strong affinity for practical yeast work as well.

The kit is self-contained except for a few minor items that can be obtained from a local drugstore. Brewers are also given a lot of options with respect to yeast strains. The kit comes with a booklet written by Dr. Raines. It gives clear, complete, and easy to follow instructions on exactly how the kit is to be used. In preparing yeast for a batch to test the kit, I did not use any of my normal equipment ( autoclave, transfer box, etc. ), but instead did the work exactly as the booklet describes in my kitchen. This batch is now in ruhr storage. I plan to bottle it in time to bring some to Milwaukee. The yeast itself has been repitched, and will be repitched a third time this weekend.

I have used every test known to me for checking yeast ( my presentation in Milwaukee will deal with these procedures ), and in every case the yeast came through with flying colors. It would be risky to call any set of procedures associated with yeast as "foolproof", however this kit comes as close to this mark as we are likely to get.

Elementary and intermediate are strongly urged to take a shot at yeast management using this kit. It is in every sense user friendly. Advanced brewers will also find much of interest here. Of special interest are Dr. Raines' nutrient media, and the yeast slants as well.

There are other options in this kit. These include petri dishes containing special media suitable for culturing yeast from bottle conditioned beers. All of this media is proprietary, and was developed by Dr. Raines in her reseach lab with beer yeast in mind. Dr. Raines booklet has a clear and

complete discussion of how culture yeast from bottles, and related topics.

I hesitate to call this kit definitive, but frankly I can not think of a single way it could be improved. It has the potential of introducing a new era in homebrewing, that will affect all brewers, be they working with advanced equipment or with elementary extract systems.

> I am considering switching from pellets to plugs, and I have a  
> couple of questions.  
> I have heard that plugs are superior to pellets with regard to  
> aromatic qualities, that they are close to whole hops in this  
> regard. True or false?  
> What is the relative utilization rate of plugs versus pellets?  
> I know pellets yield a slightly higher utilization rate than  
> whole hops, because they are more resistant to oxidation.  
> Where do plugs fit in this picture?

Hops plugs are compressed enough that they have a longer shelf life than loose leaf hops, presumably on par with pellets. They have not undergone the processing that pellets have (does this processing affect the aromatic quality of pellets?), and therefore are on par with loose leaf hops as far as boiling time/utilization goes (hop pellets break up more easily, and do not require as long of a boil as leaf hops to extract the same amount of flavor/bitterness).

Break up the plugs before you add them to the boil. They will not clog your strainer when you try to remove them, nor will they leave a bunch of gunk in the wort, an advantage over pellets. In short, they have all the advantages of loose leaf hops (and the disadvantage of a longer boiling time, but you should always boil at least an hour anyway), but with the shelf life of pellets.

They are also conveniently pressed into 1/2 oz. plugs (at least those I could find were) for easy measurement. I highly recommend them. Unfortunately, I can't find them anymore.

Date: Wed, 20 May 92 18:25:10 CDT  
From: Darren Evans-Young <DARREN@ualvm.ua.edu>  
Subject: Sparge water level / Amount of sparge water

First, a thanks to all those who responded to my queries.

Sparge water level:

The consensus on sparge water level is 1-2" above the grain bed to "float" the bed and keep it from settling/compacting and the water from channeling. I use a Listermann sparger (and love it).

Amount of sparge water:

When I started all-grain, I went by Millers recommendation of 1.33 qts/lb.  
Then I started reading about various brewers using only 1 qt/lb to keep from diluting the enzymes. I now use 1 qt/lb. I was rounding to the nearest gallon in my previous post when I said I would use 4 gallons for 15 lbs of grain. I would use 15 qts for 15 lbs for mashing.

In general:

My last all-grain batch, I used a thick mash of 1 qt/lb. My pH after doughing in the grains was still 4.6-4.8. This time I didnt NOT add CaCO<sub>3</sub> to adjust the pH since it didnt have much affect anyway. I thought it might actually interfere with conversion. I also sparged a LOT slower...a little above a trickle. Took about an hour to sparge 8 lbs of grain with 5 gallons of water keeping the water level 1-2" above the grain bed. The result? My efficiency went from a consistent 75% to 82-83%!!! I was shooting for a gravity of 1.044 (which I could consistently achieve), but instead got a final OG 1.053. Main points: RUN YOUR SPARGES SLOW!!! I think this was the main enhancement of my procedures. Still pondering the pH adjustment. But, hey, if it ain't broke, don't fix it!

From: Conn Copas <C.V.Copas%lut.ac.uk@hplb.hpl.hp.com>  
Subject: Double mashing

I recently saw a recipe that involved the following steps (a) mash the goods (b) run-off (c) add more water and mash for a further period (d) run-off, then sparge. The object was to extract both a high gravity wort and a small beer from the same mash, in the familiar barley wine fashion. The brew consisted of large proportions of unmalted cereal in a loosely Belgian ale style. I am wondering what the purpose of the second mash would be ? Presumably, this would allow one to alter grist:liquor ratios and temperatures, and thus alter the dextrin character of the second wort. On the other hand, one would think that the character was largely fixed by the original mash, and that prolonging the mash in an environment where many of the enzymes had been drained off would have little effect ?

I almost replied yesterday, but just didn't get time. Now I have time.

Yes, the yeast are in suspension. However, the beechwood aging is done  
in  
the secondary when the intent is to get the yeast \*out\* of suspension. I  
believe (not %100 certain) that the big advantage here is indeed the  
surface  
area of the beechwood that acts as a fining agent. The yeasties collect  
more  
on the beechwood than they would just settling to the bottom of the  
fermentation vessel. It's similiar to the way (some) super-saturated  
solutions  
percipitate out if some foregn object is present in the solution. Kinda'  
acts  
like a yeast magnet, if you wish to think of it that way.

by the way, if you ferment in a closed container with cracked corn you  
won't  
get mice, you'll get a thin cheap tasting brew like Budweiser!-)

From: bones!dem@csn.org (Dennis McNally)  
Subject: Bulk Hops

A few recent postings about "Mega" batches have been lamenting the problem of getting bulk hops. The most recent Freshops price list lists the following varieties and prices:

VARIETIES	PRICES
Cascade Lbs.	Cost/lb.
Centennial (CFJ 90)3/4	12.50
Chinook	112.00
Hallertauer	211.00
Northern Brewer	310.50
Perle	410.00
Tettnanger	5-10 9.50
Willamette	11+ 9.00

All hops are alpha analyzed and prices include shipping except to Alaska, Hawaii and Canada.

I have never purchased hop cones from these folks but have ordered rhizomes and have been very satisfied.

The Address and Phone  
Freshops  
36180 Kings Valley Hwy.  
Philomath, OR 97370  
(503) 929-2736

Enjoy !

From: boomer@sylsoft.com (Richard Akerboom)  
Subject: Re: Beechwood

Regarding the beechwood used by A-B, I heard the following related by Jim Koch of Samuel Adams:

The beechwood 'chips' are apparently more like the size of cedar house shingles. They are first washed to extract the sap or whatever, and are then added to the secondary fermenter. They settle to the bottom (note that once they are washed, they will sink when wet) and form a matrix. The yeast settle on this matrix-they are lager yeast and settle. The matrix allows more beer to yeast contact than if the yeast just settled to the bottom of some tank. Supposedly A-B's yeast(s) have mutated over history and sink more rapidly than your average lager yeast, so the beechwood chips are important to the secondary fermentation.

So, from what I've heard, the guy Jay Marshall talked to was on target, and this A-B rep was not just blowing hot air. By the way, note that I've said nothing about beechwood affecting the flavor.

From: Bob Jones <BJONES@NOVA.llnl.gov>  
Subject: Spargeing, hop storage and yeast culturing

A few random comments :

Sparging - its desirable to minimize the hydostatic pressure across the grain bed at all times. This can be achieved (if you are a gravity run off sparger) by raising your outflow line from your vessel to a few inches below the water level inside the vessel. Something like this :

Hop storage - I have been using one of those vacuum sealing gadgets for hop storage for several years now. I have had great success with it. I have used hops that have been stored for a 1 1/2 years in the freezer that seem as fresh as the day I packaged them. I just open bag, remove what I need and reseal the bag (vacuum reseal) and store in freezer. I even use the sealer gadget for food stuff too.

Yeast culturing - I think it is a good idea to reculture yeast for our own use. However if we all did it and never bought from our suppliers occassionally they yeast cultures would go away. I personally have got my brewing costs to the point where beer is almost free. I have stopped culturing and buy all new yeast about 2-3 times a year. I guess I feel I'm helping to keep this segment of the supply business alive, while moderately increasing my brew costs.

See ya'll at the conference,

Bob Jones

From: boubez@tastesgreat.RUTGERS.EDU  
Subject: Bush Keg

This is a repost of my posting on r.c.b, along with some clarifications.

It looks like I've inherited a Busch keg from a roommate from a previous party (don't blame me, I don't drink that stuff :-)). It's the kind you get when you pay a deposit, with a tap dispenser and a hand pump (no CO2 tank).

I can't describe it better than that, but I think you know which one. I'm looking at it in my basement and wondering, Can I use it? I don't necessarily want to ferment my next batch in it, just use it to prime and dispense the beer. Any responses would be greatly appreciated. Thanks.

toufic

PS As a response to some people who have already sent me mail telling me to return it, please understand that I don't know where my roommate got it from, and that it's been sitting in the basement for over a year now.

From: cjh@diaspar.HQ.Ileaf.COM (Chip Hitchcock)  
Subject: re boiling temps

It's true that altitude lowers boiling temperature (variation in barometric pressure makes only a trivial difference unless you're at the eye of a hurricane). However, dissolved solids //RAISE// the boiling temperature---get a candy thermometer and notice the correspondence between boiling temp. and sugar concentration, expressed somewhat poetically as the approximate hardness of a drop of solution cooled to room temperature. The increase in boiling temperature isn't a lot (for non-concentrated worts I'd /guess/ it to be around 1 centigrade degree---I don't remember the molal boiling-point elevation for water exactly) but it should be measurable.

It sounds like I should take issue with the use of "homebrewers" rather than "sterilize/sanitize", because commercial breweries don't boil the wort for 12-14 hours either.

And as long as we're being precise, how common are these thermophiles in wort? (i.e., does sterilize not mean "destruction of everything there" rather than "destruction of everything that /could/ /be/ there"?). BTW, how fast does TDT drop as the temperature is raised---what's the typical temperature in an autoclave, how long does it run, and how effective is it according to Bigelow?

From: fjdobner@ihlpb.att.com  
Subject: Wort Transport

All,

It appears from the response that I received on alternatives to carrying hot liquid from my kitchen to the basement that a direct siphon line from the kitchen through an opening in the floor to the place of fermentation is the choice option. I do still have a few questions that I have some answers for but would like to hear your input before I go off buying reels of vinyl hose.

1. Since the liquid is just about boiling hot when it gets siphoned, is it necessary to sanitize it (the hose)? I am sure to be thorough my own answer would be "YES" but if I can keep from having to sterilize one more thing that has a lower probability of infection it would be worth the thought beforehand.

2. To keep the hose from kinking at the top of the brewpot (due to such a severe temperature of the wort) I plan on using a racking tube. Does anyone know if these racking tubes (you know the ones of clear hard plastics with bend at one end) will be affected negatively by the heat (like melting for instance)?

3. Any practical recommendations as to how this operation can be simplified to a one man routine?

From: grumpy!cr@uunet.UU.NET (C.R. Saikley)  
Subject: BBC vs. BBW

I read JaH's posting about the friction between the BBC and the BBW, and decided that this required some investigation. Tom Dalldorf, editor of the Celebrator Beer News, just spoke with Jim Koch minutes ago about this very topic. This is his side of the story.

Mr. Koch claims that he knew of a brewpub opening near Fenway Park, but learned of its name only when he drove by and saw the sign. He stopped to try negotiating with them at that time, but the BBW folks were steadfast in their choice of names. Apparently one of the owners of the BBW is a lawyer from NYC, who has decided that they should dig in their heels on this. It's likely to get uglier.

Meanwhile Mr. Koch also says that BBC has received hundreds of calls about their new brewpub, which of course doesn't exist. Furthermore, some of these calls are from BBC's accounts, who are irate because they believe they are now competing with their supplier. Consequently, JK feels that there is a real issue of consumer confusion here, and that the BBW is trying to capitalize on the success of the BBC to the BBC's detriment. Businesses copyright names for a reason, and JK now feels compelled to protect his copyrights.

As beer aficionados, we are all very sensitive to cases of the big guy picking on the little guy, but in this case, who is the bad guy?

Tom is planning on getting the other side of things from the folks at BBW. We'll see what they have to say.

Subject: Mega-Brewers in Illinois?

This may be a stab in the dark but if there is anyone in the Chicago area or in at least northern Illinois that is currently brewing in large quantities (perhaps in the thirty gallons or more range) and wouldn't mind assistance in your next batch, I sure would jump at the chance to be around for the experience of one of these large brews. There are probably a thousand things I would like to know. I have a strong interest in micro-brewing and this is a nice transition step for me in pursuing that. All heavy labor is expected.  
Any takers?

Subject: David Arnold's Visit to Germany

Do not miss Dusseldorf! This city is home to the true ALTBIER style, and it is made far better here than anywhere else. My favorite stop is ZUM URIEGE brewpub, in the Altstadt, which makes a stupefyingly great altbier. Michael Jackson gives it four stars, and his description of Zum Uriege in his "Pocket Guide to Beer" is mouthwatering.

I used the Jackson pocket guide as a beer tourguide to Germany - it contains addresses and phone numbers of breweries, brew-pubs, and best of all, brewery-hotels.

The best brewery-hotel I encountered was Hotel Hirsch in Ottoburen, which has a swimming pool heated by the brew kettle. There are many others; they are members of a brewery-hotel association, and you can get a guidebook to their member establishments at any one of them.

Subject: Mazer Cup Mead Competition

1992 Mazer Cup Mead Competition

Sanctioned by the American Homebrewers Association  
Presented by the Ann Arbor Brewers Guild

Eligibility:

- o This competition is open to all brewers of Mead.
- o The fee is \$5.00 per entry.
- o All entries must be received between Monday, June 22, and Friday, July 3, 1992.
- o First round judging will be the weekend of July 12.
- o Final round judging the weekend of July 19, 1992.

Categories:

1. Traditional Mead

Flavored Meads:

2. Melomel: fruit, other than apples or grapes
3. Cyser: Apples
4. Pymment: Grapes
5. Hippocras: spiced pymment
6. Metheglin: herbs, spices
7. Braggot: malted barley

Awards and prizes:

First place mead in each category will receive a certificate and a mazer cup.

Second place mead in each category will receive a ribbon and a mazer cup.

Third place mead in each category will receive a ribbon and a mazer cup.

BEST OF SHOW will receive the Best of Show ribbon and the coveted, hand-crafted communal mazer.

Sponsors:

- o American Mead Association, Ostrander, Ohio
- o G.W. Kent, Inc., Ann Arbor, Michigan

o Home Winery Supply, Dundee, Michigan

I used a white plastic racking tube on hot wort once and the heat softened the plastic. It had a permanent curve in it after that. My carboy was sitting on the cold basement floor and broke ever so cleanly around the base.

If you're going to siphon lots of liquid, make a racking tube out of 1/2" copper pipe, a 90 Ell and a 45 Ell. Large diameter plastic hose fits over the copper pipe. I notice a big difference even in racking five gallons.

>SMALL. IF ANYONE ELSE OUT THERE HAS ANY EXPERIENCE WITH THIS MILL,  
>EMAIL ME WITH YOUR SOLUTIONS.

I also own one of these mills and have experienced the same problem with the grains not being pulled in by the rollers. However, since I drive my mill with a 1/2 hp variable speed drill, I like the small opening! I've tried, there is no way I can get my fingers down into the rollers. I'm not sure enlarging the hole will have any effect anyway. The problem is the spacing of the 1st two rollers not being wide enough. So, DONT ENLARGE THE HOLE!!! Get a good drill with a screwdriver bit, and grind away. I'm still working on a solution to the small catch basin problem.

I imagine, from what I've heard from others, that the racking tube will  
deform (melt). Your solution is to get a small section of copper  
tubing and a hose clamp. Bend the copper tubing over the edge of the  
pot and use it as your siphon pickup. Attach the vinyl tubing to the  
copper tubing with a hose clamp. Voila!

I realize this could belabor the point. But, "sterile" means that you are sure everything is dead. Period. No "degree of sterility," it is an absolute.

Because we don't know exactly what organisms are in our wort, we cannot say it is sterile unless we know that we have killed \*everything\* that could be in there. Cannery and commercial brewers do not claim to maintain sterility, but only a high degree of sanitation, usually through pasteurization. The TDT drops sharply with increased temperature (autoclave 10 min, 121C). -bdl

From: "Peter W. Karlson" <pk@columbus.dfci.harvard.edu>  
Subject: First Lager

I have a few questions for the seasoned lager gurus....

This is my first attempt at a lager, the primary fermenter is a 5 gal. glass carboy with a tube/bucket blow-by for 4-6 days @ 45-50 degrees. The secondary fermentation will be in another glass carboy with a fermentation lock at 38 degrees.

Question 1: Does it even have to be moved from the primary to the secondary or should I just leave it in the same carboy and lager it at 38 degrees (a closed system).

Question 2: After lagering at 38 degrees, what do I do at bottling time, do I need to keep the bottled beer refrigerated?

Question 3: About dry-hopping, the recipe was originally for a pilsner but it seemed too hoppy, so I didn't dry-hop. What is the advantage/result of dry hopping (bitterness, flavor, aroma). How do you dry hop? When do you add the hops to the fermenter (primary/secondary), I'm using pellet hops, should I throw them in loose or in a cheese cloth bag. If you do move the beer to a secondary fermenter, how do you/do you filter out the hops. Any help on this subject would be greatly appreciated.

Thanks in advance

-pk

From: ZLPAJGN%LUCCPUA.bitnet@UICVM.UIC.EDU  
Subject: first real use of a blow-off

Dear Brewers,

I've brewed a few batches before - some successful, and others that turn out tasting like...well, I called one "Chicago Tunnel Water" - but I've never really used a blow-off tube before. Now I should qualify that a bit: I've installed the apparatus before, but the brew never really needed it - I've either used a 5 gal. carboy for a 2 gal. batch, or as was the case with the Propensity Lager I brewed earlier this year, the kreausen never rose high enough to need a blow-off (I understand that that was because I used honey, as called for by the recipe.?). Now, however, I'm experiencing a bit of anxiety (I know, it's a home-brewer's cardinal sin...) as I watch my latest ale (porter) vigorously blow kreausen through the tube I normally use for siphoning at a rate strong enough to sustain a deep sea diver (nitrogen narcosis be damned!)

So, dear illuminati, should I worry? Specifically, I'm concerned that the tube I'm using might be too small in diameter to 1) handel the pressure, and 2) get clogged from a) leaf hops (even though I strained and sparged, I'm sure some got through.) and/or b) grain hulls which were too small to strain. Thus far, it seems to be going well enough but, considering that I only pitched the yeast this morning (Whitbread dry - 2 pkgs) and the vigorous activity I'm getting this afternoon, I worry (there's that word again...) about clogs and resultant "top-popping" (?). Oh, and another thing: due to the fact that 1) it's now summer, and 2) the temp. is presently hovering around 82F, and 3) I have little to no way to control the temp. on my porch other than w/ a fan, I'm concerned (a better word, I think!) about the effects that will have on the yeast activity (the little buggers/buggetts are presently swimming through the wort with more determination and speed that I had when I was swimming competitively in S. Fla.!!) certainly with greater activity than I've ever seen with any of my previous brews. Is this OK? Should I attend to my brew any differently?

Finally, thanks again to all - especially to Mike Tighe - for your responses about my mead questions. My batch seems to be off to a healthy start. More on that later..

Thanx in advance for your reassurances and guidance..

Subject: Hops

Hop Growers

I live in Aurora "Waynes World" Illinois and have just planted Hallertauer (hersbrucker), Saaz and Cascade cuttings just this week. I am being very very careful in making sure that the sun does no scorch these delicate plants and watering dutifully. I would like to know if anyone has a recommendation of fertilizer or plant food that has proven itself to be the key to successfully growing useable hops.

I have recently picked up a copy of the book by Beecher (or Beacher) for homegrown hops and all of his recommendations are really local to his Pacific Northwest location. Such as (not quoting directly) "plant the cuttings or rhizomes in February or March at the latest." Well, if I planted anything that early in the frost belt, it would be a brown spindly-looking twig flapping in the breeze. My question is, what kind of yield may I expect this year and will plants be able to survive the harsh winters we get here during its first calendar year in northern Illinois soil?

Your comments would be of great interest to me. Thank you.

Subject: quick question: re: blow-off hoses

Dear Brewers,

I just have a quick question: I used the hose that I normally use for siphoning for a blow-off hose, and now it seems to be stained with a mustard-like discoloration. I think I got most of the scum and resinous "blow-off" out of the tube, most if not all. I soaked it over night in a chlorinated water solution and then rinsed it meticulously with HOT water numerous times. Still, it's got a noticeable stain to it. So the question is, is it time to get a new tube for siphoning (as this one runs a risk of contamination)? If so, should I keep this old tube for future use as a blow-off tube, or get another tube for that specific use as well (or further still, should I get an all together different type of tubing - perhaps with greater I/O diameters?)

Thank in advance for the responses,

John

Subject: hops, water

Re. a question on hops: The first year will not yield any hops to speak of; it takes at least 2 years before you get any measurable harvest, and it is also dependent on the type of hops. Cascade grows faster in general than Hallertauer, for example. For fertilizing, I've heard than cow manure works well, but I use Miracle Grow instead, with good results.

My cellar gets damp and musty in the summer, so I have a constant supply of water produced from the de-humidifier. Would this be good water to brew with? Seems like it should be pure unadulterated water....

Subject: beechwood use by A-B

The following excerpts are taken from The Practical Brewer by the  
Master Brewers Association of the Americas:

. . .The old traditional European process involved adding beechwood  
chips  
(40cm x 2cm) to the fermenters claiming improved fermentation rate,  
better settling of yeast and colloidal substances, adding special and  
desirable flavor characteristics to the beer and also improving the  
physical stability of the final beer. Since the application of such a  
process is extremely labor-intensive and requires the strictest  
sanitation, this method is not in wide use. It should be noted, however,  
that one of the world's largest brewers uses this technique in its  
Kraeusening process. . . .

. . . Beechwood chips are added to the kraeusen tank by at least one  
brewer. The chips are about two feet long, four inches wide and 1/4 inch  
thick when new. They are manually placed in the kraeusen tank to a depth  
of three or four feet. They must be removed after each tank drop, washed  
and sterilized prior to installation in another tank. The chips increase  
the surface area, thereby allowing more complete fermentation with  
flocculent yeasts. They also slow the mixing of the kraeusen beer with  
the fermented beer, which results in more complete end fermentation and  
certain flavor effects. There is no flavor extracted from the wood into  
the beer. . . .

Subject: growing hops

Hello folks,

I've just got a couple of comments about the hops I planted earlier this spring. I've got three plants with three main vines coming off each plant. The vines on one plant are nearly six feet tall however the other two have only inched along to about 3 feet. The only difference I could see is that the 6' vines are climbing up natural jute line and the 3' vines are climbing up poly-nylon string. Could the nylon string slow the growth of the vines?

Anyway, I replaced the nylon string with natural jute so we will see if this makes any difference.

Subject: yeast culture

As a novice, a disgusted one, in yeast culture I have a couple of questions for the experienced. I have been working up a recipe in which I have used Wyeast Irish Ale. First from a foil pouch, secondly from a slant given to me which was purportedly cultured from a pouch, and thirdly from a liquid culture also given to me from the same source. The first two batches fermented out rapidly to the static state with good results. The third (current) batch of identical constituents is on its 3rd week of fermentation and still chugging. A taste test was not good. Unfortunately there is an added variable, the last batch was made in a new mash/lauder tun in which I used a 1" circular copper slotted tube as the filter element. This was its first use, and although I cleaned the copper well, when the mash was done, the tube was a much brighter uniform color than when I started. Is it possible that copper salts were generated which did a number on some of the yeasties, or am I left to conclude a yeast problem?

Second question...I note from the special yeast edition of Zymurgy that Whitbread is a combination of 3 yeast strains, no one of which is a self-sufficient one for brewing. Can one conclude from this that propagation from a single colony from a slant would only pick up a single strain and therefore not work?

Not worried, it's too late for that...the batch goes down the tubes.

Subject: Growing hops in sunny Cleveland, OH

I recently purchased (Freshhops) and planted 3 rhizome varieties (Cascade, Nugget, and Willamette, 2 each) in my backyard. Despite my best efforts at soil preparation (peat moss, topsoil, fertilizer) and frequent watering only one rhizome has sent up shoots (a Cascade). Another rhizome that I planted in a clay pot in potting soil (a Willamette) has been cooking along and has reached 6-7" tall. Is it normal for rhizomes to remain dormant for a month after planting? Am I doing something wrong? Should I dig up the ones that show no activity and restart them in pots? We have had fairly warm weather for the past few weeks and I assume that should be sufficient to get the buggers going. Thanks in advance for your advice and experience.

From: korz@iepubj.att.com  
Subject: Re: hops

Frank asks about hops in Illinois.

I live in Palos Hills "Star Trek XIII: Spock Plays Right Wing for the Hawks" Illinois, and actually began writing this directly to Frank, but then decided to post instead.

This year, your yield will be zero. Next year you can begin to expect some yield. You will have to spray with Malathion, Diazanone or (what I use this year) Sevin to keep the aphids at bay. Something else, maybe slugs, are eating some of my leaves at night. I had considered using Ladybugs to get the aphids, but that "something else" would have eaten the leaves as they did last year, so I (regrettably) chose to go the Chemistry route. Rabbits love hops too, the deer don't seem to bother with them, but then the rabbit fencing I used may have kept them away till the daylily leaves got tall enough for them to eat. You will need to put some rabbit fencing around them.

They prefer to grow on string. I've given them 12.5 feet and some of the shoots are already nearing the top. I may consider giving them more, but I don't know how yet (I have some oaks in the way and the oaks get preferential treatment.) This is only their second season. [By the way, John Bull Beer makes a good slug bait -- the slugs like it a lot more than I do. If I ever must drown in something, please let it be Kriek.]

Next spring, they hops will know when it's time for them to start. On really cold nights (frost warning), I wrapped the hills, rabbit fencing and all, with plastic sheets. Listen closely to the weather in the spring. If the hops are just a few inches tall or so, just pour some compost on them to keep them warm.

You say, "making sure the sun does not scorch..." I don't understand. As long as you give them enough water, they will use all the sun you give them. I give each plant about 6.25 gallons of water every morning via a timer-controlled soaker hose. Water makes a big difference. Initially, I gave each hill (4: Hallertauer, Hersbrucker, Nugget and Willamette) three 1 foot coils of soaker hose for 15 minutes per day. I soon noticed that the Willamette was doing much better than the Nugget, which was doing better than the Hersbrucker, etc. I noticed that the soaker hose was spewing more at the near end than at the far end (I should have known). After re-arranging the hose to give the far-end hills more hose, the growth rate seems to have evened out.

I use Ortho plant food (15-5-5, I believe), but some of the lower leaves are developing yellow spots. I had planned to check my copy of Beecher tonight to check what they are missing (Potassium, maybe?). I've been using the vegetable rate, but maybe hops need more than carrots.

Subject: Re: hoses

I have two comments on hoses.

Several posters suggested using vinyl hose for siphoning hot wort. Don't do it! PVC hose gets much too soft even at 150F, let alone 212F. My Ace Hardware carries two types of hose. Clear PVC and a translucent white, firmer hose. I used the soft, clear PVC for the cold side of my immersion chiller and the firmer white plastic hose for the hot side. Works great. I think it may be some kind of PolyEthylene (PE) so it should be okay for siphoning wort. I suggest using that.

Regarding John's question on blowoff hoses: Don't use the 5/16" siphon hose! It's too small! Eventually, it will clog! I use 1/2" ID -- 5/8" OD PVC hoses. I've stuffed a short length of 1/2" OD firm, white plastic hose (see above) into the stopper and then slipped the 3 feet of PVC over the end of that. You can also use a 1.125" OD PVC hose simply stuffed into the neck of the carboy. If your hardware store doesn't have it, virtually any homebrew supply store can get it for you.

From: Mark J. Easter <eastern@ccmail.orst.edu>  
Subject: Pumpernickel Porter Recipe

Last night I tasted a batch of porter that was inspired by a russian pumpernickel raisin bread baked in a local bakery. Thought I'd share the recipe and my observations with ya'll and solicit your advice for improvements.

PUMPERNICKEL PORTER  
Ingredients for 5 gallons:

5 lbs 2-row Pale Malt o.g. 1.043  
12 oz crystal (40L) s.g. 1.011  
8 oz chocolate malt  
1 lb. flaked Rye  
4 oz cocoa powder  
4 oz freshly ground coffee (Costa Rican)  
1 cup unsulphered blackstrap mollasses  
8 HBU's Willamette Hops  
Wyeast (Steinbart's)

Temperatures are in degrees F. Cook flaked rye for 5 minutes in 1 quart water. Mash-in the grist at 132 deg with 10 cups water. Adjust pH. Raise temperature to 150 deg., put into oven set at 150 deg. (my oven will allow this). Starch conversion rest for 90 minutes at 150 deg. Sparge with 4 gallons 180 deg. water. Add Molasses, Boil 90 minutes, one hop addition at 60 minutes before end of boil. After boil, shut off heat, let temperature drop to 195 deg. and add cocoa powder and coffee. Let sit for 10 minutes, then cool the wort (I put the covered pot into a tub of cold water. It cools off within 45 minutes to about 80 deg.) Racked into a carboy, primed with a starter batch of yeast. Fermented in the primary 10 days, secondary for 1 week. Bottled with 2/3 cup dextrose. It's been aging for 5 weeks.

My Analysis:

The beer is "complex", to say the least... It has a substantial malt-molasses-and-cocoa nose and my palate was satiated (almost overwhelmed) after one bottle. There are obvious molasses, coffee, and cocoa overtones, but the hop bitterness and flavor are too subtle. The color is a marvelous chocolate-reddish brown, with a beautiful creamy brown head (ala Guinness) which subsides quickly (unfortunately). I think the beer would be improved by cutting the molasses, coffee, and cocoa in half and increase the HBU's to 11-12. Adding some hops toward the end of the boil for flavor might be a nice addition, although the malt/molasses/cocoa nose is interesting and nice so I would not add aroma hops. The beer is still "green". Another month in the bottle should improve it.

Has anybody out there brewed a similar batch or used these ingredients in combination? Any ideas on how to use cocoa and coffee? A friend of mine suggested "dry-hopping" the coffee and cocoa (to cut down the bitterness and still contribute flavor) by adding it to the secondary and let it sit 2 weeks or so. Another friend, who has tasted the bread that inspired the beer, suggested adding raisins to the

boil. Anybody ever tried "raisin beer"? Looking forward to  
your input!

>Subject: Hops

>My question is, what kind  
>of yield may I expect this year and will plants be able to survive the  
>harsh winters we get here during its first calendar year in northern  
>Illinois soil?

New York used to be a hop growing region, so I presume a freeze isn't fatal. I have just this week made some cuttings for my friends and I'll see if they root and grow. (They seem to be) My first year yielded about 1oz total hops per vine (I was happy).

Another question: I have Fuggles and Hallertauer growing (No. Cal) and my Fuggles is about 15 ft and has cones on it already. Some are starting to turn a bit brown on the edges (just like in fall harvest). Should I pluck the cones as they ripen? They seem to be wonderfully fragrant and there is good lupulin production. I am just a bit surprised that there are mature cones already. Will it flower all summer requiring me to harvest once per week or so? This is the 2nd year for this plant, it sprouted in mid March, lots of sun and gets watered every day.

Thanx

> Modesto, CA. 95351 phone or fax 209-523-8874. The cost is \$15 plus  
shipping,  
> and tax if in CA. By the way it fits on 3/8 drive rachets.

This tool is easy to make. Find a cheap 13/16" spark plug socket for  
under  
\$5 at any hardware store. These are not hardened like most tools because  
they don't have to take as much torque; look for the warning that it  
should  
not be used for anything except spark plugs. Use a metal-cutting band  
saw  
or grinder (or even a hack saw will do) to cut notches in the end of the  
socket at the points of the hexagon, about 1/4" wide and 3/8" deep. The  
notches will allow the socket to come down over pins and reach the body  
of the fitting. Now you're ready to jam a pipe or other lever through  
the handle holds on the keg and crank those fittings off or on.

From: florianb@chip.cna.tek.com  
Subject: lager questions answered

Yesterday, Peter Karlson asked some lager questions, which I will try to answer as best I can.

>This is my first attempt at a lager, the primary fermenter is a 5 gal.  
>glass carboy with a tube/bucket blow-by for 4-6 days @ 45-50 degrees.  
The  
>secondary fermentation will be in another glass carboy with a  
>fermentation lock at 38 degrees.

>Question 1: Does it even have to be moved from the primary to the  
>secondary or should I just leave it in the same carboy and lager it at  
38  
>degrees (a closed system).

You should rack it off the trub as soon as the primary fermentation is over, which is roughly when the head falls. 50 F is a good temperature for the primary fermentation. After racking, you should maintain the 50 F for about a week to allow the beer to come out of shock. Then you should notice bubbles once more beginning to rise in the brew. At this point, you can start lowering the temperature down to the 38 degrees at the rate of about one or two degrees per day. This is important in order to not shock the yeast. After the temp is down to your lager point, you can leave it there until your patience runs out.

Actually, you can do the secondary fermentation at 50 F for several weeks before beginning the lager phase, if you want.

>Question 2: After lagering at 38 degrees, what do I do at bottling time, do I  
>need to keep the bottled beer refrigerated?

After bottling, you will want the brew to carbonate. So you can raise the temperature of the bottled beer to 45 or so. The carbonation step can be as long as 1-2 weeks. Then you should again lower the temperature to 38 or lower in steps of 5 degrees. I find the sequence to be fairly arbitrary at this time. However, the actual bottle aging can be carried out at 32 F for a very clean lager. Taste a bottle occasionally to determine when it's right.

>Question 3: About dry-hopping, the recipe was originally for a pilsner but  
>it seemed too hoppy, so I didn't dry-hop. What is the advantage/result of  
>dry hopping (bitterness, flavor, aroma). How do you dry hop? When do you  
>add the hops to the fermenter (primary/secondary), I'm using pellet hops,  
>should I throw them in loose or in a cheese cloth bag. If you do move the  
>beer to a secondary fermenter, how do you/do you filter out the hops.  
>Any help on this subject would be greatly appreciated.

I personally don't see how a pilsener can be too hoppy. The advantage of dry hopping is to put hop aroma into the beer. But with pilsener, the delicate aroma can be obtained by putting the aroma hops in during the last 5 minutes of boil with the lid on. If you put hop pellets in the secondary fermenter, you will risk clouding the beer and putting funky tastes into it (I think). I've never done it. If you are kegging, dry hopping becomes trivial with good fresh cone hops and a cheesecloth bag. In any case, I can't recommend dry hopping a pilsener. Dry hopping is a good way to get tremendous aroma for an ale. For example, if you use CFJ-90 (Centennial) in a keg of pale ale, you will get an incredible aroma that is nearly impossible by hopping in the kettle (NPI).

Hope this helps.  
Florian

From: fjdobner@ihlpb.att.com  
Subject: Grain Storage

I have recently been fortunate enough to have come across two little metal barrels with removable lids. Each one holds a volume of about 8-9 gallons liquid which is about the perfect size for the two types of grain that I store: two row pale and wheat malt. The problem that I have encountered is that on the label it says "Sumitomo Metal Mining Co. Ltd: Nd-Fe-B Alloy Powder." Not being particularly aware of my chemical compounds, I am very hesitant to store anything in there (even in a plastic bag) since it could be toxic.

My questions are 1) is this stuff dangerous or am I making a big deal out of this? 2) How might I go about making these barrels suitable for storing grain? Your responses as always are valued.

From: Hugh R Bynum <Hugh\_R\_Bynum@ccm.hf.intel.com>  
Subject: Racking tubes

Several people responded to a query about racking tubes and recommended using copper pipe or tubing. A tip to make the job easier: buy a tube bender along with the tubing when you make the trip to your local hardware or home supply store. This tool is a piece of coil spring, about 6"-7" long, with an inside diameter that matches the outside diameter of the tubing you want to bend. Slip the spring over the tubing where you're going to bend it, then bend the tubing GENTLY inside the spring. The spring keeps the tubing from kinking (as long as you don't try for too small a radius), and can be slipped off over the bend. Tube benders are usually sold on the same rack as fittings and all those other copper goodies you'll get to know and love as a brewer. The \$2 or so they cost is well worth the investment.

From: "ROBERT W. HOSTETLER" <8220RWH@INDINPLS.NAVY.MIL>  
Subject: Re: Grain storage

The kegs with the Nd-Fe-B markings held a a metal alloy powder used to make magnets. Nd is Neodymium, Fe is Iron, and B is boron. None of them are particularly toxic, in the sense of lead or arsenic. Wash then well and use them as you intended. If you're extremely paranoid, coat the inside with polyurethane from the local paint store, but let that stuff cure for a good long time so the grain doesn't pick up a strange taste.

Another topic: I'm about to start my first batch, and I'd appreciate any hints over and above what's available in TNCJoH or on the Munton and Fison kit I'm using. I think I've got relax and don't worry down, but I don't have the homebrew. Guess that I'll have to settle for a Molson's.

From: STROUD <STROUD%GAIA@leia.polaroid.com>  
Subject: Beechwood chips

About 3 years our club performed an experiment with aging a beer on beechwood.  
Here is the expt. and results:

About the beer:

This was a partial mash/partial extract golden ale, 5 gallons total. Starting gravity was 1.050, finishing gravity was 1.010. Wyeast #1084 ale yeast was used and total fermentation time was about 5 weeks, including aging in the secondary (3 weeks). The beer was split at the secondary stage: half was aged on 1 oz of sterilized beechwood biscuits (aka splines, obtainable from many woodworking stores. They were sterilized by boiling), while the other half underwent standard secondary fermentation. Neither batch was fined.

The two batches were bottled and allowed to condition, then served to the club in a blind tasting. People made comments before the beers' identities were revealed.

Results: About 80% of the tasters preferred (and could pick out) the beechwood aged beer. Most people thought that it was the fuller and rounder of the two, although there was some disagreement. Unlike oak, the beechwood aging didn't appear to add much 'woodiness' to the beer. The clarity of the two batches was excellent in both cases.

PS - I have since routinely used beechwood in many of my pale ales and find that it often adds an interesting nuance to their flavor profiles. I have seen no indication that it makes much difference in the final clarity of the beer. I have never used beechwood in a lager, but this discussion has made me wonder what it would do. Perhaps in my next batch.....

From: ZLPAJGN%LUCCPUA.bitnet@UICVM.UIC.EDU  
Subject: Summary of blow-off responses, etc.

Dear Brewers,

First, thanks to all who responded to my questions regarding my stained siphon/blow-off hose. I guess there's little to summarise, as I received almost unanimous responses, i.e.: get another hose for my siphoning, but keep this one for future use with blow-offs. I did get some variance with suggestions for future blow-off methods, especially when I plan to use whole leaf hops in the boil (or even dry hopping). Most of those who responded suggested that I invest in another, wider I/O diameter hose which would fit snugly into the mouth of the carboy thus decreasing the possibilities of clogging. Luckily, there's an Ace Hardware store just down the block from my apartment and I can get both hoses - replacement siphoning hose and the wider blow-off - with relative ease. Thanx again to all, and I'll keep you posted!

On a different note, can anyone tell me an accurate (or approximate) way to measure one pound of corn sugar without a scale? My latest batch - which prompted all the questions about blow-off hoses - called for 1 lb. of corn sugar, and I had to guess using a 1 cup measure how much sugar that was (and judging from the low OSG, I guessed lightly). So can anyone answer the question, how many cups of corn sugar equal (approximately) one pound? Thanx in advance.

John

From: eisen@kopf.HQ.Ileaf.COM (Carl West)  
Subject: re Hop Cuttings

I've had fair luck rooting cuttings this way:

take a cutting with at least 4 pairs of leaves

pluck off the bottom pair of leaves

dip the bottom inch or so in rooting hormone

stick in very wet potting soil (read: thick mud) in a pot with no drainage

put the whole mess in a plastic bag (transparency is not vital)

seal with a twist tie

leave it alone for a week or more in a sunny window

I've been getting better than 50% success.

Subject: Dehumidifier water

Russ Gelinas asks if dehumidifier water is good to use in homebrew.

Well, last fall I made a bitters with dehumidifier water and it turned out all right. The water is pretty soft, similar to distilled water. Before collecting the water for brewing, be certain to wash the catch basin out thoroughly. I'm currently collecting water for another batch, but have to start over because my roommate found most of a spider in the catch basin. Out go five gallons!

Before using the collected water, I boiled the amount I was going to add after boiling the wort (I extract brew). Although none of us smoke, I thought it was a good idea to sanitize water left sitting in open air. Then again, I boil the tap water I use for homebrewing too.

Subject: Auto\_Mash

Hi All,

I'm interested in a mashing system called AutoMash,  
made by Scientific Brewing Systems of Martinez, Calif.  
Does anyone have any experience/information on this system,  
how well(if at all) does it work, how easy is it to use,  
price, etc. Please feel free to send email.

Thanks,  
Jim

Subject: Auto\_Mash

Greetings fellow brewers,

I recently returned from my first ever visit to Colorado. Nice place; kinda like Alberta, only drier :-)

I was quite impressed with the level of micro/brewpub activity. Is it possible that this is the state with the largest # of micro/brewpubs per capita? Being an ale-man, I was particularly impressed with the variety of homegrown ales available in the better beer stores.

The only brewery I visited was Breckenridge, a brewpub which also bottles and sells locally (in very dark 22 oz. bottles). My favourites were their oatmeal stout and IPA. I was also impressed by a bottle of their wheat beer (60% wheat, 40% barley), but the glass I had at the pub was ho-hum and lacked the clovey distinctiveness of the (older) bottled sample.

There is a notable peculiarity in their brewing process. Their kettle has a 500 gal. capacity, but their fermenters hold 1000 gal. So, they brew up 500 gal., aerate, cool and pitch the yeast, then brew another batch the next day and ADD NEW WORT TO AN ALREADY WORKING BATCH!!!!!! The person I talked to (assistant brewmaster, I think) said that they aerate the second batch to a lesser extent and, because of an earlier start on Day 2, it's somewhat less than 24 hours between additions.

Pretty weird, huh? At least, that's what it seemed to me. Still, the results speak for themselves; the beer is good. I was trying to think if a scenario where a home-brewer might find such a system useful, but I couldn't come up with anything that wasn't totally contrived.

Does anybody brew this way? How far do you folks think this process could be carried on: to a third addition 48 hours later? A fourth after 72 hours? etc?

Rob

From: Bob Jones <BJONES@NOVA.llnl.gov>  
Subject: The NEW mill from Micah Millspaw

Success at last. Bob and myself have been trying to build a malt mill for several months, and this weekend I finally got mine debugged. This mill provides the BEST crush I have ever seen. It has two 4 inch diameter rollers that are 4 inches wide. They are both in-running driven by 4 inch dia. spur gears. The mill is powered by a 1/2 horsepower washing machine motor with two speeds. The slick part about this mill is the fact that the gap between the rollers is not adjustable. We found that the adjusting mechanism was the weak point in everyone else's grain mill. And so it was eliminated. It seemed that once the mill was adjusted to provide a good crush it was then left alone, hopefully to stay put (gap wise) A formula was found to help determine the proper gap size and the speed at which to turn the rollers, the main problem that we ran into was getting enough torque, but a big motor fixed that. At present the gap is set at .050 inch and the rollers have a fine straight knurl on them. This setup does an excellent job on both barley and wheat and even dextrin malt. The thru feed is about four pounds per minute.

radius of roll + 1/2 gap  
angle of nip      cos a = -----  
                    radius of roll + radius of particle

an angle of 12-14 is good.

speed - 6-13 surface feet per second is good

rpm  
sfm = ---- \* diametresfs=sfm/60  
3.82

5250 \* horsepower  
torque = -----  
rpm

perhaps this info will be of use to some who are building their own equipment.

>

- 1) try putting the coffee in the mash. this will help reduce any astringency from the coffee grounds. an alternative is to brew up a bunch of it separately, and add it to the boil. You do not leave grains of any sort in the boil.
- 2) With the flaked rye adjunct (or any non-barley malt/adjunct), it is desirable to use a higher enzyme lager malt, and a lower temp (122F) protein rest, according to TCHOHB (Miller). 10 cups H2O for > 6lbs grains seems like it would make for an awfully stiff mash, too.
- 3) Replace the molasses with brown sugar. Molasses leaves a notorious aftertaste, but this will fade with time (a long time - 6 months to a year or more - depending upon the type of molasses) After it develops a better head, try putting a bottle in the fridge for a month. A taste will give you a better idea what it will mature into.
- 4) You can always try rye malt instead of flaked rye. I brewed up a batch of "Bock 'n Rye" (I'm trademarking the name :-)) a few months ago. After 2 months in the bottle, it had a definite funky whiskey-like flavor, fading into a bitter aftertaste.

After 3 months (at 50-60F), the bitter aftertaste had diminished substantially.

- 5) use real chocolate instead of powdered??? I don't know - I've never put chocolate in my beer...
- 6) Put a case in your basement and don't bring it out until you're old and gray and don't have anything better to do (by which time, brewing will probably be illegal, along with everything else worthwhile, and you'll have the added satisfaction of making a political statement whilst you imbibe).

Subject: fertilizing hops

After consulting with my local nurseryman I am feeding my new hop starts a mixture of the following:

4 lbs. 0-45-0  
5 lbs. 10-10-10

I'm applying this mix in scant amounts on a regular basis.

"Dave" (the nurseryman) tells me that I will have no crop to speak of this year. My goals for this season, he says, should be to develop the rhizomes if I want to have a decent crop next season. Boosting the middle number will develop the root system. Next season we will work on boosting the last number. I'm not sure why yet -- I'll find out next season.

From: waflovers@quantum.on.ca (Bill Flowers)  
Subject: Kriek Lambic and weiss beer

Recently while on a business trip I discovered a restaurant (The Full Moon on Main St. in Ann Arbor MI) which had an amazing selection of international beers. For the first time I was able to try Lindeman's Kriek and various German Weiss beers (along with others I've only heard about such as Xingu).

I also found a store (The Beer Depot, one block down and turn the corner from The Full Moon) which claimed to have over 200 types of beer (they had all the bottles on display; I believe them) so I was able to buy a few of the better ones and bring them home.

My wife sampled the Kriek I brought home (as did my mother-in-law, and brother- and sister-in-law who all loved it) and declared that she could drink gallons of it this summer. The amazing thing about this is that the kindest thing she has ever said about any beer in the past is that it was barely tolerable if she was extremely thirsty (this includes numerous European brews). Personally I am completely hooked on the German Weiss beers I tried (served with yeast and a twist of lemon): Hacker-Pschorr Weiss and Ayinger Brau-Weisse (I brought back a bottle of Ayinger Ur-Weisse which I haven't tried yet).

My questions:

Has anyone tried the Brewferm Kriek kit (from Belgium)? How close is it to the wonderful Kriek Lambic I tried? It isn't cheap (Cdn\$20.59) esp. as it makes only 12L (instead of the normal 19L). I plan on starting it this weekend to generate those "gallons" my wife wants for the hot weather.

It calls for some sugar (500g I think), but I was thinking of substituting alfalfa honey. I think it will give me the light body called for (which DME wouldn't) without the off flavours of corn sugar. Comments?

Similarly, what is the Brewferm Weiss kit like? Should I substitute wyeast #3056 (Bavarian wheat) for the supplied dry yeast? (I know, always throw away the dry yeast that comes with a kit and substitute ...).

Which reminds me, what about the yeast in the Kriek kit?

Finally, has anyone had any success duplicating Kriek or a wonder weiss like I tried from recipe? (Extract recipes if possible, I don't mash.) I recall the recipe in the appendix (Sour mash and lambics) in TNCJoHB. The difficulty is obtaining the proper yeast(s) (can it/they be obtained commercially at all?). If I know which Wyeast to order my brew store will special order it for me. They normally only carry 5 strains.

Howdy Fellow Brewers,

I tried posting this last week, but it hasn't made a digest yet.  
Here it goes again!

Brian

With all the talk of the local brew fests, I thought I would put  
in Wisconsin's \$0.02 worth. Here's the scoop:

What : Wisconsin Microbrewers Beer Fest 1992  
Hosted By Rowland's Calumet Brewing Co. Inc.

Where : Brant Inn, Chilton Wisconsin

When : Sunday May 31st, 1992 from 1:00 - 6:00 pm

Who : Nerly every Wisconsin microbrewery will be represented!

Appleton Brewing Company (Adler Brau), Appleton WI  
Brewmasters Pub, Kenosha WI  
Capitol Brewery (Garten Brau), Middleton WI  
Cherryland Brewing, Sturgeon Bay WI  
Fox Classic Brewery, Appleton WI  
Lakefront Brewery, Milwaukee WI  
Rowland's Calumet Brewing, Chilton WI  
Sprecher Brewery, Milwaukee WI  
Water Street Brewpub, Milwaukee WI

Cost : \$16.00 in advance, \$18.00 at the door  
Tickets available from Rowlands Roll-Inn in Chilton,  
Galaxy Science and Hobby in Oshkosh (ask for Jeff),  
and ???????.

B.Y.O. Lawn Chairs  
Music By Jerry Schneider Band

For further info either call Rowland's at (414) 849 2534  
Hope to see you there.

Brian J Walter

P.S. I am in no way connected with the beer fest, with the exception that  
I already have my tickets and plan on being there and drinking good  
beer. I am just helping out a few local brewmasters without their  
knowledge.

Good Day

From: fjdobner@ihlpb.att.com  
Subject: Wort Chiller

After all the great responses I got on ways of transporting wort to my basement after brewing, I went out and bought some 1/2" copper tubing and vinyl hoses to siphon and simultaneously cool the wort. I even have approval from my wife to cut a nice round hole in the bottom of our kitchen cabinet, through the floor in order to feed the hose. I am very excited about solving this and actually improving the quality of my beer.

My question is this: Does anyone have a nice equation that would relate the length of 1/2" coil that would be required to cool wort from temperature T1 (which would really be about 212F) to T2 (depending upon if it is ale or lager yeast I am using between 40-60 F). I would imagine the specific gravity would show up in there and since temperature is already an independent variable, it could also be used to correct the SG (that is if the gravity that is used in the equation is expressed at hydrometer temperature of 60F). I am most sure that the great minds in this crowd have already come up with something. If so your input would as always be most welcome.

Frank Dobner

PS; With a baby due any day now, I am likely to suggest that we name our baby after a great beer to commemorate this great process improvement in brewing. Maybe Porter? Or Marzena? NOT! By the way, I really look forward to reading the HBD everyday. I appreciate the knowledge, interest, tips, experience, advice and humor of the participants. Thanks for your contributions!

From: S94WELKER@usuhs

Subject: Nd-Fe-B Alloy Barrels from Sumitomo Mining Corp (really?)

I'm halfway to my MD, so I guess that means I'm halfway to knowing what I'm talking about, right? So maybe Frank and everyone else will halfway listen

When I say...when it comes to reusing chemical containers, don't even think about it. While I can't jump up and scream "Neodymium will kill you cold as stone, and so will the other lanthanides!", I can say, "why take a stupid chance?" To save, maybe \$40 over buying a couple of Rubbermaid trash cans? Is that worth an exposure to a chemical which is used to dope laser rods?

Frank, if I can't convince you to toss those barrels, at least use them to store something you're not going to eat. Just because they lack the old skull and crossbones poison hazard labels doesn't mean they're safe. Besides, who wants to explain to a beer judge "that lime green color might be from the boron residue the soap and water couldn't clean out of my grain storage buckets. 'Tastes like brake fluid,' you say? Maybe I'll call it 'Bhopal Pale Ale,' or 'Love Canal Porter!'"

From: Pat Lasswell <patl@microsoft.com>  
Subject: Re: Pumpernickel Porter Recipe

I suspect that dry-hopping with coffee would destroy any head the beer might have, since (good) coffee contains a not insignificant amount of oil.

Further, coffee that has been extracted with cold water has a substantial difference in flavor over hot-extracted coffee, so you might not get what you expect (if indeed, one could anticipate the results). You might try adding the coffee to the primary after the wort has been cooled, that way any oils extracted from the coffee would adhere to the yeast and not disturb

the head. The activity of fermentation would probably flush out some of the

aromatics, so it's anybody's guess as to what it would taste like.

(Anybody  
done it?)

Pat Lasswell

Subject: a&q

Greetings all,

Russ asks about the advisability of using dehumidifier water to brew with. Russ, would you drink this stuff? After looking in the catch basin on my dehumidifier I'd have to say that I'd rather use ditch water to brew with.

Now for a question. I've got a weizen in the secondary which I intended as a dunkelweizen, but it isn't as dunkel as I'd like. I'm considering steeping a couple ounces of black patent malt with my primings in hopes of adjusting the color at bottling time. Has anyone tried anything like this? Does it seem like a reasonable idea? Any drawbacks I should consider?

Ooogy wawa,

From: arf@ddswl.mcs.com (Jack Schmidling)  
Subject: hops cuttings

To: Homebrew Digest  
Fm: Jack Schmidling

>My question to you is what is the proper way to do this whole thing:  
cutting, rooting, planting...? If anyone has any information by which I  
can  
improve, it would be very generous and welcomed. Thanks

Not sure about proper but I bought two small plants this winter and  
turned  
them into 8 by Spring.

I simply took about two inches of the growing tips of several branches  
from  
each plant. These I put in water and they grew roots within about two  
weeks  
and were then planted in soil.

I also found that if dipped in Rootone, they could be planted directly  
in  
potting soil and rooted readily.

There doesn't seem to be any reason to use root risomes as the branches  
root  
just as easily.

.....

Whitbred Yeast...

Someone just posted an article about Whitbred yeast being a combination  
of  
several strains. Is this a fact or another momily? Does it apply to  
the dry  
version?

I just pure cultured some from a pack of dry and will be pitiching in my  
next  
batch. If it is true, I just wasted a lot of effort.

I don't think it's unusual to do it this way.

The famous smoke-beer brewery Schlenkerla in Bamberg,Germany does it !

Each batch is 5000 litre,they make two batches each week and each  
fermenting vessel contains 10000 litre.  
According to my info ( The owner & brewmaster ) it is at least one  
day between the batches ,even 2-3 days.

It seems that it's approved under the 'Reinheitsgebot' to...
