Windows 95 Software Compatibility Testing Notes

< Click to view the report

Software compatibility was a key goal for Microsoft Windows 95. Right from the start, we designed Windows 95 to be as compatible as possible with existing 16-bit Windows-based and MS-DOS-based applications and drivers, while at the same time providing key features like a new user interface, Plug and Play, networking, and built-in multimedia. You can be assured that software displaying the "Designed for Windows 95" logo not only works with Windows 95, but takes advantage of new Windows 95 features.

In addition, as part of the Windows 95 development process, we tested thousands of existing applications, and working with the software publishers, where we could, made changes to Windows 95 to make sure those applications run well. In many cases, Windows 95 automatically displays a help message when the application is run, describing any known compatibility issues.

This report lists over 2500 applications tested internally by our testing team. We tested all the popular applications from all the major publishers. We also tested applications that would place a heavy stress on the operating system such as utilities, and that would be a good test of compatibility. And we tested hundreds of other applications as part of the most extensive beta testing program in history, with over 50,000 beta testers involved.

Except where noted, according to our tests these applications run about as well or better in Windows 95 as they did in Microsoft Windows 3.1. We think the compatibility of Windows 95 is excellent--what we found was that only about a hundred had serious problems running under Windows 95. Of course, you'll be the final judge. When we did encounter problems in our tests, we described them in this report together with any tips or additional information that might be useful.

If your application doesn't appear in this list, it doesn't mean it doesn't work--it will likely work just fine! It just means it wasn't part of our internal testing effort. But if you are having trouble, here are few tips which you might find helpful:

- If it is an MS-DOS-based application, run it in single MS-DOS Mode, as described in Windows 95 Help. Or you might be able to create a custom .PIF file for this application to run it under Windows 95.
- Run the application with display settings in 640x480 with 256 colors.
- Print with spooling turned off.
- Print to a network-mapped LPT port instead of a UNC name.

If you want more specific information about compatibility issues with your application, contact your software publisher, who can tell you whether there is an update available for Windows 95. We will continue to update this report as new information becomes available.
