Planning

Overview

To successfully manage software development, the project leader must determine:

1. *Scope* of work to be done
2. *Risks* to be incurred
3. *Resources* that will be required
4. *Tasks* to be accomplished
5. *Effort* (cost) that will be expended
6. *Schedule* to be followed

Software project management begins before the technical work starts.

Software project management ends when the software is retired.
