

# **SOFTWARE METRICS**

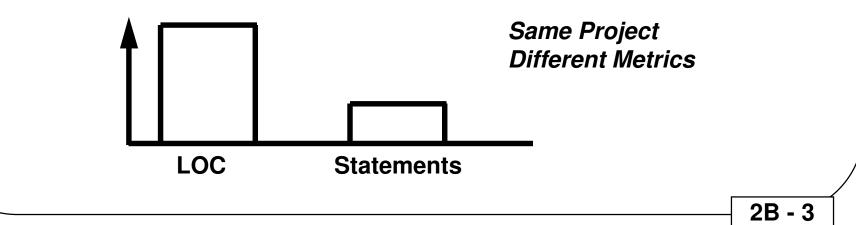

- Measuring Software
- Why Measure Software?
- Two Types of Measurements
- Categories of Metrics
- Size-Oriented Metrics
- Function Points
- Feature Points
- Function-Oriented Metrics
- Measuring Software Quality
- Relationship of LOC to FP
- Use of Productivity Data
- Integrating Metrics into the Software Engineering Process
- Collecting Software Metrics

# **Measuring Software**

- Objectively measuring software is difficult.
  - Most projects use only "lines of code" (LOC) for metrics.
  - Much disagreement exists on what and how much to measure.

#### but

 Accurately measuring software is vitally important to tracking and controlling software development.

# Why Measure Software?

То --

- 1. identify quality of the software product
- 2. assess productivity of the software developers
- 3. assess benefits of using development processes and tools
- 4. form a baseline for estimation
- 5. justify requests for tools and training

## **Two Types of Measurements**

## <u>Direct</u>

- -- cost
- -- LOC
- -- execution speed
- -- binary code size
- -- memory used
- easy to make

### Indirect

- -- functionality
- -- quality
- -- "-ilities"
- not easy to make

#### 2B - 5

<b>Categories of Metrics</b>							
Ρ	roductivity	Qua	lity	Tec	nnical		
Size-Oriented							
Function-Oriented							
Human-Oriented							
	I	I					
						_	

## **Size-Oriented Metrics**

Let *KLOC* = "thousand lines of code"

Then we can define

- productivity = KLOC / person-months
- quality = defects in code / KLOC
- cost = dollars / KLOC
- documentation = pages of documents / KLOC

Efforts and costs include all elements of software development (analysis, design, code, test, *etc.*).

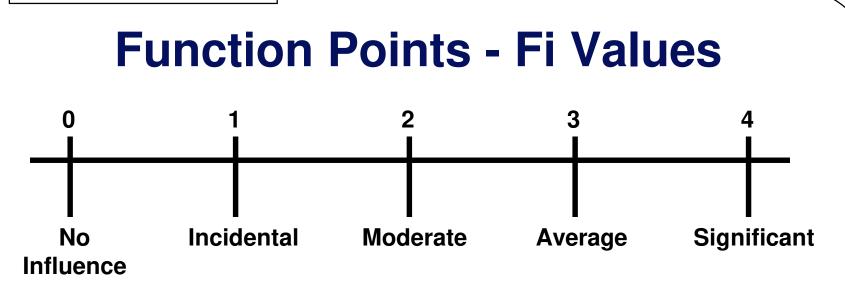

#### **Size-Oriented Metrics - Examples**

Project	Person-	Cost	KLOC	Pages of	Errors
	Months			Doc	
Α	24	\$168,000	12.1	365	29
В	62	\$440,000	27.2	1224	86
С	43	\$314,000	20.2	1050	64

Project	Productivity	Quality	Cost	Documents
	(KLOC/p-months)	(errors/KLOC)	(\$/LOC)	(pages/KLOC)
Α	0.504	2.40	\$13.88	30.17
В	0.439	3.55	\$16.18	45.00
С	0.470	3.67	\$15.54	51.98

# **Problems with Size-Oriented Metrics**

- Definition of "lines of code"
  - **O Programming language dependent**
  - **O** Penalize well-designed shorter programs
  - Cannot easily accommodate non-procedural languages
  - Difficult to assess LOC before a program is written
- Only known errors can be counted
- Types, skill levels, and productivity of personnel varies

- Does the system require reliable backup? 1.
- 2. Are data communications required?
- 3. Are there distributed processing functions?
- Is performance critical? 4.

9. Are the inputs, outputs, files, or inquiries complex?

8. Are the master files updated on-line?

- 10. Is the internal processing complex?
- 11. Is the code designed to be reusable?
- Will the system run in an existing environment? 12. Are conversion and installation included in design? 5.
- 6. Does the system require on-line data entry? 13. Is the system designed for multiple installations in
- Does the on-line data entry require the input 7. or operations?
- - different organizations?
  - transaction to be built over multiple screens 14. Is the application designed to facilitate change and ease of use?

#### **Function Points - Computation**

		We	eighti	ng	Facto	or	
Measurement Parameter	Count	Sir	nple	Average	Com	olex	Product
Number of user inputs		X	3	4	6	=	
Number of user outputs		x	4	5	7	=	
Number of user inquiries		x	3	4	6	=	
Number of files		x	7	10	15	=	
Number of external interfaces		x	5	7	10	=	
Count - Total							
	A A	1//			01	Γ,	
$\mathbf{FP} = \mathbf{count} -$	tota		<b>U.6</b>	5 + 0.	UI		$\binom{i}{i}$
							2B - 11

## **Feature Points**

## Function Point Extensions for Technical Software

- Function points were originally designed for business information systems applications.
- Extensions called *feature points* apply to technical software applications.
- Algorithms are a bounded computational problem that is included within a specific computer program.

#### **Feature Points - Computation**

**Measurement Parameter** Weight **Product** Count Number of user inputs x 4 = Number of user outputs x 5 = Number of user inquiries 4 X = Number of files Χ 7 = Number of external interfaces x 7 = Algorithms 3 X =

**Count - Total** 

 $\mathbf{FP} = \mathbf{count} - \mathbf{total}(0.65 + 0.01 \sum F_i)$ 

## Problems with Function Points and Feature Points

- 1. These metrics are based on subjective data.
- 2. Parameters can be difficult to obtain after-thefact.
- 3. Function and Feature Points have no direct physical meaning.

## **Function-Oriented Metrics**

- Focus is on "functionality" or "utility"
- Both Function Points and Feature Points support the derivation of potentially useful data for the comparison of one project to another:
  - **O Productivity = FP / person-month**
  - **O** Quality = defects / FP
  - O Cost = \$ / FP

 $\bigcirc$ 

Documentation = pages / FP

# **Measuring Software Quality**

**Before Delivery** 

- Program complexity
- Effective modularity
- Program size

After Delivery (most widely used)

- Number of defects uncovered in the field
- Maintainability of the system

# "After Delivery" Quality Metrics

- Correctness defects/KLOC or defects/FP over a one-year period
- *Maintainability* mean-time-to-change (MTTC), which is the time required to:
  - O analyze the change request,
  - **O** design a modification to the software,
  - O implement the change,
  - O test the changed software and the system as a whole, and
  - O distribute the changed system to the users

# "After Delivery" Quality Metrics, Continued

- Integrity based on threats and security
  - *Threat* probability that a specific attack will take place within a given period of time
  - Security probability that the attack of a specific type will be repelled

Integrity = 
$$\sum_{\text{allthreats}} (1 - \text{threat}(1 - \text{security}))$$

- Useability based on several perceptions of the users:
  - **O** skill required to use the program
  - **O** time required to learn the use of the program
  - The increase in productivity from using the program
  - O the user's attitude towards the program

# **Relationship of LOC to FP**

- The relationship of lines of code to feature points is a function of the programming language used and the quality of the design.
- Rough estimates of the number of lines of code to create on feature point are:

Language	LOC/FP
Assembly	300
COBOL	100
FORTRAN	100
Pascal	90
Ada	70
<b>Object-Oriented Languages</b>	30
Fourth Generation Languages	20
Automatic Code Generators	15

## **Use of Software Productivity Data**

- Do not use LOC/person-month or FP/person-month to:
  - **O** Compare one group of developers to another
  - **O** Rate the performance of an individual
- Many factors affect productivity:

A	ppi	roxi	mate	%	Variation

Factor	in Productivity
People (number, experience)	90%
Problem (complexity, number of changes)	40%
Process (language, CASE)	50%
Product (reliability, environment)	140%
Resources (CASE, hardware, software)	40%

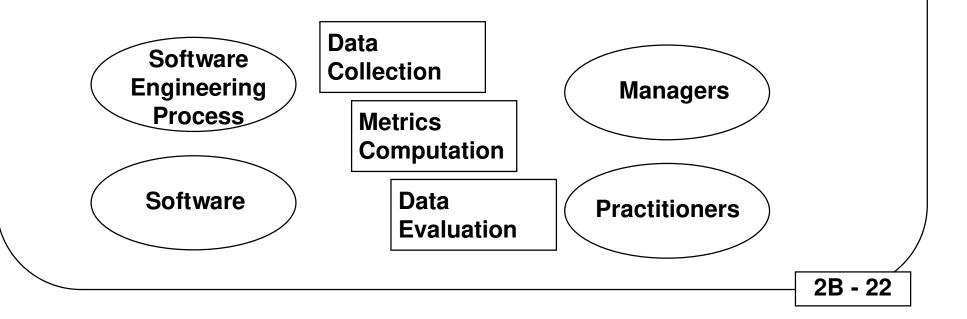

## Integrating Metrics into the Software Engineering Process

• A historical baseline of metrics data is needed:

- Company, department, or unit should be identified in the scope of this data.
- Resistance to data collection should be expected in many corporate cultures.
- At least three years of accurate, standardized metric data collection is needed to produce accurate planning estimates.

# **Collecting Software Metrics**

- The process of collecting and using software metrics includes the following steps:
  - 1. data collection
  - 2. metrics computation
  - 3. data evaluation
- The following slides show a spreadsheet model for the collection and computation of historical software baseline data.

Spreadsheet Dat	ta Collect	ion Model				
Description	Units	Sample Data
