## **Overview**

To successfully manage software development, the project leader must determine:

- 1. Scope of work to be done
- 2. Risks to be incurred
- 3. Resources that will be required
- 4. Tasks to be accomplished
- 5. Effort (cost) that will be expended
- 6. Schedule to be followed

Software project management begins before the technical work starts.

Software project management ends when the software is retired.
