About Quick Print:

Quick Print (QP) is a desk accessory written to enhance the Macintosh programming environment by providing a convenient method of listing text files. I use it with Megamax C and MacPascal in a programming lab environment consisting of 512K Macs sharing printers via a four-wire print switch. It is also useful for those who use BBS services.

QP should work with most printers and within most applications. If QP detects that the current printer is the Imagewriter, it will offer a selection of fonts, print the page header in bold, and initialize Xon/Xoff handshaking and hardware handshaking on the currently selected printer port. Otherwise, QP assumes that the printer uses an elite font, prints 66 lines per page, and requires a linefeed after a carriage return. I have used it with several communications applications with no trouble.

Features:

- Fast spool printing of text files.
- Dialog driven formatting features.
- Optional page header with date, time, filename, and page number.
- Automatic page break.
- Adjustable left and write margins.
- Variable tab settings (equally spaced).
- Optional line numbers.
- Line wraparound.
- Selection of fonts. (Imagewriter only)

Acquisition:

Quick Print 0.5 is circulated via the MacHonor system on an "as is" basis. Try it for several days. If you want it, send me \$7.00. If you want to learn how to customize Quick Print, send me \$15.00 for a disk with the latest version of Quick Print and instructions on how to customize it (via resource modification). If you really want to dig into the product, send \$30.00 for a disk with all of the above, and the source code (it hurts to let you to see my dirty source code). If you request the source code I expect you not to share it with others.
