Software Engineering Capability and Its Measurement

- **The maturity of an organization's software engineering capability can be measured in terms of the degree to which the outcome of the process by which software is developed can be predicted.**
 - **Predict the amount of time required to develop a software artifact**
 - **Predict the resources (number of people, amount of disk space, *etc.*) required to develop a software artifact**
 - **Predict the cost of developing a software artifact**
- **The *process* and the *technology* go hand in hand.**
- **One method of measurement is the *Capability Maturity Model for Software* developed by the Software Engineering Institute.**

Ada Technology

- **Ada** is a computer programming language specifically designed to support software engineering.
- Some of Ada's features include:
 - All of the normal constructs for looping, branching, flow control, and subprogram construction
 - Support for enumeration types, integers, floating point, fixed point, characters, strings, arrays, records, and user-defined data types
 - Support for algorithm templates (called generics) which allow algorithms to be expressed without concern for the kind of data on which the algorithm is applied
 - Support for interrupts and concurrent processing
 - Support for low-level control, such as memory allocation
- Ada is a *design* language as well as a *programming* language.
- Ada is designed to be read by Ada programmers and non-programmers.

Ada Technology, Continued

- From the software engineering perspective, Ada helps by acting as something much more than a programming language; Ada can be used as a common language for communicating:
 - Some aspects of the requirements
 - Some aspects of the design
 - All aspects of the code
- In particular, by using Ada as a *design language*, code is simply realized as a complete, detailed elaboration of a design.
- For large, multi-person teams, Ada can be used as an exact, precise way to communicate requirements and design information -- often in a form which may be syntactically checked by a compiler. Ada is much better than conventional English in this regard.
