About the ThesDB Demo Program

This demo program is a stand-alone application written to use the ThesDB Thesaurus Database. Specifically, the demo program uses the ThesDB DLL (THESDB16.DLL)

The demo program can look up synonyms for key words. It can also create, manage, and edit user thesaurus files.

ThesDB Packages Available

ThesDB is available in the following packages:

16- and 32-bit Windows SDKs

The ThesDB Windows SDKs provides everything you need to add a full thesaurus capability to your Microsoft Windows applications. The Windows SDKs are compatible with most DLL-capable environments, including Visual C++, Borland C++, Visual Basic, Delphi, Microsoft Access, Paradox, PowerBuilder, FoxPro, etc.

A key feature of the Windows SDKs is the built-in thesaurus dialog, which makes adding a thesaurus to your application -- including a complete user interface -- just one statement away. In less than 10 minutes, your application can have a powerful, professional-quality thesaurus.

Developers with special-purpose needs can bypass the built-in thesaurus dialog and access the ThesDB API directly.

Source SDK

The ThesDB Source SDK provides everything needed to add a powerful yet easy-to-integrate thesaurus to your C/C++ applications on virtually any platform.

The ThesDB Source SDK includes the complete ANSI-C source code for ThesDB and related software. The code was designed and built for maximum portability. The code makes no assumptions about the underlying hardware or operating system. All I/O is accomplished using the STDIO calls. Getting ThesDB up and running on a new platform typically takes less than one hour.

The ThesDB source code was designed, coded, and tested with strict attention to quality, maintainability, and portability. No GOTOs. No cheesy coding hacks. No dependence on platform-specific features. Just consistent, well-commented, and modular ANSI C that's ready to be integrated with your applications today.

ThesDB API Overview

Basic API

The basic ThesDB API allows access to the thesaurus database from applications. Users of the ThesDB Windows SDKs can bypass the ThesDB API and invoke a built-in thesaurus dialog directly.

ThesDB's API contains the following functions:

GetFirstCategory/GetNextCategory: Obtain the set of word categories matching a given key word.

GetFirstSynonym/GetNextSynonym: Obtain the set of synonyms contained by a given word category.

OpenThesaurus: Open a thesaurus file, making its contents accessible for key word searches.

AddWord/DelWord: Add or remove synonyms to or from a user thesaurus file.

GetFirstSuggestion/GetNextSuggestion: Obtain suggested alternatives for misspelled or unknown key words.

CompressInit/CompressFile/CompressEnd: Create a compressed thesaurus file.

GetCategoryAntonym: Obtain a word category with a meaning opposite to a given category.

Thesaurus Dialog Properties

Windows applications which use the built-in thesaurus dialog can set and retrieve the following properties:

Keyword: The word which will be automatically looked-up when the thesaurus dialog appears.

SelectedWord: The synonym selected by the user.

MainThesFiles: The set of files forming the main thesaurus.

UserThesFiles: The set of user-thesaurus files.
